Fishing-rod	C. S. Treadway	395,931	Jan. 8	970	249	46	201
Fishing-rod	H. Loftie	396,702	Jan. 22	2126	545	46	436
Fishing-rod case	J. C. Parker	396,767	Jan. 22	2132	546	46	437
Fishing-rods. Line-guide for	C. H. Washburn	399,588	Mar. 12	1213	313	46	1353
Flanging-machine	W. Thom	398,674	Feb. 26	2363	{627 628	46	1066
Flanging sheet-metal cylinders. Machine for	W. Thom	398,673	Feb. 26	2360	{626 627	46	1065
Flask: *See* Molders' flask.							
Flask-lock. Snap	M. B. Springer and J. C. Higgins	397,035	Jan. 29	2616	675	46	546
Flax, &c. Apparatus for scutching	J. McGrath and E. Manisty	398,171	Feb. 19	1610	{427 428	46	909
Flax. Retting	E. A. Hartshorn	396,158	Jan. 15	1307	.....	46	274
Floor-clamp	D. B. and F. S. Morrill	396,104	Jan. 15	1234	313	46	260

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Floor or wood covering. Inlaid	C. Butcher	396,917	Jan. 29	2449	629	46	512
Flooring or paving. Wood-block	M. Macleod	398,662	Feb. 19	1456	385	46	880
Flour and meal bin and sifter	J. B. Sweetland	395,639	Jan. 1	516	129	46	103
Flour-bin	F. Sanderson	399,785	Mar. 19	1505	389	46	1443
Flour-bin	C. Tangenberg	397,760	Feb. 12	1004	266	46	777
Flour-bolt	J. B. Allfree	396,851	Jan. 29	2352	{602 603	46	492
Flour-bolt	J. J. Faulkner	396,922	Jan. 29	2456	632	46	514
Flour-bolt	J. Thomas	397,761	Feb. 12	1005	266	46	777
Flour-chest	G. Kirchgraber	398,736	Feb. 26	2459	{651 652	46	1085
Flour holder and sifter	C. H. Marshall	397,737	Feb. 12	976	259	46	770
Flour. Machine for packing	S. T. Ayres	397,411	Feb. 5	465	{122 123	46	667
Flour-packer	H. A. Barnard	398,999	Mar. 5	286	78, 79	46	1169
Flour. Screen for bolting	O. P. Harford	399,616	Mar. 12	1255	332	46	1382
Flour. Self-raising	C. L. and C. C. Hills	395,747	Jan. 8	678	.....	46	145
Flower-beds. Border-plate for	I. L. Landis	397,732	Feb. 12	969	{257 258	46	769
Flower-stand	P. Bertrand	396,459	Jan. 22	1760	451	46	368
Flue-cleaner	J. T. Mead and J. Thomson	397,509	Feb. 12	619	159	46	702
Flue-cleaner	J. U. Wiler	398,481	Feb. 26	2079	547	46	1010
Fluid-meter	G. Westinghouse, Jr., and C. N. Dutton.	400,420	Mar. 26	2447	{641 642	46	1633
Fluid-releaser. Automatic	B. S. Molyneux	400,107	Mar. 26	1970	516	46	1542
Fluids and semi-fluids by means of compressed air. Forcing	S. H. Johnson and C. C. Hutchinson	399,904	Mar. 19	1608	470	46	1502
Flush-tank	J. Lawson	399,674	Mar. 19	1342	344	46	1409
Fly-paper	W. and O. Thum	395,640	Jan. 1	517	130	46	103
Fly-paper. Package of	E. F. Baker	400,035	Mar. 26	1868	485	46	1522
Flying-machine	R. J. Spalding	398,984	Mar. 5	259	71, 72	46	1164
Fodder-cutter	J. S. Wiesler	396,794	Jan. 29	2276	582	46	475
Fog-horn. Automatic	A. F. Baatz	398,367	Feb. 26	1919	505	46	979
Folding case or package	C. T. Heisel	397,914	Feb. 19	1222	326	46	837
Folding chair	J. F. Bittle	398,693	Feb. 26	2389	634	46	1071
Folding chair	J. A. Crandall	398,943	Mar. 5	192	52	46	1150
Folding chair	C. B. Demarest	396,271	Jan. 15	1470	374	46	305
Folding chair	L. Keller	399,049	Mar. 5	359	96	46	1183
Folding chair	H. O'Hare	400,357	Mar. 26	2350	616	46	1617
Folding chair. Automatic	H. H. Blake	400,183	Mar. 26	2084	545	46	1567
Folding convertible chair	D. E. Kempster	396,496	Jan. 22	1822	468	46	380
Folding table	J. Turner	399,221	Mar. 5	658	171	46	1241
Folding the edges of fabrics. Device for	J. R. Morrison	396,415	Jan. 22	1691	434	46	353
Food-warmers. Cup for	S. Clarke	399,741	Mar. 19	1434	369	46	1429
Foods. Preparation of peptonized	D. W. Chapman	397,222	Feb. 5	181	.....	46	610
Forging. Electric	E. Thomson	396,010	Jan. 8	1095	278	46	225
Forging. Machine for general	J. R. Blakeslee	395,906	Jan. 8	788	{204 205	46	164
Forging mechanism	F. W. Taylor	400,143	Mar. 26	2018	{528 529	46	1552
Fork: *See* Band-cutting fork. Hay or grain fork.							
Fork	F. L. Andrews	395,941	Jan. 8	967	253	46	204
Fork and spoon. Combined	D. P. Kisner	398,264	Feb. 19	1746	460	46	936
Fountain: *See* Drinking-fountain.							
Frame: *See* Bag-frame. Piano-action frame. Clothes-line frame. Roving-frame. Embroidery-frame. Screen-frame. Engine-frame. Sewing-machine quilting-frame. Harrow-frame. Harvester-frame. Stencil-frame. Lantern-frame. Traveling-bag frame.							
Frame-plates for rolling-stock. Apparatus for the manufacture of	S. Fox	397,178	Feb. 5	120	31, 32	46	600
Frame-plates for rolling-stock. Manufacture of	S. Fox	397,177	Feb. 5	118	31	46	599
Frame-plates. Manufacturing	S. Fox	397,179	Feb. 5	122	33, 34	46	600
Fringe fabric	W. W. Jacobs	399,332	Mar. 12	825	214	46	1301
Frog. Spring-	F. C. Weir	398,104	Feb. 19	1507	390	46	890
Fruit-assorter	F. N. Ellithorpe	399,509	Mar. 12	1050	284	46	1350
Fruit-box	J. S. Brown	396,138	Jan. 15	1274	330	46	269
Fruit-box	J. G. Letellier	398,739	Feb. 26	2462	653	46	1086
Fruit cleaner. Dried-	J. Harrell	395,621	Jan. 1	490	122	46	97
Fruit-drier	H. A. Crandell	398,584	Feb. 26	2218	586	46	1037
Fruit-drier	G. Stringer	398,469	Feb. 26	2052	539	46	1005
Fruit-driers. Rotary fan for	J. W. Cassidy	399,973	Mar. 19	1777	466	46	1496
Fruit-gatherer	J. G. Bradley	395,947	Jan. 8	995	{255 256	46	206
Fruit-gatherer	W. S. Brooks	397,334	Feb. 5	349	91	46	644
Fruit-grader	V. Rattan	399,779	Mar. 19	1491	384	46	1441
Fruit-juice extractor	J. A. Neichter	397,467	Feb. 5	554	145	46	684
Fruit-pitter	J. G. Briggs and F. Cavallaro	397,691	Feb. 12	912	{241 242	46	758
Fuel: Artificial	L. Wacks	398,810	Feb. 26	2552	.....	46	1106
Fuel-burner	H. H. Hull	398,729	Feb. 26	2451	649	46	1063
Fuel. Device for feeding	H. H. Campbell	395,739	Jan. 8	968	171	46	143
Fuel-feeding pipe	W. A. Wilcox	400,280	Mar. 26	2236	586	46	1594
Fulling apparatus	J. W. Millet	397,812	Feb. 12	1081	{287 288	46	791
Fulling-machine	J. W. Millet	397,813	Feb. 12	1082	288	46	791
Funnel and can-top. Combined	H. Greely	398,300	Feb. 26	1951	513	46	985

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Furnace: *See* Bagasse-furnace. Coking-furnace. Gas-furnace. Gas-generating furnace. Glass-pot furnace. Hot-air furnace. Open-hearth furnace. Rotary double-flame furnace. Slack-burning furnace. Slag-furnace. Smelting-furnace. Smoke-consuming furnace.							
Furnace	E. C. Condit	397,697	Feb. 12	918	243	46	759
Furnace	J. F. Durham	397,174	Feb. 5	111	29	46	598
Furnace	F. Harris	396,669	Jan. 29	2377	610	46	498
Furnace	J. P. Oliver	395,344	Jan. 1	58	15	46	14
Furnace and grate therefor	I. D. Smead	399,294	Mar. 12	767	199	46	1289
Furnace feed-pipes. Safety-gate for	C. C. Barbour	396,020	Jan. 8	1109	281	46	227
Furnace-filling barrow	T. Faller	399,393	Mar. 12	921	239	46	1318
Furnace for destroying refuse matter	W. H. Bliss	395,807	Jan. 8	792	205, 206	46	165
Furnace for heating metals	C. Payen	398,443	Feb. 26	2018	529, 530	46	998
Furnace for working zinc ores	L. Kleemann	399,995	Mar. 19	1810	470, 471	46	1502
Furnace-grate	A. C. Dakin	398,950	Mar. 5	199	53	46	1152
Furnace-grate	M. H. Moskovits	399,686	Mar. 19	1356	349	46	1413
Furnaces and like structures. Device for protecting	S. McClure and C. F. Phillips	397,376	Feb. 5	405	107	46	654
Furnaces. Compound graphitic hearth for metallurgic	C. J. Eames	396,992	Jan. 29	2552	659	46	533
Furnaces. Protecting the interior walls of	H. Roberts	398,450	Feb. 26	2026	532	46	999
Furnaces, &c. Rotary bottom or grate applicable to	W. J. Taylor	399,797	Mar. 19	1525	394	46	1447
Furniture-joint	C. P. McGimsey	396,568	Jan. 22	1963	505	46	405
Furrower, marker, and coverer	J. S. Watson and C. S. Ambruster	395,602	Jan. 1	449	115	46	92
Fuse for ordnance-shells. Electrical	J. W. Graydon	399,879	Mar. 19	1646	425	46	1470
Fuses. Circuit-closing device for electrical torpedo-	J. W. Graydon	399,876	Mar. 19	1643	425	46	1469
Gage: *See* Bevel-gage. Micrometer-gage. Printer's gage. Safety-gage. Saw-gage. Scratch-gage. Siding-gage. Stone-sawing-machine gage. Surface-gage.							
Galley. Self-locking	J. H. Youmans	397,264	Feb. 5	239	62	46	621
Galvanic battery	E. J. Colby	397,111	Feb. 5	9	2	46	560
Galvanic battery	E. D. Cross	397,969	Feb. 19	1295	346	46	850
Galvanic battery	E. D. Cross	398,132	Feb. 19	1553	412	46	899
Galvanic battery	P. R. de F. D'Humy	396,329	Jan. 15	1557	393, 394	46	390
Galvanic battery	C. E. Egan	397,116	Feb. 5	16	4	46	582
Galvanic battery	A. Imschenetzky	400,215	Mar. 26	2132	558, 559	46	1576
Galvanic battery	C. E. Kammeyer	400,088	Mar. 26	1943	508	46	1537
Galvanic battery	E. Liebert and S. A. Rosenthal	400,235	Mar. 26	2164	568	46	1582
Galvanic battery	B. Scheithauer	396,342	Jan. 15	1576	399	46	323
Galvanic battery	F. Shaw	400,126	Mar. 26	1998	523	46	1548
Galvanic battery	C. M. Thompson	397,526	Feb. 12	642	.....	46	708
Game	J. P. and J. W. Clarke	398,233	Feb. 19	1701	450	46	928
Game apparatus	T. B. Rogers and S. H. Bartlett	400,011	Mar. 19	1832	476	46	1506
Game apparatus. Musical	A. Schemmel	395,635	Jan. 1	512	128	46	102
Game. Mathematical	L. Martane	400,237	Mar. 26	2166	568	46	1582
Game-wheel	G. Wilkening	399,717	Mar. 19	1402	360	46	1423
Garbage box or receiver	W. H. Buckley, Jr.	398,579	Feb. 26	2212	585	46	1036
Garlic-separator	W. C. Ayers	396,678	Jan. 22	2088	537	46	430
Garment fastener and support	C. R. Hollis	398,046	Feb. 19	1433	380	46	875
Garment. Ventilated	J. S. Goldsmith	397,543	Feb. 12	668	174	46	712
Garments. Device for assisting in putting on	I. V. Ready	397,752	Feb. 12	994	264	46	774
Garments. Folding hanger for	G. H. Donaldson	395,884	Jan. 8	908	233	46	189
Gas and air mixer	H. J. Bell	400,175	Mar. 26	2072	542	46	1563
Gas and air mixer	H. J. Bell	400,176	Mar. 26	2074	543	46	1563
Gas and air mixer	H. J. Bell	400,177	Mar. 26	2075	543	46	1564
Gas and electric light fixture. Combined	J. C. Cassidy	399,497	Mar. 12	1066	278	46	1347
Gas and electric-light fixtures. Coupling for	R. Herman	396,039	Jan. 8	1130	287	46	231
Gas. Apparatus for separating liquids from natural	W. Moore	399,427	Mar. 12	965	251	46	1327
Gas. Apparatus for the manufacture of	J. D. Averell	398,306	Feb. 19	1813	479	46	951
Gas. Apparatus for the manufacture of	W. M. Cosh	400,060	Mar. 26	1903	495	46	1528
Gas. Apparatus for the manufacture of	J. C. Garvin and H. Moody	397,639	Feb. 12	835	218	46	743
Gas. Apparatus for the manufacture of	T. S. C. Lowe	396,338	Jan. 15	1570	398	46	322
Gas. Apparatus for the manufacture of	J. A. McCollum	395,449	Jan. 1	209	54	46	45
Gas. Apparatus for the manufacture of	H. C. Shields	399,067	Mar. 5	410	111	46	1192
Gas. Apparatus for the manufacture of	R. H. Smith	397,397	Feb. 5	436	116, 117	46	661
Gas-burner	W. P. Tibbens	399,948	Mar. 19	1742	450	46	1489
Gas-burner	C. B. Todd. (Reissue)	10,985	Feb. 12	1173	314	46	812
Gas-burner	F. White	399,104	Mar. 5	436	118	46	1197
Gas-burner. Atmospheric	H. J. Bell	396,255	Jan. 15	1451	369	46	302
Gas-burner. Atmospheric	H. J. Bell	396,256	Jan. 15	1452	370	46	302
Gas-burner. Atmospheric	H. J. Bell	400,168	Mar. 26	2065	540	46	1562
Gas-burner for billiard-tables	W. F. Folmer	397,904	Feb. 19	1206	323	46	834
Gas-burner. Incandescent	H. J. Bell	396,253	Jan. 15	1447	369	46	301
Gas-burner. Incandescent	H. J. Bell	396,254	Jan. 15	1449	369	46	302
Gas-burner. Incandescent	H. J. Bell	396,260	Jan. 15	1457	371	46	303
Gas-burner. Incandescent	H. J. Bell	400,166	Mar. 26	2063	540	46	1561
Gas-burner. Incandescent	H. J. Bell	400,169	Mar. 26	2066	541	46	1562
Gas-burner. Incandescent	F. D. Williams	396,316	Jan. 15	1538	388	46	316
Gas-burner. Regenerative	E. Fullford and H. T. Van Laun	400,072	Mar. 26	1922	501, 502	46	1532
Gas-burner. Regenerative	E. Fullford and H. T. Van Laun	400,073	Mar. 26	1924	502	46	1533

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Gas-burner. Regenerative	F. G. Johnson	398,404	Feb. 26	1957	517	46	988
Gas-burner. Regenerative	F. Siemens	399,290	Mar. 12	758	197	46	1267
Gas-burners. Air-regulating device for atmospheric	H. J. Bell	400,174	Mar. 26	2071	542	46	1563
Gas-burners. Automatic shut-off for	R. J. Henry, Jr., and W. J. Kassler	400,339	Mar. 26	2327	608	46	1611
Gas condenser. Coal	F. J. Davis	398,384	Feb. 26	1944	511	46	983
Gas cut-off. Automatic	C. M. Kirkpatrick	395,334	Jan. 1	45	11	46	11
Gas. Cut-off device for	L. B. Fulton	395,560	Jan. 1	383	97	46	79
Gas-engine	T. B. Barker	400,163	Mar. 26	2057	538, 539	46	1560
Gas-engine	J. C. Beckfeld	396,022	Jan. 8	1111	281, 282, 283	46	298
Gas-engine	S. Lawson	399,907	Mar. 19	1682	436	46	1478
Gas-engine	S. Lawson	399,908	Mar. 19	1685	437	46	1478
Gas-engine	A. Schmid	396,238	Jan. 15	1427	363	46	297
Gas-extinguisher	A. Steinbilber	398,805	Feb. 26	2548	678	46	1104
Gas-extinguisher. Automatic	C. L. Alexander	395,940	Jan. 8	986	253	46	204
Gas-furnace for steam-boilers	G. Whysall and J. A. Lambing	398,482	Feb. 26	2078	547	46	1010
Gas-furnaces. Apparatus for compacting fuel in	S. T. Wellman	395,676	Jan. 1	575	144	46	116
Gas-generating furnace	J. Gilbert	397,907	Feb. 19	1211	324	46	835
Gas-generator	J. Jordan	398,051	Feb. 19	1439	381, 382	46	876
Gas-governor	H. J. Bell	400,170	Mar. 26	2067	541	46	1562
Gas-governor	H. J. Bell	400,171	Mar. 26	2069	541	46	1562
Gas-governor	H. J. Bell	400,172	Mar. 26	2069	541	46	1562
Gas-governor	H. J. Bell	400,173	Mar. 26	2070	542	46	1563
Gas-governor. Automatic	R. H. Speake	396,899	Jan. 29	2425	623	46	508
Gas-holders. Apparatus for supplying steam to cups of telescopic	S. Cutler	397,836	Feb. 12	1111	297	46	798
Gas-incandescent	H. J. Bell	396,322	Jan. 15	1547	391	46	318
Gas-lighter. Electric	E. Kronenberg	399,416	Mar. 12	952	247	46	1325
Gas-machine	E. D. Self	396,768	Jan. 29	2237	573	46	407
Gas-machine	E. D. Self	397,305	Feb. 5	158	42	46	606
Gas. Making	W. J. Taylor	399,798	Mar. 19	1527	394	46	1447
Gas-meter	J. W. Culmer	398,707	Feb. 26	2410	639	46	1076
Gas-meter	J. J. Harrell	398,721	Feb. 26	2440	646	46	1081
Gas-meter. Plural-piston	J. W. Culmer	398,708	Feb. 26	2413	639	46	1076
Gas-motor	C. T. A. H. Wiedling	398,108	Feb. 19	1510	401, 402	46	891
Gas or liquids. Apparatus for regulating and controlling the exit of	C. S. Ford, Sr.	396,078	Jan. 15	1192	202	46	252
Gas-pressure indicator	A. and P. Thomas	400,267	Mar. 26	2218	582	46	1590
Gas-producer	W. J. Taylor	399,793	Mar. 19	1514	392	46	1445
Gas-producer	W. J. Taylor	399,794	Mar. 19	1517	392, 393	46	1446
Gas-producer	W. J. Taylor	399,795	Mar. 19	1519	393	46	1446
Gas-producer	W. J. Taylor	399,756	Mar. 19	1523	394	46	1446
Gas-producer	W. J. Taylor	399,799	Mar. 19	1527	394, 395	46	1447
Gas-purifiers. Apparatus for elevating the covers of	J. R. Floyd	396,332	Jan. 15	1564	396	46	321
Gas-regulating burner	H. J. Bell	396,257	Jan. 15	1453	370	46	302
Gas-regulating burner	H. J. Bell	396,258	Jan. 15	1454	370	46	303
Gas-regulating burner	H. J. Bell	396,259	Jan. 15	1456	370	46	303
Gas-regulator	J. Bardsley	398,021	Feb. 19	1308	360	46	864
Gas-regulator	E. J. Colby	398,881	Mar. 5	96	26	46	1132
Gas-regulator	J. H. Ruse	400,303	Mar. 26	2366	618	46	1618
Gas regulator and cut-off. Automatic	E. H. Ford	395,387	Jan. 1	122	31	46	27
Gas-regulator. Volumetric	M. G. Wilder	397,573	Feb. 12	715	185	46	731
Gas-retort	W. C. Jones	396,746	Jan. 29	2208	565	46	461
Gas-trap for tuyeres and conducting-pipes	A. D. Power	396,765	Jan. 29	2233	572	46	466
Gases. Apparatus for absorbing	F. Carlisle	395,601	Jan. 8	601	152	46	130
Gaseous fuel. Apparatus for generating and burning	R. B. Avery	398,873	Mar. 5	84	23, 24	46	1130
Gasogene or apparatus for making aerated beverages	L. G. and S. M. Chinnery	399,739	Mar. 19	1429	368	46	1428
Gasoline apparatus for illuminating and heating purposes.	J. Stubbers	397,255	Feb. 5	225	59	46	618
Gate: *See* Bridge-gate. End-gate. Farm-gate. Railway-gate. Railway-crossing gate. Sliding gate. Water-gate. Wire gate.							
Gate	J. Albers	395,804	Jan. 8	785	203	46	164
Gate	E. H. Bauer	397,216	Feb. 5	175	47	46	609
Gate	W. H. Cox	398,706	Feb. 26	2408	638, 639	46	1075
Gate	W. P. Elliott and A. Farrar	395,885	Jan. 8	909	233	46	189
Gate	G. Ford	398,718	Feb. 26	2433	645	46	1080
Gate	M. W. Foster	399,961	Mar. 19	1788	464	46	1496
Gate	M. C. Frite	396,333	Jan. 15	1565	396	46	321
Gate	A. H. Godfrey	396,558	Jan. 22	1913	494	46	395
Gate	H. S. Harris	395,827	Jan. 8	817	212	46	171
Gate	T. J. Howard	395,976	Jan. 8	1041	265	46	215
Gate	S. W. Kessling	399,619	Mar. 12	1260	324	46	1382
Gate	W. Le Mar	395,336	Jan. 1	48	12	46	12
Gate	C. J. Moore	396,646	Jan. 8	1142	290	46	234
Gate	W. O. Pierce	398,798	Feb. 26	2539	675, 676	46	1102
Gate	H. C. Riley	396,173	Jan. 15	1329	341	46	278
Gate	J. T. Sargent	398,189	Feb. 19	1636	433	46	914
Gate	J. Sisung	395,360	Jan. 1	81	21	46	19
Gate	J. R. Stanbrough	396,517	Jan. 22	1850	474, 475	46	385
Gate	W. R. White	397,572	Feb. 12	714	185	46	721
Gear-cutting machine	G. B. Grant	396,506	Feb. 26	2113	556	46	1017

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Gear. Reversing	S. J. White	397,676	Feb. 12	892	235	46	754
Gelatine. Acid	C. B. Tower	398,915	Mar. 5	147	.....	46	1142
Gelatine. Acid	C. B. Tower	398,916	Mar. 5	147	.....	46	1142
Gem-setting	D. Kutner	396,092	Jan. 15	1218	308	46	257
Generator: *See* Electric generator. Induction-generator, Gas-generator. Steam-generator. Hot-air generator.							
Generators. Regulation of alternate-current	G. Pfannkuche	396,422	Jan. 22	1704	437	46	356
Glass: *See* Binocular glass. Opera or marine glass. Opera-glass.							
Glass-cutter	A. M. Rowland	396,600	Jan. 22	1979	509	46	408
Glass-cutting machine	H. C. Wood	398,565	Feb. 26	2190	577	46	1032
Glass. Manufacture of	J. Reese	396,512	Jan. 22	1843	473	46	384
Glass. Manufacture of window and plate	J. Reese	396,511	Jan. 22	1841	.....	46	383
Glass. Manufacturing ornamental	T. B. Atterbury	398,995	Mar. 5	281	77	46	1168
Glass-mold	S. Hipkins, Jr	397,186	Feb. 5	133	36	46	602
Glass. Ornamenting	T. W. Webb	398,100	Feb. 19	1503	398	46	889
Glass plates. Apparatus for rolling	A. D. Brogan and A. M. Malloch	396,535	Jan. 22	1872	481	46	388
Glass-pot furnace	A. Weyer	398,296	Feb. 19	1801	475	46	948
					476		
Glasses. Advertising-lid for beer-	M. L. Mueller	396,224	Jan. 15	1410	359	46	294
Glove	J. Comrie	395,954	Jan. 8	1005	258	46	208
Glove-fastener	W. S. Richardson	399,161	Mar. 5	567	146	46	1224
Glove-fastening	W. S. Richardson	399,162	Mar. 5	568	146	46	1224
Glue. Vessel for holding liquid	D. N. Martin	396,586	Jan. 22	1960	505	46	405
Gluing-machine for binding-strips	C. H. Chappel	395,692	Jan. 8	603	152	46	180
Gluten and starch. Obtaining	H. Barker	399,727	Mar. 19	1417	364	46	1425
Glycerine from spent soap-lyes. Recovering	A. W. Trench	399,028	Mar. 5	329	.....	46	1177
Glycerine from spent soap-lyes. Recovering	A. W. Trench	399,172	Mar. 5	561	.....	46	1227
Gold and silver and other ores. Sponge for reducing	A. T. Hay	399,527	Mar. 12	1117	.....	46	1356
Gold, silver, &c. Reducing	A. T. Hay	399,529	Mar. 12	1118	.....	46	1356
Goods, &c. Device for handling shelf-	G. Cade	395,949	Jan. 8	997	256	46	207
Goods in exchange for coin. Apparatus for delivering	E. Powell	398,279	Feb. 19	1769	468	46	942
Goods. Machine for compressing and bundling	W. O. Crain	397,457	Feb. 5	541	142	46	681
Goods-rack	N. D. Phinney	397,750	Feb. 12	993	263	46	774
Governor	W. N. Rumely	398,452	Feb. 26	2028	533	46	1000
Governor. Engine-	D. P. Davis	395,882	Jan. 8	904	232	46	188
Governor. Engine-	H. Tate, Jr., and J. Killip, Jr	398,554	Feb. 26	2178	574	46	1030
Governor for marine engines	D. Sweeney	400,416	Mar. 26	2442	640	46	1632
Governor. Gas-engine	D. S. Regan	397,753	Feb. 12	995	264	46	774
Governor. Steam-engine	O. H. Castle	399,653	Mar. 19	1311	336	46	1404
Grader and ditcher. Road-	M. F. Perry	395,451	Jan. 1	212	54	46	45
Grading and ditching machine	G. B. Durkee	397,841	Feb. 12	1117	299	46	799
					300		
Grading machine. Road-	J. M. Holland	397,291	Feb. 5	280	72	46	629
Grain-binder	F. G. Becker	396,976	Jan. 29	2530	653	46	529
Grain-binder	H. F. Crandall	398,362	Feb. 26	1940	510	46	983
Grain-binder	G. G. Hunt	399,536	Mar. 12	1130	293	46	1358
					294		
Grain-binder	M. L. Nichols	395,991	Jan. 8	1008	270 271 272 273	46	220
Grain-binder	J. F. Seiberling	399,703	Mar. 19	1379	355 356	46	1418
Grain-binder	B. F. Stewart	398,466	Feb. 26	2047	537 538	46	1004
Grain-binder	C. B. Withington	399,108	Mar. 5	441	120 121	46	1198
Grain-binders. Cord-knotter for	L. W. Noyes	398,175	Feb. 19	1614	429	46	910
Grain-binders. Cord-tension alarm for	M. H. and N. M. Brinkerhoff	396,191	Jan. 15	1357	348	46	284
Grain-binders. Knot-tyer for	J. A. Graham	397,355	Feb. 5	375	98, 99	46	649
Grain-binders. Tension device for	J. S. Gibbs	399,872	Mar. 19	1633	423	46	1468
Grain-cleaner	H. Bryan	399,827	Mar. 19	1575	408	46	1456
Grain-cradle	H. L. Hewitt	396,743	Jan. 29	2203	564	46	459
Grain-crushing mill	J. Curtis	400,061	Mar. 26	1905	495	46	1329
Grain. Preparing	G. H. Cormack. (Reissue)	10,978	Jan. 1	580	146	46	118
Grain-sampler	B. F. Morningstar	399,667	Mar. 19	1355	349	46	1419
Grain-scourer	A. Heine	397,726	Feb. 12	948	252	46	765
Grain-scourer	P. Provost	398,538	Feb. 26	2152	568	46	1025
					569		
Grain-separator	J. A. Krake	399,148	Mar. 5	533	140	46	1218
Granular or lumpy substances. Apparatus for handling and distributing	E. J. Wood	397,679	Feb. 12	895	236	46	755
					237		
Grate	J. A. Cornish	398,131	Feb. 19	1552	411	46	899
Grate	J. W. Keyes	395,397	Jan. 1	135	34	46	29
Grate	J. Wakeham and J. Cunningham	396,248	Jan. 15	1443	367	46	300
Grate	L. P. Woods	395,606	Jan. 1	455	116	46	93
Grate attachment	J. H. Wait	399,098	Mar. 5	428	116	46	1196
Grate. Fire-	E. J. Story	398,007	Feb. 19	1363	362	46	862
Grate for stoves, &c	D. G. Littlefield. (Reissue)	10,987	Feb. 19	1915	504	46	970
Grater. Nutmeg-	C. O. Blood	399,823	Mar. 19	1572	407	46	1455
Graters. Die for forming teeth in vegetable-	W. Marx	397,559	Feb. 12	697	181	46	718
Grease-extractor	W. D. Nelson	395,401	Jan. 1	141	36	46	30
Griddle greasing and oiling utensil	S. B. Coston	396,860	Jan. 29	2364	607	46	495
Griddle. Odorless and smokeless	A. M. Amos	395,305	Jan. 1	1	1	46	3
Grinding and polishing the handles of cutlery. Machinery for	M. L. Powers	399,208	Mar. 5	638	166	46	1237
Grinding metallic bands. Machinery for	J. L. Fowle	396,553	Jan. 22	1903	491	46	394
Grinding-mill	A. Dobler	396,990	Jan. 29	2550	659	46	533
Grinding-mill	J. Good	399,518	Mar. 12	1105	287	46	1353
Grinding-mill	F. C. Hall	396,559	Jan. 22	1914	494	46	396

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Grinding-mill	G. and A. Raymond	397,618	Feb. 12	1091	290	46	793
					291		
Grinding-mill	H. F. Stone	397,445	Feb. 5	524	137	46	678
					138		
Grinding-mills. Feed-regulator for	J. F. Winchell	396,058	Jan. 8	1139	294	46	237
Grinding-pan	M. P. Boss	398,936	Mar. 5	184	49	46	1149
Grinding rotary disk cutters. Machine for	J. L. Morrison and A. D Rowe	398,741	Feb. 26	2464	653	46	1066
Grindstone-fixture	J. J. Stoppie	398,753	Feb. 26	2479	657	46	1090
Grip device. Intermittent	H. A. Smith	396,244	Jan. 15	1438	366	46	299
Grocer's bin	L. B. Hawkins	399,197	Mar. 5	620	161	46	1233
Grommet	J. Boyle	395,477	Jan. 1	252	66	46	54
Grommet	R. Brass	395,478	Jan. 1	253	66	46	54
Grommet	E. A. Sperry	400,964	Mar. 26	2212	581	46	1590
Grounding device. Automatic							
Guard: *See* Buckle-guard. Ladder-guard. Fish-net guard. Railway cattle-guard. Elevator-guard. Razor safety-guard. Key-hole guard. Window burglar-guard.							
Guard or shield for projecting surfaces	R. L. Stickney	398,909	Mar. 5	138	38	46	1140
Gun and projectile for the same	S. H. Emmens	398,595	Feb. 26	2236	592	46	1041
Gun and projectile for throwing high explosives	S. H. Emmens	397,052	Jan. 29	2639	680	46	550
Gun. Breech-loading	W. C. Maynard	398,065	Feb. 19	1462	386	46	881
Gun-cleaner	C. Tomlinson	399,452	Mar. 12	994	250	46	1334
					260		
Gun hand-protector	R. O. Heikes	397,719	Feb. 12	948	251	46	765
Gun. Machine-	H. S. Maxim	395,791	Jan. 8	758	196	46	159
					197		
Gun. Magazine-	H. A. Pitcher	397,143	Feb. 5	61	15	46	589
Gun. Magazine-	A. H. Russell	396,835	Jan. 29	2333	598	46	488
Gun-mountings. Buffer for	H. Schneider	397,027	Jan. 29	2606	672	46	544
					673		
Gun. Revolving pneumatic	J. W. Graydon	399,882	Mar. 19	1650	426	46	1471
Gun. Spring-	J. F. Klinglesmith	396,265	Feb. 19	1746	461	46	937
Gun-wad	G. Clapp	396,986	Jan. 29	2544	657	46	532
Guns. Electric appliance for discharging	B. A. Fiske	396,199	Jan. 15	1367	350	46	296
Guns. Loading apparatus for turret-	H. Schneider	397,310	Feb. 5	308	80, 81	46	635
Guns. Reflector for inspecting	A. H. Russell	399,286	Mar. 12	754	196	46	1287
Guns, shafts, &c. Manufacture of heavy	J. Shinn	397,029	Jan. 29	2608	673	46	545
Hair crimper and curler	R. W. Weldon	397,159	Feb. 5	85	21	46	594
Hair-curling device	W. I. Brigham	396,534	Jan. 22	1871	481	46	388
Hair-cutting apparatus	M. Klein	395,444	Jan. 1	202	52	46	43
Hair-pin	W. E. Banta	397,164	Feb. 5	98	25	46	596
Hair-pin	W. F. Peet	395,582	Jan. 1	424	107	46	87
Hair-pins. Machine for making	G. W. Manson	397,991	Feb. 19	1333	355	46	857
					356		
Hair-tonic	H. H. Glenck	398,690	Mar. 5	112	.....	46	1135
Halter bolt-clip	C. C. Schwaner	399,788	Mar. 19	1508	390	46	1444
Halter-square	C. C. Schwaner	398,087	Feb. 19	1486	393	46	886
Hame	H. Latshaw	397,734	Feb. 12	972	258	46	770
Hame and tug coupling	J. Gray	397,182	Feb. 5	128	35	46	604
Hame-fastener	G. W. Harrop	396,653	Jan. 22	2056	528	46	423
Hammer. Bush-	L. H. Rowell	396,174	Jan. 15	1331	341	46	279
Hammer-heads. Die for shaping the claws of	A. Laundry	398,166	Feb. 19	1604	425	46	908
Hammer or like die	W. H. Melaney	397,929	Feb. 19	1241	331	46	840
Hammock	H. M. Small	400,131	Mar. 26	2004	525	46	1550
Hammock-suspension device	J. D. Pritchard	399,928	Mar. 19	1714	444	46	1484
Hams, &c. Covering	A. Warner	395,308	Jan. 1	91	.....	46	21
Hand-rest	E. S. Hull	399,206	Mar. 12	727	189	46	1281
Handle: *See* Box-handle. Door-handle. Brake-handle. Opera-glass handle. Coffin-handle. Plow-handle. Cutlery-handle. Saw-handle. Detachable handle. Tool-handle.							
Handle	J. Tebin	399,170	Mar. 5	579	149	46	1226
Hanger: *See* Door-hanger. Picture-hanger. Eaves-trough hanger. Wall-paper hanger. Hat-hanger. Wearing-apparel hanger. Lamp-hanger.							
Harmonica-holder	A. H. Gaertner	397,541	Feb. 12	663	173	46	711
Harmonigraph or music-recording device	J. A. Decuir	398,951	Mar. 5	200	54	46	1152
					55		
					56		
Harness	F. Driffill	398,589	Feb. 26	2228	589	46	1039
Harness	P. King	399,051	Mar. 5	361	97	46	1183
Harness	A. F. Trask	395,527	Jan. 1	332	54	46	70
Harness	I. Hicks	400,211	Mar. 26	2196	557	46	1575
Harness attachment	F. Wayland	398,295	Feb. 19	1799	475	46	948
Harness attachment	E. Elliott	399,392	Mar. 12	921	239	46	1315
Harness-hook	E. F. Pfueger	399,074	Mar. 5	391	105	46	1189
Harness-pad	C. E. Bement	399,731	Mar. 19	1421	365	46	1426
Harrow	S. B. Hendricks	399,614	Mar. 12	1249	322	46	1380
Harrow	O. Lunn	397,193	Feb. 5	141	38	46	603
Harrow	H. A. Murphy	397,605	Feb. 12	793	207	46	735
Harrow	G. A. Paddock	397,514	Feb. 12	627	162	46	705
Harrow	O. Rorem	399,564	Mar. 12	1177	304	46	1367
Harrow	C. P. Russell	396,117	Jan. 15	1347	318	46	283
Harrow	E. F. Sherman	396,374	Jan. 15	1626	417	46	332
Harrow	M. Skow	397,145	Feb. 5	67	16	46	591
Harrow	A. A. Stuart	395,638	Jan. 1	514	129	46	103
Harrow	J. Whipps	398,480	Feb. 26	2076	546	46	1010
Harrow and cultivator	J. C. Bryan	400,392	Mar. 26	2409	631	46	1632
Harrow and cultivator	S. W. Kilpatrick	400,220	Mar. 26	2141	561	46	1577
Harrow and cultivator. Rolling	A. J. Adamson	399,644	Mar. 19	1297	333	46	1401

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Harrow and pulverizer. Combined	J. B. Okey	400,412	Mar. 26	2438	639	46	1631
Harrow and roller	J. Bollinger	396,068	Jan. 15	1173	297, 298	46	249
Harrow and roller	A. H. and J. H. Davis	397,342	Feb. 5	362	95	46	646
Harrow and roller. Combined	J. T. Van Pool	395,366	Jan. 1	88	23, 24	46	20
Harrow-frame	J. McMahon	396,944	Jan. 29	2457	641	46	520
Harrow. Pulverizing	M. Bruner	396,644	Jan 22	2044	525	46	421
Harrow. Rotary	A. C. Brown	398,937	Mar. 5	185	49	46	1149
Harrow. Rotary	I. E. Stump	395,364	Jan. 1	86	23	46	20
Harrow. Spring-tooth	G. Gillies	395,699	Jan. 8	611	154	46	132
Harrow. Spring-tooth	C. E. Jewell	396,686	Jan. 22	2117	543	46	435
Harrow. Spring-tooth	P. A. Spicer	398,858	Mar. 5	60	17	46	1126
Harrow-tooth	G. A. Lake	396,093	Jan. 15	1218	308	46	257
Harrow-tooth holder	D. O. Everest	400,397	Mar. 26	2417	633	46	1628
Harrow-tooth holder	D. O. Everest	400,398	Mar. 26	2418	633	46	1628
Harrow. Wheel-	J. Finnegan and W. Mies	398,600	Feb. 26	2241	593	46	1042
Harvester	J. A. Grsham, C. Martincourt, and H. F. Crandall.	398,249	Feb. 19	1724	455	46	932
Harvester	S. D. Maddin	396,409	Jan. 22	1683	432	46	352
Harvester	L. W. Noyes	395,343	Jan. 1	56	14	46	13
Harvester	C. S. Stickle	396,467	Feb. 26	2049	538	46	1004
Harvester and husker. Combined corn	A. L. Rasmuson	396,510	Jan. 22	1838	471, 472, 473	46	383
Harvester and husker. Corn	L. W. Osborn	397,998	Feb. 19	1344	358, 359	46	859
Harvester and thrashing-machine. Combined	L. A. Gillett	396,153	Jan. 15	1294	331, 332	46	273
Harvester. Corn-	E. W. Cady	396,538	Jan. 22	1875	482	46	389
Harvester. Corn-	J. McKivett	397,656	Feb. 12	862	225, 226	46	749
Harvester. Corn-	J. F. Steward	398,860	Mar. 5	62	17, 18	46	1126
Harvester-frame	J. F. Steward	396,245	Jan. 15	1438	366	46	299
Harvester. Grain-binding	L. Miller	396,758	Jan. 29	2223	569	46	464
Harvester. Grain-binding	W. N. Whiteley, W. Bayley, and O. E. Perrigo.	398,921	Mar. 5	154	40, 41	46	1143
Harvester-reel	A. O. Carman	399,652	Mar. 19	1310	336	46	1404
Harvesters. Bundle-carrier for grain	J. F. Steward	396,518	Jan. 22	1852	475	46	385
Harvesters. Cutting mechanism for	P. Hanson	395,493	Jan. 1	275	71	46	58
Harvesters. Platform-adjusting device for	J. F. Steward	396,006	Jan. 8	1091	277	46	225
Harvesters. Shock-forming table for corn	A. N. Hadley	399,988	Mar. 19	1800	467	46	1500
Harvesting-machine	J. Draper	398,711	Feb. 26	2424	641, 642	46	1078
Hasp-lock	W. Tiffany	399,451	Mar. 12	994	259	46	1334
Hat	P. N. Knapp and J. R. Britto	395,335	Jan. 1	47	11	46	12
Hat and clothes rack	H. A. Brechbill and F. H. Ensign	399,225	Mar. 19	1574	408	46	1456
Hat-band	W. T. Brigham	397,065	Jan 29	2656	684	46	554
Hat-block	J. C. Fiester	397,117	Feb. 5	18	4	46	562
Hat-forming machine	S. C. Palmer	399,551	Mar. 12	1158	300	46	1363
Hat-hanger	T. R. McDonald	397,599	Feb. 12	767	201	46	731
Hat-mark	H. H. Wright	397,768	Feb. 12	1017	271	46	779
Hat-measure	A. E. McDonald	398,340	Feb. 19	1868	492	46	961
Hat-pouncing machine	C. W. Stevens	398,551	Feb. 26	2171	573	46	1028
Hat-pouncing machine	J. C. Wilson	400,282	Mar. 26	2239	587	46	1505
Hat-support and packing-ring	G. Lane	399,901	Mar. 5	626	162	46	1234
Hat sweat-band	W. F. Beardslee	399,729	Mar. 19	1419	365	46	1436
Hats. Machine for stiffening	F. J. Murphy and A. M. Rundle	396,820	Jan. 29	2322	595	46	485
Hats. Manufacture of soft	J. R. Kelsey	398,734	Feb. 26	2457	.....	46	1085
Hatchway	J. A. Barclay	396,649	Jan. 29	2349	602	46	492
Hatchway	J. Roach	399,563	Mar. 12	1176	304	46	1368
Hatchway. Elevator	C. A. McAllister	397,197	Feb. 5	146	39	46	604
Hatchway-gates. Device for operating	F. Heine and E. Bengel	398,615	Feb. 26	2263	600	46	1046
Hay-binder	A. W. Hendrick	396,278	Jan. 15	1481	375	46	306
Hay-carrier	H. L. Ferris	399,140	Mar. 5	523	136	46	1216
Hay-carrier track	M. G. Grosscup	397,124	Feb. 5	26	7	46	563
Hay-elevator track	V. L. and J. Ney	395,714	Jan. 8	630	159	46	136
Hay-loader	W. M. White	398,682	Feb. 26	2373	630	46	1068
Hay or grain fork	W. H. Lander	396,881	Jan. 29	2398	615	46	503
Hay or grain unloader	W. G. Hunter	397,551	Feb. 12	682	177	46	715
Hay-press	W. S. Champion	397,338	Feb. 5	355	92, 93	46	645
Hay-press	A. A. Gamble	396,303	Jan. 15	1373	351	46	287
Hay-press	T. T. Mayes	397,196	Feb. 5	146	39	46	604
Hay-press	M. McCarty	398,066	Feb. 19	1464	386, 387	46	881
Hay-press. Portable	G. E. Luckey	396,042	Jan. 8	1136	289	46	223
Hay rake and loader	O. K. Kaasa	398,160	Feb. 19	1594	423	46	906
Hay rake and tedder. Combined	I. L. Landis and A. Iske	398,165	Feb. 19	1602	424, 425	46	908
Hay rake and tedder. Combined	S. B. Shank	396,002	Jan. 8	1085	276	46	223
Hay-rake. Horse	J. M. McClintock	399,765	Mar. 19	1471	379	46	1436
Hay-rake. Horse	E. Tush and J. B. Engstrom	398,808	Feb. 26	2550	679	46	1105
Hay-rakes. Tooth for horse	E. Tush	397,155	Feb. 5	81	20	46	594
Hay-stacker	H. A. Barkelew	398,114	Feb. 19	1531	406	46	894
Hay-stacker	O. H. King	397,431	Feb. 5	499	131, 132	46	674
Hay-stacker	J. Morris	397,512	Feb. 12	623	161	46	703
Hay-stacker	L. B. Morton	396,761	Jan. 29	2227	570	46	465
Hay-stacker	J. E. and H. Will	399,106	Mar. 5	439	119, 120	46	1197
Hay-stacking machine. Portable	L. Miller	396,045	Jan. 8	1141	290	46	234
Hay tedder and rake. Combined	S. L. Denney	395,550	Jan. 1	361	93	46	76
Head-chair and connecting-rod. Combined	W. J. Hooper	396,487	Jan. 22	1809	463	46	377
Head-protector	G. H. Chappell, W. and J. Brown	396,141	Jan. 15	1278	327	46	270
Head-rest	A. P. Gould	398,893	Mar. 5	117	32	46	1136
Headlight	J. F. Shawhan	396,241	Jan. 15	1434	365	46	298

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Heat-absorbing plate for cooling-coils	A. Campbell	399,493	Mar. 12	1061	277	46	1346
Heat to the body. Device for applying	D. M. Small	400,261	Mar. 26	2209	580	46	1589
Heater: *See* Agricultural heater. Lunch-heater. Car-heater. Portable heater. Feed-water heater. Steam-heater. Fire-clay heater. Stove-pipe heater. Ice-elevator heater. Water-heater.							
Heaters. Safety-door for	J. H. Mason	398,271	Feb. 19	1756	464	46	939
Heating and ventilating buildings. Means for	E. T. Johnson	395,395	Jan. 1	132	33	46	29
Heating apparatus	J. and P. Just	395,960	Jan. 8	1048	266	46	216
Heating apparatus. Air-	C. P. Fest	398,715	Feb. 26	2429	644	46	1080
Heating apparatus. Hot-water	N. A. Boynton	396,602	Jan. 29	2289	585, 586	46	477
Heating. Electrical	J. V. Capek	395,950	Jan. 8	998	256, 257	46	207
Heel-burnishing machine	C. H. Helms	396,999	Jan. 29	2560	661	46	525
Heel-cutting die	C. W. Glidden	399,608	Mar. 12	1243	320	46	1379
Heel-finishing machine	A. B. Fowler and G. E. Warren	396,690	Jan. 22	2107	541, 542, 327, 328	46	433
Heel-nailing machine	J. H. Pope	399,631	Mar. 12	1273	384	46	1440
Heel-nailing machine	J. H. Pope	399,777	Mar. 19	1488	384	46	1440
Heel-nailing machine	F. F. Raymond, 2d	398,846	Mar. 5	44	14	46	1122
Heel-trimmer	C. H. Helms	397,000	Jan. 29	2561	662	46	535
Heel-trimmer	C. H. Helms	397,001	Jan. 29	2562	662	46	535
Heel-trimmer	O. L. Noble	399,453	Mar. 5	545	141	46	1220
Heel-trimming machine	C. H. Helms	397,655	Jan. 29	2643	681	46	551
Heel-trimming machine	O. L. Noble	399,625	Mar. 12	1266	326	46	1384
Heel-trimming tool	C. W. Glidden	399,607	Mar. 12	1242	320	46	1379
Heels. Manufacturing	G. Dorwart	396,076	Jan. 15	1186	301	46	251
Heeling, nailing, and finishing jack	N. Weber	395,727	Jan. 8	651	166	46	140
Hides. Machine for stretching, scraping, and finishing	G. E. Danforth	396,811	Jan. 29	2300	589	46	480
Hides or skins. Machine for stretching	L. V. Benét	399,964	Mar. 19	1764	456	46	1494
Hinge	D. S. Luce	396,660	Jan. 22	2064	530	46	425
Hinge	R. E. Nolley	400,003	Mar. 19	1821	473	46	1504
Hinge	C. F. Sullivan	399,582	Mar. 12	1207	311	46	1372
Hinge	E. A. Mallory	396,636	Feb. 26	2302	609	46	1033
Hinge. Adjustable	M. Young	396,319	Jan. 15	1541	389, 390	46	317
Hinge-blanks. Machine for bending	E. Haines	399,751	Mar. 19	1450	373	46	1432
Hinge. Friction-	S. D. Wells	395,370	Jan. 1	93	24	46	21
Hinge. Gate-	T. C. Read	397,836	Feb. 19	1251	334	46	842
Hinge. Lock-	C. J. Seymour	398,752	Feb. 26	2478	657	46	1089
Hinge. Lock-	L. M. Devore	396,989	Jan. 29	2550	659	46	533
Hinge. Spring-	L. M. Devore and F. W. Hoefer	396,081	Jan. 8	1122	285	46	230
Hinge. Spring-	L. M. Devore and F. W. Hoefer	396,650	Jan. 22	2052	527	46	423
Hinge. Spring-	J. Keene	397,190	Feb. 5	136	37	46	603
Hinge. Spring-	N. Linsley	395,337	Jan. 1	49	12	46	12
Hinge. Spring-	W. C. Perkins	395,403	Jan. 1	143	36	46	31
Hinge. Wire	W. Haas	399,033	Mar. 5	334	89, 90	46	1178
Hinges. Machine for making sheet-metal	M. Hirst	398,780	Feb. 26	2516	668	46	1097
Hitching device	C. E. Price	400,113	Mar. 26	1978	518	46	1544
Hitching device for vehicles	B. G. Knapp	399,904	Mar. 19	1678	435	46	1477
Hitching-post	R. M. Brown	396,856	Jan. 29	2360	605	46	494
Hoe	J. Thomas	396,590	Jan. 22	1854	476	46	385
Hogs. Apparatus for use in dressing	A. E. Brown	395,873	Jan. 8	894	220	46	186
Hoisting and conveying machine	A. E. Brown	400,188	Mar. 26	2091	547	46	1508
Hoisting and conveying machine	H. Kennedy	398,785	Feb. 26	2523	670	46	1098
Hoisting apparatus	G. E. Newell	396,664	Jan. 22	2070	531	46	426
Hoisting-bucket	G. J. Anderson	397,621	Feb. 12	810	211, 212	46	738
Hoisting-machine	V. W. Mason	397,243	Feb. 5	909	55	46	615
Hoisting mechanism	T. A. Weston	400,150	Mar. 26	2037	532, 533	46	1556
Holder: *See* Bag-holder. Pen-holder. Belt-holder. Pillow-sham holder. Book-holder. Plate-holder. Broom-holder. Post-holder. Brush-holder. Rein-holder. Chalk-holder. Ribbon-holder. Copy-holder. Sample-holder. Corn-cob holder. Sash-holder. Cuff-holder. Scarf-holder. Curtain-holder. Sewing-machine-attachment holder. Dental disk-holder. Eyeglass-holder. Sewing-machine spool-holder. Flour-holder. Harmonica-holder. Shade-holder. Harrow-tooth holder. Shaft-holder. Hose-holder. Spool-holder. Instrument-holder. Stereotype-plate holder. Jar-holder. Strainer-holder. Knife-blade holder. Tag-holder. Lead and rule holder. Telephone paper-pad holder. Mop-holder. Tidy-holder. Mop and scrubbing-brush holder. Tumbler-holder. Music-book holder. Twine-holder. Music or book holder. Umbrella-holder. Opera-glass holder. Vignette-holder. Paper-holder. Work-holder.							
Honey-comb. Artificial	L. A. Aspinwall	397,046	Jan. 29	2039	678	46	549

Hook: *See* Back-band hook. Safety-hook. Check-hook. Snap-hook. Combination-hook. Suspender-hook. Fish-hook. Vacuum-hook. Harness-hook. Whiffletree-hook. Locking-hook. Wire hook.							
Hook	A. M. Lewellen	398,060	Feb. 19	1454	384	46	879
Hook	P. Miles	396,169	Jan. 15	1322	338	46	277
Hook	P. Miles	396,756	Jan. 29	2220	568	46	464
Hook	P. Miles	396,757	Jan. 29	2221	568	46	464
Hook	C. S. Van Wagoner	397,157	Feb. 5	83	21	46	594
Hook for awnings, &c	W. F. Maulick	396,587	Jan. 22	1962	505	46	405
Hop-shovel	B. F. Jacobs	398,330	Feb. 19	1850	488	46	958
Hopple	T. Herrin	397,722	Feb. 12	952	252	46	766
Hopple	W. Whitton	398,683	Feb. 26	2375	630	46	1068
Horizontally-divided die	J. A. Furman	395,619	Jan. 1	476	121	46	97
Horse-blanket	A. H. Kinder	399,672	Mar. 19	1340	343	46	1409
Horse-boot	J. B. Hoyt	398,834	Mar. 5	32	11	46	1120
Horse-boot	T. B. Mason	396,167	Jan. 15	1320	338	46	277
Horse-check. Automatic	W. H. Kilbourn	395,333	Jan. 1	43	11	46	11
Horse-checking device	F. T. Aikins	399,061	Mar. 19	1761	455	46	1493
Horse-checking device	W. P. Smith	399,708	Mar. 19	1367	357, 358	46	1420
Horse-detacher	H. Latshaw	397,733	Feb. 12	971	252	46	770
Horse-detacher	G. W. McLaughen and A. K. Loftin	395,990	Jan. 8	1066	270	46	220
Horse-detacher	G. T. Parker	399,434	Mar. 12	974	253	46	1329
Horse-detacher	H. Riesenberg	395,589	Jan. 1	432	110	46	89
Horse-detacher	S. H. Roblin	398,977	Mar. 5	248	69	46	1162
Horse-detacher	C. R. Wilson	400,156	Mar. 26	2047	536	46	1558
Horse-power	D. Berlew	397,219	Feb. 5	178	48	46	610
Horse-power	C. V. Birk	399,478	Mar. 12	1042	273	46	1343
Horse-power for hay-stackers	R. J. Smith	398,462	Feb. 26	2043	536	46	1003
Horse-power regulator	F. Hart	396,931	Jan. 29	2470	636, 637	46	516
Horse-powers. Driving device for	W. H. Osburn	399,280	Mar. 12	744	194	46	1284
Horse-releasing device	E. L. Fox	398,827	Mar. 5	22	6	46	1118
Horseshoe	G. W. Wemple	396,521	Jan. 22	1857	476	46	386
Horseshoe-nail	J. A. Coleman	397,696	Feb. 19	1193	320	46	832
Horseshoe-nails. Machine for feeding	J. A. Coleman	396,467	Jan. 22	1771	453, 454, 455	46	370
Horseshoe-nails. Machine for forging	D. F. Williams	399,226	Mar. 5	665	173, 174	46	1242
Hose-clamp	O. Thum	396,625	Jan. 22	2019	519	46	417
Hose-coupling	C. Callahan	395,877	Jan. 8	899	230	46	187
Hose-coupling	J. Coghlan	396,684	Jan. 22	2099	539	46	432
Hose-coupling	J. L. Holton and L. H. Britton	397,187	Feb. 5	134	36	46	602
Hose-coupling	J. D. Sloan	396,435	Jan. 22	1725	444	46	361
Hose coupling. Brake	E. A. Leland	398,059	Feb. 19	1453	384	46	879
Hose-coupling for steam and air hose. Auxiliary	G. W. Vernon	395,673	Jan. 1	569	142	46	114
Hose-holder	W. C. Willits	396,129	Jan. 15	1263	323	46	267
Hose-machine	J. Murphy	399,547	Mar. 12	1150	296	46	1361
Hose-nozzle	J. Clifford	399,654	Mar. 19	1313	336	46	1405
Hose-nozzle	W. Stebbins	396,119	Jan. 15	1249	318	46	264
Hose or tubing	T. Midgley	398,425	Feb. 26	2000	525	46	994
Hose or tubing	T. Midgley	398,426	Feb. 26	2001	525	46	994
Hose or tubing	T. Midgley	398,430	Feb. 26	2004	526	46	995
Hose-pipe	E. H. Crosby	397,171	Feb. 5	108	28	46	598
Hose-pipes. Device for supporting and giving vibrating motion to	H. C. Collins	395,611	Jan. 1	460	117	46	94
Hose-pipes. Electric coupling for	D. J. Simpson	396,176	Jan. 15	1334	343	46	280
Hose-reel	C. W. Kimball	397,997	Feb. 19	1329	354	46	856
Hose-strap	I. N. Glauber	397,180	Feb. 5	124	34	46	600
Hose to couplings. Device for securing	R. Cowen	398,582	Feb. 26	2216	586	46	1037
Hot-air furnace	N. Brayer	395,420	Jan. 1	164	42	46	35
Hot-air furnace	J. Gray	397,979	Feb. 19	1320	352	46	854
Hot-air furnace	B. F. Price	397,660	Feb. 12	868	228	46	750
Hot-air furnace	L. W. Turner	397,154	Feb. 5	79	20	46	593
Hot-air furnace	E. W. Wells	396,905	Jan. 29	2434	625	46	509
Hot-air generator	E. M. Crandall and T. H. Turner	395,813	Jan. 8	798	208, 209	46	167
Hotel-call	E. J. Colby	400,304	Mar. 26	2273	595	46	1601
Hotel-register	A. D. Mackey	399,622	Mar. 12	1263	325	46	1383
House interiors. Finishing of	W. J. Boda	395,945	Jan. 8	993	255	46	205
Hub	G. J. Raithel	396,652	Feb. 26	2329	619	46	1059
Hub-boring machine	D. M. Parry	397,816	Feb. 12	1086	289	46	792
Hub. Vehicle-	J. Haish	398,148	Feb. 19	1577	418	46	902
Hub. Vehicle-	M. B. Southerland	399,577	Mar. 12	1195	309	46	1370
Hubs. Dust-guard for vehicle-	J. T. Richards and J. F. Newell	395,666	Jan. 1	561	140	46	113
Huller: *See* Pea-huller.							
Hydrant	C. Carr	396,396	Jan. 15	1321	392, 393	46	319
Hydrant	W. Ryle	400,414	Mar. 26	2440	639	46	1632
Hydrant	E. Zwiebel	397,213	Feb. 5	172	46	46	609
Hydraulic elevator. Electrically-controlled	C. Whittier	399,716	Mar. 19	1398	360	46	1422
Hydraulic elevator. Variable-pressure	T. W. Heermans	398,044	Feb. 19	1429	378, 379	46	874
Hydraulic engine	H. G. T. Glazebrook	396,556	Jan. 22	1908	492, 493	46	395
Hydraulic engine	J. McAdams	399,204	Mar. 5	629	163	46	1235
Hydraulic jack	F. I. Joyce	396,784	Feb. 26	2521	670	46	1098
Hydraulic motor	J. A. Myers	400,411	Mar. 26	2435	638, 639	46	1631

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Hydraulic press for covering electrical conductors with soft metal	W. Siemens	399,291	Mar. 12	750	197	46	1288
Hydraulic pressure. Apparatus for utilizing	J. M. Marty	395,844	Jan. 8	847	219	46	178
Hydrocarbon-burner	J. Darby	397,784	Feb. 12	1045	279	46	784
Hydrocarbon-burner	F. B. Meyers	399,770	Mar. 19	1479	381	46	1438
Hydrocarbon-burner	J. L. Newton	396,226	Jan. 15	1412	360	46	294
Hydrocarbon-burner	J. Patten	397,749	Feb. 12	991	263	46	773
Hydrocarbon-engine	G. M. Richards	399,348	Mar. 12	846	220, 221, 222	46	1305
Hydrocarbons. Apparatus for burning	J. H. Bullard	397,336	Feb. 5	353	92	46	645
Hydrocarbons. Apparatus for burning	J. H. Bullard	397,337	Feb. 5	354	92	46	645
Ice and for cooling purposes. Machine for manufacturing	J. C. Rossi	397,820	Feb. 12	1094	292	46	793
Ice-boat	J. McGrath	395,848	Jan. 8	851	220	46	179
Ice-box pan	C. W. Smith	396,619	Jan. 22	2009	517	46	415
Ice-cream box	J. Van Dyk	396,443	Jan. 22	1736	446	46	363
Ice-elevator heater	J. N. Briggs	399,012	Mar. 5	312	84	46	1174
Ice from store-houses. Automatic apparatus for lowering	J. N. Briggs	399,011	Mar. 5	309	83	46	1174
Ice. Machine for manufacturing	J. C. Rossi	397,819	Feb. 12	1092	291	46	793
Ice-planing machine	L. R. Carhart	400,189	Mar. 26	2093	548	46	1568
Illuminating apparatus	W. F. Folmer	397,903	Feb. 19	1205	323	46	834
Implement-joint	F. H. Richards	397,389	Feb. 5	422	112	46	658
Incandescent device	C. A Von Welsbach	399,174	Mar. 5	583	150	46	1227
Incrustation. Device for preventing	E. E. Euchenhofer	396,033	Jan. 8	1124	285	46	230
Incrustation preventive	B. M. Henney	397,547	Feb. 12	673	.....	46	713
Incubator	J. F. Carr	395,483	Jan. 1	281	67	46	55
Incubator	J. F. Carr	395,484	Jan. 1	202	68	46	55
Incubator	J. K. Meschter	397,016	Jan. 29	2583	668	46	540
Index	J. P. Findley	400,070	Mar. 26	1918	500	46	1532
Index. Page-	J. A. Cook	400,059	Mar. 26	1902	494	46	1528
Indexes. Machine for cutting	E. P. Donnell	399,250	Mar. 12	701	182, 183	46	1276
Indexing-machine	F. W. Hewes	396,742	Jan. 29	2196	502, 503	46	458
Indicating and recording changes at a distant point. Apparatus for	G. E. Winslow	395,802	Jan. 8	871	225	46	183
Indicating apparatus. Coin-controlled	F. C. Lynde	398,519	Feb. 26	2129	560, 561	46	1020
Indicating apparatus. Coin-controlled	F. C. Lynde	398,520	Feb. 26	2131	561, 562	46	1020
Indicating apparatus. Coin-controlled	F. C. Lynde	398,521	Feb. 26	2132	562	46	1020
Indicator: *See* Bottle-indicator. Letter-box indicator. Cash-indicator. Speed-indicator. Electric-current indicator. Station-indicator. Elevator-indicator. Street and station indicator. Gas-pressure indicator. Stock-indicator.							
Indicator	G. W. Kennedy	400,345	Mar. 26	2342	611	46	1613
Indicator-bolt	S. Harris	398,722	Feb. 26	2142	646	46	1092
Induction-coil. Coin-operated	F. G. Williams and A. W. Roovers	399,591	Mar. 12	1216	314	46	1374
Induction generator. Static-	E. T. Birdsall	398,122	Feb. 19	1539	409	46	896
Inductor. Alternate-current	E. Thomson and M. J. Wightman	399,851	Mar. 19	1531	396	46	1448
Ingots from molds. Apparatus for removing	W. R. Jones	395,330	Jan. 1	39	10	46	10
Inhaler	E. Jahr	399,901	Mar. 19	1674	434	46	1476
Inhaler and respirator	C. Breuillard	399,736	Mar. 19	1426	367	46	1427
Inhaler for warm air	L. Welgert	398,991	Mar. 5	273	75	46	1167
Inhaling-tip	M. S. Green	395,436	Jan. 1	186	49	46	40
Ink and color slab. Indian-	E. G. Soltmann	397,146	Feb. 5	68	16	46	591
Ink-bottle and attachment therefor	N. Johnson	396,495	Jan. 22	1820	467	46	380
Ink-bottles. Adjustable bracket for	W. Lumley	397,558	Feb. 12	694	180	46	717
Inkstand	S. G. Baldwin	397,330	Feb. 5	344	90	46	643
Inkstand	E. Davis	399,644	Mar. 19	1597	414	46	1460
Inkstand	B. F. Henkle	397,983	Feb. 19	1324	353	46	855
Insect-powder, &c. Machine for distributing	J. H. White	400,279	Mar. 26	2234	586	46	1593
Insect-trap	C. P. Brown	395,542	Jan. 1	350	89	46	73
Insect-trap	J. H. Brown	396,024	Jan. 8	1114	283	46	228
Insecticide	J. Turlington	396,807	Feb. 26	2549	.....	46	1105
Insecticide composition	T. Manahan	399,999	Mar. 19	1815	.....	46	1503
Insecticides. Preparing	J. M. A. Miller	398,727	Feb. 26	2139	.....	46	1022
Instrument-holder	G. Hatch	398,506	Feb. 26	2116	556	46	1017
Insulating jacket or covering	W. J. Hulford	396,933	Jan. 29	2474	637	46	517
Insulating-support for electric conductors	S. H. Short	398,661	Feb. 26	2341	622	46	1061
Insulator	W. C. Brown	396,095	Feb. 19	1404	370	46	849
Insulator. Overhead	S. H. Gibson	396,334	Jan. 15	1566	397	46	321
Interlocking switch and signal	H. B. Potter	395,452	Jan. 1	213	55	46	46
Internasal tube	D. H. Goodwillie	399,985	Mar. 19	1795	465	46	1500
Iron: *See* Sad-iron. Whiffletree or neck-yoke iron. Soldering-iron.							
Iron. Apparatus for converting cast-	L. Iauke	397,365	Feb. 5	393	103	46	652
Iron into malleable iron or steel. Converting crude	G. L. Robert	395,633	Jan. 1	510	128	46	102
Iron into malleable iron or steel. Converting crude	G. L. Robert	400,010	Mar. 19	1831	475	46	1505
Iron. Machine for forming skelp	C. Benker	398,120	Feb. 19	1537	408	46	895
Iron. Manufacture of	A. T. Hay	399,611	Mar. 12	1246	.....	46	1379
Iron. Manufacturing planished sheet	W. D. Wood	395,605	Jan. 1	453	.....	46	93
Iron or steel. Manufacturing	E. H. Cowles	397,491	Feb. 12	589	.....	46	698
Iron. Purifying	G. G. Mullins. (Reissue)	10,998	Feb. 26	2553	.....	46	1106
Ironing board	R. Gude	395,895	Jan. 8	925	238	46	192
Ironing-board	H. C. Perry	399,925	Mar. 19	1711	443	46	1483
Ironing-board and step-ladder	J. H. Whisler	398,297	Feb. 19	1803	476	46	949

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Ironing-board support	W. E. Berry	400,290	Mar. 26	2252	589	46	1507
Ironing-machine	W. F. Crevert and J. Claus	397,700	Feb. 12	921	244	46	760
Ironing or calendering machine	R. Crawford	397,586	Feb. 12	743	192	46	726
Ironing-table	A. Riersen	400,009	Mar. 19	1620	475	46	1505
Ironing table. Shirt	J. H. Mount	396,416	Jan. 22	1692	434	46	354
Irrigating hills for plants. Machine for	H. F. Olsen	399,279	Mar. 12	743	193	46	1284
Jack:							
See Carriage-jack. Lifting-jack. Heeling, nailing, and sectional jack. finishing jack. Wagon-jack. Hydraulic jack.							
Jack-a-lantern	G. A. Beidler	396,259	Jan. 15	1446	368	46	301
Jar-caps. Closure for	H. Rosamyer, Jr	397,094	Jan. 29	2097	607	46	561
Jar cover. Slop	F. Haberman	397,425	Feb. 5	467	128	46	672
Jar-holder and kettle-cover	I. Zander	400,385	Mar. 26	2298	627	46	1624
Jars. Sealing device for fruit	J. Legan	398,633	Feb. 26	2900	808	46	1058
Jewelry	E. Schill and A. Becker	396,657	Feb. 26	2234	627	46	1060
Jewelry-case	C. F. Domann	399,603	Mar. 12	1237	319	46	1378
Jewelry-setting	L. Krug	397,434	Feb. 5	503	132	46	675
Joint:							
See Boat-joint. Metal joint. Chair-joint. Metallic joint. Furniture-joint. Pipe-joint. Implement-joint. Rail-joint.							
Joints. Device for cushioning loose	J. E. Boynton and W. Crisp	395,310	Jan. 1	8	2	46	4
Journal-bearing	W. W. Smalley	398,547	Feb. 26	2164	571	46	1027
Journal-bearing. Roller	O. R. Chaplin	400,053	Mar. 26	1894	492	46	1526
Journal-box	T. E. Hayes and A. J. Read	400,210	Mar. 26	2125	557	46	1575
Journal-box	W. W. Worswick	399,721	Mar. 19	1406	362	46	1423
Journal-box for crank-pins	P. W. Leffler	400,231	Mar. 26	2158	566	46	1581
Journal-box. Self-cooling	J. W. Storey and J. Olsson	397,038	Jan. 29	2020	676	46	547
Journal-boxes. Die for the manufacture of lids for	N. H. Davis	397,786	Feb. 12	1047	279 / 290	46	785
Journal-boxes. Machine for lining	B. J. Downs	398,588	Feb. 26	2227	588	46	1039
Jug-holding device and shipping-case. Combined	N. S. Chandler	396,984	Jan. 29	2541	656	46	531
Jute, hemp, &c. Machine for softening	J. Cheyne	395,741	Jan. 8	671	172	46	144
Kegs, &c. Device for opening and closing the apertures of	W. Duncan	397,787	Feb. 12	1048	280	46	785
Key	J. P. Dandurand	398,499	Feb. 26	2100	554	46	1014
Key	O. Stoddard	399,094	Mar. 5	424	115	46	1195
Key-hole guard	C. R. Uhlmann	396,123	Jan. 15	1253	320	46	265
Key-noses. Safety-cover for	G. P. Schmidt	399,570	Mar. 12	1187	307	46	1369
Key-ring	R. H. Ingersoll	398,835	Mar. 5	33	11	46	1120
Kiln:							
See Brick-kiln. Malt-kiln.							
Kiln for firing decorated china, glass, &c. Portable	F. E. Hall	397,642	Feb. 12	839	219	46	744
Kitchen-cabinet	C. B. Rogers	399,438	Mar. 12	979	255	46	1330
Kitchen table and cabinet	J. Everitt	397,073	Jan. 29	2069	690	46	556
Kneader. Dough	J. H. Bowers	400,187	Mar. 26	2090	547	46	1568
Knife:							
See Pocket-knife. Table-knife.							
Knife	F. S. Foote	395,821	Jan. 8	809	211	46	170
Knife and fork cleaner	H. R. Fay	398,742	Feb. 19	1567	415	46	901
Knife-blade	A. L. Clark	397,602	Feb. 12	914	242	46	759
Knife-blade holder	S. V. Ellis	399,855	Mar. 19	1615	418	46	1464
Knife-cleaner	R. W. Jamieson	396,492	Jan. 22	1815	466	46	379
Knit fabric	R. M. Appleton	395,942	Jan. 8	988	253	46	205
Knit fabric. Widened tubular	R. W. Scott	398,191	Feb. 19	1639	434	46	914
Knit webs. Transferring mechanism for	A. T. L. Davis and G. E. Stevens	400,062	Mar. 26	1906	496	46	1529
Knitting-machine	G. H. Coburn	395,314	Jan. 1	11	3, 4	46	5
Knitting-machine	F. Wilcomb	397,408	Feb. 5	454	121	46	665
Knitting machine. Circular	G. Cooper	397,417	Feb. 5	473	125	46	669
Knitting machine. Circular	G. H. Gilbert	398,145	Feb. 19	1571	416	46	901
Knitting machine. Circular	E. Lippitt	396,378	Jan. 22	1946	501 / 502 / 503	46	402
Knitting machine. Circular	R. W. Scott and L. N. D. Williams	395,927	Jan. 8	964	248	46	199
Knitting machine. Circular	W. H. Stewart	397,444	Feb. 5	520	137	46	678
Knitting machine. Circular	E. Vermilyea	395,764	Jan. 8	701	179 / 180	46	149
Knitting machine. Circular-warp	H. B. Payne and W. Campion	397,142	Feb. 5	56	14	46	588
Knitting-machine needle	S. N. Goodman	400,330	Mar. 26	2316	606	46	1609
Knitting-machine stop-motion mechanism	A. T. L. Davis	400,063	Mar. 26	1908	496 / 497	46	1529
Knitting machine. Straight	H. B. Payne	397,141	Feb. 5	54	13, 14	46	588
Knitting machine. Warp	H. B. Payne and W. Campion	397,140	Feb. 5	51	12, 13	46	588
Knitting-machines. Electrical stop-motion mechanism for	E. G. Conner	397,537	Feb. 12	635	171 / 172	46	710
Knitting machines. Pattern-wheel for warp	J. Keeton	398,623	Feb. 26	2273	603	46	1048
Knitting-machines. Stopping device for	J. S. Crane	397,973	Feb. 19	1300	347 / 348	46	851
Knitting-machines. Take-up and tension device for	F. Wilcomb	396,907	Jan. 29	2436	696	46	510
Knitting-machines, &c. Tension device for	F. A. Calley	398,127	Feb. 19	1546	410	46	897
Knitting widened tubular fabrics	R. W. Scott	398,190	Feb. 19	1637	434	46	914
Knob attachment. Door	H. A. Iddings and J. P. Megeath	396,571	Jan. 22	1935	498	46	400
Knob. Sheet-metal	J. Berbecker	399,476	Mar. 12	1040	273	46	1343
Knockdown box and blank therefor	N. J. Dobbins	395,615	Jan. 8	801	209	46	168
Knockdown table	H. A. Butler	396,918	Jan. 29	2450	630	46	512
Labeling machine Can	M. V. B. Ethridge	398,775	Feb. 26	2506	665 / 666	46	1096
Laces. Appliance for hanging and exhibiting boot or shoe	J. Paton	399,559	Mar. 12	1160	300	46	1363
Ladder and ironing and bread board. Combined step-	J. C. Armstrong	400,158	Mar. 26	2050	536 / 537	46	1559

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Ladder and scaffold attachment. Extension	I. H. Rasor	400,008	Mar. 19	1629	475	46	1505
Ladder. Fire extension	H. T. Hayes	396,564	Jan. 22	1934	496	46	398
Ladder. Fire extension	H. T. Hayes	396,565	Jan. 22	1936	496	46	398
Ladder guard. Step	O. J. Meisel	396,886	Jan. 29	2466	617	46	504
Ladder. Step	G. W. and S. D. Hatcher	397,913	Feb. 19	1221	336	46	837
Ladders. Folding crank for extensible	P. S. Bradford	399,313	Mar. 12	797	206	46	1294
Lamp	J. Franklin	395,969	Jan. 8	1098	282	46	212
Lamp	J. W. Williams	396,348	Jan. 15	1589	401	46	324
Lamp. Alcohol disinfecting	M. S. Purdy and H. Alber	399,078	Mar. 5	397	107	46	1190
Lamp and stove. Safety car	O. Franks and W. Carroll	400,071	Mar. 26	1920	500 / 501	46	1532
Lamp. Arc	W. H. Miller	400,352	Mar. 26	2351	614	46	1615
Lamp. Arc	W. L. Silvey	398,906	Mar. 5	134	37	46	1140
Lamp attachment	J. H. Schenkel and R. B. Magruder	397,569	Feb. 12	711	184	46	739
Lamp-burner	S. Ellis	398,503	Feb. 26	2106	555	46	1015
Lamp. Candle	J. Martin	395,574	Jan. 1	407	104 / 105	46	84
Lamp. Car	W. W. Willits	395,937	Jan. 8	982	252	46	203
Lamp. Carbureting	W. W. Austin	397,485	Feb. 12	582	151	46	697
Lamp. Carbureting	J. Kidd	396,041	Jan. 8	1134	288	46	232
Lamp. Carbureting	A. Kitson and W. S. Horry	395,834	Jan. 8	827	215	46	174
Lamp. Carbureting	J. P. Magenis	400,096	Mar. 26	1952	510	46	1539
Lamp. Central-draft	J. C. Miller	395,912	Jan. 8	947	243	46	196
Lamp-covering	G. H. Dean	396,146	Jan. 15	1292	329	46	271
Lamp. Electric-arc	E. A. Edwards	400,198	Mar. 26	2104	552	46	1571
Lamp. Electric-arc	G. M. Lane	399,054	Mar. 5	364	98	46	1184
Lamp. Electric-arc	W. L. Silvey	398,907	Mar. 5	136	37	46	1140
Lamp-extinguisher	J. H. Paige	397,891	Feb. 19	1244	332	46	841
Lamp filament. Incandescent	T. A. Edison	395,963	Jan. 8	1021	260	46	211
Lamp fixture and switch. Electric	L. W. Dillon	399,134	Mar. 5	510	134	46	1214
Lamp. Gas	F. Siemens	399,289	Mar. 12	757	197	46	1287
Lamp-hanger	E. Miller	395,845	Jan. 8	848	219	46	178
Lamp hanger. Electric	M. M. Wood	397,953	Feb. 19	1273	340	46	846
Lamp. Incandescent electric	T. A. Edison	398,774	Feb. 26	2505	665	46	1095
Lamp. Incandescent electric	E. Weston	400,378	Mar. 26	2388	625	46	1622
Lamp. Incandescent gas	H. J. Bell	400,167	Mar. 26	2063	540	46	1561
Lamp-lighting device	H. Landon	397,923	Feb. 19	1231	329	46	839
Lamp manufacture. Incandescent	J. A. Vandegrift	397,479	Feb. 5	508	147	46	686
Lamp. Oil	W. Brazer	400,320	Mar. 26	2297	601 / 602	46	1606
Lamp. Oil	H. A. Kent	398,163	Feb. 19	1598	424	46	907
Lamp. Oil spray or vapor	A. Neilson and J. Taylor	397,745	Feb. 12	988	261	46	773
Lamp or night light	J. A. H. Leynen-Hougaerts	397,011	Jan. 29	2578	666	46	539
Lamp-shade protector	G. A. Tank	400,372	Mar. 26	2376	621	46	1621
Lamp-shade support	W. Harper	400,998	Mar. 26	2122	556	46	1574
Lamp socket. Incandescent	O. P. Loomis	396,581	Jan. 22	1955	504	46	404
Lamp socket. Incandescent electric	C. E. Egan	399,748	Mar. 19	1446	372	46	1431
Lamp-standard	J. C. Miller and A. H. Jones	396,946	Jan. 29	2498	642	46	520
Lamps. Automatic switch for electric-arc	E. R. Knowles	397,729	Feb. 12	963	256	46	768
Lamps. Hanger-board for arc	J. J. Wood	398,870	Mar. 5	79	22	46	1130
Lamps. Holder for electric-arc	J. Pawlowski	395,735	Jan. 8	689	176	46	147
Lamps, lanterns, &c. Indicator for	W. A. Chase	396,540	Jan. 22	1978	481	46	389
Lamps. Lens-holder for signal	C. W. Helbig	398,253	Feb. 19	1731	456	46	933
Lamps. Manufacturing electric	T. A. Edison	395,903	Jan. 8	1021	.....	46	211
Lamps. Oil-feed for	C. Sieghold	395,460	Jan. 1	226	57	46	49
Lamps. Regulator for gas	J. Franklin	396,995	Jan. 29	2556	660	46	534
Lamps. Suspending electric-light	A. Siegrist	396,897	Jan. 29	2424	623	46	506
Lamps. Suspension device for	W. C. Homan	397,462	Feb. 5	547	144	46	682
Lamps, &c. Suspension device for	F. Rhind and G. L. Cooper	397,510	Feb. 12	632	164	46	706
Lantern	L. F. Betts	397,624	Feb. 12	914	213	46	739
Lantern	O. D. Woodruff	395,864	Jan. 8	879	225	46	184
Lantern-frame	F. D. Spear	399,944	Mar. 19	1736	449	46	1488
Lantern. Magic	H. J. Brower	399,596	Mar. 12	1227	316 / 317	46	1376
Lantern or lamp	G. W. Stockly	400,140	Mar. 26	2015	527	46	1551
Lantern. Tubular	L. F. Betts	397,625	Feb. 12	915	213	46	740
Lantern. Tubular	F. Dietz	395,489	Jan. 1	271	69	46	57
Lantern. Tubular	W. Westlake	399,807	Mar. 19	1543	398	46	1450
Lantern. Tubular	O. D. Woodruff	395,863	Jan. 8	876	225	46	183
Last	G. H. Healey	399,227	Mar. 5	668	174	46	1243
Last	J. W. Lamphier	399,996	Mar. 19	1812	471	46	1502
Last	G. E. Smith	395,668	Jan. 1	563	140	46	113
Last	F. M. Wade	395,465	Jan. 1	232	59	46	50
Last	E. C. Woodward	398,923	Mar. 5	159	41	46	1143
Last attachment	A. S. Trowbridge	399,096	Mar. 5	425	116	46	1195
Lasting-machine	A. F. Preston	395,629	Jan. 1	496	125 / 126	46	100
Latch	O. A. Jenison	399,268	Mar. 12	729	189	46	1281
Latch	P. L. Maltbie	399,423	Mar. 12	961	250	46	1327
Latch and lock. Combined	M. E. De Aguero	397,235	Feb. 5	188	49	46	612
Latch and lock. Combined	T. Overton	400,111	Mar. 26	1976	517	46	1543
Latch and lock. Combined	G. Worrall	398,016	Feb. 19	1388	367	46	867
Latch-case	C. M. Burgess	396,916	Jan. 29	2448	629	46	512
Latch. Gate	A. Sime and W. M. Moore	398,351	Feb. 19	1883	496	46	964
Lathe	S. A. Penny	398,077	Feb. 19	1475	390 / 391	46	884
Lathe	A. D. Waymouth	397,598	Feb. 12	644	168 / 169	46	706
Lathe attachment	F. Clarke and H. H. Bassett	397,694	Feb. 12	916	242	46	759
Lathe-carriage	W. Lodge	396,700	Jan. 22	2124	544	46	436
Lathe. Engine	J. Flather	398,601	Feb. 26	2243	594	46	1042
Lathe for turning bodies having elliptical cross-sections	J. K. Koons	395,838	Jan. 8	834	216	46	175
Lathe for turning spiral forms	E. D. Mackintosh	396,283	Jan. 15	1490	377 / 378	46	308

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Lathe-tool	J. Whatley	398,918	Mar. 5	149	39	46	1143
Lathe. Wood-turning	L. N. Norcross	396,227	Jan. 15	1414	360	46	294
Lathes and planers. Tool for	W. W. Pipes and A. L. Kelly	396,764	Jan. 29	2231	571	46	466
Lathes. Feed-reversing attachment for	G. Q. Whitney	395,531	Jan. 1	336	85	46	71
Lathes. Stop-motion for	S. L. Worsley	398,871	Mar. 5	82	23	46	1130
Lathes. Tail-stock for	E. R. Osgood	397,564	Feb. 12	703	183	46	719
Lawn-rake	H. W. Steiner	395,721	Jan. 8	639	162	46	138
Lawn-sprinkler	D. D. Buick	397,775	Feb. 12	1029	275	46	781
Lawn-tennis ball	H. H. Waddington	398,558	Feb. 26	2182	575	46	1030
Lead and rule holder for type-compositors' use	A. A. Low	395,984	Jan. 8	1053	{267 / 268}	46	217
Lead pigment. Making a	A. G. Fell	396,275	Jan. 15	1477	.....	46	306
Leather-dressing	J. J. Hayward	399,893	Mar. 19	1664	.....	46	1474
Leather. Japanning	S. C. Howell	397,803	Feb. 12	1070	285	46	789
Leather-smoothing machine	F. Storch	397,821	Feb. 12	1095	292	46	794
Leather-splitting machine	F. F. Stanley	395,750	Jan. 8	696	177	46	148
Lemon-squeezer	E. M. Scott	399,229	Mar. 5	670	174	46	1243
Letter-box	W. R. Augustine	395,308	Jan. 1	6	2	46	4
Letter-box	T. C. Chappell and E. D. Moore	400,299	Mar. 26	2263	{592 / 593}	46	1599
Letter-box	M. J. Hewlett	396,360	Jan. 15	1609	411	46	330
Letter-box	J. A. Jacobs	397,552	Feb. 12	663	178	46	715
Letter-box	R. J. Mitchell	400,244	Mar. 26	2179	572	46	1585
Letter-box	H. S. Schaadt	396,767	Jan. 29	2235	572	46	467
Letter-box	M. Wiberg	395,802	Jan. 8	780	203	46	163
Letter-box indicator	G. A. Colton	397,341	Feb. 5	360	94	46	646
Letter. Raised stone incrusted	C. Gosling	395,563	Jan. 1	388	99	46	80
Letter-sheet and envelope. Combined	H. A. Ditzell	398,822	Mar. 5	16	4	46	1117
Levee-protector	J. M. McLemore and C. D. Jones	400,101	Mar. 26	1961	514	46	1540
Level. Hand-	C. E. Lawrence	396,883	Jan. 29	2402	616	46	504
Level. Plumb-	A. B. Ewing	399,859	Mar. 19	1618	419	46	1465
Level. Plumb-	O. I. Lewis	397,010	Jan. 29	2576	666	46	538
Level. Spirit-	R. D. Werden	397,043	Jan. 29	2625	677	46	548
Leveling-instrument	E. R. Clough and E. M. Easley	397,695	Feb. 12	917	243	46	759
Leveling-instrument	C. A. Karr	397,294	Feb. 5	265	73, 74	46	630
Lever	R. W. Hardie	398,152	Feb. 19	1562	420	46	903
Library-case	J. A. Lyons	397,012	Jan. 29	2579	666	46	539
Lid or cover for metallic or other receptacles	W. T. Seymour	397,391	Feb. 5	424	112	46	658
Lid-raiser	J. S. Anderson	396,972	Jan. 29	2527	652	46	529
Life-boat and mattress. Combined	J. Martin	395,986	Jan. 8	1060	{268 / 269}	46	218
Life-saving net	M. Hunter	396,491	Jan. 22	1814	465	46	378
Lifter: *See* Stump or stone lifter. Transom-lifter.							
Lifting-jack	J. Barrett	399,470	Mar. 12	1024	270	46	1340
Lifting-jack	H. Gortner	400,205	Mar. 26	2119	556	46	1573
Lifting-jack	B. A. Sahlmann and J. Schenousky	395,517	Jan. 1	317	81	46	67
Lifting-jack	A. A. Strom	395,928	Jan. 8	965	248	46	200
Lifting-machine. Coin-controlled	B. Füchter	397,229	Feb. 5	192	51	46	612
Lifting-machine. Coin-controlled	J. G. Kearney	397,295	Feb. 5	287	74	46	631
Light: *See* Vault-light.							
Lightning-arrester	C. H. Wilson	399,305	Mar. 12	787	204	46	1293
Lightning-rod	L. L. Mast	395,399	Jan. 1	137	35	46	30
Limekiln. Oil-burning	A. V. Clark and E. T. Mapel	396,541	Jan. 22	1879	488	46	329
Liniment	D. Bates	398,024	Feb. 19	1403	.....	46	869
Liniment	W. E. Brine	396,804	Jan. 29	2294	.....	46	478
Liniment	S. Somerville	397,033	Jan. 29	2614	.....	46	546
Liquid-holding vessel	S. R. Mace	398,061	Feb. 19	1455	385	46	880
Liquid or gas meter	L. G. Welker	398,013	Feb. 19	1379	365	46	865
Liquids under pressure. Vessel for holding	J. A. Feld and J. Siebrecht	400,318	Mar. 26	2294	600	46	1605
Lobsters. Pound for	J. R. Burns	399,241	Mar. 12	690	180	46	1275
Lock: *See* Bag-lock. Car-lock. Combination-lock. Door-lock. Flask-lock. Hasp-lock. Mail-bag lock. Nut-lock. Paper-box lock. Permutation-lock. Seal-lock. Spring-lock. Tongue-lock.							
Lock	W. D. Doremus	400,316	Mar. 26	2289	{599 / 600}	46	1604
Lock	J. M. Edgar	399,189	Mar. 5	607	158	46	1231
Lock	W. S. Fiske	399,026	Mar. 5	527	88	46	1177
Lock	W. S. Fiske	399,141	Mar. 5	594	137	46	1216
Lock	H. A. Holt	397,501	Feb. 12	605	156	46	700
Lock	J. Roche	399,083	Mar. 5	406	109	46	1192
Lock	H. Van Hoevenbergh	396,628	Jan. 22	2022	520	46	417
Lock-case	C. M. Burgess	396,915	Jan. 29	2448	629	46	512
Lock-case	C. M. Burgess	399,240	Mar. 12	688	179	46	1275
Lock-case. Sheet-metal	C. M. Burgess	399,239	Mar. 12	688	179	46	1275
Lock for satchels, &c	F. F. Braillard	397,487	Feb. 12	585	152	46	697
Lock for trunks, &c	J. J. Sager	399,784	Mar. 19	1504	389	46	1443
Lock-nut	D. H. Allen and M. Loree	397,103	Feb. 5	1	1	46	579
Lock-nuts. Manufacture of	G. A. Goodwin and W. F. How	396,477	Jan. 22	1792	459	46	374
Locket	G. D. Briggs	397,774	Feb. 12	1028	274	46	781
Locket. Chewing-gum	C. W. Robertson	395,515	Jan. 1	316	80	46	67
Locking-clasp for traveling-bags, pocket-books, &c	C. A. Stark	398,287	Feb. 19	1756	472	46	945
Locking-hook. Automatic	F. Splittstoser	396,775	Jan. 29	2248	574	46	469
Locomotive-boiler	G. A. Karwiese	398,161	Feb. 19	1505	423	46	906
Locomotive for single-rail railways	A. Mallet	399,679	Mar. 19	1347	346	46	1410
Locomotive. Street-	T. Roberts	396,113	Jan. 15	1242	{316 / 317}	46	262
Locomotives. Steam-brake for	P. Reilly	397,024	Jan. 29	2601	671	46	543
Loom	J. R. Fitton	397,074	Jan. 29	2670	690	46	556

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Loom	A. Urbahn	397,156	Feb. 5	81	20, 21	46	594
Loom. Double-pile-fabric	W. H. Balratow	395,472	Jan. 1	244	{63 / 64 / 65}	46	53
Loom for weaving chenille, &c	H. Skinner and E. Tymeson	400,260	Mar. 26	2202	{578 / 579 / 580}	46	1588
Loom for weaving chenille and fringe	K. Hartley	396,205	Jan. 15	1379	{352 / 353}	46	288
Loom for weaving terry fabrics	C. Strobel	396,964	Jan. 29	2513	648	46	526
Loom for weaving unspun plant-stalks	P. de Hemptinne	399,745	Mar. 19	1440	{370 / 371}	46	1430
Loom. Hand-	W. H. Kynett	396,221	Jan. 15	1488	377	46	308
Loom let-off mechanism	S. and S. M. Hamblin	399,195	Mar. 5	617	160	46	1233
Loom-picker	J. W. Barlow	398,570	Feb. 26	2197	579	46	1033
Loom-picker	H. Kelly	397,649	Feb. 12	851	222	46	746
Loom picker-check	J. Davidson and J. Bannister	399,656	Mar. 19	1315	337	46	1405
Loom positive shuttle-motion	C. F. Wickwire	396,522	Jan. 22	1858	476	46	386
Loom-shedding mechanism	G. F. Hutchins	398,618	Feb. 26	2267	601	46	1047
Loom-shuttle	C. F. and T. H. Wickwire	400,152	Mar. 26	520	533	46	1556
Loom shuttle-motion	W. Tucker	397,823	Feb. 12	1097	293	46	794
Loom stop-motion	J. J. McComish	399,917	Mar. 19	2040	{440 / 441}	46	1481
Loom stopping mechanism	H. Wyman	400,382	Mar. 26	1701	626	46	1623
Loom take-up mechanism	W. J. Lutton	397,086	Jan. 29	2685	695	46	559
Loom-temple	J. Nuttall	398,791	Feb. 26	2533	673	46	1100
Loom-temples. Roll for	B. D. Stevens	399,445	Mar. 12	2103	257	46	1333
Loom weft stop mechanism	G. M. Atchison	400,159	Mar. 26	968	537	46	1559
Looms for weaving fabrics having end borders. Shuttle-box-pattern mechanism for	F. Hebden	399,613	Mar. 12	2051 1248	321	46	1380
Looms. Knife-sharpener for double-pile-fabric	R. Simon	399,293	Mar. 12		199	46	1289
Looms. Pattern mechanism for	G. F. Hutchins	398,398	Feb. 19	1848	{487 / 488}	46	958
Looms, &c. Pattern mechanism for	W. Wattie	396,057	Jan. 8	1156	293	46	237
Looms. Positive shuttle-motion for	J. W. Eisenhart	399,138	Mar. 5	765	135	46	1215
Looms. Positive shuttle-motion for	W. F. Hitchcock	395,829	Jan. 8	822	213	46	172
Looms. Positive shuttle-motion for	W. F. Hitchcock	398,964	Mar. 5	228	63	46	1158
Looms. Shedding mechanism, &c., for	G. F. Hutchins	397,858	Feb. 12	1141	305	46	804
Looms. Shuttle-check for	C. A. Littlefield	395,841	Jan. 8	840	217	46	176
Looms. Shuttle-operating mechanism for	C. A. Littlefield	395,842	Jan. 8	842	218	46	176
Looms. Take-up mechanism for narrow-ware	H. Wyman	398,365	Feb. 19	1912	{503 / 504}	46	970
Looms. Warp-tension-regulating device for	J. L. Aldinger	398,017	Feb. 19	1392	{367 / 368}	46	867
Lubricator: *See* Axle-lubricator. Elevator-lubricator. Engine-lubricator. Mintng machine lubricator.							
Lubricator	W. H. Craig	398,583	Feb. 26	2216	586	46	1037
Lubricator	W. M. Derby	396,471	Jan. 29	1785	457	46	372
Lubricator	H. O'Connell and S. A. Cahill	400,356	Mar. 26	2357	615	46	1616
Lug chair. Two-part self-locking	W. McLain	396,599	Jan. 22	1965	506	46	405
Lumber. Machine for grooving	J. T. Grzybowski	396,399	Jan. 22	1667	428	46	349
Lumber. Mechanism for conveying and distributing	T. B. Hyman	395,978	Jan. 8	1045	265	46	216
Lumber-piler	C. D. Clarke	397,490	Feb. 12	588	153	46	698
Lumber-rack	G. Streich	400,015	Mar. 19	1838	477	46	1507
Lunch-heater	T. O'Mahony	399,922	Mar. 19	1708	442	46	1463
Maccaroni and noodles. Machine for making	C. Held	396,567	Jan. 22	1930	497	46	399
Machinery. Device for preventing the backward movement of	J. A. Allen	400,284	Mar. 26	2243	587	46	1595
Machinist's blocking	C. E. Pollard	399,926	Mar. 19	1712	443	46	1483
Magnetic regulator	S. E. Nutting	398,744	Feb. 26	2468	654	46	1067
Magnetic separator	J. A. Burden	399,375	Mar. 12	895	{232 / 233}	46	1312
Magnetic separator	T. A. Edison	396,356	Jan. 15	1593	403	46	326
Magnets. Winding field	T. A. Edison	397,705	Feb. 12	928	245	46	761
Mail-bag	E. D. Moore	398,529	Feb. 26	2141	565	46	1022
Mail-bag	A. B. Quinan	398,185	Feb. 19	1631	432	46	913
Mail-bag fastening	H. L. Boyle	397,689	Feb. 12	910	241	46	757
Mail-bag fastening	J. S. Goodwin	399,966	Mar. 19	1796	466	46	1500
Mail-bag fastening	J. Jacobs	398,967	Mar. 5	231	64	46	1158
Mail-bag lock	T. W. Ivory	398,157	Feb. 19	1587	421	46	904
Mail-bags. Hermetic mouth-piece for	E. D. Moore	398,530	Feb. 26	2142	565	46	1022
Mail box and pouch	W. Wicek	400,026	Mar. 19	1750	481	46	1509
Mains. Seal for hydraulic	R. Haberthür	400,333	Mar. 26	2319	607	46	1610
Mainsprings and removing the same. Inserting	E. Karthaus	397,585	Feb. 12	612	158	46	701
Mainsprings. Temporary case for	J. W. Riglander	397,564	Feb. 12	705	183	46	719
Malt. Apparatus for making	J. Whitney	395,468	Jan. 1	247	60, 61	46	51
Malt-kiln	P. Lauth	400,229	Mar. 26	2153	565	46	1579
Malting-drum. Pneumatic	J. Henning	400,338	Mar. 26	2325	608	46	1610
Mantles. Apparatus for regenerating incandescent	C. A. Von Welsbach	400,419	Mar. 26	2446	641	46	1633
Mantles of refractory incandescing earths. Re-enforcing	C. A. Von Welsbach	396,347	Jan. 15	1581	400	46	324
Manure and urine conduit	H. Cole	398,379	Feb. 26	1937	509	46	962
Marble. Manufacturing artificial	L. Nathan	396,225	Jan. 15	1411	.....	46	294
Marine vehicle	W. Henry	396,496	Jan. 22	1808	463	46	377
Marker, furrower, and coverer	E. Wyckoff	399,309	Mar. 12	793	205	46	1293
Marking designs in artificial stone. Roller for	J. Laird and W. Mendham	397,731	Feb. 12	964	257	46	769
Mashing-machine. Brewer's	C. Kaestner	398,621	Feb. 26	2270	602	46	1048
Mashing potatoes, &c. Machine for	C. Warren	399,587	Mar. 19	1313	313	46	1373
Mason's float	G. Kantz	398,732	Feb. 26	2454	650	46	1084
Mast-arm	C. M. Keller	399,334	Mar. 12	827	215	46	1301
Mat: *See* Door-mat. Wire mat.							
Mat	C. Wolcott	397,452	Feb. 5	537	141	46	681

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Match-box and cane. Combined	S. B. Simon	397,663	Feb. 12	872	229	46	751
Match-flasks. Latch for	M. B. Springer	397,399	Feb. 5	444	118	46	663
Match-making machine	W. Getz	398,322	Feb. 19	1837	485	46	956
Match-package	F. Schilz	397,756	Feb. 12	999	265	46	775
Match-safe and automatic light	F. S. Ballard	396,135	Jan. 15	1269	325	46	268
Match-splints. Machine for making	G. E. Norris	397,513	Feb. 12	624	161, 162	46	704
Matches, splints, and match-boxes. Machinery for cutting wood for	W. Ellis	398,593	Feb. 26	2232	590, 591	46	1040
Mattress-stuffing machine	E. N. Stephenson	399,093	Mar. 5	420	114, 115	46	1194
Mattress. Wire	O. Howe	396,695	Jan. 22	2116	543	46	435
Mattresses. Combined corner-iron and tightening device for wire	C. H. Triphagen	396,122	Jan. 15	1253	319	46	264
Mattresses. Making	D. Haynes	399,041	Mar. 5	349	94	46	1181
Mattresses, &c. Woven-wire	D. H. and J. F. Gail	399,867	Mar. 19	1627	422	46	1466
Measure. Automatic grain	H. W. Cowan	395,743	Jan. 8	673	172, 173	46	145
Measuring and controlling apparatus. Electrical	W. Siemens	399,292	Mar. 12	761	198	46	1288
Measuring apparatus. Electrical	H. V. Hayes and A. C. White	395,974	Jan. 8	1034	264	46	214
Measuring apparatus for liquids	C. G. Mollu	398,528	Feb. 26	2140	564	46	1022
Measuring device for liquids. Automatic	B. Burton	395,652	Jan. 1	541	136	46	109
Measuring device. Liquid	F. Winters and H. A. Bingham	397,452	Feb. 5	536	141	46	680
Measuring machine. Automatic grain	W. McConachie	400,100	Mar. 26	1959	513, 514	46	1540
Measuring vessel. Fluid	T. E. Armistead	400,386	Mar. 26	2399	638	46	1624
Measuring-wheel. Rotary	R. J. Buchanan	399,966	Mar. 19	1766	457	46	1494
Meat-cutter	A. Shepard	399,790	Mar. 19	1516	391	46	1445
Meat-roaster	E. B. Rich	399,561	Mar. 12	1174	304	46	1366
Meats for transportation. Preparing	J. W. Street	396,344	Jan. 15	1578	399	46	323
Mechanical motion	W. C. Showalter	396,003	Jan. 8	1089	277	46	224
Mechanical movement	E. F. Antenrieth	398,214	Feb. 19	1668	441	46	920
Mechanical movement	R. L. Ayer	395,415	Jan. 1	158	40	46	34
Mechanical movement	D. W. Dodson and F. H. Richards	399,746	Mar. 19	1441	371, 372	46	1431
Mechanical movement	J. C. Fulton	395,971	Jan. 8	1030	263	46	213
Mechanical movement	G. W. Huckabay	398,400	Feb. 26	1961	516	46	987
Mechanical movement	C. W. White	395,677	Jan. 1	576	145	46	116
Medical battery	H. E. Waite	395,932	Jan. 8	971	249, 250	46	201
(Medicine.) Catarrh remedy	P. S. Cheshier	399,836	Mar. 19	1589	.....	46	1450
(Medicine.) Remedy for catarrh, &c	S. Males	398,639	Mar. 5	37	12	46	1121
(Medicine.) Remedy for diphtheria	C. H. A. Noortwyck	398,435	Feb. 26	2009	.....	46	996
(Medicine.) Remedy for rheumatism, &c	J. F. Lindgren	397,192	Feb. 5	141	.....	46	603
Metal. Apparatus for compressing scrap	J. W. Summers and T. Sharp	400,415	Mar. 26	2441	640	46	1632
Metal, &c. Apparatus for scouring, cleansing, and polishing	J. Pfeifer	395,563	Jan. 1	424	108	46	88
Metal articles with a glass lining. Making	T. E. Halford and R. Morant	397,641	Feb. 12	838	.....	46	744
Metal bars. Die for upsetting	W. R. Webster	400,148	Mar. 26	2035	539	46	1555
Metal bars, tubes, &c. Machine for straightening	W. A. McCool	395,400	Jan. 1	138	35, 36	46	30
Metal-bending machine	S. Vanstone	395,723	Jan. 8	644	164, 165	46	139
Metal. Device for upsetting and bending	M. Kennedy	399,903	Mar. 19	1677	435	46	1477
Metal joint. Universal	J. C. Haggett	397,961	Feb. 19	1321	352	46	854
Metal plates or sheets. Cleaning	R. B. Thomas	398,094	Feb. 19	1494	395, 396	46	888
Metal. Producing forged articles from scraps of	E. N. Colwell	397,278	Feb. 5	261	68	46	625
Metal-roll-cooling device	F. Newlin	395,713	Jan. 8	629	159	46	135
Metal-shearing machine	L. W. Noyes	397,020	Jan. 29	2590	669	46	541
Metal-shearing machine	L. W. Noyes	397,021	Jan. 29	2592	670	46	542
Metal sheet for surfacing walls, &c	H. A. Lee	397,298	Feb. 5	294	75	46	639
Metal skeletons for composite structures. Mechanism for making coils for	J. Bordenave	399,484	Mar. 12	1047	274	46	1344
Metal table	E. H. Peck and A. H. Jones	398,182	Feb. 19	1626	431	46	912
Metal working and welding machine. Electric	E. Thomson	398,914	Mar. 5	144	39	46	1142
Metal working. Electric	E. Thomson	396,014	Jan. 8	1101	279	46	226
Metals. Apparatus for welding and working	E. Thomson	396,012	Jan. 8	1098	279	46	226
Metals by electricity. Forming, brazing, and welding of	E. Thomson	396,009	Jan. 8	1094	278	46	225
Metals. Drawing	W. A. McCool	400,238	Mar. 26	2168	568, 569	46	1582
Metallic fastening device	F. W. Starr	396,900	Jan. 29	2428	624	46	508
Metallic joint	F. Funk	398,321	Feb. 19	1836	485	46	956
Metallic wheel	T. Hill	399,969	Mar. 19	1802	467	46	1501
Meter: *See* Electric meter. Fluid-meter. Gas-meter. Liquid or gas meter. Time-meter. Water-meter.							
Micrometer-gage	C. H. Russom	397,442	Feb. 5	517	136	46	677
Middlings. Apparatus for treating	A. R. Parkison and J. Pullinger	395,580	Jan. 1	418	107	46	86
Middlings-purifier	S. Stone and J. W. Kingston	395,637	Jan. 1	513	129	46	103
Milk-can. Measuring	R. Eagan	397,788	Feb. 12	1049	280	46	785
Milking machine. Cow	J. J. Lefeber	396,577	Jan. 22	1943	500, 501	46	401
Mill: *See* Cane-mill. Coffee-mill. Crushing and grinding mill. Curd-mill. Grain-crushing mill. Grinding-mill. Quartz-mill. Roller-mill. Roller reduction-mill. Seed-mill. Triturating-mill.							
Milling-machine	J. W. Packard	396,952	Jan. 29	2494	643, 644	46	522
Millstone-dressing machine	J. L. Maroney	397,014	Jan. 29	2581	667	46	539
Mineral wool. Apparatus for gathering	R. D. A. Parrott	396,050	Jan. 8	1147	291	46	235

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Minerals. Appliance for breaking loose or splitting all kinds of	E. Mould	398,742	Feb. 26	2406	654	46	1085
Mining-caisson	S. A. Bowe	397,688	Feb. 12	908	240	46	757
Mining-drill	W. H. Jenkins	396,875	Jan. 29	2386	612, 613	46	500
Mining-drill and channel-cutter	J. P. Paynter	395,716	Jan. 8	633	160	46	136
Mining-machine	E. E. Carter	398,313	Feb. 19	1825	482, 483	46	953
Mining-machine	A. T. Moats	397,089	Jan. 29	2090	696	46	560
Mining-machine	A. F. Watkins	396,719	Jan. 22	2150	551	46	442
Mining-machine	E. W. Whitcomb	398,298	Feb. 19	1804	476	46	949
Mining-machine lubricator	E. W. Whitcomb	398,299	Feb. 19	1805	476	46	949
Mining purposes. Tool for	G. A. Barth	398,308	Feb. 19	1817	480	46	952
Mirror. Window	N. Andersen	398,994	Mar. 5	280	77	46	1168
Mitering the metal of show-case moldings. Machine for	F. X. Ganter	398,603	Feb. 26	2246	595	46	1043
Mitten	J. Tysdal	399,222	Mar. 5	658	172	46	1241
Mixing liquid and powdered substances. Apparatus for	B. D. Milliken	399,276	Mar. 12	739	192	46	1284
Model. Display	H. Schweibold	398,658	Feb. 26	2335	621	46	1060
Mold: *See* Brick-mold. Candy-mold. Glass-mold.							
Molds. Apparatus for making	S. Alley and J. A. MacLellan	397,683	Feb. 12	902	238	46	756
Molds. Apparatus for making	E. Reddy	346,893	Jan. 29	2418	621	46	507
Molder's flask	C. Bogenschutz, Jr	398,219	Feb. 19	1677	444	46	922
Molder's turn-table	S. Alley and J. A. MacLellan	397,684	Feb. 12	903	239	46	756
Molding and mold-distributing machine	M. W. Walker and W. Jowitt	395,466	Jan. 1	233	60	46	50
Molding device	M. O'Connor	396,831	Jan. 29	2328	596	46	457
Molding fibrous ware. Machine for	H. Carmichael	397,778	Feb. 12	1032	276	46	782
Molding-machine	J. Baker	398,568	Feb. 26	2195	578, 579	46	1033
Molding-machine	T. A. Considine	398,704	Feb. 26	2406	638	46	1075
Molding machine. Sand	A. L. Teetor	397,316	Feb. 5	318	83, 84	46	637
Moldings. Machine for turning	J. F. Gebhardt	399,871	Mar. 19	1621	423	46	1467
Moldings to be polished. Reciprocating table for holding	L. Malchaw	399,762	Mar. 19	1466	378	46	1435
Monogram-pattern	J. W. Miller	400,105	Mar. 26	1908	515	46	1542
Mop and scrubbing-brush holder	J. T. Varney	399,223	Mar. 5	660	172	46	1241
Mop-holder	J. Duncan	396,330	Jan. 15	1589	395	46	320
Mop. Rotary	J. Rourke	397,521	Feb. 12	635	165, 166	46	707
Mop-wringer	F. R. Smith	396,436	Jan. 22	1727	444	46	361
Mordant	W. J. Williams	398,564	Feb. 26	2149	.....	46	1032
Mortar. Grinding and amalgamating	G. W. White	399,809	Mar. 19	1547	400	46	1450
Mortising-machine	F. V. Phillips	399,435	Mar. 12	975	254	46	1330
Mosaics of glass. Making	H. F. Belcher	396,911	Jan. 29	2442	627	46	511
Mosaics. Mold for making	H. F. Belcher	396,912	Jan. 29	2443	628	46	511
Motion. Means for converting	E. Burke	399,492	Mar. 12	1060	276	46	1346
Motion. Mechanism for converting	J. De Monnin	396,147	Jan. 15	1283	329	46	271
Motion. Mechanism for converting	F. Rourk	397,590	Feb. 12	635	165	46	706
Motor: *See* Car-motor. Current-motor. Electric motor. Hydraulic motor. Spring-motor. Steam-motor. Thermo-magnetic motor. Water-motor. Wind-motor.							
Motor	C. C. Burmeister	398,767	Feb. 26	2408	662, 663	46	1093
Motor	E. T. Heinsohn and J. Hoffmann	397,988	Feb. 5	276	71	46	628
Movement-cure machine	M. F. Henderson	398,255	Feb. 19	1733	457	46	934
Mower	W. R. Baker	398,307	Feb. 19	1814	479	46	951
Mower	J. C. Bloom	396,023	Jan. 8	1113	283	46	228
Mower	S. D. Maddin	397,924	Feb. 19	1232	329, 330	46	839
Mower	J. H. and S. H. Redfield and A. E. Hansbro.	395,349	Jan. 1	65	16	46	15
Mower-knives. Machine for grinding	R. Dutton	395,615	Jan. 1	468	118, 119	46	96
Mower. Lawn	D. Bearly	395,809	Jan. 8	686	227	46	185
Mower. Lawn	L. De Hall	396,038	Jan. 8	1129	287	46	231
Mowing and reaping machines. Swath-board for	A. B. Smith	398,853	Mar. 5	54	16	46	1124
Mowing-machine	W. A. Knowlton	395,981	Jan. 8	1049	266, 267	46	216
Mowing-machine attachment	W. S. Fox. (Reissue)	10,990	Mar. 12	1294	332	46	1389
Mowing-machine cutter-bar	I. F. Bassford	397,685	Feb. 12	904	239	46	757
Mowing-machine sections. Apparatus for tempering	L. L. Lamb	399,673	Mar. 19	1340	343, 344	46	1409
Music. Binding sheet	E. Harris	397,360	Feb. 5	382	101	46	650
Music-book holder	J. P. Caston and L. C. Smith	398,128	Feb. 19	1548	410	46	898
Music-boxes. Stop-motion for	G. J. Jaccard	395,440	Jan. 1	189	50	46	40
Music-leaf turner	F. H. Loughlin	397,241	Feb. 5	206	54	46	614
Music or book holder	H. O. Brown	397,627	Feb. 12	819	214	46	746
Music-racks. Adjustable standard for	A. Koehn	398,408	Feb. 26	1976	519	46	989
Music-stand	P. L. Brachet	395,808	Jan. 8	703	206	46	166
Musical box	F. E. P. Ehrlich and G. A. F. Müller	398,241	Feb. 19	1714	452	46	930
Musical box	A. B. Meylan	400,104	Mar. 26	1907	515	46	1542
Musical instrument. Automatic	J. McTammany	400,102	Mar. 26	1902	514	46	1541
Musical instrument. Key-board	A. L. Caldera	395,543	Jan. 1	351	90	46	74
Musical instruments. Attachment for	E. W. Sylvan	397,877	Feb. 12	1162	311	46	808
Musical instruments. Tuning-pin for	V. Von Frankenberg	399,712	Mar. 19	1304	330	46	1421
Mustache-trainer	L. A. Allard	398,925	Mar. 5	160	42	46	1144
Nail: *See* Barbed nail. Horseshoe-nail.							
Nail	A. S. Wall	399,804	Mar. 19	1540	398	46	1449

Invention.	Name.	No	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Nail-box	G. Hendricks	398,724	Feb. 26	2445	647	46	1082
Nail-machine	M. Chase and M. H. Foster	397,068	Jan. 29	2661	685, 686	46	554
Nail-machine	E. P. Hurd	399,410	Mar. 12	945	245	46	1323
Nail-machine	J. W. Thompson	398,009	Feb. 19	1368	363	46	863
Nail machine. Wire	F. Bryant	397,067	Jan. 29	2658	684, 685	46	554
Nail machine. Wire	H. B. Happe	397,592	Feb. 12	756	197, 198	46	729
Nail machine. Wire	J. B. Hastings	397,426	Feb. 5	488	128	46	672
Nail machine. Wire	E. B. Parkhurst	397,022	Jan. 29	2597	670, 671	46	543
Nail-making machine	L. Goddu	398,891	Mar. 5	113	30, 31	46	1135
Nails. Die used in making decorative	H. P. Fiske	396,200	Jan. 15	1370	351	46	286
Nails. Forming metal blanks for capping	H. P. Fiske	395,888	Jan. 8	914	234	46	190
Nails. Machine for finishing decorative	H. P. Fiske	398,038	Feb. 19	1421	376	46	873
Nails. Machine for rolling	H. E. Fuller	397,460	Feb. 5	544	143	46	682
Nails. Rolling	H. E. Fuller	397,422	Feb. 5	483	126, 127	46	671
Nailing machine. Wire	L. Goddu	398,606	Feb. 26	2249	596	46	1043
Naphthaline. Apparatus for the manufacture of	H. J. and G. H. Fenner	399,139	Mar. 5	521	136	46	1216
Neckband-shaper and shirt-bosom board	W. H. Jacoby and C. A. Fuller	398,331	Feb. 19	1851	488, 489	46	958
Neckscarf	H. Stern	396,840	Jan. 29	2340	599	46	490
Necktie-fastener	G. Borst	396,913	Jan. 29	2446	628	46	511
Necktie-fastener	J. L. Brallier	398,696	Feb. 26	1392	635	46	1072
Necktie-fastener	J. Well	397,042	Jan. 29	2624	677	46	548
Needle for sewing bags, &c	S. M. Neely	398,531	Feb. 26	2144	565	46	1022
Needle or pin case	R. Wheatley, Jr	399,856	Mar. 19	1735	453	46	1491
Nickel matte from nickel ores. Producing	W. Brandreth	399,010	Mar. 5	306	.....	46	1173
Nippers	J. Sponseller	398,464	Feb. 26	2045	537	46	1003
Note-case. Banker's and merchant's	J. B. T. Hall	399,885	Mar. 19	1656	428	46	1472
Nozzle. Exhaust	J. H. McIndoe and W. Meredith	396,168	Jan. 15	1321	338	46	277
Nozzle. Overflow-check	E. W. Spear	396,376	Jan. 15	1629	418	46	333
Nozzle. Sprinkling	J. W. Anderson	396,059	Jan. 15	1163	295	46	247
Numbering-machine	J. D. Humphrey	399,991	Mar. 19	1803	468, 469	46	1501
Numbering-machine	W. Koch	398,624	Feb. 26	2274	603	46	1049
Nut-cracker	F. J. Rabbeth	397,023	Jan. 29	2599	671	46	543
Nut cracking and shelling machine	H., C., and H. E. Kuhlmann	397,863	Feb. 12	1146	306, 307	46	805
Nut-lock	H. H. Allen	399,813	Mar. 19	1551	401	46	1451
Nut-lock	G. H. Griffin	396,691	Jan. 22	2111	542	46	434
Nut-lock	J. C. Morehead	397,436	Feb. 5	506	133	46	675
Nut-lock	T. W. Patten	398,535	Feb. 26	2149	567	46	1024
Nut-lock	M. Pennybacker	396,795	Feb. 26	2537	675	46	1101
Nut-lock	A. Rassinier	399,696	Mar. 19	1369	352	46	1416
Nut-lock	S. H. Ray	395,348	Jan. 1	63	16	46	15
Nut-locks. Machine for making	W. Dunn	397,840	Feb. 12	1115	298, 299	46	798
Nut-wrench. Thumb	C. W. Kimball	397,988	Feb. 19	1331	355	46	856
Nuts. Device for preventing the loosening of	J. Powell	397,935	Feb. 19	1250	333	46	842
Nuts on bolts. Machine for fitting	F. Philips	396,597	Jan. 22	1974	508	46	407
Obstetrical forceps	A. C. Galiano	399,749	Mar. 19	1448	372	46	1431
Odometer	G. W. Johnson	396,210	Jan. 15	1300	356	46	290
Office-chair	C. H. Tyler	398,293	Feb. 19	1796	474	46	947
Oil-bath for wheels. Portable	H. C. Handlen	397,643	Feb. 12	840	219	46	744
Oil-burner	J. Bains	396,525	Jan. 22	1861	478	46	386
Oil-burner	W. E. Facer	397,493	Feb. 12	593	153	46	698
Oil-burner	C. Gilbert	399,517	Mar. 12	1104	287	46	1353
Oil-burner	A. U. Page and J. Bragg	396,049	Jan. 8	1146	291	46	235
Oil-burner	A. J. Pierce	398,536	Feb. 26	2150	567	46	1024
Oil burner for stoves, &c. Hydrocarbon	C. H. Prentiss	397,872	Feb. 12	1156	309	46	807
Oil burner or heating apparatus. Coal	J. M. Clark	397,971	Feb. 19	1297	346	46	850
Oil burner. Spray	W. C. Fisk	399,864	Mar. 19	1623	421	46	1466
Oil-cup	J. S. Hall	396,336	Jan. 15	1568	397, 398	46	322
Oil-cup	C. H. Nunn	397,202	Feb. 5	154	41	46	605
Oil-distributing rocket	W. Rupp and A. Giese	397,522	Feb. 12	637	166	46	707
Oil. Extracting	W. T. Forbes and Q. Leder	397,792	Feb. 12	1055	281	46	786
Oil for fuel. Apparatus for burning kerosene	G. L. Swett	397,150	Feb. 5	74	18	46	592
Oil from oil-cakes. Apparatus for extracting	J. L. Moss and N. Littell	400,254	Mar. 26	2197	576	46	1567
Oil. Paint	A. Sommer	396,774	Jan. 29	2246	.....	46	469
Oil-press	L. Gismondi	400,328	Mar. 26	2312	605	46	1608
Oil projectile. Luminous	F. Silas	397,031	Jan. 29	2611	674	46	545
Oil-tank	J. C. Dilworth	395,551	Jan. 1	365	94	46	76
Oils or other liquids. Oxidizing	G. B. Wiggin	396,636	Jan. 22	2034	522	46	419
Oiler	D. J. M. Corsaen	397,050	Jan. 29	2635	679	46	549
Oiler. Automatic	A. Kinney	397,432	Feb. 5	501	132	46	675
Oiling-machine	F. P. Hawkins	395,778	Jan. 8	721	185, 186	46	153
Open-hearth furnace	H. W. Lash, H. Aiken, and D. E. Park. (Reissue.)	10,984	Feb. 5	577	149	46	688
Opera-glass	G. Holle	396,657	Jan. 22	2060	529	46	424
Opera-glass. Coin-controlled	C. E. Patterson	395,345	Jan. 1	59	15	46	14
Opera-glass handle	G. Plessy	398,277	Feb. 19	1766	466, 467	46	941
Opera-glass holder	H. Borsch	395,946	Jan. 8	995	255	46	206
Opera-glass holder	W. Mack	399,543	Mar. 12	1145	297	46	1360
Opera or marine glass	W. Mack	399,542	Mar. 12	1144	296	46	1360
Optician's measuring-instrument	E. B. Meyrowitz and C. E. Dressler	397,744	Feb. 12	985	261	46	772
Orange-grader	T. W. Moore	395,793	Jan. 8	764	198	46	160
Oranges, &c. Machine for wrapping	H. J. Williams	398,015	Feb. 19	1383	366, 367	46	865
Ordnance	B. T. Babbitt	400,160	Mar. 26	2052	537	46	1559

Ordnance-mounting	J. Vavasseur	397,764	Feb. 12	1611	268, 269	46	778
Ore-concentrator	C. H. Taylor	398,663	Mar. 5	70	19	46	1128
Ore-concentrator	M. T. Van Derveer	398,475	Feb. 26	2064	543	46	1007
Ore-crusher	J. D. Copien	399,600	Mar. 12	1234	318	46	1377
Ore-feeder	J. and J. H. Hendy. (Reissue)	10,983	Feb. 5	574	149	46	687
Ore-sampling apparatus	C. E. Palmer	398,275	Feb. 19	1761	466	46	940
Ore-separator	E. Derbec	397,070	Jan. 29	2665	687, 688, 689	46	535
Ore-separator	T. A. Edison	400,317	Mar. 26	2293	600	46	1605
Ore-separator	A. Emmons	399,658	Mar. 19	1317	337, 338	46	1405
Ore separator and amalgamator	E. L. Giroux	397,542	Feb. 12	604	173, 174	46	712
Ore-washer	H. G. Blasdel	397,581	Feb. 12	737	191	46	725
Organ stop-action	J. P. Nyström	395,503	Jan. 1	291	75	46	62
Organs. Pneumatic action for	F. Pritchard	396,945	Jan. 29	2501	645	46	594
Ornament. Tin brilliant	P. Knorpp and G. A. Mayer	397,083	Jan. 29	2622	694	46	558
Ornamental box	M. Baskam	395,417	Jan. 1	102	41	46	34
Oven. Baker's	F. Dührkop	396,395	Jan. 22	1660	427	46	347
Oven. Baker's	E. A. C. Petersen	400,250	Mar. 26	2192	575	46	1567
Oven. Baking	J. Junker	395,979	Jan. 8	1047	266	46	216
Oven. Domestic or portable	M. S. Sager	399,567	Mar. 12	1180	305, 306	46	1367
Oven for vapor-stoves	G. M. Yolts and C. H. Shultz	399,301	Mar. 12	791	203	46	1292
Oven. Pastry	J. P. Conner	398,380	Feb. 26	1938	510	46	962
Ovens. Heat-protector for bake	J. J. Seifert	398,192	Feb. 19	1641	434	46	914
Overflow-alarm	L. Hofmeister and O. E. Schwabe	395,830	Jan. 8	823	213	46	178
Overshoe	P. Long	395,338	Jan. 1	50	12	46	12
Ox-shoe	J. Deeble	398,034	Feb. 19	1416	374	46	879
Ozone. Apparatus for manufacturing	G. H. Merkel	397,993	Feb. 19	1336	356	46	857
Package-carrier	J. W. Bildwell	399,180	Mar. 5	501	132	46	1228
Package or wrapper. Sample	H. H. Johnson	396,090	Jan. 15	1216	307	46	257
Packing	S. H. Mosher	396,222	Jan. 15	1407	359	46	293
Packing for stuffing-boxes. Metallic	W. W. St. John	396,120	Jan. 15	1250	319	46	264
Packing. Metallic	F. A. Westbrook and W. S. Cook	396,634	Jan. 22	2031	522	46	419
Packing. Metallic stuffing-box	F. O. Franke	395,968	Jan. 8	1027	262	46	212
Packing. Piston-rod	F. F. Swain	398,756	Feb. 26	2464	650	46	1091
Packing. Piston-rod-guide	G. A. Barth	398,931	Mar. 5	177	47	46	1147
Packing. Steam or water	J. T. Smith	398,461	Feb. 26	2042	536	46	1003
Pad: *See* Bosom-pad, Collar-pad, Harness-pad, Truss-pad, Under-arm pad.							
Padlock	A. Peterson	396,596	Jan. 22	1974	508	46	407
Padlock	H. F. Sise	396,960	Jan. 29	2509	647	46	525
Padlock. Permutation	G. F. Seiser, C. R. Johnson, and M. B. Perry.	398,600	Feb. 26	2339	621	46	1061
Pail. Milk	J. E. Mayer	396,696	Jan. 29	2319	594	46	485
Paint	D. Bell	397,105	Feb. 5	2	.....	46	579
Paint	I. Townsend	398,917	Mar. 5	148	.....	46	1142
Paints from oil foots. Making	G. W. Scollay	396,439	Jan. 22	1720	.....	46	360
Palette and easel. Combined	O. B. Brown and H. L. Moody	397,108	Feb. 5	4	2	46	579
Pan: *See* Ash-pan, Baking and roasting pan, Bed-pan, Dust-pan, Evaporating-pan, Grinding-pan, Ice-box pan, Scale-pan.							
Panel-fastener	E. Harroun	399,261	Mar. 12	719	187	46	1280
Paneling and striping implement	A. J. Avery	399,233	Mar. 12	676	177	46	1273
Pantaloons-protector	A. Diamond and O. Kohnert	397,703	Feb. 12	927	245	46	761
Pantaloons-protector	A. Diamond and O. Kohnert	357,704	Feb. 12	927	245	46	761
Paper and other material. Apparatus for coating	T. Manahan	399,544	Mar. 12	1146	297	46	1360
Paper. Apparatus for dyeing and drying tissue and other	E. Crompton	397,069	Jan. 29	2663	686, 687	46	535
Paper bag	L. D. Benner	397,217	Feb. 5	176	47	46	610
Paper bag	G. J. Stevens	398,908	Mar. 5	137	37	46	1140
Paper-bag and twine holder	C. E. Kamble	399,671	Mar. 19	1338	343	46	1408
Paper-bag machine	L. D. Benner	397,772	Feb. 12	1022	273, 274	46	780
Paper-bag machine	F. E. Porter	398,278	Feb. 19	1767	467	46	941
Paper bag. Waxed	E. G. Sparks	395,520	Jan. 1	332	81	46	68
Paper bags. Making striped	C. A. Dean and F. H. Eoble	399,846	Mar. 19	1509	415	46	1461
Paper-barrel machine	G. W. Laraway	398,752	Jan. 29	2215	506, 507	46	463
Paper box	J. F. Diemer and P. E. Gonon	399,849	Mar. 19	1605	416	46	1462
Paper box	W. H. Emery	395,846	Jan. 8	912	234	46	189
Paper box	G. W. T. Harley	399,891	Mar. 19	1663	430	46	1474
Paper box	F. G. Hotchkiss	396,570	Jan. 22	1933	498	46	399
Paper box	E. L. Meyer	398,971	Mar. 5	237	66	46	1150
Paper-box lock	F. E. De Long	397,227	Feb. 5	189	50	46	612
Paper boxes or wrappers. Graduated blank for	W. C. Tiffany	397,475	Feb. 5	563	147	46	646
Paper-coating machine	J. M. McCausland	399,151	Mar. 5	542	141	46	1219
Paper. Composition for the manufacture of tarred	W. B. Lupton	398,337	Feb. 19	1402	.....	46	960
Paper. Conservatory for	I. M. Chase	397,276	Feb. 5	259	67	46	625
Paper-cutter	A. Bess	398,575	Feb. 26	2204	581	46	1035
Paper-cutting machine	E. Morgan	398,341	Feb. 19	1670	402	46	961
Paper-cutting machines. Clamping apparatus for	G. Daniels	399,743	Mar. 19	1435	360	46	1420
Paper-folding machine	F. L. and S. G. Goss	399,987	Mar. 19	1708	466, 467	46	1500
Paper garment	R. C. Mudge and E. M. Wasson	397,437	Feb. 5	506	133	46	676
Paper-hangers. Folding table for the use of	G. H. Boysen	396,531	Jan. 22	1867	480	46	387

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Paper-hanging machine	J. R. Hartford	398,154	Feb. 19	1584	{420 421}	46	904
Paper-holder	C. D. Crane	395,771	Jan. 8	709	183	46	151
Paper-holder and cutter. Roll-	A. Q. Ross	398,750	Feb. 26	2476	656	46	1069
Paper-holder and cutter. Roll-	G. Winhelm	398,702	Feb. 26	2492	660	46	1092
Paper-machine	V. G. Hazard	398,394	Feb. 26	1955	514	46	966
Paper-machines. Suction-plate for	C. Chapin	395,544	Jan. 1	354	91	46	74
Paper-making machine	H. L. Carter and T. H. Savery	397,275	Feb. 5	257	66, 67	46	624
Paper-making machine	R. Smith	398,091	Feb. 19	1490	{394 395}	46	887
Paper. Naphthaline	A. Taheppe	397,250	Feb. 5	234	60	46	620
Paper-ornamenting machine	C. G. Mortimer	397,091	Jan. 29	2602	696	46	561
Paper pail	J. L. Colhapp	396,028	Jan. 8	1119	284	46	229
Paper-pulp. Manufacture of pails, &c., from	H. Fairbanke	396,198	Jan. 15	1364	350	46	285
Paper roll. Toilet or wrapping	S. Wheeler	396,675	Jan. 22	2084	536	46	429
Paper. Waxing	J. R. Anderson	395,645	Jan. 1	529	132	46	106
Paper-waxing machine	S. Hodkinson and G. E. Raymond	396,402	Jan. 22	1671	429	46	350
Paper-weight	A. E. Swift	396,519	Jan. 22	1853	475	46	385
Paraffine-wax. Purifying	J. E. Bicknell	400,042	Mar. 26	1879	489	46	1524
Paraffine-wax. Purifying	J. E. Bicknell	400,043	Mar. 26	1881	489	46	1524
Parer and corer. Apple	W. A. C. Oaks	397,871	Feb. 12	1154	309	46	807
Pattern: *See* Monogram-pattern.							
Patterns. Machine for cutting	J. W. Dearing	399,847	Mar. 19	1600	415	46	1461
Pavement	L. J. Cadwell	398,939	Mar. 5	187	50	46	1150
Pavement	L. J. Cadwell	398,940	Mar. 5	188	50	46	1150
Pavement	B. W. Hunter	399,045	Mar. 5	355	.....	46	1182
Pavement	J. E. Knoche	398,055	Feb. 19	1447	383	46	878
Pavement	F. C. Ross	399,932	Mar. 19	1722	.....	46	1485
Pavement. Composite	M. Cunningham	398,946	Mar. 5	195	.....	46	1151
Pavement-curb	I. L. Landis	398,630	Feb. 26	2296	607	46	1052
Pavement or roadway	H. Steinberg	400,013	Mar. 19	1835	476	46	1506
Paving composition	E. S. McCaughey	398,421	Feb. 26	1996	.....	46	994
Pea-huller	R. P. Scott and J. A. Chisholm	399,702	Mar. 19	1377	355	46	1418
Peach-stoner	C. L. Ferriott	399,513	Mar. 12	1097	286	46	1339
Pen. Drawing-	G. Bennett	400,178	Mar. 26	2076	544	46	1564
Pen-extractor or device for removing pens from their holders.	A. G. Hofstatter	400,341	Mar. 26	2336	609	46	1612
Pen. Fountain-	T. F. Bourne	397,413	Feb. 5	467	123	46	668
Pen. Fountain	J. H. Crowell	395,695	Jan. 8	606	153	46	131
Pen. Fountain-	S. A. De Normanville	396,547	Jan. 22	1895	489	46	392
Pen. Fountain-	R. C. Frampton	397,053	Jan. 29	2641	680	46	551
Pen. Fountain-	O. F. Grant	397,123	Feb. 5	25	6	46	583
Pen. Fountain-	B. Rosenthal	400,253	Mar. 26	2196	576	46	1567
Pen. Fountain-	P. E. Wirt	399,306	Mar. 12	788	204	46	1293
Pen-holder	F. H. Durell	398,317	Feb. 19	1632	484	46	955
Pen-holder	L. Holzworth	399,043	Mar. 5	353	94	46	1182
Pen-holder	T. R. Stuart	400,364	Mar. 26	2371	619	46	1619
Pencil-sharpener	D. Codd	399,830	Mar. 19	1502	413	46	1460
Pendulum. Compensation	A. Lawrence	396,095	Jan. 15	1220	309	46	258
Perforating-machine	C. Seybold	396,240	Jan. 15	1430	364	46	298
Perforating paper patterns. Machine for	M. Bendick	398,572	Feb. 26	2199	580	46	1033
Perfuming apparatus. Coin-operated	H. M. Wilson	397,574	Feb. 12	718	186	46	721
Permutation-lock	L. A. Becht	399,002	Mar. 5	294	61	46	1171
Permutation-lock	B. J. Douds	396,273	Jan. 15	1472	{374 375}	46	306
Petroleum-burner	F. H. Smith and J. W. Wright	398,352	Feb. 19	1884	496	46	964
Petroleum-burner and steam-generator	H. H. Hyland	395,786	Jan. 8	746	{191 192}	46	157
Petroleum-engine	M. V. Schiltz	399,569	Mar. 12	1183	306	46	1368
Petroleum in furnaces. Injector for burning	H. H. Hyland	395,785	Jan. 8	744	{190 191}	46	157
Phenacetine	O. Hinsberg	400,086	Mar. 26	1941	.....	46	1537
Phonograms. Duplicating	G. R. Herrington	399,264	Mar. 12	794	188	46	1281
Phonograms. Duplicating	G. H. Herrington	399,265	Mar. 12	795	188	46	1281
Phonograph	T. A. Edison	397,706	Feb. 12	998	246	46	761
Phonograph recorder and reproducer	T. A. Edison	397,280	Feb. 5	263	68	46	626
Photograph-burnisher	S. H. Randall	397,309	Feb. 5	307	80	46	635
Photograph transferring and printing frame	C. T. Cain	398,941	Mar. 5	189	51	46	1150
Photographs. Wall-case for exhibiting	F. East	398,953	Mar. 5	206	56, 57	46	1153
Photographic apparatus. Automatic	W. R. Pope and E. L. Poole	396,428	Jan. 22	1714	{440 441}	46	359
Photographic camera	E. B. Barker	400,102	Mar. 26	2054	538	46	1560
Photographic camera	L. Chevallier	398,231	Feb. 19	1698	449	46	927
Photographic camera	S. P. Hasey	395,699	Jan. 8	929	239	46	192
Photographic camera	J. J. Higgins	397,428	Feb. 5	492	{129 130}	46	673
Photographic camera	J. J. Higgins	397,429	Feb. 5	496	{130 131}	46	674
Photographic cards. Temporary binder for	I. H. Brown	396,727	Jan. 29	2164	555	46	452
Photographic chair	T. Endean	398,712	Feb. 26	2425	642	46	1079
Photographic lens	A. G. Clark	399,499	Mar. 12	1068	279	46	1347
Photographic pictures. Magnesium lighting apparatus for taking	J. W. C. C. Schirm	398,084	Feb. 19	1482	392	46	886
Photographic plates. Magazine plate-holder for	F. A. Hetherington	396,656	Jan. 22	2059	529	46	424
Photographic proofs and copies. Mounting and preserving	D. K. Zumwalt	400,031	Mar. 19	1802	.....	46	1512
Photographic shutter	H. Herbert	400,084	Mar. 26	1930	506	46	1536
Photographic shutter	E. Kuhn	396,699	Jan. 22	2121	544	46	436
Photometer-stand. Revolving	J. W. Packard	396,951	Jan. 29	2493	643	46	522
Piano	G. Steck	399,710	Mar. 19	1390	358	46	1421
Piano-action frame. Upright	H. Mallebré	398,635	Feb. 26	2302	609	46	1053
Piano action. Upright	S. Hansing	398,151	Feb. 19	1581	419	46	903
Piano and organ cases. Foot-shield for	M. R. Brinkman	396,137	Jan. 15	1273	326	46	269

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Piano attachment	F. W. Hale	396,156	Jan. 15	1304	331	46	274
Piano-case	P. Gmehlin	397,121	Feb. 5	22	5, 6	46	583
Piano-forte	F. W. Hale	396,155	Jan. 15	1299	{333 334}	46	273
Piano-forte action	H. Kranich and J. Bach	397,239	Feb. 5	203	54	46	614
Pianos. Device for muting	J. Keller	396,696	Jan. 22	2120	544	46	435
Pianos. Harmonic damper for	H. Worrall	396,924	Mar. 5	159	42	46	1143
Pianos. Muffler for upright	E. L. S. Osborn	397,815	Feb. 12	1064	282	46	791
Pianos. Stringing and tuning device for	S. Hansing	398,150	Feb. 19	1580	419	46	903
Pianos. Stringing and tuning device for	G. M. Guild	396,335	Jan. 15	1567	397	46	332
Picker: *See* Cotton-picker.	G. M. Guild	396,740	Jan. 29	2193	561	46	458
Picture-exhibiting device	V. Bonnet, H. Lissagaray, A. and A. Richard.	399,127	Mar. 5	491	131	46	1216
Picture-exhibitor. Automatic	C. Bach	396,455	Jan. 22	1755	449	46	366
Picture-exhibitor. Automatic	C. E. Patterson	399,553	Mar. 12	1161	301	46	1364
Picture-frames. Canvas-stretcher for	W. Murphy	397,139	Feb. 5	50	11	46	587
Picture-hanger. Automatic adjustable	O. and A. Jaeger	396,260	Jan. 15	1487	377	46	307
Pigeon-holes and drawers. Partition-support for	W. Lumley	397,866	Feb. 12	1149	307	46	805
Pile	R. B. Markle	395,448	Jan. 1	208	54	46	44
Pile-covering	H. Anderson and H. Elias	395,866	Jan. 8	882	226	46	184
Pillow or head-rest	W. L. Miller	397,993	Feb. 19	1337	356	46	857
Pillow-sham holder	G. J. Kraushaar	397,084	Jan. 29	2663	694	46	558
Pillow-sham holder	G. W. Schiffer and A. L. Knight	400,122	Mar. 26	1993	522	46	1547
Pin: *See* Hair-pin. Safety-pin.							
Pin-and-link couplers. Attachment for	W. L. Dwyre	396,863	Jan. 29	2368	608	46	406
Pins and tubes of wood. Machine for making cylindrical	R. King	397,727	Feb. 12	959	255	46	767
Pipe: *See* Blow-pipe. Hose-pipe. Conducting-pipe. Tobacco-pipe. Fuel-feeding pipe.							
Pipe bending and coiling machine	H. E. Fowler	397,783	Feb. 12	1056	282	46	786
Pipe-bending machine	H. E. Fowler	397,712	Feb. 12	935	249	46	763
Pipe-bending machine	H. E. Fowler	397,713	Feb. 12	938	249	46	763
Pipe-coupler	C. G. Thayer	395,671	Jan. 1	566	142	46	114
Pipe-coupling	J. F. Dill and S. A. Rote	396,550	Jan. 22	1901	490	46	393
Pipe-coupling	T. Flesher	399,661	Mar. 19	1324	339	46	1406
Pipe-coupling	W. G. Richards	398,448	Feb. 26	2023	531	46	999
Pipe-coupling	W. H. H. Sisum	399,351	Mar. 12	859	222	46	1307
Pipe-coupling. Insulating	S. Bergmann	397,218	Feb. 5	178	47	46	610
Pipe coupling. Parallel-	J. McEwan	398,068	Feb. 19	1467	382	46	922
Pipe-elbow. Sheet-metal	W. J. Gordon and E. D. Gilbert	399,664	Mar. 19	1328	340	46	1407
Pipe-joining and pipe-work. Electric	E. Thomson	396,013	Jan. 8	1099	279	46	236
Pipe-joint	P. V. Dwyer	396,354	Jan. 15	1501	403	46	326
Pipe-joint	J. A. Gilliam	396,080	Jan. 15	1195	303	46	253
Pipe-joint delineator	G. S. Kimball	397,132	Feb. 5	41	9, 10	46	586
Pipe. Machine for molding multitubular	C. Carr	395,740	Jan. 8	669	171	46	144
Pipe-molding apparatus	A. C. Bruce	399,651	Mar. 19	1309	336	46	1404
Pipe seal. Dip-	O. F. Smith and G. H. Barbour	397,032	Jan. 29	2612	674	46	545
Pipe-section. Adjustable curved	L. Smith	396,773	Jan. 29	2244	574	46	468
Pipe-threading machine	G. W. Bumgarner	398,560	Feb. 26	2213	585	46	1036
Pipe-threading machine	W. J. Daly	396,968	Jan. 29	2546	658	46	532
Pipe-wrench	M. V. Barton	396,118	Feb. 19	1535	407	46	895
Pipe-wrench	J. H. Vinton	397,618	Feb. 12	868	210	46	778
Pipe-wrench. Chain	G. M. Marshall	395,790	Jan. 8	756	196	46	159
Pipes. Anti-freezing device for water-	J. W. Kent and R. Orr	395,748	Jan. 8	679	174	46	145
Pipes. Apparatus for molding	W. A. Palmer	396,506	Jan. 22	1833	470	46	382
Pipes. Conductor for stand-	J. B. Kenison	398,735	Feb. 26	2458	651	46	1085
Pipes. Gas-check for water-	H. B. Eareckson	399,390	Mar. 12	918	238	46	1317
Pipes. Joint for soft-metal	W. A. Henderson	396,654	Jan. 22	2057	528	46	424
Pipes. Machine for forming sheet-metal	F. W. Davidson	400,310	Mar. 26	2280	{506 507}	46	1602
Pipes. Thimble for coupling lead and cast-iron	L. Wolff	399,720	Mar. 19	1404	361	46	1423
Pipes together. Steam-power apparatus for screwing	L. A. Stanford	397,400	Feb. 5	445	119	46	662
Piston	W. Simpkin	396,004	Jan. 8	1049	277	46	234
Pitman	F. H. Rogers	395,850	Jan. 8	853	220	46	179
Pitman-connection	F. Forbes	398,717	Feb. 26	2431	{644 645}	46	1080
Plane	H. Fry	398,247	Feb. 19	1722	454	46	932
Plane. Bead-	J. F. Lewallen	399,760	Mar. 19	1464	377	46	1435
Planes. Gage attachment for	G. H. Russell	399,287	Mar. 12	755	196	46	1297
Planer. Cylinder	F. B. Philbrick	397,946	Feb. 5	213	56	46	616
Planer. Revolving surface	J. H. Rudolph	397,568	Feb. 12	708	184	46	720
Planing-machine	W. E. Davis	399,977	Mar. 19	1783	{462 463}	46	1497
Planing-machine	J. A. Saucier	396,513	Jan. 22	1845	473	46	384
Planing-machine	M. Stixrud	399,711	Mar. 19	1391	359	46	1421
Planing-machine	T. A. Thorsen	397,671	Feb. 12	882	232	46	753
Planing-machine	S. A. Woods and J. R. Thomas	397,575	Feb. 12	721	{166 167}	46	722
Planing-machine cutter-head	V. V. Lawrence	399,758	Mar. 19	1461	377	46	1434
Planing-machine rolls	J. R. Thomas	397,151	Feb. 5	74	18	46	592
Planing machine. Wood-	A. B. Hutchinson	395,495	Jan. 1	279	72	46	59
Planing machine. Wood-	A. B. Hutchinson	396,934	Jan. 29	2475	637	46	517
Planing machine. Wood-	A. B. Hutchinson and E. F. Antenrieth.	398,048	Feb. 19	1435	380	46	875
Planing machine. Wood-	S. A. Woods	398,382	Feb. 19	1905	{500 501 502}	46	968
Planing-machines. Pressure-plate for	F. H. Crafts	395,487	Jan. 1	269	69	46	57
Plant-propagating nest	L. Vaughan	396,784	Jan. 29	2256	577	46	479
Planter	J. J. Ballard	397,215	Feb. 5	173	44	46	609

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Planter	T. L. Cromer	395,694	Jan. 8	604	153	46	131
Planter	B. P. Green	395,655	Jan. 1	544	136	46	109
Planter	D. W. Hoshall	397,549	Feb. 12	676	176	46	713
Planter	S. A. Lowe	396,884	Jan. 29	2404	616	46	504
Planter	C. R. Reid	399,559	Mar. 12	1171	303	46	1365
Planter and fertilizer-distributer. Seed-	E. G. Van Pelt	398,477	Feb. 26	2070	545	46	1008
Planter and fertilizer-distributer. Seed-	W. J. Wallis	395,674	Jan. 1	570	143	46	115
Planter. Automatic corn-	S. B. Alley	396,797	Jan. 29	2282	583	46	477
Planter. Check-row	L. A. Aspinwall	397,771	Feb. 12	1020	272	46	760
Planter. Corn-	G. M. Bolton	398,695	Feb. 26	2391	635	46	1072
Planter. Corn-	J. Brady	397,690	Feb. 12	911	241	46	758
Planter. Corn-	J. D. Fitzgerald	397,351	Feb. 5	369	97	46	648
Planter. Corn-	J. A. Fullerton	395,970	Jan. 8	1029	{262 / 263}	46	213
Planter. Corn-	S. Huffman	396,490	Jan. 22	1813	465	46	378
Planter. Corn-	F. P. Murphey	398,789	Feb. 26	2530	{672 / 673}	46	1100
Planter. Corn-	C. M. Rust	395,356	Jan. 1	77	20	46	18
Planter. Corn-	H. C. Shanahan	400,125	Mar. 26	1997	523	46	1548
Planter. Corn-	M. A. Westbrook	399,102	Mar. 5	433	{117 / 118}	46	1196
Planter. Corn-	E. N. Williams	398,868	Mar. 5	77	21	46	1129
Planter. Cotton-	J. J. Long	399,273	Mar. 12	735	191	46	1283
Planter. Cotton or corn	J. Stone, T. and B. A. Watson	398,006	Feb. 19	1363	361	46	862
Planter. Hand-	W. S. Wikle	396,185	Jan. 15	1350	346	46	283
Planter. Hand seed-	J. E. Shaw	399,938	Mar. 19	1730	447	46	1467
Planter. Potato-	J. E. Ohlson	398,071	Feb. 19	1470	389	46	883
Planter. Seed-	E. G. Van Pelt	398,476	Feb. 26	2067	{543 / 544}	46	1008
Planters. Check-row device for	J. W. Bartlett	398,485	Feb. 26	2082	548	46	1011
Planters. Self-winding reel for check-row	W. N. Aldrich	398,872	Mar. 5	83	23	46	1130
Planting attachment. Potato-	O. Baughn	398,119	Feb. 19	1536	407	46	895
Planting machine. Tree-	T. A. Stratton	398,754	Feb. 26	2480	{657 / 658}	46	1090
Plaster, &c. Compound to restrain the setting of	G. R. King	397,296	Feb. 5	289	.....	46	631
Plastic mineral composition	J. L. Hastings	400,335	Mar. 26	2321	.....	46	1610
Plastic mineral composition	J. L. Hastings	400,336	Mar. 26	2323	.....	46	1610
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,300	Jan. 15	1518	.....	46	313
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,301	Jan. 15	1519	.....	46	313
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,302	Jan. 15	1520	.....	46	314
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,303	Jan. 15	1521	.....	46	314
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,304	Jan. 15	1521	.....	46	314
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,305	Jan. 15	1522	.....	46	314
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,306	Jan. 15	1523	.....	46	314
Plastic mineral composition, &c	J. L. Stewart and J. L. Hastings	396,307	Jan. 15	1524	.....	46	314
Plate-holder	W. C. Engel	399,024	Mar. 5	325	87	46	1177
Plate. Safe or armor	W. H. Melaney	397,928	Feb. 19	1239	331	46	840
Plotter and protractor. Combined	J. R. Duffin	398,501	Feb. 26	2101	554	46	1014
Plow	A. F. Björkström	397,891	Feb. 19	1185	318	46	831
Plow	A. Haggvist	396,204	Jan. 15	1377	352	46	287
Plow	A. R. Mallory	395,573	Jan. 1	405	104	46	84
Plow	J. and W. Paterson	398,648	Feb. 26	2320	615	46	1057
Plow	W. T. Rhodes	396,051	Jan. 8	1150	292	46	235
Plow	T. W. Shunk	396,434	Jan. 22	1723	443	46	361
Plow	J. A. Stewart	399,217	Mar. 5	652	170	46	1239
Plow	M. J. Todd	397,317	Feb. 5	322	84, 85	46	638
Plow	J. R. White	395,861	Jan. 8	870	224	46	183
Plow and weeder. Hand	G. Glidden	399,143	Mar. 5	527	137	46	1216
Plow attachment	A. J. Parmeter	395,994	Jan. 8	1074	273	46	221
Plow. Cultivating-	G. B. Hart	398,393	Feb. 26	1954	514	46	986
Plow. Edging-	J. S. Stevens	396,714	Jan. 22	2143	548	46	440
Plow. Gang-	W. Holloway	395,831	Jan. 8	824	213	46	173
Plow-handle	S. I. Allen	396,524	Jan. 22	1860	478	46	386
Plow. Hillside-	M. D. Beach	399,000	Mar. 5	288	79, 80	46	1170
Plow. Hillside-	M. D. Beach	399,001	Mar. 5	292	80	46	1171
Plow. Mold-board or breaking	M. S. and E. L. Cadwell	397,415	Feb. 5	471	124	46	669
Plow. Mole-	J. C. Allen	397,682	Feb. 12	900	238	46	756
Plow-point	M. S. and E. L. Cadwell	396,726	Jan. 29	2165	555	46	453
Plow-point	J. Hawke	397,855	Feb. 12	1137	304	46	803
Plow. Reversible	J. A. Cole	396,142	Jan. 15	1279	328	46	270
Plow. Riding-	H. W. Wildman	396,793	Jan. 29	2274	581	46	475
Plow-standard cap	E. S. Hartman	398,831	Mar. 5	26	8	46	1119
Plow. Steam-	J. Q. A. Newsom	396,170	Jan. 15	1323	{339 / 340}	46	277
Plow. Sulky-	C. Anderson	399,814	Mar. 19	1551	{401 / 402 / 403}	46	1451
Plow. Sulky-	G. W. Haines	396,480	Jan. 22	1797	460	46	375
Plow. Sulky-	I. M. Linderman	398,266	Feb. 19	1748	461	46	937
Plow. Sulky-	J. H. Zinn	399,402	Mar. 12	1012	{265 / 266}	46	1338
Plow. Swivel-	F. J. Blanke	396,460	Jan. 22	1760	451	46	368
Plow. Walking-	D. W. Cheney	397,582	Feb. 12	738	191	46	725
Plow. Wheel-	A. Goodyear	398,961	Mar. 5	218	60	46	1155
Plow. Wheel-	H. H. Sater	396,606	Jan. 22	1926	511	46	409
Plows. Revolving mold-board for	C. Gaylord	396,397	Jan. 22	1662	427	46	346
Plows. Riding attachment for	C. Hanson	399,039	Mar. 5	346	93	46	1180
Plumbers' traps. Manufacture of	R. Clarke	399,247	Mar. 12	992	180	46	1275
Pneumatic dispatch-tube	C. A. Lieb	398,414	Feb. 26	1982	{521 / 522}	46	991
Pneumatic-tube switch	C. A. Lieb	398,836	Mar. 5	34	11	46	1120
Pocket-book	B. A. Capehart	399,376	Mar. 12	897	233	46	1313
Pocket-book clasp	C. G. Pfingsten	397,933	Feb. 19	1247	333	46	841
Pocket-book, purse, or satchel frame fastening	L. B. Prahar	397,248	Feb. 5	216	57	46	617

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Pocket-books or other articles. Frame for	M. Koenig	397,862	Feb. 12	1145	306	46	885
Pocket-box	G. W. Parks	396,110	Jan. 15	1239	315	46	262
Pocket for garments	H. E. Whaley	395,729	Jan. 8	653	167	46	141
Pocket-knife	E. Jansen	399,047	Mar. 5	356	95	46	1192
Poison-distributer	W. P. Towne	400,145	Mar. 26	2023	530	46	1553
Poison on plants. Machine for distributing	G. R. and J. W. Brown	397,679	Feb. 12	817	214	46	740
Poke	E. Heath	397,079	Jan. 29	2577	692	46	557
Poke. Animal-	J. D. Higgins	395,392	Jan. 1	129	33	46	98
Pole. Carriage-	J. Ives	395,702	Jan. 8	614	155	46	133
Pole for vehicles. Metallic	F. H. Wells	397,767	Feb. 12	1016	270	46	779
Pole. Vehicle-	T. W. Porter	397,934	Feb. 19	1248	333	46	841
Poles or rods. Machine for finishing	H. Ferguson	398,243	Feb. 19	1717	453	46	931
Polishing-cylinder	J. L. Perry	399,629	Mar. 12	1270	326	46	1384
Polishing-wheel	F. W. Starr	395,730	Jan. 8	638	162	46	138
Pool-register	E. R. Robbins	398,081	Feb. 19	1480	392	46	885
Pool-table pocket	J. Adams	395,803	Jan. 8	784	203	46	164
Portable bath	S. S. Burr	399,968	Mar. 19	1770	458	46	1495
Portable heater	D. C. McIntire	395,576	Jan. 1	413	106	46	85
Portfolio	A. G. Dyrenforth	399,979	Mar. 19	1765	463	46	1497
Post: *See* Fence-post. Signal-post. Hitching-post.							
Post-driver	I. W. Bradshaw	397,892	Feb. 19	1187	318	46	831
Post-holder	W. B. Thomas	396,624	Jan. 22	2018	518	46	416
Post-hole-boring machine	H. H. Digga	399,317	Mar. 12	804	207	46	1296
Post-hole machine	W. W. and G. F. Nivison	397,363	Feb. 5	415	110	46	656
Post-office furniture	J. M. Morris	395,989	Jan. 8	1065	270	46	219
Pot: *See* Coffee-pot. Watering-pot. Coffee or tea pot.							
Potato-digger	I. W. Hoover	396,818	Jan. 29	2309	591	46	482
Potato-digger	J. H. Lewis	395,571	Jan. 1	403	103	46	83
Potato-digger	J. W. Scott	396,433	Jan. 22	1721	{442 / 443}	46	360
Potato-digger	H. M. Shaw	398,545	Feb. 26	2162	571	46	1027
Potato-digger	I. Vance	399,363	Mar. 12	874	227	46	1309
Pottery-ware. Decorating	L. A. Fry	399,029	Mar. 5	329	.....	46	1177
Poultry. Device for catching	J. L. Wals	400,277	Mar. 26	2232	585	46	1593
Power: *See* Horse-power. Water-power.							
Power. Apparatus for transmitting	T. W. Lemieux	395,446	Jan. 1	205	53	46	43
Power from water and air currents. Means for obtaining motive	J. B. Fox	397,118	Feb. 5	19	5	46	582
Power. Pneumatic device for transmitting	W. G. Scott	399,789	Mar. 19	1509	390	46	1444
Power. Transmitting	T. W. Lemieux	397,506	Feb. 12	613	158	46	701
Precious stones, &c. Machine for cutting and polishing	T. Blumtschll	399,006	Mar. 5	301	82	46	1172
Press: *See* Baling-press. Drawing-press. Brick-press. Hay-press. Cheese-press. Hydraulic press. Copying-press. Oil-press. Crock-press. Seal-press.							
Press	F. F. Westphal	396,906	Jan. 29	2435	625	46	509
Presser-bar	H. F. Campbell	395,380	Jan. 1	112	28	46	25
Pressing fabrics. Machine for	T. C. Fawcett	399,511	Mar. 12	1093	285	46	1351
Pressure engine. Fluid-	J. G. Schreuder	396,239	Jan. 15	1428	363	46	297
Pressure-regulator	J. Barrow	397,063	Jan. 29	2653	683	46	553
Pressure-regulator	L. B. Fulton	395,550	Jan. 1	380	97	46	79
Pressure-regulator	J. C. Glass	399,663	Mar. 19	1326	340	46	1407
Pressure-regulator	C. Rogers	398,849	Mar. 5	48	14, 15	46	1153
Printer's gage	C. L. Storrs	397,676	Feb. 12	1161	311	46	806
Printer's galley	F. Wesel	395,934	Jan. 8	975	251	46	202
Printers' inking-rollers. Composition for	J. D. Bavlis	396,387	Jan. 22	1647	.....	46	345
Printer's quoin	M. W. Berryman	399,368	Mar. 12	861	229	46	1310
Printers' rules. Machine for cutting	F. Wesel	395,728	Jan. 8	653	167	46	140
Printing block or type	S. Jones	400,087	Mar. 26	1942	{507 / 508}	46	1537
Printing cards, &c. Machine for	S. McAuliffe	395,499	Jan. 1	284	73, 74	46	60
Printing-cylinder	W. Berri	396,390	Jan. 22	1650	424	46	346
Printing-machine	H. H. Harrison	398,042	Feb. 19	1496	{377 / 378}	46	874
Printing-machine feeding apparatus	W. Nurse	396,288	Jan. 15	1500	380	46	310
Printing-machine inking apparatus	W. Scott	396,612	Jan. 22	1900	{514 / 515}	46	412
Printing-machine. Rotary	J. Michaud	396,502	Jan. 22	1968	{506 / 507}	46	408
Printing-machine. Rotary	C. A. Thompson	400,269	Mar. 26	2220	582	46	1591
Printing-machine sheet-delivery apparatus	R. Miehle	395,710	Jan. 8	622	157	46	134
Printing-machine sheet-delivery apparatus	R. Miehle	398,642	Feb. 26	2309	612	46	1054
Printing-machine sheet-delivery apparatus	W. Scott	396,896	Jan. 29	2422	622	46	507
Printing-machine sheet-delivery apparatus	W. Scott	397,662	Feb. 12	870	220	46	750
Printing-machine sheet-delivery apparatus	W. Scott	398,544	Feb. 26	2160	{570 / 571}	46	1027
Printing-machines. Ink-distributing apparatus for	J. T. King	400,221	Mar. 26	2142	{561 / 562}	46	1577
Printing-machines. Ink-distributing apparatus for	J. T. King	400,222	Mar. 26	2144	562	46	1578
Printing-machines. Ink-distributing apparatus for	J. T. King	400,223	Mar. 26	2144	{562 / 563}	46	1578
Printing-machines. Means for collecting and evening up sheets for	W. Scott	397,314	Feb. 5	312	82	46	636
Printing-machines. Means for reciprocating ink-distributing rolls of	H. C. A. Ffrost	395,966	Jan. 8	1024	261	46	212
Printing newspapers or pamphlets	J. L. Firm	399,650	Mar. 19	1319	338	46	1466

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Printing-press sheet-feeding machine	J. C. and S. Danziger	398,710	Feb. 26	2416	640, 641	46	1077
Printing-presses. Adjustable fly-table for	R. Timroth	399,220	Mar. 5	657	171	46	1240
Printing-presses. Feed-gage for	L. Conant	399,384	Mar. 12	910	236	46	1316
Printing-presses. Gripper for platen	R. Mingay, Jr	396,502	Jan. 22	1830	469	46	381
Printing-presses. Gripper mechanism for platen	W. H. Price, Jr	399,282	Mar. 12	749	194, 195	46	1285
Prints. Toning blue	H. Whiting	397,480	Feb. 5	570		46	686
Profile-cutting machine	S. T. Barras	397,888	Feb. 19	1180	315, 316	46	829
Projectiles. Tail-guide for	J. W. Graydon	399,880	Mar. 19	1647	426	46	1470
Propeller. Screw	L. Bidauld	395,538	Jan. 1	346	88	46	73
Propeller. Vibrating	J. S. Lamar	398,629	Feb. 26	2295	607	46	1082
Propelling and steering apparatus. Pneumatic	R. A. Chesebrough	397,223	Feb. 5	183	49	46	611
Propelling and steering vessels. Apparatus for	T. B. Heathorn	399,530	Mar. 12	1119	290, 291	46	1356
Propelling mechanism. Boat-	P. E. Collins	398,703	Feb. 26	2404	638	46	1075
Propelling ships. Mechanism for	J. Stenard, Sr	396,672	Jan. 22	2079	534, 535	46	428
Protector: *See* Boot or shoe protector. Lamp-shade protector. Chimney-protector. Levee-protector. Ear-protector. Pants-protector. Electric-circuit protector. Shank-protector. Gun hand-protector. Water-closet-seat protector.							
Protractor	A. Butler	395,875	Jan. 8	896	230	46	187
Pruning implement	A. Bohn	399,370	Mar. 12	884	229	46	1311
Pruning-shears	J. R. Gascoigne	399,869	Mar. 19	1630	422	46	1467
Puller: *See* Stalk-puller.							
Pulley	W. L. Field	397,978	Feb. 19	1318	352	46	854
Pulley	J. Hixenbaugh	400,213	Mar. 26	2129	558	46	1576
Pulley	F. A. Lomont	395,572	Jan. 1	404	104	46	84
Pulley	G. Snedden	395,669	Jan. 1	564	141	46	113
Pulley-and-cord hoisting-gearing. Differential	C. H. W. Reichel	396,430	Jan. 22	1718	442	46	359
Pulley. Belt-	J. A. J. Shultz	399,636	Mar. 12	1283	329	46	1386
Pulley. Clutch-	E. Blake	396,977	Jan. 29	2331	654	46	530
Pulley. Expanding	J. E. Dustin	395,816	Jan. 8	802	209	46	168
Pulley. Split	J. R. Mackinnon	397,654	Feb. 12	859	224	46	748
Pulley. Split	J. J. McErlain	396,101	Jan. 15	1229	311	46	260
Pulley. Split	W. A. Willingham	396,637	Jan. 22	2035	523	46	419
Pulley wheel. Grip-	R. P. Walsh	400,276	Mar. 26	2229	584, 585	46	1593
Pulp. Apparatus for manufacturing hollow ware from	F. B. Howard	398,397	Feb. 26	1958	515	46	986
Pulp engine. Refining-	J. Norton, Jr	398,845	Mar. 5	43	13, 14	46	1122
Pulverizer and amalgamator	E. Derbec	395,957	Jan. 8	1009	259	46	209
Pulverizing-machine	A. D., Sr., A. D., Jr., and D. C. Searls	398,905	Mar. 5	133	36, 37	46	1139
Pump	J. H. Branson	398,220	Feb. 19	1678	444	46	922
Pump	W. L. Butts	398,936	Mar. 5	186	50	46	1149
Pump	W. H. Cloud	396,193	Jan. 15	1359	349	46	284
Pump	J. Darling	395,772	Jan. 8	712	183	46	151
Pump	W. Kegler	399,199	Mar. 5	624	162	46	1224
Pump	A. H. Nixon	396,504	Jan. 22	1832	474	46	382
Pump	W. M. Scott	400,124	Mar. 26	1996	523	46	1548
Pump actuated by fluid-pressure	W. Donaldson	400,196	Mar. 26	2101	551	46	1570
Pump. Air-	A. Conacher	397,760	Feb. 12	1035	277	46	783
Pump and condenser. Duplex	J. Reid	399,780	Mar. 19	1492	385	46	1441
Pump. Combined centrifugal and screw	A. A. Willson	398,301	Feb. 19	1808	477	46	950
Pump. Filter-	O. H. Woodworth	397,263	Feb. 5	238	62	46	621
Pump. Hydraulic air-	F. R. and F. G. Johnson	398,405	Feb. 26	1968	517, 518	46	988
Pump-operating mechanism	O. Henjum	396,485	Jan. 22	1807	463	46	376
Pump. Sand or mud	R. G. Mead and B. Magee	396,501	Jan. 22	1828	469	46	381
Pump-spout	L. A. Brigel	397,532	Feb. 12	649	170	46	709
Pump. Steam-	J. Maslin	397,738	Feb. 12	977	259	46	771
Pump. Steam-	H. A. Wahlert	396,247	Jan. 15	1440	366, 367	46	300
Pumps. Plunger-rod for	W. C. Westaway	397,892	Feb. 12	1170	313	46	811
Pumps. Valve-gear for duplex steam-	C. M. Miller	399,203	Mar. 5	628	163	46	1235
Pumps. Valve mechanism for automatically starting steam-	E. Knowles	395,906	Jan. 8	943	242	46	195
Pumping-engine. Portable	W. O. Webber	395,933	Jan. 8	974	250	46	202
Punch	S. T. Nakashjian	395,342	Jan. 1	55	13	46	13
Punch	G. W. Southwick	399,943	Mar. 19	1735	448	46	1468
Punch, &c. Hydraulic	J. Weeks	395,675	Jan. 1	572	143, 144	46	115
Punch. Paper-	S. H. Fish	395,320	Jan. 1	24	6	46	7
Punching and eyeleting machine	M. H. Pearson and C. Bennion	396,890	Jan. 29	2411	619, 620	46	505
Punting-machine	H. C. Schrader	398,454	Feb. 26	2030	533	46	1009
Push-button	J. H. Lehman	400,232	Mar. 26	2160	566	46	1581
Puzzle	M. Jacobs	399,146	Mar. 5	531	139	46	1217
Quartz-mill	P. A. Snell	395,670	Jan. 1	564	141	46	113
Quilling-machines. Stop-motion for	D. Ashley	396,384	Jan. 22	1643	423	46	345
Quilting-machine	A. Beck	400,039	Mar. 26	1876	488	46	1523
Racing-boat. Tubular	F. Frenzel, Jr	397,282	Feb. 5	266	69	46	627
Rack: *See* Broom-rack. Lumber-rack. Goods-rack. Show-rack. Hat and clothes rack. Ticket-rack.							
Racking-off apparatus for beer, wine, and other liquids	J. Johnson	398,261	Feb. 19	1740	458	46	935
Radial drill	J. J. Batman	395,943	Jan. 8	989	254	46	205

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Radiator	J. Reilly	399,079	Mar. 5	398	107	46	1190
Radiator	J. Shackleton	400,258	Mar. 26	2101	577	46	1588
Radiator apparatus. Heat-	A. C. Edwards	395,818	Jan. 8	806	210	46	169
Radiator for hot-air furnaces. Heat-	C. J. Manning	400,097	Mar. 26	1953	511	46	1539
Radiator. Heat-	A. Peart	399,776	Mar. 19	1487	384	46	1440
Radiator. Steam or hot-water	S. D. Tompkins and T. H. Williams	397,527	Feb. 12	642	167, 168	46	708
Radiators. Water-discharge regulator for steam-	D. H. Streeper	398,552	Feb. 26	2176	573	46	1029
Rags or other material. Machine for cutting	J. Nuttall	398,273	Feb. 19	1759	464, 465	46	939
Rail-bending tool	W. H. Phillips	399,630	Mar. 12	1272	327	46	1385
Rail-chair	H. F. Cox	398,381	Feb. 26	1939	510	46	963
Rail-chair	A. I. Wolfe	400,027	Mar. 19	1856	481	46	1510
Rail-chair	C. P. Espinasse	396,473	Jan. 22	1787	458	46	373
Rail chair and sleeper. Combined	A. Belzano	399,483	Mar. 12	1047	274	46	1343
Rail-chairs on timber-sleepers. Fixing	M. W. Smith	398,903	Mar. 5	257	71	46	1163
Rail-drill	J. P. Lancaster	397,005	Jan. 29	2574	665	46	538
Rail-joint	I. and W. T. Lynd	397,242	Feb. 5	208	54, 55	46	615
Rail-joint	C. M. Culp	398,709	Feb. 26	2415	640	46	1076
Rail joint or chair	T. G. Palmer	397,306	Feb. 5	303	79	46	634
Rail point. Switch-	F. A. Bartholomew	398,023	Feb. 19	1402	370	46	869
Rail-support for elevated roads	F. C. Weir and N. O. Goldsmith	398,105	Feb. 19	1508	400	46	890
Rail switch. Slot-	S. McCloud	395,339	Jan. 1	50	12, 13	46	12
Rails. Machine for reducing old	A. A. Strom	395,930	Jan. 8	969	249	46	201
Rails. Tie-rod for switch-	S. A. Bemis and L. Pfingst	398,087	Feb. 26	2381	632	46	1069
Railway	R. P. Faddis	398,037	Feb. 19	1420	375	46	873
Railway	J. M. Heverly	398,256	Feb. 19	1735	457	46	934
Railway block-signal	N. J. Pritchard and J. S. Templon	399,159	Mar. 5	560	144, 145	46	1223
Railway-brakes. Device for applying pressure to	P. F. Barr	398,369	Feb. 26	1921	505	46	979
Railway. Cable	W. S. Phelps	397,395	Feb. 5	417	110	46	656
Railway. Cable or electric street-	J. St. Clair	395,760	Jan. 8	697	178	46	149
Railway carriages, stations, &c. Device for lighting and extinguishing lights in	A. W. Elchelberger	398,392	Feb. 26	2222	589	46	1040
Railway cattle-guard	G. W. Willford	398,563	Feb. 26	2188	576, 577	46	1031
Railway-chair and securing rails therein	C. J. Van Depoele	396,311	Jan. 15	1529	396	46	315
Railway conductors. Hooked suspender for electric-	C. J. Van Depoele	400,375	Mar. 26	2230	622, 624	46	1621
Railway conductors. Pneumatic flexible-slot conduit for electric-	C. J. Van Depoele	396,312	Jan. 15	1530	396, 397	46	315
Railway conductors. Suspension device for electric-	W. Haddock	399,145	Mar. 5	530	138, 139	46	1217
Railway-conduit construction. Cable-	B. Jennings	395,442	Jan. 1	198	51, 52	46	42
Railway. Conduit electric	E. M. Bentley	400,179	Mar. 26	2078	544	46	1564
Railway contact. Electric-	J. T. Clark	396,807	Jan. 29	2296	587, 588	46	479
Railway-crossing	H. C. Lowrie	398,269	Feb. 19	1754	463	46	938
Railway crossing	W. Haddock	399,036	Mar. 5	341	91, 92	46	1179
Railway crossing. Cable-	G. Provost	399,929	Mar. 19	1716	444	46	1484
Railway crossing. Cable-	F. C. Weir	398,106	Feb. 19	1509	400	46	891
Railway crossing. Cable-	F. C. Weir	398,202	Feb. 19	1656	437	46	917
Railway-crossing gate	O. H. Clark	396,072	Jan. 15	1179	299, 300	46	250
Railway crossings and bridges. Flangeway-rail for	W. Lawrence	399,149	Mar. 5	536	140	46	1218
Railway. Electric	J. B. Blair	399,236	Mar. 12	682	178	46	1274
Railway. Electric	S. H. Short	398,662	Feb. 26	2342	622	46	1061
Railway. Electric	H. W. Smith	399,091	Mar. 5	417	113	46	1194
Railway. Elevated	J. R. Chapman	400,054	Mar. 26	1895	492, 493	46	1596
Railway. Elevated	H. W. Libbey	399,997	Mar. 19	1814	471	46	1508
Railway. Elevated	R. F. Robison	397,519	Feb. 12	634	165	46	706
Railway. Elevated street-	R. F. Robison and H. M. Crocken	395,921	Jan. 8	958	246	46	198
Railway-frog	C. B. Price	398,975	Mar. 5	243	67, 68	46	1160
Railway-frog	A. A. Strom	395,929	Jan. 8	967	248, 249	46	200
Railway-frog	F. C. Weir	398,203	Feb. 19	1656	438	46	917
Railway-frog	F. C. Weir	398,205	Feb. 19	1658	438	46	918
Railway-frog	F. C. Weir and N. O. Goldsmith	398,201	Feb. 19	1655	437	46	917
Railway-gate	J. W. Nebergall	399,624	Mar. 12	1265	325	46	1383
Railway-gate	D. C. Thomas	399,947	Mar. 19	1741	449, 450	46	1489
Railway gate and signal. Automatic	J. Bolt	400,390	Mar. 26	2403	629, 630	46	1625
Railway-gate. Electrical	M. Tomlmin	397,880	Feb. 12	1166	312	46	809
Railway grip. Cable-	E. C. Phillips	399,075	Mar. 5	392	106	46	1189
Railway plow. Electric-	E. M. Bentley	400,038	Mar. 26	1873	488	46	1522
Railway plow. Electric-	E. M. Bentley	400,180	Mar. 26	2080	544	46	1565
Railway. Pneumatic	G. L. Du Laney	399,319	Mar. 12	807	208	46	1296
Railway-rail-joint fastener	N. Rowen	396,236	Jan. 15	1426	362	46	327
Railway-rails. Automatic lock-joint for	J. L. Pope	395,918	Jan. 8	954	245	46	197
Railway-rails. Chair and lock-joint for	J. N. Martin and W. H. Harris	398,522	Feb. 26	2134	562	46	1021
Railway sheave. Cable-	W. Haddock	399,035	Mar. 5	340	91	46	1179
Railway-signal	W. P. Kookogey	396,749	Jan. 29	2212	566	46	462
Railway-signal	W. P. Kookogey	396,750	Jan. 29	2213	566	46	462
Railway-signal	W. C. Paul and O. D. Kleinsteuber	396,365	Jan. 15	1615	413, 414	46	331
Railway-signal	J. D. Yarrington and H. D. Shanklin	397,884	Feb. 12	1172	314	46	811
Railway-signal. Electric	A. Z. Beda	397,270	Feb. 5	246	645	46	623
Railway-signal. Electric	T. A. B. Putnam	399,556	Mar. 12	1166	302	46	1364
Railway-signal. Electric	D. G. Smith	395,667	Jan. 1	561	140	46	113
Railway-signal. Electrical	H. Hayden, Jr., and W. F. Z. Desant	398,613	Feb. 26	2230	600	46	1045
Railway-signal. Electrical	W. P. Kookogey	396,748	Jan. 29	2210	565	46	461
Railway-signal. Pneumatic	J. K. Leedy	398,632	Feb. 26	2298	608	46	1052

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Railway signals and switches. Interlocking apparatus for	T. W. Burley	398,766	Feb. 26	2496	662	46	1093
Railway signaling apparatus. Electrical	H. J. Palmer	399,155	Mar. 5	552	143	46	1221
Railway signaling device	F. P. Benjamin	399,474	Mar. 12	1035	273	46	1342
Railway signaling device. Cable	W. M. Bulkley	397,335	Feb. 5	350	91, 92	46	644
Railway. Single-rail	R. H. Brown	396,139	Jan. 15	1275	326, 327	46	269
Railway-spike	H. A. Harvey	395,898	Jan. 8	927	239	46	192
Railway-spike	G. P. Rose	395,925	Jan. 8	961	247	46	199
Railway-spikes. Manufacture of	J. T. Jones	400,405	Mar. 26	2426	636	46	1629
Railway splice-bar	G. P. Rose	395,922	Jan. 8	959	246	46	198
Railway splice-bar	G. P. Rose	395,923	Jan. 8	960	247	46	199
Railway splice-bar	G. P. Rose	395,924	Jan. 8	960	247	46	199
Railway-stringers. Fastening for	D. Atwood	399,232	Mar. 12	677	177	46	1273
Railway structure. Cable	W. H. Young	396,638	Jan. 22	2036	523	46	420
Railway-switch	W. H. Barwick	396,679	Jan. 22	2089	537	46	430
Railway-switch	J. Hunter	396,873	Jan. 29	2383	611, 612	46	500
Railway-switch	D. E. Shea	395,407	Jan. 1	147	37, 38	46	31
Railway-switch	W. Spielman	400,135	Mar. 26	2009	526	46	1550
Railway-switch	S. Stewart	399,792	Mar. 19	1513	391	46	1445
Railway-switch	J. B. Suffern	400,370	Mar. 26	2373	620	46	1620
Railway-switch	C. W. Walker	396,629	Jan. 22	2023	520	46	417
Railway switch and alarm. Electric	W. S. Hull and J. C. Anderson	399,331	Mar. 12	822	213, 214	46	1300
Railway switch and signal	H. F. Parsons	396,419	Jan. 22	1696	435, 436	46	355
Railway-switch. Automatic	J. W. Leslie	398,169	Feb. 19	1608	427	46	909
Railway-switch. Automatic	A. I. Parsons	396,418	Jan. 22	1694	435	46	354
Railway-switch. Automatic	J. Renner	398,748	Feb. 26	2474	655	46	1088
Railway switch. Cable	F. C. Weir and N. O. Goldsmith	398,200	Feb. 19	1654	437	46	917
Railway switch. Center-rail elevated	F. A. Bartholomew	400,164	Mar. 26	2050	530	46	1560
Railway switch. Electric	E. Blake	399,732	Mar. 19	1421	366	46	1426
Railway-switch. Pneumatic	M. Wuerpel	398,364	Feb. 19	1911	503	46	970
Railway-switch signal	H. M. Norton	399,342	Mar. 12	896	218	46	1303
Railway switch-stand	G. F. Gage	395,891	Jan. 8	918	236	46	191
Railway switch. Street	N. O. Goldsmith	398,248	Feb. 19	1722	454	46	932
Railway switch. Street	F. C. Weir	398,204	Feb. 19	1657	438	46	918
Railway switch. Street	W. White	396,127	Jan. 15	1260	322	46	266
Railway switch. Street	W. White	396,128	Jan. 15	1261	322	46	266
Railway-switches. Tie-bar for	W. J. Morden	397,090	Jan. 29	2091	496	46	560
Railway system. Cable	C. J. Van Depoele	398,294	Feb. 19	1797	474, 475	46	948
Railway system. Electric	C. S. Bradley	399,372	Mar. 12	866	230, 231	46	1311
Railway system. Electric	D. G. Weems	396,633	Jan. 22	2029	521, 522	46	418
Railway-tie	J. M. Davis	397,785	Feb. 12	1046	279	46	784
Railway-tie	A. K. Hoffmeier	399,330	Mar. 12	820	213	46	1300
Railway-tie	M. Maloney	395,447	Jan. 1	207	53	46	44
Railway-tie. Metallic	S. U. Smith	398,004	Feb. 19	1360	361	46	861
Railway-track cleaner. Street	J. A. Lewis	399,421	Mar. 12	958	249	46	1326
Railway track. Street	T. H. Gibbon	396,036	Jan. 8	1128	286	46	231
Railway-tracks. Apparatus for depositing torpedoes upon	J. F. McLaughlin	397,378	Feb. 5	408	108	46	655
Railway-train signaling. Electric coupling for	W. C. Johnston, Jr.	397,553	Feb. 12	685	178	46	716
Railway-trains. Electric brake for	A. H. Bowman and W. P. Widdifield	396,577	Feb. 26	2206	581, 582, 583, 584	46	1035
Railway-trains. Means for safely coupling or uncoupling the pipes of pneumatic brakes or steam-heating apparatus on	B. Heimsoeth	399,894	Mar. 19	1665	430	46	1474
Railway-trains. Signaling device for	M. McCormick and F. Farish	398,067	Feb. 19	1466	387	46	882
Railway trolley and support. Electric	S. H. Short	396,618	Jan. 22	2008	517	46	414
Railway wires. Support for electric	T. H. Brady	398,489	Feb. 26	2086	550	46	1012
Railways. Apparatus for sanding	H. C. Noble	398,174	Feb. 19	1613	428	46	910
Railways. Automatic block-signaling system and apparatus for	H. F. Parsons	396,421	Jan. 22	1701	436, 437	46	356
Railways. Automatic switch for cable	W. Phenix	397,610	Feb. 12	799	208	46	736
Railways. Conductor for electric	O. Dahl	398,498	Feb. 26	2098	553	46	1014
Railways. Conductor for electric	R. M. Hunter	399,409	Mar. 12	944	245	46	1323
Railways. Conduit for electric	S. Trott	395,761	Jan. 8	898	178	46	149
Railways. Continuous rail-frog for	H. F. Parsons	396,420	Jan. 22	1700	436	46	355
Railways. Crossing-conduit for electric	I. W. Heysinger	398,963	Mar. 5	225	63	46	1157
Railways. Current-collecting device for electric	R. M. Hunter	398,402	Feb. 26	1963	516	46	987
Railways. Curve for cable	C. L. Snyder	396,054	Jan. 8	1152	292, 293	46	236
Railways. Danger-signal for	J. Prince	397,469	Feb. 5	535	145	46	684
Railways. Fault-detector for electric	E. M. Bentley	400,182	Mar. 26	2083	545	46	1566
Railways. Overhead line for electric	F. J. Sprague	397,875	Feb. 12	1159	310	46	807
Railways. Rack and gear for inclined	W. H. Knight	400,347	Mar. 26	2345	612	46	1614
Railways. Suspended switch for electric	C. H. Wells	396,124	Jan. 15	1254	320, 321	46	265
Railways. Switch mechanism for electric	S. H. Short	398,663	Feb. 26	2244	622	46	1002
Railways. Traveler for electric	C. J. Van Depoele	396,310	Jan. 15	1527	396	46	315
Railways. Trolley for electric	W. F. Jenkins	395,703	Jan. 8	617	155	46	133
Railways. Turn-table for cable or electric	W. Davidson	396,649	Jan. 22	2050	527	46	423
Raisin-stemmer	C. L. North	395,916	Jan. 8	952	245	46	197
Rake: *See* Hay-rake. Lawn-rake. Wooden rake.							
Range-boiler	T. W. Rees	396,957	Jan. 29	2506	646	46	524
Range-boiler	T. W. Rees	399,558	Mar. 12	1170	302	46	1365

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Rasp-cutting machine	P. S. Stokes	397,254	Feb. 5	222	58, 59	46	618
Ratchet-and-pawl device	W. S. Buxton	395,737	Jan. 8	666	170	46	143
Ratchet-brace	J. S. Fray	395,889	Jan. 8	915	235	46	190
Ratchet-drill	G. Fletcher	395,774	Jan. 8	714	184	46	154
Ratchet-drill	C. E. Abrams	395,895	Jan. 8	881	226	46	184
Ratchet-wrench	J. Turner	400,418	Mar. 26	2445	641	46	1633
Razor. Safety	T. F. Curley and A. S. Granger	398,947	Mar. 5	196	52, 53	46	1151
Razor safety-guard	T. F. Curley and A. S. Granger	398,948	Mar. 5	197	53	46	1152
Razor safety-guard	W. W. Swan	397,525	Feb. 12	640	167	46	708
Reamer	J. A. Sherman	399,349	Mar. 12	857	222	46	1306
Reamer. Cast chilled	L. Piom and J. D'Andrimont	399,156	Mar. 5	554	143	46	1222
Reamer for forming blast-holes	H. H. Taylor	399,352	Mar. 12	861	223	46	1307
Reaming-machine	D. K. Howe	399,407	Mar. 12	942	244	46	1322
Receipts. Cover for shipping							
Recorder: *See* Cash-recorder. Time-recorder.							
Reel: *See* Bolting-reel. Hose-reel. Fishing-reel. Wire-reel. Harvester-reel. Wire-rod reel.							
Reel and sprinkler. Combined	R. Wylie	400,030	Mar. 19	1860	482, 483	46	1511
Reflector-bracket	H. M. Guild	395,972	Jan. 8	1032	263	46	213
Refractory compounds. Producing	J. L. Hastings	396,693	Jan. 22	2113	.....	46	434
Refrigerating and freezing apparatus	L. Perkins	399,207	Mar. 5	634	164, 165, 166	46	1236
Refrigerating-machine	A. Comacher	396,730	Jan. 29	2169	536, 537	46	453
Refrigerating-machines. Absorber for	M. Piel	395,512	Jan. 1	313	79	46	96
Refrigerator	J. C. Berger	396,261	Jan. 15	1458	371	46	262
Refrigerator	N. Davis	399,976	Mar. 19	1761	462	46	1497
Refrigerator	W. T. Forbes	397,791	Feb. 12	1053	281	46	786
Refrigerator	E. B. Hess and W. X. Stevens	397,984	Feb. 19	1396	353, 354	46	855
Refrigerator	W. C. Sweet. (Reissue)	10,992	Mar. 26	2454	643	46	1634
Refrigerator	J. H. Windiech	399,307	Mar. 12	791	205	46	1293
Refrigerator. Milk	C. B. Traver	395,464	Jan. 1	231	59	46	50
Refrigerators. Combined goblet-holder and drip-cup attachment for	A. J. Page	400,358	Mar. 26	2360	616	46	1617
Refuse-burner	E. G. Teed	398,671	Feb. 26	2357	625	46	1064
Register: *See* Egg-count register. Hotel-register. Fare-register. Pool-register.							
Regulator: *See* Draft-regulator. Feed-regulator. Electric-current regulator. Feed-water regulator. Gas-regulator. Electric-machine regulator. Horse-power regulator. Magnetic regulator. Electrical-machinery regulator. Pressure-regulator. Speed-regulator. Elevator speed-regulator. Temperature-regulator. Thrasher-regulator. Engine-regulator. Watch-regulator.							
Regulator	A. Gartner	395,492	Jan. 1	273	70	46	58
Rein-holder for wagons	P. S. Transue	398,290	Feb. 19	1792	473	46	946
Rein-support. Hip	A. Kempkey	397,922	Feb. 19	1230	329	46	839
Rendering	F. Winter	399,810	Mar. 19	1548	400	46	1451
Rerolling old rails. Apparatus for	A. Reese	395,350	Jan. 1	67	16, 17	46	15
Resins and other substances. Bleaching and refining	E. A. Behrens	395,731	Jan. 8	656	168	46	141
Respirator	H. M. Cochran	396,809	Jan. 29	2206	568	46	480
Respirator for firemen	H. R. Hurd	396,161	Jan. 15	1310	335	46	275
Revolving chair and stand	L. F. Seeger	395,406	Jan. 1	146	37	46	31
Ribbed conoidal washer	D. Dodd	398,952	Mar. 5	205	56	46	1153
Ribbon-holder	J. A. Grant	395,701	Jan. 8	613	154	46	132
Ribbon-winding device	W. S. Burroughs	396,070	Jan. 15	1176	298	46	250
Rice. Milling	J. L. Sheppard	397,944	Feb. 19	1261	336	46	843
Ring: *See* Curtain-ring. Ear-ring. Curtain-pole ring. Key-ring.							
Ring for curtain-poles	J. Rings	396,604	Jan. 22	1985	510	46	409
River-power engine	A. F. W. Neynaber	398,070	Feb. 19	1469	368	46	883
Rivet-setting machine	F. W. Beale and J. H. Reed	395,868	Jan. 8	883	266, 267	46	185
Riveting. Electric	E. Thomson	396,015	Jan. 8	1102	280	46	226
Road-engine	R. R. Down	397,976	Feb. 19	1308	350, 351	46	852
Road-engine	H. K. Sams	397,144	Feb. 5	63	15, 16	46	590
Road-sweeping machine	W. T. Carter and J. Keeble	399,971	Mar. 19	1774	459, 460	46	1496
Roaster: *See* Meat-roaster.							
Rock-crusher	G. E. Ames	400,157	Mar. 26	2049	536	46	1559
Rock-drill	J. McCulloch	398,637	Feb. 26	2303	609, 610, 611	46	1053
Rock-drill. Electro-magnetic	H. N. Marvin	395,575	Jan. 1	408	105	46	84
Rock-drills. Carriage for direct-acting	G. A. Barth	397,623	Feb. 12	813	212	46	709
Rock-drills. Carriage for direct-acting	G. A. Barth	397,627	Feb. 12	1101	294, 295	46	795
Rock-drills. Device for sharpening	F. A. Grace	397,230	Feb. 5	193	51	46	618
Rock-drills. Hand-guard for	B. Giovanni	395,700	Jan. 8	612	154	46	132
Rock-drills. Machine for operating	H. Huston and E. J. Martin	396,745	Jan. 29	2206	564	46	460
Rocket. Line-carrying	P. Cunningham	395,881	Jan. 8	903	231	46	188

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Rocking-chair	O. S. Turner	399,584	Mar. 12	1209	312	46	1372
Rod: *See* Connecting-rod. Lightning-rod. Fishing-rod.							
Rods, rails, &c. Making	G. C. Baker	395,684	Jan. 8	502	148	46	128
Roll	D. B. Oliver	397,563	Feb. 12	701	182	46	719
Roll and pinion	R. C. Totten	399,295	Mar. 12	768	200	46	1290
Roller: *See* Curtain-roller.							
Roller-gin	D. S. Chapin	400,190	Mar. 26	2094	548, 549	46	1569
Roller-mill	J. Dawson	399,186	Mar. 5	598	154, 155	46	1230
Roller-mill	J. D. Mawhood	398,339	Feb. 19	1865	492	46	960
Roller-mill feed-hopper	W. J. Purdy	400,413	Mar. 26	2439	639	46	1632
Roller-mills. Feed mechanism for	W. M. Jewell. (Reissue)	10,979	Jan. 8	1161	294	46	237
Roller reduction-mill	J. H. Woolcott	395,534	Jan. 1	340	86, 87	46	72
Rolling metal strips	E. L. Clark	397,603	Feb. 12	914	242	46	759
Rolling-mill guide	P. L. Day	398,771	Feb. 26	2502	664	46	1094
Rolling-mill plant	E. L. Clark	397,339	Feb. 5	356	93, 94	46	646
Rolling-mill plant	E. L. Clark	400,192	Mar. 26	2097	549	46	1569
Rolling-pins, &c. Revolving handle for	J. H. Sunderman	397,149	Feb. 5	73	18	46	592
Rolling seamless tubing. Machine for	C. Kellogg	397,724	Feb. 12	953	253, 254	46	766
Rolling-shafts, &c. Machine for	T. McBride and E. Fisher	400,099	Mar. 26	1956	511, 512, 513	46	1539
Rolling-train. Universal	W. Bansen	399,726	Mar. 19	1415	363, 364	46	1425
Roof	E. C. Richmond	396,292	Jan. 15	1505	381	46	311
Roof for vaults and other structures	J. T. Hough	396,040	Jan. 8	1132	287, 288	46	232
Roof-slates. Fastening for	O. W. Norcross	396,593	Jan. 22	1970	507	46	406
Roofs. Lining for corrugated sheet-metal	W. Lorenz	396,824	Jan. 29	2317	593	46	484
Roofing. Gable-end finish for	J. E. Carroll	397,534	Feb. 12	651	170	46	709
Roofing. Hip-covering and corner-finish for	J. E. Carroll	397,535	Feb. 12	652	171	46	710
Roofing. Lock-cap cleatless	J. W. Prall	397,093	Jan. 29	2696	697	46	561
Roofing. Metal	W. C. Berger	399,004	Mar. 5	300	82	46	1172
Roofing. Metallic	S. C. Frederick	396,246	Feb. 19	1721	454	46	931
Roofing. Metallic	L. L. Sagendorph	396,605	Jan. 22	1986	511	46	409
Roofing. Metallic	L. H. Montross	397,381	Feb. 5	413	109	46	656
Roofing or siding. Metallic	W. H. Asbury	399,816	Mar. 19	1539	404	46	1453
Root-cutter	L. Torres	398,097	Feb. 19	1498	396, 397	46	888
Ropeway. Suspended	J. M. Finch and W. D. Gray	398,388	Feb. 26	1949	512, 513	46	985
Rotary bolt	G. Sunmerton	395,680	Jan. 1	579	145, 146	46	117
Rotary bolt	J. H. Walsh	398,478	Feb. 26	2073	545	46	1009
Rotary brake	P. Langhammer	398,058	Feb. 19	1459	384	46	879
Rotary double-flame furnace	G. Pietzka	398,973	Mar. 5	239	66, 67	46	1160
Rotary elevator for raising liquids	R. Smith	398,855	Mar. 5	56	16	46	1125
Rotary engine	C. Bailey	395,647	Jan. 1	592	133, 134	46	107
Rotary engine	W. C. Culbertson	396,143	Jan. 15	1280	328	46	270
Rotary engine	L. C. Huson	398,512	Feb. 26	2120	557, 558	46	1018
Rotary engine	L. C. Huson	398,782	Feb. 26	2518	669	46	1097
Rotary engine	C. Mindt	396,759	Jan. 29	2225	569, 570	46	465
Rotary engine	H. T. Morse	395,711	Jan. 8	624	158	46	134
Rotary engine	J. Thorne	395,722	Jan. 8	641	162, 163, 164	46	138
Rotary engine	A. Tickle	398,968	Mar. 5	269	73, 74	46	1166
Rotary engine	J. H. Venables and J. Hughes	400,021	Mar. 19	1845	479	46	1508
Rotary engine	C. Ward	399,952	Mar. 19	1751	452	46	1491
Rotary-engine reversing-gear	C. Bailey	395,646	Jan. 1	530	132, 133	46	106
Roving-frame, &c	S. Tweedale	396,718	Jan. 22	2149	550, 551	46	442
Rubber boot	M. T. Wynkoop	400,421	Mar. 26	2451	642	46	1634
Rubber-dam clamp	W. G. Browne	396,537	Jan. 22	1674	481	46	389
Rubber from waste. Recovering	N. C. Mitchell	395,987	Jan. 8	1062	269	46	219
Ruler. Drafting	W. F. Hellin	396,568	Jan. 22	1931	497	46	399
Ruler. Parallel	S. M. Goss	398,828	Mar. 5	22	7	46	1119
Rules. Gage-head for pocket	G. W. Cochler	396,806	Jan. 29	2298	588	46	479
Sad-iron-heating apparatus	J. M. Wishart	399,960	Mar. 19	1760	455	46	1493
Sad-iron. Self-heating	J. J. Czepull	398,949	Mar. 5	198	53	46	1152
Sad-iron. Self-heating	G. Heidel	396,998	Jan. 29	2559	661	46	535
Sad-iron. Self-heating	W. H. Mull	398,743	Feb. 26	2467	654	46	1087
Saddle. Harness	F. Rehkopf	399,697	Mar. 19	1570	353	46	1416
Saddle-hub and ferrule combination	M. F. Dolan	399,850	Mar. 19	1606	416	46	1462
Safe and copying-press. Combined	T. S. Spivey	396,670	Jan. 22	2077	533	46	428
Safe-lining	W. W. Booth	396,680	Jan. 22	2091	538	46	431
Safe. Marine	W. W. Fuzzey	396,202	Jan. 15	1372	351	46	387
Safe or vault	J. L. Hall	398,610	Feb. 26	2255	598, 599	46	1045
Safes, &c. Interlocking joint for the doors and frames of	J. L. Hall	398,608	Feb. 26	2251	597	46	1044
Safes, &c. Means for fastening the doors of	J. L. Hall	398,609	Feb. 26	2253	597, 598	46	1044
Safes, &c. Packing for	A. Graf	398,607	Feb. 26	2250	596	46	1044
Safety-gage	A. F. Nagle	398,069	Feb. 19	1467	388	46	882

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Safety-hook	F. Schley	400,365	Mar. 26	2389	618	46	1619
Safety-pin	G. P. Farmer	398,140	Feb. 19	1565	414	46	901
Safety-pin	G. P. Farmer	398,141	Feb. 19	1566	414	46	901
Safety-pin	W. F. Hyatt	399,667	Mar. 19	1331	341	46	1408
Sail	W. P. Cutler	397,589	Feb. 12	754	196	46	738
Salt-box	E. S. Ayer	397,104	Feb. 5	2	1	46	579
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,111	Mar. 5	451	123	46	1199
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,112	Mar. 5	455	123, 124	46	1201
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,113	Mar. 5	457	124	46	1201
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,114	Mar. 5	460	124, 125	46	1202
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,115	Mar. 5	462	125	46	1202
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,116	Mar. 5	464	125, 126	46	1203
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,117	Mar. 5	466	126	46	1204
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,118	Mar. 5	467	126, 127	46	1204
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,119	Mar. 5	470	127	46	1204
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,120	Mar. 5	471	127, 128	46	1205
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,121	Mar. 5	473	128	46	1205
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,122	Mar. 5	475	128, 129	46	1205
Salts and desulphurizing ores. Apparatus for use in decomposing metallic	P. H., Jr., and O. T. X. Adams	399,123	Mar. 5	476	129	46	1206
Salts. Making basic lead	F. M. Lyte	396,703	Jan. 22	2127		46	437
Sample-holder	W. A. Campbell	398,017	Mar. 5	317	85	46	1175
Sand and gravel. Apparatus for dredging, washing, and separating	J. M. Miller	395,624	Jan. 1	482	123	46	98
Sand, &c. Transporting	A. McDougall	397,741	Feb. 12	981	260	46	772
Sandal	A. L. and B. J. Carroll	397,967	Feb. 19	1293	345	46	850
Sanding machine. Mold	G. Potts	397,247	Feb. 5	215	54	46	616
Sash-balance	Q. Baldwin	399,963	Mar. 19	1763	456	46	1483
Sash-balance	F. L. Rosentreter	397,941	Feb. 19	1257	335	46	843
Sash-balance	J. Spencer	399,216	Mar. 5	651	170	46	1239
Sash-balances. Chain attachment for	R. A. Breul	398,221	Feb. 19	1679	444	46	913
Sash-cord fastener	E. W. Abbe	397,680	Feb. 12	898	237	46	756
Sash-fastener	G. H. Aylworth	396,720	Jan. 15	1545	390	46	318
Sash-fastener	J. I. Baringer	395,685	Jan. 8	592	148	46	128
Sash-fastener	F. A. Bascom	396,386	Jan. 22	1646	423	46	345
Sash-fastener	A. N. Bender	400,289	Mar. 26	2251	589	46	1596
Sash-fastener	C. H. Dexter	396,548	Jan. 22	1898	490	46	393
Sash-fastener	J. Eberhardt	398,884	Mar. 5	99	27	46	1132
Sash-fastener	J. G. Erickson	396,150	Jan. 15	1290	330	46	272
Sash-fastener	J. S. Fisher	395,321	Jan. 1	25	6	46	7
Sash-fastener	G. Gehrung	398,589	Mar. 5	111	30	46	1135
Sash-fastener	W. T. Morgan	396,363	Jan. 15	1613	412	46	330
Sash-fastener	D. J. Powers	395,513	Jan. 1	314	80	46	66
Sash-fastener	T. S. Smith	398,549	Feb. 26	2168	572	46	1028
Sash-fastener	T. H. Teal and R. A. Campbell	399,169	Mar. 5	578	149	46	1236
Sash-fastener	H. A. Flatman and J. Seed	398,039	Feb. 19	1423	376	46	873
Sash-holder	J. M. Grubb	395,894	Jan. 8	924	238	46	192
Sash-holder	A. G. Murray	396,830	Jan. 22	2327	595	46	467
Sash-holder	L. Pfingst	396,709	Jan. 22	2135	544	46	438
Sash-holder	W. F. Mills	399,683	Mar. 19	1352	347	46	1412
Sash. Machine for bending metal	W. F. Mills	399,545	Mar. 12	1147	297	46	1361
Sash. Machine for making metal	H. Geyer	400,323	Mar. 26	2304	603	46	1607
Sausage-stuffing machine. Hydraulic	G. H. Holmes	397,646	Feb. 12	844	220	46	745
Saw	A. Oakes	398,792	Feb. 26	2533	674	46	1100
Saw	N. Petry	398,079	Feb. 19	1478	391	46	885
Saw	W. T. Wilson	398,302	Feb. 19	1609	478	46	950
Saw attachment. Hand	N. W. Rasnicke	399,695	Mar. 19	1368	352	46	1416
Saw-clamping device	R. F. Darling	396,145	Jan. 15	1281	328	46	271
Saw. Drive	G. T. Shepley	398,350	Feb. 19	1692	496	46	964
Saw. Fire-wood drag	F. M. Aylward	397,957	Feb. 19	1278	341	46	847
Saw-gage. Adjustable	W. V. Prince	396,606	Jan. 22	2072	532	46	427
Saw-gin	R. S. Munger	396,706	Jan. 22	2129	545	46	437
Saw-gummer	C. S. McMillan	399,066	Mar. 5	381	103	46	1187
Saw. Hack	G. N. Clemson	400,057	Mar. 26	1900	494	46	1528
Saw-hammering machine	R. Whitehill	399,366	Mar. 12	879	228	46	1310
Saw handle. Crosscut	M. Bennett	397,580	Feb. 12	736	191	46	725
Saw machine. Swing	E. D. Mackintosh	396,217	Jan. 15	1402	357	46	292
Saw machine. Swing	E. D. Mackintosh	396,218	Jan. 15	1403	358	46	292
Saw-mill dog	J. Flesher	397,636	Feb. 12	831	217	46	743
Saw-mill dog	H. R. Wolfe	395,373	Jan. 1	99	26	46	22
Saw-mill feed mechanism	A. Lang	395,840	Jan. 8	837	216, 217	46	175
Saw-mill set-works	F. W. Cook	398,942	Mar. 5	191	51	46	1150
Saw-set	A. L. and E. Buell	399,490	Mar. 12	1059	276	46	1345
Saw-set	A. J. Lewis and F. A. Sauer	396,406	Jan. 22	1680	431	46	852
Saw-setting device	A. Effinger, L. L. Dewecse, C. W. Koons, and W. H. Metzger	399,391	Mar. 12	920	239	46	1318
Saw-setting device	W. Trabue	398,357	Feb. 19	1893	498	46	966
Saw-setting machine	A. Logan	396,823	Jan. 29	2314	593	46	483
Saw sharpeners. Feed device for gin	W. Behan and P. Frienschner	396,800	Jan. 29	2285	584, 585	46	477
Saw-sharpening machine	M. Covel	398,030	Feb. 19	1410	372	46	870

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Saw-swaging machine	M. Covel	398,032	Feb. 19	1413	{373 / 374}	46	871
Saw. Swinging	E. E. Williams	400,281	Mar. 26	2228	586	46	1594
Saw-tables. Feed mechanism for	C. R. Morgan	397,930	Feb. 19	1243	332	46	840
Saw-tightener	S. Walter	395,367	Jan. 1	89	24	46	20
Saws. Device for holding and dressing	M. Covel	398,031	Feb. 19	1411	373	46	871
Saws. Guide for band and scroll	D. W. Perry	395,797	Jan. 8	772	200	46	1303
Saws. Machine for fitting the ends of band	J. M. Petersen	399,344	Mar. 12	839	219	46	1462
Saws. Machine for gumming and sharpening gin	T. H. Nance	399,919	Mar. 19	1704	441	46	1482
Saws. Tempering	J. Pelts	400,248	Mar. 26	2187	574	46	1586
Sawing-machine	R. H. Hoyt	399,900	Mar. 19	1672	{433 / 434}	46	1476
Sawing-machine	J. B. Ivey	396,935	Jan. 29	2476	{638 / 639}	46	517
Sawing-machine	W. E. Patterson	397,203	Feb. 5	155	41	46	606
Sawing-machine	E. W. Snedeker	395,719	Jan. 8	637	{161 / 162}	46	137
Sawing machine. Scroll	C. W. Sedwick	398,803	Feb. 26	2546	678	46	1104
Sawing machine. Wood	T. J. Baldwin	397,622	Feb. 12	812	212	46	739
Sawing machine. Wood	B. F. Camp	396,026	Jan. 8	1116	284	46	228
Scaffold. Adjustable	M. Kull	396,163	Jan. 15	1313	336	46	275
Scale and measure. Grain	E. J. M. Becker	399,473	Mar. 12	1031	271	46	1341
Scale. Automatic grain	J. Locher	399,678	Mar. 19	1346	{345 / 346}	46	1410
Scale. Dress-cutter's	R. Hurlle	395,566	Jan. 1	392	100	46	81
Scale. Electro-magnetic grain	W. A. Holly and U. Malin	397,594	Feb. 12	762	199	46	730
Scale for surface measurements	G. H. Benedict	397,686	Feb. 12	905	{239 / 240}	46	757
Scale for weighing liquids. Spring	T. Lieb	399,052	Mar. 5	369	99	46	1185
Scale-measure	S. J. Hester	397,128	Feb. 5	34	8	46	585
Scale-pan	F. H. Burrill and G. G. Russell	399,315	Mar. 12	801	207	46	1295
Scale. Weighing	L. C. Farmer	399,860	Mar. 19	1619	419	46	1465
Scale. Weighing	T. H. Herndon	396,569	Jan. 22	1932	497	46	399
Scale. Weighing	W. H. Stewart	399,446	Mar. 12	989	258	46	1333
Scale. Weighing	J. G. McNeill	396,285	Jan. 15	1496	379	46	309
Scale. Weighing and price	O. W. Van Denburgh	397,040	Jan. 29	2621	676	46	547
Scale. Weighing and price	H. A. Lewis	397,464	Feb. 5	550	144	46	683
Scales. Hydrostatic indicator for weighing	H. L. Fisher and J. W. Ballard	398,824	Mar. 5	18	5	46	1117
Scales. Railway	J. T. Friend	399,865	Mar. 19	1625	421	46	1466
Scales. Weighing	G. B. Adams	397,955	Feb. 19	1276	340	46	846
Scarf-holder	M. Forbes	396,994	Jan. 29	2555	660	46	534
Scarf-tip	E. S. Bellows	399,730	Mar. 19	1420	365	46	1426
Scissors. Button-hole	J. A. Henckels	398,509	Feb. 26	2117	557	46	1017
Scourer: *See* Grain-scourer.							
Scraper	L. R. Carbart	396,647	Jan. 22	2048	526	46	422
Scraper and roller	W. Huggins	395,784	Jan. 8	743	190	46	157
Scraper. Foot	W. H. Tyler	400,019	Mar. 19	1844	479	46	1508
Scraper. Road	E. Burbance	398,581	Feb. 26	2214	{585 / 586}	46	1037
Scratch-gage	W. G. Rose	396,371	Jan. 15	1021	415	46	332
Screen-frame	H. F. Hall	397,797	Feb. 12	1061	283	46	788
Screw-cutting die	A. E. Brion	395,810	Jan. 8	796	208	46	167
Screw-cutting die	T. L. Smith	399,707	Mar. 19	1398	357	46	1420
Screw-cutting die	J. E. Woodbridge	399,367	Mar. 12	880	229	46	1310
Screw-driver	C. B. Morgan	395,450	Jan. 1	211	54	46	45
Screw-driver	C. A. Strasser	398,986	Mar. 5	266	73	46	1165
Screw. Jack	C. H. Hopkins	398,617	Feb. 26	2306	601	46	1047
Screw. Jack	M. Relsch	397,367	Feb. 5	420	111	46	657
Screw-tapping machine	H. H. Taylor	399,353	Mar. 12	863	224	46	1307
Screws and bolts by electricity. Manufacturing	E. Thomson	398,912	Mar. 5	141	38	46	1141
Screws. Clamping operating handle for adjusting	W. Lyman	395,965	Jan. 8	1056	268	46	217
Screws. Tool for nicking heads of	J. F. Thayer	397,208	Feb. 5	164	43	46	607
Seal	E. J. Brooks	395,481	Jan. 1	257	67	46	55
Seal-lock	E. C. Bartlett	398,371	Feb. 26	1923	{506 / 507}	46	980
Seal-lock	M. C. Harney	399,526	Mar. 12	1116	290	46	1356
Seal-lock	E. H. Lea and W. B. Marks	398,411	Feb. 26	1975	520	46	990
Seal-lock	E. Meise	395,792	Jan. 8	761	197	46	160
Seal-lock	O. T. Welch	397,210	Feb. 5	168	45	46	608
Seal-lock	C. Zwickart	399,722	Mar. 19	1408	362	46	1424
Seal. Metallic	A. J. Phelps	397,324	Feb. 5	416	110	46	656
Seal-press	J. G. Strodtmann	395,521	Jan. 1	322	82	46	68
Seat: *See* Car-seat. Carriage-seat. Valve-seat. Vehicle-seat. Wagon-seat.							
Secondary battery	J. L. Huber	399,535	Mar. 12	1129	293	46	1358
Secondary battery	R. M. Hunter	400,404	Mar. 26	2425	635	46	1629
Secondary battery	W. Kingsland	397,650	Feb. 12	852	222	46	747
Secondary battery	I. Kitsee	400,226	Mar. 26	2149	564	46	1579
Secondary battery	E. R. Knowles	399,052	Mar. 5	361	97	46	1183
Secondary battery	O. Lugo	396,213	Jan. 15	1395	.....	46	291
Secondary battery	O. Lugo	396,214	Jan. 15	1396	.....	46	291
Secondary battery	J. T. Pedersen	398,075	Feb. 19	1473	390	46	884
Secondary battery	I. L. Roberts	396,367	Jan. 15	1617	.....	46	331
Secondary battery	I. L. Roberts	396,368	Jan. 15	1617	414	46	331
Secondary battery	I. L. Roberts	396,369	Jan. 15	1619	415	46	331
Secondary battery	J. S. Sellon	396,769	Jan. 29	2241	573	46	468
Secondary battery	J. S. Sellon	396,770	Jan. 29	2242	573	46	468
Secondary battery	J. S. Sellon	396,956	Jan. 29	2507	646	46	525
Secondary battery	W. A. Shaw	397,443	Feb. 5	519	136	46	677
Secondary battery	I. A. Timmis	396,194	Feb. 19	1645	435	46	915

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Sectional boiler	J. H. Mills	400,243	Mar. 26	2176	{571 / 572}	46	1584
Sectional jack	J. H. Baird	396,321	Jan. 15	1546	391	46	318
Seed cleaner. Cotton	C. Baumgarten	399,819	Mar. 19	1562	404	46	1453
Seed-drill	J. S. Sheridan	398,450	Feb. 26	2040	535	46	1002
Seed-drill	M. F. White	399,460	Mar. 12	1010	264	46	1337
Seed grader and cleaner	W. Mlnigh	396,887	Jan. 29	2407	{617 / 618}	46	504
Seed. Machine for delinting cotton	E. T. Gennert	396,996	Jan. 29	2557	661	46	534
Seed Machine for delinting cotton	T. P. Sullivan	397,448	Feb. 5	529	139	46	679
Seed mill. Cotton	W. B. Traylor	400,373	Mar. 26	2377	{621 / 622}	46	1621
Seeder, harrow, and roller	W. G. Michael	400,351	Mar. 26	2349	613	46	1615
Seeding-machine	W. D. Arnett	398,112	Feb. 19	1524	{403 / 404}	46	893
Selling-machine. Automatic	J. W. Vaughn	396,674	Jan. 22	2062	{535 / 536}	46	429
Semaphore	J. W. C. C. Schirm	395,405	Jan. 1	145	37	46	31
Semaphore-signal	F. Stitzel and C. Weinedel	398,353	Feb. 19	1886	{496 / 497}	46	964
Semaphore-signal	F. Stitzel and C. Weinedel	399,579	Mar. 12	1198	{309 / 310}	46	1371
Separator: *See* Garlic-separator. Grain-separator. Magnetic separator. Ore-separator.							
Separator	J. M. Bradshaw and W. E. Meek	399,486	Mar. 12	1050	275	46	1344
Separator	J. M. Finch and J. R. Cross	400,201	Mar. 26	2108	553	46	1572
Separator and concentrator. Combined	J. D. Coplen	397,585	Feb. 12	742	192	46	736
Sewage by electricity. Apparatus for purifying	W. Webster, Jr	397,407	Feb. 5	452	121	46	664
Sewage by electricity. Purifying	W. Webster, Jr	396,101	Feb. 19	1504	396	46	889
Sewer-trap	D. H. Donaldson	399,978	Mar. 19	1784	463	46	1497
Sewer-trap	W. Kerr	395,907	Jan. 8	941	242	46	195
Sewer-ventilator	T. P. Worthington	396,187	Jan. 15	1352	347	46	283
Sewing	G. A. and J. G. Xander	399,310	Mar. 12	794	205	46	1294
Sewing-machine	J. Bartlett and G. B. Wiggin	397,579	Feb. 12	733	190	46	744
Sewing-machine	J. Bartlett and G. B. Wiggin	399,818	Mar. 19	1561	404	46	1453
Sewing-machine	J. Bartlett and G. B. Wiggin	400,037	Mar. 26	1870	{486 / 487}	46	1582
Sewing-machine	E. C. Bean	398,765	Feb. 26	2495	{661 / 662}	46	1093
Sewing-machine	J. Boppel	396,979	Jan. 29	2533	{654 / 655}	46	530
Sewing-machine	W. C. Foster	397,496	Feb. 12	598	155	46	699
Sewing-machine	J. H. Griffin	398,323	Feb. 19	1841	486	46	956
Sewing-machine	J. A. House and C. H. Dimond	399,990	Mar. 19	1802	{467 / 468}	46	1501
Sewing-machine	C. F. Littlejohn	397,808	Feb. 12	1076	286	46	790
Sewing-machine	F. W. Müller, Jr	397,996	Feb. 19	1340	357	46	858
Sewing-machine	C. W. Weise	399,364	Mar. 12	875	{227 / 228}	46	1309
Sewing-machine-attachment holder	R. S. Barnum	397,867	Feb. 19	1178	315	46	899
Sewing-machine-attachment holder	E. Seltz	400,257	Mar. 26	2200	577	46	1588
Sewing-machine bobbins, &c. Machine for winding	W. R. Landfear	398,057	Feb. 19	1449	383	46	879
Sewing machine. Button	H. H. Cummings	397,587	Feb. 12	744	{193 / 194}	46	736
Sewing machine. Button	H. H. Cummings	397,588	Feb. 12	750	{194 / 195 / 196}	46	737
Sewing machine. Button	H. H. Cummings	398,585	Feb. 26	2220	587	46	1038
Sewing machine. Button	H. H. Cummings	398,586	Feb. 26	2224	{587 / 588}	46	1038
Sewing machine. Button	L. J. Driscoll	395,384	Jan. 1	117	30	46	26
Sewing machine. Button	L. C. Wing	395,372	Jan. 1	96	25	46	21
Sewing-machine button-hole attachment	H. J. Williams	399,304	Mar. 12	784	204	46	1292
Sewing-machine button-hole-cutting attachment	R. Spahn	399,638	Mar. 12	1286	330	46	1387
Sewing-machine feed mechanism	C. H. Willcox	398,300	Feb. 19	1607	477	46	949
Sewing-machine feeding mechanism	S. W. Wardwell, Jr	396,630	Jan. 22	2025	591	46	418
Sewing-machine heads. Locking device for	W. H. Palmer, Jr	398,534	Feb. 26	2147	567	46	1094
Sewing-machine hemmer	A. Wayne	396,379	Jan. 15	1634	419	46	334
Sewing-machine needle	L. C. Wing	397,619	Feb. 12	809	211	46	738
Sewing-machine needle-clamp	C. P. Bostian	396,350	Jan. 15	1596	402	46	325
Sewing-machine. Overedge	D. R. Dawson	399,744	Mar. 19	1438	370	46	1430
Sewing-machine presser-foot	W. A. Neely	400,355	Mar. 26	2236	615	46	1616
Sewing-machine quilting-frame	H. T. Davis	396,328	Jan. 15	1556	393	46	320
Sewing-machine. Rotary-shuttle	F. T. Leilich	397,652	Feb. 12	854	{223 / 224}	46	747
Sewing-machine ruffler and gatherer	H. C. Goodrich	397,906	Feb. 19	1213	325	46	835
Sewing-machine ruffling and gathering attachment	E. Seltz	398,193	Feb. 19	1641	434	46	914
Sewing-machine shuttle	C. H. Benoit	397,369	Feb. 5	345	84	46	603
Sewing-machine shuttle	S. W. Wardwell, Jr	396,631	Jan. 22	2027	591	46	418
Sewing-machine shuttle-driving mechanism	L. Schultz	399,701	Mar. 19	1376	355	46	1418
Sewing-machine shuttle-operating mechanism	J. Tripp	398,291	Feb. 19	1793	474	46	947
Sewing-machine spool-holder	C. L. Thomas	399,095	Mar. 5	425	115	46	1195
Sewing-machine take-up device	L. E. Moore and W. A. Davis	399,685	Mar. 19	1353	348	46	1419
Sewing-machine take-up mechanism	J. Tripp	399,949	Mar. 19	1744	450	46	1489
Sewing-machine trimming attachment	T. B. Moore	395,626	Jan. 1	492	124	46	99
Sewing-machine. Wax-thread	A. S. Richardson	398,653	Feb. 26	2230	619	46	1052
Sewing-machines. Automatic tension apparatus for	J. S. Gorton	397,640	Feb. 12	837	216	46	744
Sewing-machines. Button-attaching device for	M. Gardner	400,322	Mar. 26	2302	603	46	1607
Sewing machines. Channel-cutting device for sole	E. B. Allen	398,305	Feb. 19	1812	476	46	951
Sewing-machines. Clamp-operating mechanism for button-hole	F. W. Ostrom	396,344	Feb. 19	1873	493	46	961
Sewing-machines. Combined thread-tension and lubricating device for	D. A. Mooney and J. Ireland	398,433	Feb. 26	2007	527	46	996
Sewing-machines. Guiding attachment for	H. C. Goodrich	399,873	Mar. 19	1634	424	46	1468

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg's.	Official Gazette. Vol.	Official Gazette. Page.
Sewing machines. Loop removing and spreading mechanism for button	W. E. Bennett	399,179	Mar. 5	589	151, 152	46	1228
Sewing machines. Loop removing and spreading mechanism for button	R. Thompson	398,010	Feb. 19	1374	363, 364	46	864
Sewing-machines. Waxing device for wax-thread	E. A. Stiggins	399,578	Mar. 12	1196	309	46	1371
Shade cloth. Machine for creasing and cutting window	F. Gaeth	400,321	Mar. 26	2300	602	46	1606
Shade-holder	G. E. Somers	400,133	Mar. 26	2007	525	46	1350
Shade rollers. Extension-strip for window	A. B. Dunkle	398,137	Feb. 19	1561	413	46	900
Shades, maps, &c. Exhibitor for window	E. A. Ballard	396,463	Jan. 22	1765	463	46	369
Shaft. Adjustable vehicle	W. B. Farrar	395,820	Jan. 8	808	211	46	169
Shaft attachment for vehicles	D. D. Hare	399,525	Mar. 12	1115	290	46	1355
Shaft-bearing. Adjustable	B. A. Dobson	395,428	Jan. 1	177	47	46	38
Shaft-coupling for vehicles	D. M. Parry	396,231	Jan. 15	1419	361	46	296
Shaft-holder and wrench. Combined	H. W. Nott	396,048	Jan. 8	1145	291	46	235
Shaft support. Vehicle	J. A. Peel	398,076	Feb. 19	1475	390	46	884
Shaft-supporter for vehicles	H. F. Welch	395,641	Jan. 1	518	130	46	103
Shaking-bolt	H. Bittinger	398,692	Feb. 26	2388	634	46	1071
Shank-protector	H. Schnarr	398,453	Feb. 26	2030	533	46	1000
Shaping material to the arc of any desired circle. Device for	P. Leeds	399,675	Mar. 19	1343	344	46	1410
Shaving utensil. Combination	W. Shay	397,028	Jan. 29	2607	673	46	545
Shavings. Machine for making packing	O. Evenstad and O. Senstad	397,281	Feb. 5	285	68, 69	46	626
Shawl-strap	D. W. Brockway	398,125	Feb. 19	1545	410	46	897
Shearing and clipping machine	T. A. Martin	399,763	Mar. 19	1467	378	46	1435
Shears. *See* Animal-shears. Pruning-shears.							
Shears	F. J. Cooper	397,698	Feb. 12	919	243	46	760
Shears	W. Richard	396,291	Jan. 15	1504	381	46	311
Shears	W. S. Kisinger	398,897	Mar. 5	124	33	46	1137
Sheave	W. Duncan	397,279	Feb. 5	282	68	46	626
Sheet-metal binding	P. Richards	399,502	Mar. 12	1175	304	46	1366
Sheet metal. Cold-rolling	L. L. Sagendorph	398,655	Feb. 26	2332	620	46	1060
Sheet-metal joints. Machine for locking	W. Werts	396,789	Jan. 29	2265	578, 579	46	473
Sheet-metal rings. Machine for threading	J. F. Gent	395,893	Jan. 8	921	237	46	191
Sheet or flake products. Machine for making	J. M. D. France	396,813	Jan. 29	2303	589	46	481
Shelf. Book	L. Schmitt	397,251	Feb. 5	220	57	46	617
Shelf-support. Adjustable	J. W. Graydon	399,881	Mar. 19	1648	426	46	1470
Shell	J. W. Graydon	399,877	Mar. 19	1644	425	46	1469
Shell. High-explosive							
Sheller: *See* Corn-sheller.							
Shelving. Metal	M. R. Jewell	395,328	Jan. 1	36	9	46	10
Shingle sawing machine	E. Anderson	397,328	Feb. 5	340	89	46	642
Shingle-sawing machine	D. and W. L. Chase	398,230	Feb. 19	1694	448, 449	46	926
Shingles. Machine for coating and sanding	J. Jaquet	398,332	Feb. 19	1854	489	46	959
Shipping-case	B. S. Atwood	397,214	Feb. 5	173	46	46	609
Shipping-package	I. L. Rock	398,839	Feb. 26	2156	569	46	1025
Ship's locker	F. M. Barber	395,648	Jan. 1	534	134	46	108
Ships' logs. Register for	R. Rood	397,661	Feb. 12	869	228	46	750
Shirt	S. Miller	399,914	Mar. 19	1698	439	46	1481
Shirt or vest and suspenders. Combined	J. T. Brodnax	399,238	Mar. 12	696	179	46	1274
Shirt-wristband	W. E. Howell	397,920	Feb. 19	1328	328	46	838
Shock binder	C. Ben	398,935	Mar. 5	182	48	46	1148
Shoe	N. Ward	396,787	Jan. 29	2262	578	46	472
Shoe-clasp	M. N. Bray	399,237	Mar. 12	665	179	46	1274
Shoe-horn	S. D. McKenty	396,411	Jan. 22	1657	433	46	353
Shoe-maker's anvil	P. Murtha	396,106	Jan. 15	1236	314	46	261
Shoe-polishing machine	J. D. Bright	398,124	Feb. 19	1543	400	46	897
Shoes. Manufacturing	G. W. Canton	397,488	Feb. 12	586	152	46	608
Shoes or gloves. Fastener for	W. J. Brown	395,778	Jan. 8	767	192	46	151
Shoeing-stand	J. J. Halstead	399,886	Mar. 19	1657	428	46	1472
Shores. Device for protecting	J. M. Rearden	398,080	Feb. 19	1479	392	46	865
Shoulder-brace	R. V. Shockey	396,837	Jan. 29	2337	598	46	489
Shovel: *See* Hop-shovel. Snow-shovel.							
Shovel	H. Brand	397,964	Feb. 19	1289	344	46	849
Shovel	E. L. Fenerty	398,887	Mar. 5	101	28	46	1133
Show-case	F. X. Ganter	398,605	Feb. 26	2248	596	46	1043
Show-case. Revolving	F. X. Ganter	398,604	Feb. 26	2247	595	46	1043
Show-case supporter and card-holder	G. C. Frye	399,256	Mar. 12	712	185	46	1279
Show-rack	B. G. Casler	398,027	Feb. 19	1406	371	46	870
Shower-bath	D. Grove	398,694	Mar. 5	118	32	46	1135
Shutter-bower	J. J. Taylor	396,442	Jan. 22	1736	446	46	363
Shutter-fastener	J. A. Baehman	399,734	Mar. 19	1411	363	46	1424
Shutter-fastener	G. F. Folsom	395,557	Jan. 1	379	96	46	78
Shutter. Window	J. T. and S. W. Miller	395,577	Jan. 1	415	106	46	86
Side spring for carriages	E. A. Chubb	396,071	Jan. 15	1178	298	46	250
Side spring. Vehicle	J. F. Thomas	398,008	Feb. 19	1367	362	46	863
Siding-gage	S. G. Hosack	399,898	Mar. 19	1669	432	46	1475
Siding gage and square	P. M. Curtis	396,075	Jan. 15	1185	300	46	251
Sieves. Device for mending	E. A. Bolus	400,292	Mar. 26	2254	590	46	1597
Sifter	G. H. Fountain	399,662	Mar. 19	1621	420	46	1465
Sifter. Ash	G. W. Bown	399,371	Mar. 12	885	230	46	1311
Sifter for stoves. Ash	E. E. Smith	396,178	Jan. 15	1339	344	46	280
Sifter. Household	J. T. Quinn	396,834	Jan. 29	2333	597	46	488
Sign	G. W. Sanderson	400,364	Mar. 26	2367	618	46	1619
Sign-plate	D. Macdonald	396,704	Jan. 22	2128	545	46	437
Sign. Translucent	E. A. Dubey	397,072	Jan. 29	2069	530	46	556
Signal: *See* Danger-signal. Semaphore-signal. Railway-signal. Switch-signal. Railway block-signal.							
Signal device. Pedal bell	J. B. Griffin	396,898	Jan. 29	2376	610	46	498

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg's.	Official Gazette. Vol.	Official Gazette. Page.
Signal-operating device for trains	W. Glasgow	399,193	Mar. 5	614	160	46	1232
Signal-post	J. T. Hambay	399,580	Mar. 19	1661	429	46	1473
Signal transmitter. Multiple	M. Martin	397,194	Feb. 5	143	38	46	603
Signaling and alarm apparatus. Electric	W. L. Denio	397,638	Feb. 12	1113	298	46	798
Signaling apparatus. Electric	J. P. Coleman	395,315	Jan. 1	12	4	46	5
Signaling apparatus. Electric	M. W. Dewey	395,958	Jan. 8	1010	259	46	209
Signaling apparatus. Electric	M. W. Dewey	395,959	Jan. 8	1015	259	46	210
Signaling apparatus. Electric	W. Henion	396,307	Jan. 15	1385	355	46	289
Signaling apparatus. Electric	J. Young	396,795	Jan. 29	2278	582	46	475
Signaling apparatus. Transmitting-instrument for electric	W. J. Dudley	399,505	Mar. 12	1079	281, 282	46	1349
Silk. Machine for throwing	J. E. Tynan	396,350	Feb. 19	1898	499	46	967
Sink-cleaner	W. V. Esmond	399,321	Mar. 12	810	209	46	1297
Skate	T. H. McQueown	396,413	Jan. 22	1688	433	46	353
Skate	J. A. Whelpley	399,365	Mar. 12	877	228	46	1310
Skylight	O. André	395,306	Jan. 1	2	1	46	3
Slack-burning furnace	T. Wilkinson and J. Glendinning	397,951	Feb. 19	1271	330	46	845
Slag-furnace	O. T. X. Adams	395,644	Jan. 1	524	131, 132	46	105
Slag. Manufacture of	S. T. C. Bryan	400,048	Mar. 26	1867	490	46	1625
Slag. Mechanically treating and annealing	S. T. C. Bryan	400,046	Mar. 26	1865	.....	46	1625
Slag. Treating	S. T. C. Bryan	400,047	Mar. 26	1867	.....	46	1625
Slate. Artificial	C. Brown	399,374	Mar. 12	894	239	46	1312
Slates, blackboards, &c. Cleaner for	N. Jensen	395,905	Jan. 8	937	241	46	194
Sled	F. M. Conner	395,879	Jan. 8	900	231	46	187
Sled	F. W. Hofele	397,060	Jan. 29	2678	603	46	558
Sled	F. W. Hofele	397,061	Jan. 29	2679	603	46	558
Sled. Bob	J. Parr	395,993	Jan. 8	1073	273	46	221
Sled-brake	F. Gretzler	397,231	Feb. 5	195	52	46	613
Sled-brake	C. E. Holley	399,405	Mar. 12	940	243	46	1322
Sled-propeller	J. Draper	395,553	Jan. 1	368	94	46	77
Sled-shoe	F. W. Tilden	397,617	Feb. 12	807	210	46	738
Sled. Steam	J. F. Conniff	400,058	Mar. 26	1901	494	46	1598
Sleeper	H. Hipkins	396,160	Jan. 15	1309	335	46	275
Sleigh	H. A. Currier	395,955	Jan. 8	1007	258	46	208
Sleigh	W. J. Hamill	399,890	Mar. 19	1661	429	46	1473
Sleigh	L. Kelley	399,335	Mar. 12	808	215	46	1301
Sleigh	F. C. Klipstein	397,728	Feb. 12	961	256	46	767
Sleigh. Bob	R. H. Olive	397,747	Feb. 12	990	262	46	773
Sleigh. Bob	J. F. Platt	396,232	Jan. 15	1420	361	46	296
Sleigh-brake	W. R. Wilcox	396,844	Jan. 29	2345	600	46	491
Sleigh-knee	T. G. Mandt	399,913	Mar. 19	1697	430	46	1480
Sleigh-knee	W. H. Spear	396,005	Jan. 8	1091	277	46	234
Sleigh-knee	E. J. Youngs	399,642	Mar. 12	1292	331	46	1389
Sleigh-kneee. Coupling for bent	J. J. Cobb	395,679	Jan. 1	578	145	46	117
Sleigh-runner	T. E. Lewis	395,398	Jan. 1	136	35	46	30
Sleigh-runner for wheeled vehicles	D. G. Wyeth	400,381	Mar. 26	2390	625, 626	46	1623
Sliding gate	G. W. Stewart	398,861	Mar. 5	67	18	46	1127
Slimes. Apparatus for saving	S. Hansen	395,826	Jan. 8	815	212	46	171
Smelting-furnace slag steam-generating furnace and plant	O. T. X. Adams	395,643	Jan. 1	520	129, 130, 131	46	104
Smelting ores. Plant for use in	P. H., Jr., and O. T. X. Adams	399,124	Mar. 5	479	129, 130, 131	46	1206
Smelting ores. Plant for use in	P. H., Jr., and O. T. X. Adams	399,123	Mar. 5	481	130, 131	46	1207
Smoke-consumer	A. C. Badan	399,817	Mar. 19	1560	404	46	1453
Smoke-consumer	H. Blaisdell	398,688	Feb. 26	2383	632	46	1070
Smoke. Consuming	R. H. Michell	399,062	Mar. 5	376	101	46	1186
Smoke-consuming bridge-wall cap	H. Liebbe	398,415	Feb. 26	1986	522	46	902
Smoke-consuming furnace	J. Gilbert	397,353	Feb. 5	371	97, 98	46	648
Smoke-consuming furnace	C. McGinnis	397,135	Feb. 5	46	10	46	587
Smoke-consuming furnace and air-heater	F. W. Wiesebrock	398,684	Feb. 26	2316	631	46	1068
Smoke, spark, and cinder arrester	W. B. Johnson	396,607	Jan. 22	2118	543	46	435
Snap-hook	O. V. Blanier	399,005	Mar. 5	301	82	46	1172
Snap-hook	W. N. Fessenden	398,599	Feb. 26	2240	593	46	1041
Snap-hook	H. G. McLean	397,136	Feb. 5	47	11	46	587
Snap-hook	R. R. Waddell	397,948	Feb. 19	1267	336	46	845
Snap-hook and buckle. Combined	A. J. McCord	395,963	Jan. 1	556	139	46	112
Snap-hook wire	S. P. Scott	400,256	Mar. 26	2199	577	46	1588
Snarling-machine	W. McPherson	396,412	Jan. 22	1638	433	46	353
Snell	E. C. Vom Hofe	396,246	Jan. 15	1440	366	46	299
Snell	H. L. Willoughby	396,130	Jan. 15	1264	323	46	247
Snow-plow	J. Corbett	395,548	Jan. 1	358	92	46	75
Snow-plow	M. B. Eaton	400,197	Mar. 26	2102	554, 555	46	1571
Snow-plow	E. M. Hesselbom	399,895	Mar. 19	1666	431	46	1474
Snow-plow	J. Rudrauff	398,982	Feb. 19	1776	469, 470	46	943
Snow-plow	O. Williams	400,154	Mar. 26	2043	534, 535	46	1557
Snow shovel and scraper	L. Fairweather	399,394	Mar. 12	922	239	46	1318
Soap. Making	H. T. D. Schwahn	396,343	Jan. 15	1577	.....	46	393
Sod-cutter and pulverizing-harrow	A. Madson	396,166	Jan. 15	1318	337	46	276
Sod-cutter, stalk-cutter, and roller	T. Horton and J. P. Whitehouse	397,502	Feb. 12	607	157	46	701
Soda. Recovering	C. F. Dahl	396,546	Jan. 22	1891	487, 488, 489	46	392
Sodium salt. Making a	J. I. Watts and W. A. Richards	399,176	Mar. 5	585	.....	46	1228
Sodium. Salt of	J. I. Watts and W. A. Richards	399,175	Mar. 5	564	.....	46	1227
Sofa	F. W. Heringshausen	397,400	Feb. 12	1066	284	46	736
Sofa and bed. Combined	C. T. Hard	400,079	Mar. 26	1932	504	46	1534
Solder. Device for feeding and cutting	C. W. Sleeper	398,645	Feb. 26	2247	623	46	1062
Solder-rods. Apparatus for manufacturing	J. Robertson	398,976	Mar. 5	946	66	46	1161

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Soldering caps in filled cans	E. Norton	395,796	Jan. 8	771	200	46	161
Soldering-iron. Hand	E. J. Dolan	399,387	Mar. 12	914	237	46	1316
Soldering-machine	E. J. Dolan	399,386	Mar. 12	912	236, 237	46	1316
Soldering-machine	J. Solter	397,758	Feb. 12	1000	265, 266	46	776
Soldering machine. Can-	W. D. Brooks	400,294	Mar. 26	2256	500	46	1597
Soldering machine. Can-	W. D. Brooks	400,295	Mar. 26	2259	501	46	1598
Soldering machine. Can-	J. M. Colbert	399,020	Mar. 5	321	86	46	1176
Soldering machine. Can-	W. Hippering	399,012	Mar. 5	330	94	46	1181
Sole-edge-burnishing tool	W. Gordon	399,009	Mar. 12	1244	320	46	1379
Sole-laying machine	A. T. Tregurtha	398,358	Feb. 19	1895	498	46	966
Sounder attachment	G. H. Carey and W. McArthur	396,465	Jan. 22	1767	433	46	370
Sounding-lead	H. Holden	398,396	Feb. 26	1957	515	46	998
Sower. Rotary seed-	J. H. Adamson	396,251	Jan. 15	1445	368	46	301
Sower. Seed-	W. A. C. Oaks	397,606	Feb. 12	795	207	46	735
Spade. Ditching-	J. E., J. H., and S. E. Ketcham	396,659	Jan. 22	2063	530	46	425
Spark-arrester	G. B. Taylor	397,258	Feb. 5	222	60	46	620
Spark-conductor	K. H. Carper	398,818	Mar. 5	10	3	46	1116
Spark extinguisher and arrester	Q. J. Hoke	397,363	Feb. 5	385	101, 102	46	651
Specific-gravity apparatus	J. J. Hicks	398,726	Feb. 26	2447	648	46	1083
Speculum. Rectal	J. M. King	395,705	Jan. 8	618	155	46	133
Speech. Recording	G. H. Herrington	397,456	Feb. 12	1138	304	46	903
Speed-indicator	E. N. Barber	398,928	Mar. 5	172	44, 45	46	1146
Speed-indicator	E. N. Barber	398,929	Mar. 5	174	45	46	1146
Speed-indicator	E. C. Smith	397,295	Feb. 5	429	114	46	659
Speed-regulating device. Fluid	W. E. Nickerson	396,108	Jan. 15	1237	314	46	261
Speed regulator	F. Hart	397,716	Feb. 12	942	250	46	764
Spike-machine	J. F. Collins	399,500	Mar. 12	1069	279	46	1347
Spinning and twisting yarn. Machine for	G. B. Lukens	398,270	Feb. 19	1735	463	46	930
Spinning-frames, &c. Clearer for removing waste, &c., from the top of	W. E. Sharples	396,616	Jan. 22	2004	516	46	414
Spinning frames. Traveler-clearer for ring-	T. H. Speakman	398,550	Feb. 26	2171	573	46	1028
Spinning hemp, &c. Feed-regulator for machines for	G. Ryan	398,848	Mar. 5	47	14	46	1123
Spinning-machine, &c	P. Wallace	398,676	Feb. 26	2365	628	46	1066
Spinning-machine spindle	D. Jackson	399,046	Mar. 5	355	95	46	1182
Spinning machines, &c. Support for spindles and rings of ring-	E. Dummer	396,148	Jan. 15	1284	329	46	271
Spinning-machines. Top roll for	E. Wright	395,938	Jan. 8	983	252	46	204
Spinning-spindles. Bobbin-support for	L. D. Van Valkenberg	398,809	Feb. 26	2351	679	46	1105
Spinning-spindles. Driving mechanism for	T. L. Butler	397,620	Feb. 12	822	215	46	741
Spittoon	A. E. Moore	397,200	Feb. 5	153	41	46	605
Spoke-tenon	W. F. Morton	397,995	Feb. 19	1339	357	46	856
Spokes. Machine for drawing	W. Shelly	400,127	Mar. 26	1999	523	46	1549
Spokes. Machine for trimming wire	P. Gendron	396,814	Jan. 29	2303	589, 590	46	481
Spokeshave	I. Camier	395,738	Jan. 8	667	170	46	143
Spool-holder	T. W. Norton	399,921	Mar. 19	1706	442	46	1483
Spool-stand	V. Melas	399,760	Mar. 19	1477	381	46	1437
Spools of thread. Spindle for	S. B. Pratt	398,000	Feb. 19	1356	360	46	860
Spools. Thread-holder for	S. B. and C. B. Pratt	397,999	Feb. 19	1355	359	46	860
Spoon-rest	H. H. Abbe	397,885	Feb. 19	1177	315	46	829
Spray-producing apparatus. Electric	H. A. B. Huguet de Vars	398,327	Feb. 19	1847	487	46	957
Spring: *See* Bolster-spring. Car-spring. Cart-spring. Door-spring. Side spring. Vehicle-spring. Wagon-spring. Wagon-bolster spring.							
Spring	F. Latulip	397,969	Feb. 19	1331	355	46	856
Spring-bending machine	J. N. Rice	399,160	Mar. 5	563	145, 146	46	1223
Spring-block	M. W. Clark	395,545	Jan. 1	355	91	46	74
Spring-clasp for holding letters	L. Steinberger	400,138	Mar. 26	2013	527	46	1551
Spring-coiling machine	L. J. Pennock	395,511	Jan. 1	310	78, 79	46	66
Spring-lock	H. K. Harker	398,392	Feb. 26	1953	514	46	985
Spring-making machine	C. C. Hill	400,340	Mar. 26	2328	608, 609	46	1611
Spring-motor	C. H. Smith	396,243	Jan. 15	1436	365	46	298
Spring-motor	H. L. Suydam	396,355	Feb. 19	1891	497	46	966
Springs. Making flat coiled	G. Kelly	397,861	Feb. 12	1145	306	46	805
Springs. Making steel-trap	S. Mitchell	395,846	Jan. 8	849	219	46	178
Sprinkler: *See* Lawn-sprinkler. Water-sprinkler.							
Sprinkler	J. Naber, Jr	398,901	Mar. 5	128	35	46	1138
Sprinkling or irrigating apparatus	J. Walter	395,726	Jan. 8	649	166	46	140
Spur	W. Nicholls	397,304	Feb. 5	301	77	46	633
Square and bevel. Try-	C. F. Merrifield	399,424	Mar. 12	963	250	46	1327
Square, bevel, and protractor. Try-	F. S. Talmadge	396,761	Jan. 29	2255	576	46	470
Square. Dress-maker's	K. A. Luta	396,099	Jan. 15	1226	310	46	259
Square. Micrometer caliper-	L. S. Starrett	399,167	Mar. 5	576	148	46	1236
Square. Tailor's and dress-maker's	P. Fant	396,396	Jan. 22	1661	427	46	347
Stacker	T. Berry	398,934	Mar. 5	180	48	46	1148
Stacker. Shiftable	W. S. Reeder	399,211	Mar. 5	641	168	46	1227
Stalk cutter. Corn or cotton	M. B. Banowets	398,216	Feb. 19	1671	442	46	921
Stalk-puller	G. W. Rogers	396,894	Jan. 29	2418	621, 622	46	507
Stall and stock-handling apparatus. Combined	C. F. Shedd	397,206	Feb. 5	161	42, 43	46	606
Stamp-affixing machine	W. R. Miller	397,087	Jan. 29	2087	695	46	559
Stamp. Printing-	J. Sigwalt, Jr	399,069	Mar. 5	414	112	46	1193
Stamp. Rubber-	E. Reynolds	396,233	Jan. 15	1421	362	46	296
Stamps. Dating device for hand-	L. K. Scotford	395,518	Jan. 1	319	81	46	67
Stamping designs in metal leaf	M. J. Masters	396,220	Jan. 15	1405	.....	46	293
Stanchion. Cattle-	D. Lane	399,630	Mar. 12	1261	324	46	1382

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Stand: *See* Barrel-stand. Christmas-tree stand. Flower-stand. Music-stand. Photometer-stand. Railway-switch stand. Shoeing-stand. Spool-stand. Switch-stand. Wash-stand. Water-cooler stand. Window-stand. Work-stand.							
Stand for charts, &c	L. B. Somerby	397,759	Feb. 12	1003	266	46	776
Standards. Holder for revolving	H. Westphal	395,766	Jan. 8	705	181	46	150
Starch. Manufacturing	J. N. Hurty	395,977	Jan. 8	1042	265	46	215
Starching-machine	T. J. Blake	400,184	Mar. 26	2085	546	46	1567
Station-indicator	J. R. Angel	396,019	Jan. 8	1108	281	46	227
Station-indicator	O. E. Miebaud	400,942	Mar. 26	2175	570, 571	46	1584
Station-indicator	J. Tullina	397,894	Feb. 12	1098	294	46	795
Statistics. Apparatus for compiling	H. Hollerith	395,783	Jan. 8	739	189	46	156
Statistics. Compiling	H. Hollerith	395,781	Jan. 8	725	187, 188, 189	46	154
Statistics. Compiling	H. Hollerith	395,782	Jan. 8	736	75, 76, 77	46	156
Stave jointing and planing machine	W. J. Wright	398,993	Mar. 5	275	76	46	1167
Stave-making machine	W. L. Kellogg	399,670	Mar. 19	1235	342	46	1408
Stave-sawing machine	C. R. Penfield	396,763	Jan. 29	2229	571	46	465
Stay. Garment-	M. P. Bray	396,533	Jan. 22	1870	480	46	388
Steam-boiler	A. I. Barranoff	396,116	Feb. 19	1533	408	46	895
Steam-boiler	A. I. Barranoff	396,376	Feb. 26	1922	505	46	979
Steam-boiler	W. Cowles	396,545	Jan. 22	1887	485, 486, 487	46	391
Steam-boiler	A. Heberer	395,780	Jan. 8	794	188	46	154
Steam-boiler	W. E. Kelly	397,190	Feb. 5	36	8, 9	46	585
Steam-boiler	R. Reynolds	399,560	Mar. 12	1173	303	46	1366
Steam-boiler	G. Stringer	398,470	Feb. 26	2053	539	46	1005
Steam-boiler. Sectional	J. J. and M. A. Rufe	397,026	Jan. 29	2004	672	46	544
Steam-boiler. Sectional	C. L. Seabury	399,571	Mar. 12	1187	307	46	1369
Steam-engine	E. Beare	396,850	Jan. 29	2351	692	46	492
Steam-engine	G. W. Fite	395,967	Jan. 8	1026	261	46	212
Steam-engine	D. A. Frazer	398,822	Jan. 8	810	211	46	170
Steam-engine	H. N. Gale	398,143	Feb. 19	1568	415	46	901
Steam-engine	D. D. Hardy	400,081	Mar. 26	1934	505, 506	46	1535
Steam-engine	E. S. Harpst	395,395	Jan. 1	30	7, 8	46	8
Steam-engine	N. Nilson	399,771	Mar. 19	1480	381, 382	46	1438
Steam-engine	A. J. Pierce	398,444	Feb. 26	2019	530	46	998
Steam-engine	G. W. Price	397,468	Feb. 5	555	145	46	684
Steam-engine	J. West	399,101	Mar. 5	432	117	46	1196
Steam-engine	H. H. Westinghouse and F. M. Rites	396,635	Jan. 22	2033	502	46	419
Steam-engine	W. O. and J. D. Worth	399,593	Mar. 12	1222	315	46	1375
Steam-engine. Direct-acting	F. H. Laforge and H. J. Barker	398,164	Feb. 19	1600	424	46	907
Steam-engine. Revolving-piston	W. E. Leonard	397,299	Feb. 5	295	76	46	632
Steam-engine. Rotary	Z. R. Farrington	397,707	Feb. 12	929	246, 247	46	761
Steam-engine. Rotary	D. E. Powers	397,516	Feb. 12	629	163, 164	46	705
Steam-generator	A. L. Gilstrap	399,250	Mar. 12	717	186	46	1280
Steam-generator	H. H. Lindemuth	398,267	Feb. 19	1750	462	46	937
Steam-generator	C. C. Mulford	396,105	Jan. 15	1235	313	46	261
Steam-generator	T. J. Reynolds	399,781	Mar. 19	1494	385, 386	46	1442
Steam-generator	I. Sharp	396,053	Jan. 8	1151	292	46	236
Steam-generator	D. W. Smith	399,165	Mar. 5	573	147, 148	46	1225
Steam generator and radiator combined. Portable	R. G. Ferguson	399,512	Mar. 12	1094	295, 296	46	1351
Steam-generator. Slag	O. B. Peck	395,665	Jan. 1	559	139	46	112
Steam-generators. Fire-box for	A. Graf	397,852	Feb. 12	1134	303	46	802
Steam-heater	D. D. G. Langlands and O. E. Moulton.	397,651	Feb. 12	853	223, 224	46	747
Steam-heater	H. Sperl	396,438	Jan. 22	1730	445	46	363
Steam-motor	O. Noll	399,772	Mar. 19	1483	382, 383	46	1439
Steam-muffler	W. E. Pearson	396,507	Jan. 22	1835	471	46	382
Steam or other pressure gages. Apparatus for testing	J. D. Bowman	398,815	Mar. 5	6	2	46	1115
Steam or pneumatic engine. Direct-acting	G. A. Barth	397,958	Feb. 19	1281	341, 342	46	849
Steam-trap	E. E. Gold	398,719	Feb. 26	2435	645, 646	46	1061
Steam-trap	W. S. Johnson	399,198	Mar. 5	621	161, 162	46	1234
Steam-trap	C. Kammerer	398,622	Feb. 26	2271	602	46	1048
Steam-trap	J. F. Lightford	400,349	Mar. 26	2147	612	46	1614
Steam-trap. Measuring	G. Gunts	397,184	Feb. 5	130	35	46	601
Steel bars. Apparatus for toughening	J. Coffin	399,381	Mar. 12	985	235	46	1315
Steel. Hardening	F. Sedgwick	400,366	Mar. 26	2370	618	46	1619
Steel. Manufacture of	A. T. Hay	399,612	Mar. 19	1947	.....	46	1379
Steel. Manufacture of	R. J. Tilford and H. M. Redemann	397,476	Feb. 5	564	.....	46	688
Steel. Manufacture of	R. J. Tilford and H. M. Redemann	397,477	Feb. 5	565	.....	46	688

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Steel. Manufacture of	R. J. Tilford and H. M. Redemann	397,478	Feb. 5	567	.....	46	686
Steel. Manufacturing	A. T. Hay	399,528	Mar. 12	1118	.....	46	1356
Steel. Manufacturing	J. J. McTighe	397,743	Feb. 12	984	.....	46	772
Steering apparatus	J. Hayes	395,565	Jan. 1	390	99, 100	46	80
Steering apparatus	J. L. Hornig	397,919	Feb. 19	1227	328	46	838
Steering apparatus	J. L. Hornig	398,326	Feb. 19	1845	487	46	957
Steering apparatus for vessels	J. J. Duarte	396,736	Jan. 29	2188	560	46	457
Steering apparatus for vessels	F. W. Martin	396,900	Mar. 5	126	34	46	1138
Steering device for vessels. Auxiliary	C. D. Wooley	396,166	Jan. 15	1352	346	46	283
Steering-gear for vessels and floating bodies	V. F. Lässoe	398,631	Feb. 26	2297	608	46	1052
Stencil	W. F. McKay	396,410	Jan. 22	1686	433	46	353
Stencil-frame	G. W. Lindsey	397,864	Feb. 12	1147	307	46	805
Stenographic machine	C. A. Damon	399,247	Mar. 12	698	181	46	1276
Step. Folding	H. T. Cork	398,496	Feb. 26	2096	552	46	1014
Stereoscope	A. E. Foutch	399,863	Mar. 19	1623	420, 421	46	1465
Stereotype-plate	L. Goss	395,435	Jan. 1	186	48, 49	46	39
Stereotype-plate holder	W. G. Slauson	398,852	Mar. 5	52	15	46	1124
Stereotype-plates. Machine for trimming, planing, and sawing	L. Goss and S. W. Trew	396,478	Jan. 22	1793	459	46	374
Stiffening fabric for garments	N. Jenkins	396,920	Jan. 29	2311	592	46	483
Stilt. Walking	G. P. Smith	398,854	Mar. 5	55	16	46	1125
Stirrup	J. C. Taylor	396,179	Jan. 15	1343	344	46	281
Stitching fabrics	W. C. Foster	397,495	Feb. 12	597	154	46	699
Stitching machine. Wire	C. L. Lasca	397,372	Feb. 5	400	105, 106	46	654
Stock-indicator	J. A. Enos	398,713	Feb. 26	2426	642, 643	46	1079
Stocking	S. M. Michelson	396,945	Jan. 29	2487	641	46	520
Stockings. Making	O. Osborne	398,532	Feb. 26	2145	566	46	1022
Stone. Apparatus for leveling and squaring	M. Hänsel	397,286	Feb. 5	274	71	46	628
Stone-cutting machine	H. Young	397,410	Feb. 5	456	121, 122	46	665
Stone-dressing machine	F. Manning	395,843	Jan. 8	844	218	46	177
Stone-dressing machine	F. Manning	396,044	Jan. 8	1139	289	46	233
Stone, &c. Implement for cutting	J. W. Maloy	399,680	Mar. 19	1349	346	46	1411
Stone-planing machine	W. E. Sidnell	399,705	Mar. 19	1383	356, 357	46	1419
Stone rubbing or dressing machine	D. Mackie	398,634	Feb. 26	2300	609	46	1053
Stone-sawing machine	A. Auguste	398,113	Feb. 19	1596	404, 405	46	893
Stone-sawing-machine gage	L. Melchior and F. Meyer	397,244	Feb. 5	210	55	46	615
Stones. Machine for polishing	M. Hurth	396,162	Jan. 15	1312	335, 336	46	275
Stool for stores. Counter	A. O. Sients	397,615	Feb. 12	803	209	46	737
Stool or seat	C. W. Wiecking	397,044	Jan. 29	2025	677	46	548
Stools or tables. Detachable leg and standard for	G. E. Clow	397,225	Feb. 5	186	49	46	611
Stools. Supplemental bearer for coffin or casket	B. G. Casler	395,381	Jan. 1	113	29	46	25
Stopper: *See* Bottle-stopper.							
Stopper-fastener	C. P. Maiser	396,685	Jan. 29	2405	617	46	504
Store-service apparatus	J. T. Cowley	395,316	Jan. 1	14	4, 5	46	5
Store-service apparatus	G. Keyser	395,332	Jan. 1	41	10, 11	46	11
Store-service apparatus. Electrical	R. N. Dyer	395,961	Jan. 8	1018	260	46	210
Store-service apparatus. Electrical	R. N. Dyer	399,137	Mar. 5	517	135	46	1215
Stove	R. Boersig	398,694	Feb. 26	2390	634	46	1071
Stove	C. W. Emerson	395,430	Jan. 1	178	47	46	38
Stove	W. B. Ginnis	399,767	Mar. 19	1475	380	46	1437
Stove	N. J. Graham	399,030	Mar. 5	330	88	46	1177
Stove and burner. Vapor	H. P. Roberts	399,212	Mar. 5	643	168	46	1238
Stove and furnace. Heating	C. L. Ridgway	395,332	Jan. 1	71	17	46	16
Stove. Combined box and cooking	J. McMaster	399,918	Mar. 19	1703	441	46	1462
Stove. Cooking	G. F. Filley	397,844	Feb. 12	1124	301	46	800
Stove. Cooking	J. U. Musick and W. J. Andrews	398,790	Feb. 26	2531	673	46	1100
Stove-foot	J. F. Fowler	397,714	Feb. 12	940	249	46	764
Stove for heating sad-irons	J. B. Winter	399,719	Mar. 19	1403	361	46	1423
Stove. Gas	A. S. Dinsmore	399,022	Mar. 5	323	87	46	1176
Stove. Gas	L. Ketchum	396,575	Jan. 22	1938	499, 500	46	400
Stove. Gas	L. Ketchum	396,576	Jan. 22	1941	500	46	401
Stove. Heating	G. F. Filley	397,710	Feb. 12	933	248	46	762
Stove. Heating	H. Hopkins and J. R. Perry	395,327	Jan. 1	34	9	46	9
Stove. Heating	C. L. Ridgway	395,333	Jan. 1	73	18, 19	46	17
Stove-hood	H. Neef	399,436	Mar. 19	971	262	46	1329
Stove. Hot-blast	H. Kennedy	398,976	Mar. 5	236	65	46	1150
Stove. Hot-blast	H. Massicks and W. Crooke	398,840	Mar. 5	88	12	46	1121
Stove. Lamp	W. G. Amor	395,535	Jan. 1	342	87	46	72
Stove or range	H. E. Janes	398,050	Feb. 19	1439	381	46	876
Stove or range	G. G. Kniffin	398,515	Feb. 26	2124	559	46	1019
Stove-panel	J. A. Price	395,919	Jan. 8	956	246	46	196
Stove-pipe and tent-support. Combined	J. W. Ancel	396,846	Jan. 29	2146	601	46	491
Stove-pipe heater and ventilator. Combined	A. H. Ross	395,999	Jan. 8	1061	275	46	223
Stove-pipes. Ventilating attachment for	G. L. Jones and E. M. Miles	396,968	Mar. 5	233	64	46	1159
Stove. Portable cooking	A. S. Tomkins	400,271	Mar. 26	2263	583	46	1502
Stove. Portable heating or cooking	J. B. Anderson	395,730	Jan. 8	654	167	46	141
Stove. Safety car	A. Reese	398,890	Feb. 26	2542	676	46	1103
Stove. Smoke-preventing	J. Stott	398,862	Mar. 5	68	19	46	1127
Stoves. Initial lighting device for gasoline-vapor	G. W. Billings	398,691	Feb. 26	2286	633	46	1070
Stoves. Mechanism for preventing the pulsation of burning jets in vapor	G. W. Billings	398,690	Feb. 26	2285	633	46	1070
Stoves. Water-front for	T. F. Hutzel	398,783	Feb. 26	2520	670	46	1097
Strainer-holder	L. A. Tarring	397,357	Feb. 5	231	60	46	630

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Strap: *See* Elastic strap. Hose-strap. Shawl-strap. Trousers-strap.							
Strap, trace, and lace trimmer and cutter	J. Bradley	399,965	Mar. 19	1765	456, 457	46	1494
Straw braid. Machine for grading and reeling	D. Brown	395,734	Jan. 8	602	168, 169	46	142
Straw-carrier	F. Strobel	396,345	Jan. 15	1379	400	46	324
Straw-stacker	R. S. Arbogast	399,312	Mar. 12	796	208	46	1204
Straw-stacker	L. F. Dieter	399,188	Mar. 5	602	156, 157	46	1231
Straw-stacker	W. W. Dingee	399,504	Mar. 12	1076	281	46	1348
Strawberry-vine cutter and cultivator. Combined	G. W. Love	396,098	Jan. 15	1225	310	46	259
Street-curb and subsoil drain	H. S. Hallwood	399,194	Mar. 5	616	160	46	1233
Street or station indicator	W. F. Seeley	396,613	Jan. 22	2000	515	46	413
Street-sprinkling apparatus	M. Haughey	397,287	Feb. 5	275	71	46	628
Street-sweeping machine	C. Z. O'Neill	395,627	Jan. 1	493	125	46	100
Strength-tester. Coin-controlled	G. Soeding	399,942	Mar. 19	1733	448	46	1467
Stringed instruments. Bridge for	M. W. White	396,107	Feb. 19	1509	400	46	891
Stud or other jewelry	A. Luthy	396,661	Jan. 22	2065	530	46	435
Stump-extractor	H. Hollowell	396,067	Jan. 15	1212	306	46	256
Stump or stone lifter. Wheeled	J. S. Kemp	397,807	Feb. 12	1075	286	46	790
Submarine vessel	G. Poore and W. C. Storey	399,693	Mar. 19	1363	351	46	1414
Sugar-cane-slicing machine	C. Rabe	398,348	Feb. 19	1880	495	46	963
Sugar creaming and mixing machine	W. Walther	399,100	Mar. 5	430	117	46	1196
Sulkies. Case for	R. A. Stone	396,779	Jan. 29	2253	575	46	470
Sulky	H. Heinemann	399,231	Mar. 5	672	175	46	1243
Sulky	C. O. Yale	395,375	Jan. 1	102	26	46	23
Sulphur compound	E. Baumann	[illegible]	Jan. 22	1863	.....	46	387
Sunshade	E. Dean	397,172	Feb. 5	109	28	46	598
Superheater and burner	J. Livingstone	399,541	Mar. 12	1142	296	46	1360
Supporter: *See* Abdominal supporter. Ankle-supporter. Shaft-supporter. Show-case supporter.							
Suppository	H. Schmels	398,085	Feb. 19	1484	392	46	886
Surface-gage	C. G. Osteman	396,109	Jan. 15	1238	314	46	261
Surfacing-machine	R. M. Prichard	395,631	Jan. 1	507	127	46	102
Surgical appliance	J. H. Bowen	397,106	Feb. 5	3	1	46	579
Surgical chair	A. P. Gould	397,077	Jan. 29	2673	691, 692	46	557
Surgical drainage-tube	J. E. Lee	399,540	Mar. 12	1141	296	46	1360
Surgical instruments. Handle for	W. Walb	397,949	Feb. 19	1968	388, 389	46	845
Suspender-hook	E. F. Paramore	399,775	Mar. 19	1486	383	46	1440
Suspenders	J. E. Atwood	397,061	Jan. 29	2651	682	46	553
Suspenders	C. P. Crane	396,861	Jan. 29	2366	607	46	496
Suspenders	B. O. Foster	399,514	Mar. 12	1099	286	46	1352
Swill-receptacle	J. W. Hall	396,401	Jan. 22	1671	429	46	350
Swimming apparatus	E. P. Johnston	397,059	Jan. 29	2647	682	46	552
Switch: *See* Blind-switch. Electric switch. Electric-circuit switch. Electric-motor switch. Electrical switch. Interlocking switch. Pneumatic-tube switch. Rail-switch. Railway-switch. Three-throw split switch. Time-switch. Tramway-switch.							
Switch and signal interlocking apparatus	H. Reid	395,588	Jan. 1	431	110	46	89
Switch-board	J. W. Kelly	399,289	Mar. 12	730	190	46	1282
Switch crossing. Double safety	D. Tracy	395,672	Jan. 1	568	149	46	114
Switch for overhead tracks	J. Bouchard	399,007	Mar. 5	304	82	46	1173
Switch for overhead tracks	J. Bouchard	399,008	Mar. 5	305	82	46	1173
Switch mechanism	J. T. Hambay	399,288	Mar. 19	1659	429	46	1473
Switch operating and locking device	T. W. Burley	397,414	Feb. 5	469	124	46	688
Switch-signal	F. N. Kelsey	399,538	Mar. 12	1138	295	46	1359
Switch-stand	A. A. Strom	398,354	Feb. 19	1890	497	46	965
Switch-stand. Automatic	H. Elliot	395,964	Jan. 8	1022	260	46	211
Switches. Connecting-rod for	F. C. Weir	398,102	Feb. 19	1506	399	46	890
Syringe	A. M. Knapp	397,060	Jan. 29	2650	682	46	553
Syringe	B. F. Sutton	397,256	Feb. 5	230	60	46	620
Table: *See* Billiard-table. Dining-table. Folding table. Ironing-table. Kitchen-table. Knock-down table. Metal table. Molder's turn-table. Turn-table.							
Table implement	L. P. Valiquet	400,273	Mar. 26	2294	583	46	1502
Table-knife for green corn	J. F. Wynkoop	399,109	Mar. 5	448	122	46	1199
Table-spreads. Ornamental fabric for	D. W. Campbell	399,182	Mar. 5	503	153	46	1229
Table-top. Folding	A. C. F. Baisy	397,466	Feb. 12	583	151	46	697
Tablet. Combined paper and envelope	R. W. Burns	399,530	Mar. 19	1563	410	46	1458
Tablet cover. Writing	W. B. Pearson	396,508	Jan. 22	1835	471	46	382
Tablet. Duplicating	W. H. Pardee	398,072	Feb. 19	1471	389	46	888
Tablet. Envelope	R. W. Burns	399,529	Mar. 19	1562	409	46	1458
Tablet. Writing	J. C. Chorpenning	397,976	Feb. 19	1296	346	46	850
Tag. Combination	W. H. Lamon	399,756	Mar. 19	1459	376	46	1434
Tag-fastener	W. H. D. Ludlow	400,407	Mar. 26	2431	637	46	1530
Tag-fastener	C. Schoolherr	396,610	Jan. 22	1996	514	46	412
Tag-holder and tag	M. L. Fogel	399,385	Mar. 12	923	248	46	1318
Tag. Shipping	F. R. Alderman	399,812	Mar. 19	1550	400	46	1451
Tally. Grain	J. Bemis	396,603	Jan. 15	1167	326	46	248
Tally-sheet	F. W. Barrett	399,215	Mar. 12	660	178	46	1273
Tallying apparatus for grain-hoppers	J. A. Demuth	396,621	Mar. 5	14	4	46	1117

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Tank: *See* Flush-tank. Water-closet flushing-tank. Oil-tank.							
Tanning	J. Lalor	396,337	Jan. 15	1569	.....	46	322
Tap. Expansible and collapsible	T. F. Hammer	397,126	Feb. 5	29	7	46	584
Tap-hole plug	C. G. Dodge	397,639	Feb. 12	1115	298	46	796
Tap. Pipe	H. C. Bradford	397,167	Feb. 5	103	27	46	597
Tape. Reamer-head for	D. G. Langlands and O. E. Moulton	395,909	Jan. 8	944	242	46	195
Tapping and connecting mains. Apparatus for	A. P. Smith	396,177	Jan. 15	1337	343	46	220
Tapping-bung	J. Van Zandt	399,173	Mar. 5	582	150	46	1227
Tapping-bush for barrels	J. McKenzie	397,377	Feb. 5	407	107	46	655
Tape and ribbon delivering device	J. Brady	395,948	Jan. 8	996	256	46	206
Tapers. Machine for turning and grinding	J. Flather	396,077	Jan. 15	1189	301, 302	46	252
Target	B. Dufner and E. Freiner	399,604	Mar. 12	1238	319	46	1378
Target	M. O. Rehfuss	398,186	Feb. 19	1612	432	46	913
Target. Flying	A. C. Reuss	395,996	Jan. 8	1076	274	46	222
Target. Self-indicating	J. Paterson	395,581	Jan. 1	421	107	46	87
Tax-receipt blank	J. S. Harrison and J. M. Howard	396,560	Jan. 22	1915	495	46	396
Tea-kettle	G. Dakin and H. L. Drullard	399,843	Mar. 19	1596	414	46	1460
Teaching apparatus. Kindergarten	H. Bodey	396,067	Jan. 15	1171	297	46	249
Tedder	A. Arndt	395,307	Jan. 1	4	2	46	3
Teeth. Composition for cleaning the	C. B. Clark	396,192	Jan. 15	1358	.....	46	284
Telegraph-cable	W. R. Patterson	398,441	Feb. 26	2016	529	46	997
Telegraph-cable	W. R. Patterson	398,442	Feb. 26	2017	529	46	998
Telegraph. Octuplex	M. W. Dewey	396,734	Jan. 29	2183	559	46	456
Telegraph. Printing	M. W. Dewey	395,614	Jan. 1	466	118	46	95
Telegraph. Printing	F. H. W. Higgins	398,833	Mar. 5	28	8, 9, 10	46	1119
Telegraph. Printing	A. T. McCoy	397,466	Feb. 5	552	145	46	683
Telegraph. Railway	B. Cade	396,963	Jan. 29	2540	656	46	531
Telegraph-station. Floating	U. Dieuleveult	398,035	Feb. 19	1417	375	46	872
Telegraph system	W. Barnley	399,314	Mar. 12	798	206	46	1295
Telegraph system. Municipal	T. J. Zoeller	396,450	Jan. 22	1745	448	46	365
Telegraphs. Circuit-closer for railway-car	G. I. Hopkins	399,228	Mar. 5	669	174	46	1243
Telegraphic purposes. Dynamo for	B. Gmür and O. Flatz	396,557	Jan. 22	1916	493, 494	46	395
Telegraphic transmitter	R. C. Stone	400,141	Mar. 26	2016	528	46	1532
Telegraphy	C. E. Dressler	397,977	Feb. 19	1312	351	46	853
Telegraphy. Automatic	P. B. Delany	395,427	Jan. 1	173	46	46	37
Telegraphy. Automatic	J. O'Neil	399,154	Mar. 5	546	142, 143	46	1220
Telegraphy. Electro-harmonic	M. W. Dewey	395,613	Jan. 1	464	118	46	95
Telegraphy. Multiplex	F. J. Patten	395,508	Jan. 1	297	77	46	63
Telegraphy. Multiplex	F. J. Patten	395,509	Jan. 1	302	77	46	64
Telegraphy. Multiplex	F. J. Patten	395,510	Jan. 1	305	78	46	65
Telegraphy. Quadruplex	C. L. Healy	398,614	Feb. 26	2261	600	46	1046
Telegraphy. Railway	B. Cade	397,049	Jan. 29	2633	679	46	549
Telegraphy. Vibratory multiplex	S. D. Field	395,556	Jan. 1	372	95, 96	46	77
Telephone	N. B. Ginochio	400,395	Mar. 26	2308	604	46	1608
Telephone	N. B. Ginochio	400,396	Mar. 26	2310	604	46	1608
Telephone call-box	A. Griffith and H. A. Burbank	397,284	Feb. 5	270	70	46	627
Telephone circuit and apparatus	J. A. Barrett	397,331	Feb. 5	345	90	46	643
Telephone-exchange	W. B. Vansize. (Reissue)	10,989	Mar. 5	673	176	46	1244
Telephone-line cable	G. F. Shaver	399,635	Mar. 12	1283	329	46	1386
Telephone-line wires. Stretcher for mechanical	A. W. Butterworth	399,016	Mar. 5	316	85	46	1175
Telephone. Mechanical	T. S. and W. W. Davis	396,688	Jan. 22	2104	540	46	433
Telephone. Mechanical	A. W. Hall	398,507	Feb. 26	2115	556	46	1017
Telephone or analogous electric system	A. B. Ferdinand	397,176	Feb. 5	114	30, 31	46	599
Telephone paper-pad holder	J. B. Seymour, Jr	397,422	Feb. 5	559	146	46	685
Telephone. Speaking	F. Blake	395,476	Jan. 1	251	66	46	54
Telephone-transmitter	C. A. Hitchcock	399,666	Mar. 19	1329	340	46	1407
Telethermometer	C. G. Hoffmann	397,548	Feb. 12	674	175, 176	46	713
Temperature-regulator	H. J. Lutcher	396,215	Jan. 15	1309	357	46	291
Tennis-racket	R. B. Brown	397,220	Feb. 5	180	48	46	610
Tennis-rackets. Rubber sleeve for	R. W. Morgan	399,340	Mar. 12	833	217	46	1302
Tenoning-machine	E. Totman	395,596	Jan. 1	329	83, 84	46	69
Tension-adjuster	G. B. Webb	398,009	Feb. 19	1502	398	46	889
Tent	A. B. Wood	399,640	Mar. 12	1289	331	46	1388
Tent-closing device	H. Thomas	396,842	Jan. 29	2242	600	46	490
Testing and recording machine	T. Olsen	399,549	Mar. 12	1153	299	46	1362
Testing-machine	W. J. Keep	399,754	Mar. 19	1452	374, 375	46	1432
Tether	J. W. Grubbs	396,276	Jan. 15	1479	375	46	306
Textile fabrics. Machine for piling	O. Wolfsohn	396,720	Jan. 22	2182	551	46	442
Theatrical appliance	J. T. Kilham	395,633	Jan. 1	481	123	46	98
Theatrical appliance	F. Wilson	397,678	Feb. 12	894	236	46	735
Theatrical stage	J. Douglass	399,318	Mar. 12	805	208	46	1296
Thermo-magnetic motor	N. Tesla	396,121	Jan. 15	1251	319	46	264
Thermometer. Metallic	J. Sudmann	398,755	Feb. 26	2483	658	46	1090
Thermometer. Oven	H. Henderson and F. N. Johnston	397,127	Feb. 5	33	7	46	584
Thermometers. Graduating	H. Schulze-Berge	398,851	Mar. 5	51	15	46	1124
Thermometers or other indicators. Holder for	T. W. Shepherd	398,804	Feb. 26	2547	678	46	1104
Thermostat	E. H. Davis and R. Westervelt	400,312	Mar. 26	2283	597	46	1603
Thermostat	W. E. Lewis	398,740	Feb. 26	2463	653	46	1086
Thill-coupling	W. H. Bowman	397,455	Feb. 5	539	141	46	681
Thill-coupling	I. Clark	397,633	Feb. 12	868	216	46	749
Thill-coupling	D. Kavanaugh	396,909	Mar. 5	235	65	46	1159
Thill-coupling	W. Keton	395,396	Jan. 1	133	53	46	29
Thill-coupling	F. J. Miller	399,682	Mar. 19	1350	347	46	1411
Thill-coupling	G. T. Wilson	398,923	Mar. 5	158	41	46	1143
Thill-couplings. Anti-rattler for	F. P. Stiles	399,447	Mar. 12	990	266	46	1333

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Thill. Vehicle	E. J. Hagan	397,357	Feb. 5	378	100	46	649
Thill. Vehicle	G. H. Hutton	399,537	Mar. 12	1138	294, 295	46	1359
Thimble	F. X. Gosselin	395,322	Jan. 1	25	7	46	8
Thrasher and separator. Portable corn	J. W. Terman	397,879	Feb. 12	1165	311, 312	46	809
Thrasher regulator. Steam	E. Howland	398,896	Mar. 5	120	32	46	1137
Thrashing-machine	A. Johnston	400,217	Mar. 26	2135	559	46	1577
Thrashing-machine	A. H. Wagner	396,765	Jan. 29	2258	577	46	471
Thrashing-machines. Band-cutter and feeder for	J. W. Turner	396,843	Jan. 29	2343	600	46	490
Thrashing-machines. Grain-elevator attachment for	E. M. Thorpe	400,270	Mar. 26	2222	582, 583	46	1591
Thrashing-machines. Traction-tongue for	H. Cooprider, Jr	395,547	Jan. 1	357	91	46	74
Thread. Ball of	S. Stieglitz	395,636	Jan. 1	513	129	46	102
Thread from short fibers. Manufacturing	A. Mitscherlich	395,914	Jan. 8	948	244	46	196
Thread-gripping device	S. W. Wardwell, Jr	396,183	Jan. 15	1346	345	46	282
Three-throw split switch	A. D. Simpson	399,090	Mar. 5	415	112	46	1193
Ticket and sizer. Lot	S. J. Wallach	396,904	Jan. 29	2433	625	46	509
Ticket rack. Railway coupon	G. Ross	395,354	Jan. 1	76	19	46	17
Ticket. Railway	J. Culton	399,742	Mar. 19	1505	413	46	1460
Ticket. Railway	W. A. Megrath	396,591	Jan. 22	1965	506	46	405
Tidy-holder	J. B. Sweetland	398,757	Feb. 26	2485	659	46	1091
Tie: *See* Bedstead-tie. Railway-tie.							
Tile-cutting machine	C. A. Elsaner	398,883	Mar. 5	100	27, 28	46	1133
Tile. Glass	H. Lazard, F. A. Stanger, and T. C. Duffield.	398,730	Feb. 26	2452	650	46	1084
Tile-machine	C. Carr	396,466	Jan. 22	1768	453	46	370
Tile-machine	F. M. Hicks	396,685	Jan. 15	1902	305, 306	46	255
Tile-machine	H. Z. Young	397,770	Feb. 12	1019	271, 272	46	779
Tile or brick pressing machine	J. Taber	396,967	Jan. 29	2519	650, 651	46	527
Tile-settings. Device for holding	A. Greenaway	400,076	Mar. 26	1929	503	46	1534
Time-meter. Electric	G. F. Card	396,645	Jan. 22	2046	525	46	421
Time-recorder	H. R. Adams	400,283	Mar. 26	2241	587	46	1505
Time-switch	B. E. Waters	396,632	Jan. 22	2028	521	46	418
Tire and felly. Wheel	A. W. Thomas	399,360	Mar. 12	871	226	46	1309
Tire and felly. Wheel	A. W. Thomas	399,361	Mar. 12	872	226	46	1309
Tire apparatus	P. Schlosser	397,390	Feb. 5	423	112	46	658
Tire-fastener	G. W. Huckabay	398,398	Feb. 26	1959	515	46	967
Tire-heating apparatus	W. Hassman	397,503	Feb. 12	760	198	46	729
Tire-tightener	C. D. Hammon	397,902	Feb. 19	1322	353	46	855
Tire. Vehicle-wheel	H. M. Du Bois	397,458	Feb. 5	543	142	46	682
Tire. Vehicle-wheel	H. M. Du Bois	397,459	Feb. 5	543	143	46	682
Tire. Vehicle-wheel	A. W. Thomas	399,354	Mar. 12	864	224	46	1306
Tire. Wheel	A. W. Thomas	399,355	Mar. 12	865	225	46	1306
Tire. Wheel	A. W. Thomas	399,356	Mar. 12	867	225	46	1308
Tire. Wheel	A. W. Thomas	399,357	Mar. 12	868	225	46	1308
Tire. Wheel	A. W. Thomas	399,358	Mar. 12	869	225	46	1308
Tires. Machine for cooling wagon	W. X. Rupp and H. Resseger	397,942	Feb. 19	1258	335, 336	46	843
Tires on wagon or other wheels. Device for setting	N. B and A. T. McCreary	398,843	Mar. 5	41	13	46	1122
Tobacco-bag. Self-closing	C. W. Van Alstine	400,020	Mar. 19	1844	479	46	1508
Tobacco-box	A. D. Kimball	399,050	Mar. 5	360	97	46	1183
Tobacco-cutting machine	A. Gordon and D. De Garmo	397,544	Feb. 12	669	174	46	713
Tobacco-pipe	G. F. Colquitt	395,486	Jan. 1	267	69	46	56
Tobacco-pipe and cane. Combined	G. H. Coursen	395,426	Jan. 1	172	45	46	37
Tobacco-transplanter	M. Smith. (Reissue)	10,982	Jan. 29	2715	702	46	564
Toe-weight	F. W. Floyd	399,253	Mar. 12	708	184	46	1278
Tongs	J. T. Evans	400,067	Mar. 26	1916	499	46	1581
Tongs. Combination	J. H. Cook	398,129	Feb. 19	1549	411	46	898
Tongs. Pipe	R. B. Magee and F. C. Knowles	396,753	Jan. 29	2218	567	46	463
Tongue lock. Wagon	C. C. Andrews	396,189	Jan. 15	1354	348	46	284
Tongue-support	G. E. Ring	396,766	Jan. 29	2234	572	46	467
Tongue support. Wagon	E. D. Blake	396,065	Jan. 15	1169	296	46	248
Tongue-tip for vehicles	W. Chatterson	396,663	Jan. 22	2008	538	46	432
Tongues, &c. Metal blank for vehicle	C. M. Carnahan	399,909	Mar. 19	1772	458	46	1495
Tool-box	E. Caldwell	398,700	Feb. 26	2397	636, 637	46	1073
Tool. Combined	G. H. Brooks	399,649	Mar. 19	1307	335	46	1403
Tool. Combined	G. H. Tucker	399,297	Mar. 12	773	200	46	1291
Tool. Combination	A. Waggoner	395,598	Jan. 1	445	114	46	91
Tool-handle	J. H. Wundes	399,641	Mar. 12	1291	331	46	1388
Tool-holding box	G. H. Bartlett	400,286	Mar. 26	2246	588	46	1596
Tool-holding box	G. H. Bartlett	400,287	Mar. 26	2248	588	46	1596
Tool-holding box	G. H. Bartlett	400,288	Mar. 26	2250	589	46	1596
Torch	F. Leiss	397,009	Jan. 29	2575	666	46	538
Torpedo and gun boat. Combined	R. J. Gatling	399,516	Mar. 12	1100	287	46	1359
Toy	E. F. Lane	396,094	Jan. 15	1219	308	46	258
Toy	J. Schofield	396,295	Jan. 15	1508	382	46	311
Toy. Detonating	D. Baldwin	395,667	Jan. 8	883	226	46	164
Toy figure. Cut	J. McLoughlin	397,302	Feb. 5	299	77	46	633
Toy. Flying	F. J. Lutz	397,435	Feb. 5	506	133	46	675
Toy fortune-wheel	W. C. Blakeman	398,576	Feb. 26	2205	561	46	1035
Toy furniture	G. H. Stone	396,963	Jan. 29	2513	647	46	526
Toy gun. Magazine	H. Reason	395,792	Jan. 8	773	200, 201	46	161
Toy. Mechanical	J. B. Barfoot	399,015	Mar. 5	315	85	46	1175
Toy. Mechanical	W. D. Chase	400,055	Mar. 26	1898	493	46	1527
Toy. Mechanical	J. Morrow	396,221	Jan. 15	1406	358	46	298
Toy. Movable	R. Teichmann	398,672	Feb. 26	2359	625, 626	46	1065

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Toy. Musical	D. A. A. Buck	399,967	Mar. 19	1768	457, 458	46	1494
Toy. Musical	J. Schöenner	400,123	Mar. 26	1995	522	46	1548
Toy. Musical pneumatic	W. H. Brown	398,697	Feb. 26	2393	635	46	1072
Trace-carrier	A. E. Clark	399,496	Mar. 12	1068	278	46	1247
Track-cleaner	A. F. Priest	398,347	Feb. 19	1877	494	46	962
Track-clearer	G. W. Cook	397,584	Feb. 12	740	192	46	726
Track-laying apparatus	D. E. Johnson	399,048	Mar. 5	357	95, 96	46	1182
Tracks. Plant for laying	G. Anderson	397,577	Feb. 12	726	188, 189	46	723
Traction mechanism	H. L. Van Zile	399,299	Mar. 12	777	202	46	1291
Traction-wheel	L. O. Drew	396,892	Jan. 29	2366	607	46	496
Tramway. Electrical	H. T. Blake	396,814	Mar. 5	3	1, 2	46	1115
Tramway-switch	C. A. Beach	396,910	Jan. 29	2441	627	46	511
Transom-lifter	G. J. Dickson	398,240	Feb. 19	1713	452	46	930
Transom-lifter	J. Finnegan	396,357	Jan. 15	1394	404	46	327
Transom-lifter	A. A. Page	396,953	Jan. 29	2496	644	46	523

Trunk-fastener	C. A. Taylor	397,878	Feb. 12	1164	311	46	809
Trunk-fixture	C. A. Taylor	395,597	Jan. 1	444	113	46	91
Trunk-securing guard attachment	J. Ware	399,805	Mar. 19	1540	398	46	1449
Trunk-trimming	H. E. Gilson	399,393	Mar. 12	911	210	46	1298
Trunks, &c. Roping attachment for	J. R. Shoemaker	398,546	Feb. 26	2163	571	46	1027
Trunnion for cylinders	G. A. Barth	398,571	Feb. 26	2198	580	46	1033
Truss	H. S. Greene	397,545	Feb. 12	670	175	46	713
Truss	J. R. Meloney	396,414	Jan. 22	1690	434	46	353
Truss	S. R. Nye	398,343	Feb. 19	1879	493	46	961
Truss	A. Owen	399,433	Mar. 12	973	253	46	1329
Truss	J. A. Tignor	396,180	Jan. 15	1344	345	46	281
Truss for torsion-balances and the like	W. Kent	396,497	Jan. 22	1694	468	46	380
Truss-pad	O. Eckert	397,345	Feb. 5	864	95	46	647
Tub: *See* Bath-tub. Butter-tub.							
Tube: *See* Internasal tube. Surgical drainage-tube. Pneumatic dispatch-tube. Waste and overflow tube.							
Tube boiler. Radial	J. Clarke and R. W. Savage	396,393	Jan. 22	1655	425	46	347
Tube scraper and cleaner	J. Ponlesson	399,346	Mar. 12	841	219	46	1304
Tube-welding mandrels. Ball for	W. S. McManus	398,638	Feb. 26	2305	611	46	1054
Tubes from pulp. Machine for forming seamless	H. J. Medbery	396,103	Jan. 15	1232	312, 313	46	260
Tubes. Making beaded	S. R. Wilmot	400,025	Mar. 19	1849	481	46	1509
Tubes or cylinders. Machine for molding	H. G. Keasbey	397,800	Feb. 12	1143	305, 306	46	804
Tubing	E. C. Converse	399,244	Mar. 12	693	180	46	1276
Tubing. Duplex	A. H. Limont	400,094	Mar. 26	1950	510	46	1538

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Tubing. Manufacture of	E. C. Converse	399,245	Mar. 12	695	181	46	1276
Tubing. Mechanism for impressing ornamental forms or designs upon metallic	J. Burkhardt	400,394	Mar. 26	2411	631	46	1627
Tubing. Wire	T. Midgley	398,498	Feb. 26	2003	526	46	995
Tubular boiler	J. P. Serve	398,003	Feb. 19	1358	360	46	861
Tufting-machine	H. H. Humphrey	397,092	Jan. 29	2380	693	46	558
Tug attachment	F. A. Robbins	397,939	Feb. 19	1255	335	46	843
Tug. Hame	J. G. Miller. (Reissue)	10,981	Jan. 29	2714	702	46	564
Tug. Hame	G. W. Moliere	395,847	Jan. 8	850	219	46	178
Tug. Hame	J. E. Weiglein	399,458	Mar. 12	1006	263	46	1336
Tumbler-holder	J. W. Gaskill	399,870	Mar. 19	1630	422	46	1467
Tumbler-holder. Reversible	F. H. Saylor	395,409	Jan. 1	149	38	46	32
Turn-table	W. H. Wheeler	396,118	Jan. 15	1248	318	46	264
Turn-table for cranes	H. Casper	398,867	Mar. 5	76	21	46	1139
Turnstile. Coin-controlled	J. M. Hartman	399,972	Mar. 19	1776	460	46	1496
Tuyere	B. McGroder	399,263	Mar. 12	722	188	46	1281
Tuyere	I. Davis	396,102	Jan. 15	1231	312	46	260
Twine-holder	P. F. Saul	399,601	Mar. 12	1235	318	46	1378
Twine-holder	C. Fleming, Jr	399,700	Mar. 19	1375	354	46	1417
Twine-winder. Automatic	L. K. Johnson and A. A. Low	400,203	Mar. 26	2111	553	46	1573
Type-case. Compositor's	M. G. Merritt	397,003	Jan. 29	2565	663, 664	46	536
Type. Die for trimming	R. B. Hastie	400,001	Mar. 19	1818	472	46	1503
Type-forms. Matrix impression-guard for	M. G. Merritt	397,232	Feb. 5	195	52	46	613
Type. Making	E. L. Tarbox	400,000	Mar. 19	1816	472	46	1503
Type-wheels and other curved surfaces. Molding	C. N. Leonard	399,945	Mar. 19	1738	449	46	1488
Type-writer cabinet	C. A. Lee	400,234	Mar. 26	2163	567	46	1561
Type-writer cabinet and copy-holder	G. Bofinger	398,738	Feb. 26	2160	652	46	1036
Type-writer ciphograph	J. H. Currier and E. I. Blount	396,529	Jan. 22	1865	478, 479, 539, 540	46	387
Type-writing machine	J. S. Dove, Jr	396,686	Jan. 22	2102	588	46	432
Type-writing machine	J. Felbel and A. W. Steiger	398,587	Feb. 26	2227	592	46	1039
Type-writing machine	N. G. Moore	400,200	Mar. 26	2106	614, 615	46	1571
Type-writing machine	L. J. Odell	398,646	Feb. 26	2316	631	46	1056
Type-writing machine	C. Spiro	399,205	Mar. 5	631	164	46	1236
Type-writing machine	C. Spiro	395,799	Jan. 8	773	201	46	162
Type-writing machine	H. H. Uns	400,265	Mar. 26	2215	581	46	1560
Type-writing machine	G. W. N. Yost	400,146	Mar. 26	2025	530, 531	46	1553
Type-writing machine	G. W. N. Yost and C. E. Merritt	400,384	Mar. 26	2396	626, 627	46	1624
Type-writing machine ribbon-shield	G. H. Loker, Jr	400,383	Mar. 26	2394	626	46	1624
Ultramarine. Manufacture of	L. J. B. A. J. Bouillet	398,837	Mar. 5	35	11	46	1121
Umbrella	D. Rose	398,375	Feb. 26	1931	508	46	961
Umbrella	J. T. Smith	396,235	Jan. 15	1425	362	46	296
Umbrella-holder	A. Denhard	398,606	Feb. 26	2348	623	46	1063
Umbrellas, walking-canes, &c. Handle for	W. Taylor	400,064	Mar. 26	1909	497	46	1529
Under-arm pad	C. M. Southworth	399,449	Mar. 12	992	259	46	1333
Undertaker's use. Canopy-table for	M. E. Welsh	397,570	Feb. 12	712	184	46	720
Urethral powder-applier	C. Sage	400,024	Mar. 19	1848	480	46	1509
Vacuum for motive power. Apparatus for creating a	J. R. Cameron	396,904	Mar. 5	132	36	46	1139
Vacuum-hook	F. White	395,690	Jan. 8	600	152, 153	46	130
Valve	G. A. Matteson	398,679	Feb. 26	2369	629	46	1067
Valve	M. B. Mills	397,134	Feb. 5	45	10	46	586
Valve	M. B. Mills	395,501	Jan. 1	288	74	46	61
Valve	R. N. Pratt	397,088	Jan. 29	2689	695	46	580
Valve	F. W. Seaver	397,751	Feb. 12	993	264	46	774
Valve	E. Ware	397,757	Feb. 12	999	265	46	775
Valve and coupling. Automatic	A. V. Abbot and F. C. F. Knaak	399,302	Mar. 12	782	203	46	1292
Valve and trap. Check	C. K. Moore	398,111	Feb. 19	1522	403	46	893
Valve. Automatic	T. O. Perry	396,503	Jan. 22	1831	470	46	382
Valve. Balanced	C. M. Farrar	400,249	Mar. 26	2188	574, 575, 560, 561	46	1586
Valve. Balanced	M. Wuerpel	396,737	Jan. 29	2189	560, 561	46	457
Valve controller. Throttle	G. S. Neu	397,225	Feb. 12	1099	294	46	795
Valve. Electric atop	R. Wellens	400,245	Mar. 26	2181	573	46	1585
Valve. Flush-tank	P. V. Dwyer	397,260	Feb. 5	235	61	46	621
Valve for automatic brake mechanisms. Triple	F. Moore	399,506	Mar. 12	1066	282	46	1350
Valve for engines. Cut-off	O. Kromer	400,108	Mar. 26	1972	516	46	1543
Valve for fluid-pressure brakes	H. Gnels	395,657	Jan. 1	547	137	46	110
Valve for fluid-pressure brakes	G. H. Poor	396,154	Jan. 15	1297	333	46	273
Valve for fluid-pressure brakes	R. M. Dunn	397,125	Feb. 5	28	7	46	584
Valve for oil-well stand-pipes. Discharge	T. H. Haberkorn	396,171	Jan. 15	1327	340	46	278
Valve for operating air-brake mechanisms. Combination	A. Mayer	397,115	Feb. 5	14	4	46	582
Valve for steam fire-engines. Relief	J. C. Bayles	398,630	Mar. 5	25	7	46	1119
Valve for steam-pipes. Drain	W. H. Bray and C. Nickerson	398,941	Mar. 5	80	12	46	1121
Valve for water-gages. Automatic safety	S. M. Chase	395,607	Jan. 1	456	116	46	93
Valve for water-works. Float	C. H. Shepherd	399,735	Mar. 19	1425	367	46	1427
Valve. Gate	E. Garst	397,595	Feb. 19	1192	320	46	832
Valve-gear	R. Wilby	400,128	Mar. 26	2000	524	46	1549
Valve-gear	J. V. Rice, Jr	399,323	Mar. 12	925	240, 241	46	1319
Valve-gear. Eccentric	J. W. Thompson	397,323	Feb. 5	332	86, 87	46	640
Valve-gear for engines	J. J. Heindl	399,081	Mar. 5	402	109	46	1191
Valve-gear. Steam-engine	W. M. Whitlock	396,377	Jan. 15	1630	418	46	333
Valve gearing. Trip	T. W. Heermans	399,531	Mar. 12	1121	291	46	1356
Valve Hydraulic		398,014	Feb. 19	1380	366	46	865
		396,206	Jan. 15	1384	354	46	229

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Valve. Hydraulic elevator	I. H. Venn	398,098	Feb. 19	1500	397 / 398	46	889
Valve. Locomotive	T. Tripp	400,374	Mar. 26	2378	622 / 623	46	1621
Valve mechanism for ore-stamps	E. Reynolds and B. V. Nordberg	398,902	Mar. 5	130	35, 36	46	1139
Valve-motion for Corliss steam-engines	G. Rothenbücher	398,751	Feb. 26	2477	656	46	1069
Valve. Pop safety	F. A. Miller	395,911	Jan. 8	946	243	46	196
Valve. Pop safety	R. F. Pratt	398,445	Feb. 26	2020	530	46	998
Valve. Pressure-regulating	J. Nageldinger	399,548	Mar. 12	1151	298	46	1362
Valve. Regulating	W. Vogel	400,275	Mar. 26	2227	584	46	1592
Valve. Relief	A. N. Carver and N. J. Stone	396,858	Jan. 29	2362	606	46	495
Valve. Safety	H. G. Ashton	395,536	Jan. 1	343	87	46	72
Valve. Safety	F. X. Vien	398,557	Feb. 26	2181	575	46	1030
Valve-seat for hot-blast stoves	P. T. Berg	398,933	Mar. 5	179	47, 48	46	1147
Valve. Slide	T. T. Brown	395,735	Jan. 8	663	169	46	143
Valve. Slide	F. C. Cleaver	397,170	Feb. 5	107	28	46	598
Valve. Steam-actuated	A. Ball	396,643	Jan. 22	2042	524 / 525	46	421
Valve. Steam-actuated	G. A. Barth	398,930	Mar. 5	175	46	46	1147
Valve. Steam-actuated	J. C. Bromley	398,491	Feb. 26	2088	550	46	1012
Valve. Steam-actuated	T. Small	395,592	Jan. 1	440	112	46	90
Valve. Steam-engine	P. R. Fester	398,777	Feb. 26	2512	667	46	1096
Valve. Steam-engine	W. A. Walker	395,725	Jan. 8	647	165 / 166	46	139
Valve. Stop or throttle	F. W. Richey	399,782	Mar. 19	1496	396	46	1449
Valve. Supply and waste	R. Finn	396,151	Jan. 15	1291	331	46	272
Valve. Tank	P. White	398,681	Feb. 26	2371	630	46	1067
Valve. Tank and water	W. H. Newell	399,692	Mar. 19	1361	350 / 351	46	1414
Valve. Tank or water	W. H. Newell	399,690	Mar. 19	1359	350	46	1413
Valve. Throttle	J. Tonge	397,672	Feb. 12	885	232	46	753
Valves. Automatic pressure-regulating	W. S. Johnson	397,895	Feb. 12	1072	286	46	799
Valves. Means for raising and lowering	W. Bunting, Jr.	397,899	Feb. 12	1104	296	46	796
Vapor-burner	G. W. Billings	398,689	Feb. 26	2383	633	46	1070
Vapor-burner	C. H. Childs	399,183	Mar. 5	594	153	46	1229
Vapor-burner	J. N. Clayton	396,353	Jan. 15	1590	403	46	326
Vaporizer	R. B. Carsley	397,631	Feb. 12	825	216	46	741
Vaporizer and burner. Hydrocarbon	C. G. Rollins	397,940	Feb. 19	1256	335	46	843
Vaporizer and superheater. Retort	S. D. Biddison	400,291	Mar. 26	2253	299 / 300	46	1597
Vaporizer. Hydrocarbon	H. C. Davis	400,313	Mar. 26	2284	598	46	1603
Vaporizing-case. Combustible	J. Morris	399,220	Mar. 5	671	174	46	1243
Vault light and ventilator	T. W. Langill	399,419	Mar. 12	955	248	46	1325
Vault. Portable grave	S. E. Baker	395,537	Jan. 1	344	87, 88	46	72
Vehicle	C. M. Blydenburgh	395,870	Jan. 8	889	228	46	186
Vehicle. Advertising	T. F. Scanlan	398,802	Feb. 26	2545	677	46	1103
Vehicle-bodies. Apparatus for framing and setting up	T. Clements and G. H. Royce	395,485	Jan. 1	265	68	46	56
Vehicle-brake	J. Fraser	398,958	Mar. 5	213	59	46	1154
Vehicle-brake	G. W. Huckabay	398,399	Feb. 26	1960	516	46	987
Vehicle-brake	A. Jeenel	399,668	Mar. 19	1339	341	46	1408
Vehicle-brake	C. T. Quick	399,557	Mar. 12	1169	302	46	1365
Vehicle-brake. Automatic	B. A. Davis	396,030	Jan. 8	1121	285	46	229
Vehicle brake-gear	C. Fuller and J. H. Cunningham	395,746	Jan. 8	677	173	46	145
Vehicle-dash	A. Waggoner	395,599	Jan. 1	447	114	46	92
Vehicle dash-board	C. L. Baker	397,329	Feb. 5	343	90	46	643
Vehicle-gear	C. M. Blydenburgh	396,978	Jan. 29	2532	654	46	530
Vehicle-gear	F. L. Perry	397,932	Feb. 19	1245	332	46	841
Vehicle. Hand-propelled	C. Yingst	399,110	Mar. 5	448	122 / 123	46	1199
Vehicle runner. Wheeled	F. Driffill	398,385	Feb. 26	1945	512	46	984
Vehicle running-gear	A. W. Johnson	396,494	Jan. 22	1818	466 / 467	46	379
Vehicle-seat	F. A. Comstock	396,194	Jan. 15	1300	349	46	285
Vehicle-seat	J. F. Goodrich	397,590	Feb. 12	754	196 / 197	46	728
Vehicle-seat	D. M. and T. H. Parry	398,179	Feb. 19	1022	430	46	911
Vehicle-seat	J. A. West	396,250	Jan. 15	1444	368	46	300
Vehicle-seat. Removable	J. P. Moore	396,827	Jan. 29	2320	594	46	485
Vehicle-seat. Shifting	J. L. Mason	398,419	Feb. 26	1993	523	46	993
Vehicle. Spring	H. A. Meyer	396,223	Jan. 15	1409	359	46	293
Vehicle-spring	G. H. Blakeman	395,608	Jan. 1	457	116	46	94
Vehicle-spring	J. Diehl	396,272	Jan. 15	1470	374	46	305
Vehicle-spring	C. C. Hayes	398,156	Feb. 19	1586	421	46	904
Vehicle-spring	J. T. Hovis	396,744	Jan. 29	2205	564	46	460
Vehicle-spring	E. Jarrell	395,496	Jan. 1	280	72	46	59
Vehicle-spring	E. Jarrell	397,366	Feb. 5	394	103 / 104	46	652
Vehicle-spring	J. R. Linton	399,677	Mar. 19	1345	345	46	1410
Vehicle-spring	S. H. Raymond	399,210	Mar. 5	641	167	46	1237
Vehicle-spring	W. S. and H. C. Rounds	400,362	Mar. 26	2305	617	46	1618
Vehicle-spring	R. Sproul	396,671	Jan. 22	2078	534	46	428
Vehicle-spring	J. F. Thomas	395,463	Jan. 1	231	59	46	50
Vehicle-spring	E. M. Van Valkenburg and F. L. Wood	398,011	Feb. 19	1376	364	46	865
Vehicle-spring	J. W. Wetmore	399,955	Mar. 19	1754	453	46	1491
Vehicle-spring	J. A. Witmer	396,317	Jan. 15	1539	388	46	317
Vehicle-spring support	D. M. and T. H. Parry	398,180	Feb. 19	1023	430	46	912
Vehicle. Three-wheeled	W. J. Francisco	395,388	Jan. 1	124	31	46	27
Vehicle-tool	L. S. Lewis	395,658	Jan. 1	548	137	46	119
Vehicle-top	G. D. W. Lennon	398,168	Feb. 19	1607	426	46	908
Vehicle-top prop	J. A. Kaspar and W. B. Curtis	396,937	Jan. 29	2479	639	46	518
Vehicle. Two-wheeled	A. A. Abbott	396,640	Jan. 22	2039	524	46	420
Vehicle. Two-wheeled	I. Brown	399,650	Mar. 19	1307	335	46	1403

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Vehicle. Two-wheeled	D. A. Garver and C. H. Straight	396,382	Jan. 15	1637	420	46	234
Vehicle. Two-wheeled	D. M. and T. H. Parry	395,508	Jan. 1	294	76	46	83
Vehicle. Two-wheeled	D. M. and T. H. Parry	398,178	Feb. 19	1021	430	46	911
Vehicle. Two-wheeled	J. G. Parsons	397,515	Feb. 19	628	163	46	705
Vehicle. Two-wheeled	F. Rudolph	398,901	Feb. 26	2544	677	46	1103
Vehicle. Two-wheeled	F. Rupp	395,355	Jan. 1	76	90	46	18
Vehicle. Two-wheeled	L. Schierstedt	399,289	Mar. 19	756	196	46	1297
Vehicle-wheel	J. Bolick	396,461	Jan. 22	1762	451	46	368
Vehicle-wheel	H. E. Crome	397,897	Feb. 19	1195	320	46	832
Vehicle-wheel	J. E. Fisher	397,711	Feb. 19	934	248	46	782
Vehicle-wheel	W. Haslup	397,078	Jan. 29	2676	692	46	557
Vehicle-wheel	H. F. Hicks	396,672	Jan. 29	2362	611	46	499
Vehicle-wheel	C. E. James	398,403	Feb. 26	1964	517	46	988
Vehicle-wheel	N. Schaus and F. Mayer	396,514	Jan. 22	1847	474	46	384
Vehicle-wheel	C. Taylor	395,523	Jan. 1	326	82	46	69
Vehicle-wheel	A. W. Thomas	399,362	Mar. 12	873	226 / 227	46	1309
Vehicle-wheel	G. T. Warwick	399,453	Mar. 12	996	260	46	1334
Vehicle. Wheeled	F. B. Von Wechmar	400,376	Mar. 26	2385	624	46	1622
Vehicles. Mechanism for driving wheeled	J. Martignoni	398,690	Mar. 5	196	34	46	1138
Vehicles. Reach-connection for	J. N. Brown	395,610	Jan. 1	469	117	46	94
Vehicles. Runner for wheeled	F. Driffill	395,653	Jan. 1	542	136	46	109
Vehicles. Shifting seat for	E. H. Bates	396,062	Jan. 15	1166	296	46	247
Vehicles. Storm-apron for	C. C. King	395,749	Jan. 8	662	174	46	146
Vehicles. Traction mechanism for self-propelling	H. L. Van Zile	399,296	Mar. 12	775	201	46	1291
Vehicles. Wear-iron for	J. M. R. Gedney	395,439	Jan. 1	181	48	46	38
Velocipede	H. Behr	396,349	Jan. 15	1584	401	46	325
Velocipede	C. E. Bentley	399,003	Mar. 5	297	81	46	1172
Velocipede	R. E. Bowen	396,854	Jan. 29	2357	604 / 605	46	494
Velocipede	P. Gendron	400,074	Mar. 26	1925	502 / 503	46	1533
Velocipede	W. Golding	400,204	Mar. 26	2112	553 / 554 / 555 / 556	46	1573
Velocipede	W. Goulden	400,075	Mar. 26	1928	503	46	1533
Velocipede	F. H. Harris	396,063	Jan. 15	1300	304	46	254
Velocipede	C. Jackson	395,441	Jan. 1	190	50, 51	46	40
Velocipede	T. B. Jeffery	398,158	Feb. 19	1589	422	46	905
Velocipede	T. B. Jeffery	398,159	Feb. 19	1591	423	46	905
Velocipede	J. Knapp	400,090	Mar. 26	1946	509	46	1537
Velocipede	E. G. Latta	396,164	Jan. 15	1314	336	46	276
Velocipede	J. M. Marlin	400,098	Mar. 26	1954	511	46	1539
Velocipede	J. McCoy	397,015	Jan. 29	2582	667 / 668	46	539
Velocipede	A. H. Overman	398,533	Feb. 26	2146	566	46	1024
Velocipede	O. Unsicker	397,099	Jan. 29	2705	699	46	563
Velocipede-brake	T. B. Jeffery	400,343	Mar. 26	2338	410	46	1612
Velocipede-driving mechanism	G. A. Schubert	398,455	Feb. 26	2032	534	46	1001
Velocipede. Ice	C. Sprake	398,465	Feb. 26	2046	537	46	1003
Velocipede-pedal	T. B. Jeffery	397,188	Feb. 5	135	36	46	602
Velocipede-pedal	E. E. Tufts	396,673	Jan. 29	2081	535	46	499
Velocipedes. Ball-bearing for	G. T. Warwick	399,456	Mar. 12	1002	262	46	1335
Vending apparatus	C. F. De Redon	397,975	Feb. 19	1304	348 / 349 / 350	46	851
Vending apparatus	F. M. Leavitt	397,297	Feb. 5	990	74, 75	46	631
Vending apparatus	J. Schofield	396,296	Jan. 15	1510	382	46	312
Vending apparatus	J. Schofield	396,297	Jan. 15	1512	382 / 383	46	312
Vending apparatus	J. W. Vaughn	397,319	Feb. 5	329	65	46	640
Vending apparatus. Automatic	J. M. O'Kelly	396,228	Jan. 15	1415	360	46	294
Vending-machine	E. S. Ford	398,245	Feb. 19	1719	452 / 454	46	931
Veneer-machine. Rotary-cutting	E. S. and C. R. Gorham	397,181	Feb. 5	125	34	46	600
Ventilating mechanism	R. A. Rew	399,437	Mar. 12	978	254 / 255	46	1330
Ventilation of buildings	S. L. Bailey	398,874	Mar. 5	86	24, 25	46	1130
Ventilation. Window	A. C. Stevenson	396,901	Jan. 29	2489	624	46	508
Ventilator: *See* Car-ventilator. Sewer-ventilator.							
Ventilator	P. Abrahamson	396,134	Jan. 15	1267	324	46	268
Ventilator	E. A. Goodell	397,122	Feb. 5	24	6	46	583
Vessels. Construction of	J. D. Cornwall	396,648	Jan. 22	2049	536	46	422
Vessels. Leak-stopper for holds of	P. B. Viele	396,016	Jan. 8	1104	280	46	226
Vessels. Signal-light for	J. W. Coulston	395,820	Jan. 8	901	231	46	188
Veterinary drencher	C. C. Carrasco	400,298	Mar. 26	2263	592	46	1589
Veterinary drenching-horn	G. A. Doran	395,744	Jan. 8	676	173	46	145
Veterinary medical apparatus	C. H. Barr	399,234	Mar. 12	980	177	46	1273
Veterinary remedy	B. M. V. Price	396,111	Jan. 15	1240	.....	46	262
Veterinary surgical scraper	A. MacDonald	397,013	Jan. 29	2580	667	46	539
Vibrating engine	D. D. Hardy	399,327	Mar. 12	817	211 / 212	46	1299
Vignette-holder	A. L. Geer	399,750	Mar. 19	1449	373	46	1432
Violin-rest	J. Bohmann	397,454	Feb. 5	538	141	46	681
Violin tail-piece	R. A. Macready	396,408	Jan. 22	1663	432	46	338
Vise	J. A. Blake	396,066	Jan. 15	1170	297	46	248
Vise	P. Brown	399,014	Mar. 5	314	84, 85	46	1174
Vise	F. E. Farwell	400,069	Mar. 26	1917	500	46	1531
Vise	E. D. Morgan	395,661	Jan. 1	554	138	46	111
Vise	W. H. Remsen	397,479	Feb. 5	557	146	46	644
Vises. Adjustable strut for	F. Michel	396,755	Jan. 29	2219	568	46	464
Voltaic battery	T. Coad	395,709	Jan. 8	708	182	46	151

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr's.	Official Gazette. Vol.	Official Gazette. Page.
Voltaic battery	I. Kitsee	400,224	Mar. 26	2145	563	46	1578
Voltaic battery	I. Kitsee	400,225	Mar. 26	2146	563 564	46	1579
Voltaic battery	I. Kitsee	400,227	Mar. 26	2151	564	46	1579
Voltaic battery. Dry	I. Kitsee	395,706	Jan. 8	618	156	46	133
Voting-machine	G. W. Traban and T. Babin	398,196	Feb. 19	1648	435	46	915
Vulcanizing wood	S. E. Haskin	399,196	Mar. 5	618	160	46	1223
Wagon	E. C. Davis	399,502	Mar. 12	1072	280	46	1348
Wagon-beds. Attachable brake for	S. R. Riffle	396,340	Jan. 15	1573	398	46	325
Wagon-bolster spring	J. Cliff	397,832	Feb. 12	1107	296	46	797
Wagon-brake	A. C. T. Bantain	399,471	Mar. 12	1027	270	46	1341
Wagon-brake	L. E. Lane and G. Hilliard	400,228	Mar. 26	2152	564	46	1579
Wagon-brake	P. Pueschel	398,799	Feb. 26	2541	676	46	1102
Wagon-brake	J. R. Robinson	395,516	Jan. 1	316	80	46	67
Wagon-brake	L. Stüfee	396,780	Jan. 29	2254	576	46	470
Wagon-brake	B. Wilcox	399,958	Mar. 19	1758	454	46	1492
Wagon-brake	F. A. Young	398,303	Feb. 19	1810	478	46	950
Wagon brake. Hay-	F. E. Lathrop	396,822	Jan. 29	2313	592	46	483
Wagon. Butcher's	G. R. Kent	397,725	Feb. 12	957	254 255	46	767
Wagon. Coal-	H. P. Wayman	399,806	Mar. 19	1542	398	46	1449
Wagon-jack	W. R. Moore	400,109	Mar. 26	1974	517	46	1543
Wagon-perch-crotch coupling	T. E. Brown	400,045	Mar. 26	1884	490	46	1534
Wagon running-gear	F. H. Harris	396,082	Jan. 15	1198	304	46	254
Wagon-seat	D. F. Head	398,252	Feb. 19	1720	456	46	933
Wagon-spring	C. A. Howard	396,694	Jan. 22	2115	542	46	434
Wagons. Draw-iron for	J. Groh	395,389	Jan. 1	124	32	46	27
Wall for houses	W. R. Ray	399,284	Mar. 12	752	195	46	1286
Wall-paper cutter	J. Marks	397,736	Feb. 12	974	259	46	770
Wall-paper hanger	L. E. Kenworthy	395,443	Jan. 1	201	52	46	42
Walls. Finishing compound for plastered	T. J. Neavitt	399,920	Mar. 19	1706	.....	46	1462
Walls. Material for the treatment of	G. H. Wooster	397,529	Feb. 12	646	.....	46	709
Warp-beaming machine	J. M. Stone	396,055	Jan. 8	1154	293	46	226
Warp-dressing machine	S. Odenheimer	398,647	Feb. 26	2319	615	46	1056
Warp-linking machine	R. and J. Garsed and W. Mason	396,554	Jan. 22	1905	491 492	46	394
Warping-machines. Stop-motion for	L. H. A. Schwartz	395,851	Jan. 8	855	221	46	179
Wash-board	S. Bingham	395,650	Jan. 1	537	135	46	106
Wash-board	H. C. Hall	397,591	Feb. 12	756	197	46	729
Wash-board	A. R. Kibbe	397,430	Feb. 5	498	131	46	674
Wash-boiler	M. K. Ocobock	399,432	Mar. 12	978	253	46	1329
Wash-boiler	C. E. Poore and G. Martin	400,007	Mar. 19	1823	475	46	1505
Wash-boiler	T. C. Robinson	397,873	Feb. 12	1157	300	46	807
Wash-boilers. Fountain attachment for	G. W. Day	399,845	Mar. 19	1598	414	46	1461
Wash-stand	N. O. Bond	397,963	Feb. 19	1288	343 344	46	849
Wash-stand	E. W. Woodruff	399,461	Mar. 12	1011	264 265	46	1337
Wash-stand. Portable	N. O. Bond	400,186	Mar. 26	2089	546 547	46	1567
Washer: *See* Bottle-washer. Ore-washer. Dish-washer. Ribbed conoidal washer.							
Washing-fluid	S. L. Paramore	399,626	Mar. 12	1266	.....	46	1384
Washing-machine	G. E. Beane	398,486	Feb. 26	2083	548	46	1011
Washing-machine	I. F. Field	397,349	Feb. 5	367	96	46	647
Washing-machine	H. H. Fisher	399,980	Mar. 19	1786	463	46	1496
Washing-machine	W. H. Goss	399,610	Mar. 12	1245	321	46	1379
Washing-machine	C. D. La Port	396,496	Jan. 22	1825	468	46	380
Washing-machine	E. B. Leverich	398,170	Feb. 19	1609	427	46	909
Washing-machine	G. A. Miller	399,425	Mar. 12	964	250	46	1327
Washing-machine	G. J. Squires	395,596	Jan. 1	443	113	46	91
Washing-machine	J. A. Walker	399,099	Mar. 5	429	116	46	1196
Washing-machine	C. E. Warner	398,866	Mar. 5	75	20	46	1128
Washing-machine	E. E. Willis	397,211	Feb. 5	169	45	46	608
Washing-machines. Reversing-gearing for	J. M. Oakley	400,246	Mar. 26	2183	573	46	1586
Waste and overflow tube for sanitary structures. Combined	G. F. Brown	398,224	Feb. 19	1685	446	46	924
Watch-bow fastening	F. G. Faxon	399,861	Mar. 19	1620	420	46	1465
Watch-case	C. K. Giles	399,606	Mar. 12	1241	320	46	1379
Watch-case bow	J. H. Cooper	399,840	Mar. 19	1503	413	46	1460
Watch-case pendant	F. G. Faxon	398,957	Mar. 5	212	58	46	1154
Watch case-shaping machine	H. L. Haldy	398,251	Feb. 19	1726	455	46	933
Watch-mainspring	E. Karthaus	397,504	Feb. 12	610	157	46	701
Watch-maker's and jeweler's pliers	J. Daniels	399,655	Mar. 19	1315	337	46	1405
Watch-maker's tool	F. Leach and V. L. Figarotta	397,191	Feb. 5	139	37	46	603
Watch-movement box	C. T. Graham	397,853	Feb. 12	1135	303	46	803
Watch-regulator	R. B. Richmond	395,351	Jan. 1	70	17	46	16
Watch-regulator	C. Teske	398,987	Mar. 5	267	73	46	1166
Watch. Stem winding and setting	A. Fischer	400,202	Mar. 26	2110	553	46	1572
Watch. Stem winding and setting	H. Schütz	397,313	Feb. 5	312	82	46	636
Watch. Stem winding and setting	O. F. Stedman	396,777	Jan. 29	2250	575	46	469
Watch. Stop-	F. Bovet and A. E. Bessire	396,914	Jan. 29	2447	628 629	46	512
Watches. Cannon-pinion for	D. D. Palmer	395,754	Jan. 8	689	176	46	147
Watches, &c. Demagnetizing	J. Greaves	397,423	Feb. 5	465	127	46	671
Watches. Dust-band for	D. H. Church	396,267	Jan. 15	1465	373	46	304
Water. Apparatus for elevating	W. O. Lentz	398,518	Feb. 26	2128	560	46	1020
Water-closet	J. J. Balla	398,023	Feb. 19	1397	369	46	888
Water-closet	H. H. Craigie	397,721	Feb. 12	1037	277	46	763
Water-closet	S. F. Snifen	396,023	Jan. 22	2016	518	46	416
Water-closet	P. White	397,571	Feb. 12	713	185	46	721
Water-closet basin	J. Shanks	396,959	Jan. 29	2508	646	46	585
Water-closet bowls, &c. Coupling for	H. Machin	398,838	Mar. 5	36	18	46	1121

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr's.	Official Gazette. Vol.	Official Gazette. Page.
Water-closet cistern	J. L. Mott, Jr	397,650	Feb. 12	867	227 228	46	749
Water-closet flushing-tank	A. Haarlander	396,927	Jan. 29	2463	634	46	515
Water-closet. Plunger	H. H. Craigie	397,722	Feb. 12	1040	277 278	46	763
Water-closet-seat protector	E. Breher	396,903	Jan. 29	2292	587	46	478
Water-closet. Siphon	H. H. Craigie	399,184	Mar. 5	595	153 154	46	1229
Water-closet valve	E. L. Knight	399,905	Mar. 19	1679	436	46	1477
Water-closet valve	P. White	398,680	Feb. 26	2370	629	46	1067
Water-closets. Siphon-valve for	C. H. Harkins	397,359	Feb. 5	381	100	46	650
Water-closets, &c. Valve for	E. Hanmann	398,149	Feb. 19	1579	418	46	902
Water-cooler	N. Davis	398,770	Feb. 26	2501	664	46	1094
Water-cooler stand	C. P. Rallo	398,446	Feb. 26	2021	531	46	998
Water-drainer and pop safety-valve	C. Parent	399,070	Mar. 5	386	104	46	1188
Water-elevating device	O. F. Burton	395,482	Jan. 1	250	67	46	55
Water-elevator. Automatic compressed-air	J. K. Leedy	396,405	Jan. 22	1679	431	46	351
Water-elevator. Pneumatic	T. O. Perry	398,184	Feb. 19	1628	431	46	912
Water gate. Mill-pond waste-	W. T. McCloskey	398,842	Mar. 5	40	13	46	1122
Water-heater	M. Havey	395,326	Jan. 1	31	8	46	9
Water heater and filter	J. S. Roake	396,234	Jan. 15	1422	362	46	296
Water-heater. Sectional	R. Bigley	395,688	Jan. 8	596	149	46	129
Water heating and circulating apparatus	W. J. Barnstead	398,217	Feb. 19	1673	443	46	921
Water-heating apparatus	R. P. Barnstead	398,022	Feb. 19	1400	370	46	868
Water-meter	G. A. Graeser	400,331	Mar. 26	2317	606	46	1609
Water-meter. Piston	F. Gutzkow	400,401	Mar. 26	2422	634	46	1628
Water-motor	B. B. Bower	396,069	Jan. 15	1175	298	46	249
Water-motor	J. Coates	396,729	Jan. 29	2168	550	46	453
Water-motor	J. H. Hagerty	400,402	Mar. 26	2423	635	46	1629
Water-motor	H. Studte	397,096	Jan. 29	2099	697	46	562
Water-motor	H. E. Trumble	395,529	Jan. 1	333	85	46	70
Water-motor	H. E. Trumble	395,530	Jan. 1	335	85	46	71
Water-motor	H. R. Wolfe	396,318	Jan. 15	1540	380	46	317
Water-motor. Sub-surface	D. G. Haskins	400,209	Mar. 26	2123	557	46	1574
Water or liquid elevator	D. C. Battey	397,869	Feb. 19	1182	317	46	810
Water or other liquids. Purifier for	T. H. McCulloch	399,429	Mar. 12	989	253	46	1328
Water-power	L. Lohman	398,968	Feb. 19	1752	462 463	46	938
Water-power device	J. Swan	396,056	Jan. 8	1155	293	46	236
Water-proof compound containing cork	C. Grünzweig	395,438	Jan. 1	188	.....	46	40
Water-purifying apparatus	J. H. Blessing	395,651	Jan. 1	538	135	46	106
Water renovating and purifying device	L. S. Chichester	400,301	Mar. 26	2208	563 564	46	1600
Water-renovator	L. S. Chichester	398,494	Feb. 26	2091	551 552	46	1013
Water-sprinkler. Hand	G. W. Traban	397,762	Feb. 12	1007	267	46	777
Water to water-motors. Supply of	J. H. Hagerty	398,779	Feb. 26	2515	668	46	1096
Water-wheel	E. Derbec	397,071	Jan. 29	2068	689	46	556
Watering-pot	W. Dischо	399,602	Mar. 12	1236	319	46	1378
Watering-trough	G. W. Langdon	399,418	Mar. 12	954	247	46	1325
Watering trough. Stock-	T. A. Perry	396,595	Jan. 22	1973	508	46	407
Watering troughs. Heater for stock-	H. A. and J. Keir	398,052	Feb. 19	1442	382	46	877
Waterproofing compound	C. T. Snedeker	396,622	Jan. 22	2015	.....	46	416
Waterproofing textile materials. Composition for	J. Welti	395,410	Jan. 1	151	.....	46	32
Wearing-apparel hanger	W. Egges	399,510	Mar. 12	1092	284	46	1351
Weather-strip	J. E. Jones	399,413	Mar. 12	949	246	46	1324
Weather-strip	J. E. Jones	399,414	Mar. 12	950	246	46	1324
Weather-strip	J. C. and J. Reid	398,187	Feb. 19	1633	432 433	46	913
Weather-strip	J. Walker	396,181	Jan. 15	1344	345	46	282
Weather-strips. Machine for making	J. Poyton	398,346	Feb. 19	1876	493 494	46	962
Web-feeding mechanism	L. C. Crowell	396,470	Jan. 22	1782	456 457	46	372
Wedge-bolt for locomotives	J. P. Van Ness	395,763	Jan. 8	700	179	46	149
Weed-cutter and horse-hoe	A. Chezem	398,376	Feb. 26	1934	508	46	981
Weed-cutter. Self-cleaning	F. E. Lux	399,337	Mar. 12	829	216	46	1302
Weeding-machine	J. B. Mansfield	397,735	Feb. 12	973	258	46	770
Weigher and measurer. Automatic grain	W. S. Scott	399,164	Mar. 5	571	147	46	1224
Weighing and registering machine. Grain	W. H. H. Brunton	397,628	Feb. 12	820	214 215	46	740
Weighing apparatus. Grain-	L. C. Tryon	398,473	Feb. 26	2062	542	46	1007
Weighing grain. Machine for automatically	H. M. Fulwider	395,561	Jan. 1	384	98	46	80
Weighing-machine	P. Guillaumin	400,400	Mar. 26	2420	634	46	1622
Weighing machine. Automatic grain	C. E. Warner	397,101	Jan. 29	2706	700	46	563
Weighing-machine. Coin-controlled	W. S. Davenport	396,394	Jan. 22	1657	426	46	347
Weighing-machine. Coin-operated	G. Salter	395,926	Jan. 8	962	247 248	46	199
Weighing package tea, coffee, &c. Mechanism for	O. A. Gill	399,192	Mar. 5	612	159	46	1232
Weighing traveling loads. Machine for	A. E. Brown	399,487	Mar. 12	1051	275	46	1344
Weighing traveling loads. Machine for	A. E. Brown	399,488	Mar. 12	1054	275	46	1345
Welding. Electric	C. L. Coffin	395,878	Jan. 8	899	231	46	187
Welding. Electric	C. L. Coffin	396,270	Jan. 15	1469	374	46	305
Welding. Electric	C. L. Coffin	399,019	Mar. 5	320	86	46	1176
Welding. Electric	E. Thomson	396,011	Jan. 8	1097	279	46	225
Welding-machine. Electrical	E. Thomson	398,913	Mar. 5	142	39	46	1141
Well-boring machine	S. Adams	398,211	Feb. 19	1664	440	46	919
Well-boring machine	G. Pech	398,649	Feb. 26	2322	616	46	1057
Well-cleaning device	J. F. Hudson	399,044	Mar. 5	354	95	46	1182
Well-crib	W. H. Williscraft	400,155	Mar. 26	2045	535	46	1558
Well-drilling machine	W. C. Wells	399,450	Mar. 12	1007	263 264	46	1336
Well head. Driven-	J. Edwards	399,747	Mar. 19	1443	372	46	1431
Wells. Casing-spear for	W. H. Edwards	395,318	Jan. 1	17	5	46	6

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Wells. Rig for drilling and pumping	G. Corbett	396,544	Jan. 22	1883	484, 485	46	390
Wheat for food. Preparing	R. Smith	396,621	Jan. 22	2014	518	46	416
Wheel: *See* Car-wheel. Carrying-wheel. Fifth-wheel. Game-wheel. Measuring-wheel. Metallic wheel. Polishing-wheel. Pulley-wheel. Toy fortune-wheel. Traction-wheel. Vehicle-wheel. Water-wheel. Wheelbarrow-wheel.							
Wheel	E. M. Benster	399,475	Mar. 12	1039	273	46	1343
Wheel	H. Boland	396,292	Jan. 15	1459	371	46	304
Wheel	R. W. Donmoyer	396,991	Jan. 29	2551	659	46	533
Wheel	T. J. Rice	396,366	Jan. 15	1616	414	46	331
Wheel	H. N. Thayer	396,782	Jan. 29	2255	576	46	470
Wheel	H. N. Thayer	396,783	Jan. 29	2256	576	46	470
Wheel-pit and mechanism for the admission of water thereto.	C. M. Bartlett	398,309	Feb. 19	1818	480	46	952
Wheels. Apparatus for forming abrading	W. H. Taggart	395,365	Jan. 1	87	23	46	20
Wheels. Forming vehicle	T. B. Jeffery	397,189	Feb. 5	135	37	46	602
Wheels. Machine for making metal	G. J. Zimmerman	396,796	Jan. 29	2270	563	46	475
Wheels. Rim and tire for	A. W. Thomas	399,359	Mar. 12	989	226	46	1308
Wheelbarrow	J. Annin	399,723	Mar. 19	1409	362	46	1424
Wheelbarrow	J. Dupuy	398,773	Feb. 26	2504	665	46	1095
Wheelbarrow-wheel	C. F. Farnsworth	397,347	Feb. 5	366	96	46	647
Whiffletree	H. Courtad	398,705	Feb. 26	2407	638	46	1075
Whiffletree	F. R. Willson, Sr	396,676	Jan. 22	2085	536	46	430
Whiffletree-clip	W. W. Burson	399,831	Mar. 19	1584	410	46	1458
Whiffletree-hook	J. R. Davis	397,112	Feb. 5	10	3	46	581
Whiffletree-hook	S. O. Nichols	397,201	Feb. 5	154	41	46	605
Whiffletree or neck-yoke iron	E. J. Sugden	398,553	Feb. 26	2176	574	46	1029
Whip	H. A. Cowles	397,456	Feb. 5	541	142	46	681
Whip-socket	H. Elder	395,819	Jan. 8	807	210	46	189
Whip-socket	W. Wright	395,374	Jan. 1	101	26	46	22
Whip-socket fastening	F. E. Benton	396,323	Jan. 15	1548	391	46	318
Whisk-broom	C. Skeels	399,575	Mar. 12	1192	308	46	1370
Whisk-broom	J. Wright	399,308	Mar. 12	792	205	46	1293
Whistle	H. Atkinson and G. W. Hull	398,213	Feb. 19	1667	441	46	990
Whistle. Bicycle	F. L. Johnson	396,921	Jan. 29	2313	592	46	483
Wick-adjusting mechanism	C. H. Lyman	399,912	Mar. 19	1606	439	46	1480
Wick. Lamp	A. Mueller	399,277	Mar. 12	741	193	46	1284
Wick-lifting device	F. Rhind	395,757	Jan. 8	692	176, 177	46	148
Wick-raiser for lamps	L. Henkle	398,725	Feb. 26	2446	647, 648	46	1082
Wind-motor	A. Dumont	400,065	Mar. 26	1910	497, 498	46	1530
Winding yarn. Machine for	F. Rosskothen	400,118	Mar. 26	1989	521	46	1546
Windlass. Oyster-dredge	H. Lawson	398,167	Feb. 19	1606	426	46	906
Windmill	W. H. Aldrich	399,645	Mar. 19	1299	333	46	1402
Windmill	G. Dietert	400,195	Mar. 26	2100	550	46	1570
Windmill	G. W. Haines	399,887	Mar. 19	1658	428	46	1472
Windmill	N. P. Hess and C. Vestergard	396,084	Jan. 15	1201	304, 305	46	254
Windmill	D. J. Howenstine	396,489	Jan. 22	1812	464	46	377
Windmill	F. B. Kendall	398,054	Feb. 19	1445	382, 383	46	878
Windmill	B. F. Lefever	400,230	Mar. 26	2156	566	46	1589
Windmill	C. E. Olds	400,004	Mar. 19	1822	473, 474	46	1504
Windmill	Z. P. Townsend	399,171	Mar. 5	580	149, 150	46	1227
Window	B. F. Dettra and G. R. Roth	398,239	Feb. 19	1710	451, 452	46	929
Window-bead stop	M. A. Cutter	397,837	Feb. 12	1112	298	46	798
Window burglar-guard	J. B. Harris	396,157	Jan. 15	1305	334	46	274
Window-cleaner and fire-escape. Combined	A. Schaefer	400,121	Mar. 26	1993	521, 522	46	1547
Window opener and closer	A. Rapp	396,599	Jan. 22	1978	509	46	408
Window-stand	K. Rukawietia	399,491	Mar. 12	1060	276	46	1345
Window-stop	W. Pendleton	400,403	Mar. 26	2124	635	46	1629
Windows. Device for cleaning	W. B. Zerr	396,133	Jan. 15	1296	324	46	267
Windows. Support for persons cleaning	W. Pront	397,249	Feb. 5	217	57	46	617
Wine. Assaying-glass for testing	T. F. Bergmann	397,961	Feb. 19	1295	343	46	848
Wire	P. V. Husted	398,250	Feb. 19	1739	458	46	935
Wire and pipe supporting and snow-removing apparatus.	S. D. Locke. (Reissue)	10,980	Jan. 29	2713	701	46	564
Wire. Apparatus for drawing	A. S. and T. Bolton	397,272	Feb. 5	252	65, 66	46	624
Wire-barbing machines. Automatic stop for	A. M. Munson	395,712	Jan. 8	625	158, 159	46	135
Wire-bending machine	E. Hanson	396,930	Jan. 29	2468	636	46	516
Wire. Continuously annealing and plating	J. Collin	399,382	Mar. 12	907	235	46	1315
Wire-coupling	W. Bainbridge	399,465	Mar. 12	1016	266	46	1339
Wire. Drawing	A. S. and T. Bolton	397,271	Feb. 5	251	65	46	623
Wire-drawing machine	F. Smith	398,962	Mar. 5	256	70	46	1163
Wire-drawing machine	H. Smith	396,437	Jan. 22	1728	444, 445	46	361
Wire fabric	E. F. Shellaberger	396,771	Jan. 29	2243	574	46	468
Wire fabric	D. C. Stover	396,007	Jan. 8	1092	278	46	225
Wire gate	J. W. Palmer	396,230	Jan. 15	1418	361	46	295
Wire hook	P. Ashen	396,847	Jan. 29	2347	601	46	491
Wire. Machine for covering	H. Splitdorf	395,363	Jan. 1	84	22	46	19
Wire machines. Barb-feeding mechanism for barb	G. W. McKinny	397,925	Feb. 19	1234	330	46	839

Alphabetical list of inventions, January to March, inclusive—Continued.

Invention.	Name.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Wire mat and scraper. Woven	R. R. Pease	399,554	Mar. 12	1163	301	46	1364
Wire-reel	O. Saar	397,943	Feb. 19	1259	336	46	843
Wire-reeling device	P. L. Day	398,772	Feb. 26	2503	664	46	1094
Wire-rod reel	W. Garrett	396,925	Jan. 29	2460	633	46	515
Wire rope or cable	W. H. and T. Laidler	397,371	Feb. 5	399	105	46	653
Wire ropes, &c. Machine for making strands for	T. C. Barraclough and J. F. Kay	400,285	Mar. 26	2244	588	46	1596
Wire splicer and cutter	H. V. Wülbecke	395,642	Jan. 1	518	130	46	104
Wire-splicing tool	H. G. Hubbell	396,819	Jan. 29	2310	592	46	462
Wire-stretcher	J. L. Euyeart	398,596	Feb. 26	2238	592	46	1041
Wire-stretcher	G. R. Hughes	398,047	Feb. 19	1434	380	46	875
Wire-stretcher	F. A. Landee	399,053	Mar. 5	363	97	46	1184
Wire-stretcher	F. J. Townsend	398,759	Feb. 26	2497	659	46	1091
Wire stretcher and holder	J. W. Davy	399,185	Mar. 5	597	154	46	1230
Wire-support	R. C. Caughey	397,830	Feb. 12	1105	296	46	796
Wire-tightener	C. B. Butler	396,682	Jan. 22	2097	538	46	432
Wire-tightener	L. S. Flatau	397,635	Feb. 12	830	217	46	742
Wire-tightener	T. Reily	396,172	Jan. 15	1328	341	46	278
Wire-tightener	S. P. R. Taylor and S. S. Clark	399,946	Mar. 19	1740	449	46	1489
Wire-twisting machine	J. W. Eisenhart	399,856	Mar. 19	1616	418	46	1464
Wire-twisting machine	F. D. Fry	398,888	Mar. 5	102	28, 29, 30	46	1133
Wood-carrier	E. W. Payne	398,902	Mar. 5	129	35	46	1139
Wood-choppers. Foot-board for	A. L. Stevens	399,444	Mar. 12	987	257	46	1332
Wood into chips. Machine for cutting	O. A. Winter	399,107	Mar. 5	440	120	46	1198
Wood. Preserving	W. Youngblood	398,366	Feb. 19	1914	.....	46	970
Wood. Preserving and hardening	W. Iddings	398,619	Feb. 26	2263	.....	46	1047
Wood-splitting machine	C. Barr	396,722	Jan. 29	2167	553	46	451
Wood-worker	W. H. Doane	397,113	Feb. 5	11	3	46	581
Wood-working machine	J. Schofield	396,298	Jan. 15	1515	383	46	313
Wooden plates. Producing fancy-figured	R. Himmel	400,085	Mar. 26	1939	507	46	1536
Wooden rake	J. A. Shafer	400,259	Mar. 26	2202	578	46	1588
Wool-fat. Refining	H. W. Langbeck	399,906	Mar. 19	1681	.....	46	1478
Wool-washing machine	W. Lund	395,498	Jan. 1	283	73	46	60
Woolen fabrics to their original dimensions. Restoring fulled	R. C. Rutherford	398,847	Mar. 5	46	.....	46	1123
Work-holder	I. N. Roberts	400,116	Mar. 26	1985	520	46	1546
Work-stand	D. H. Murphy	399,546	Mar. 12	1149	298	46	1361
Working-beam	C. E. Emery	398,955	Mar. 5	208	57	46	1154
Working-beam for steam-engines	C. E. Emery	398,956	Mar. 5	209	58	46	1154
Wreath. Artificial	A. and H. Kumpf	399,270	Mar. 12	732	190	46	1282
Wrench: *See* Nut-wrench. Pipe-wrench. Ratchet-wrench.							
Wrench	L. F. Carstensen	396,857	Jan. 29	2261	605	46	495
Wrench	A. L. Duncan	396,689	Jan. 22	2106	540	46	433
Wrench	G. E. Franklin	395,491	Jan. 1	180	47	46	38
Wrench	C. H. Kennedy	396,877	Jan. 29	2392	614	46	501
Wrench	A. K. Spaulding	395,595	Jan. 1	442	113	46	91
Wrench	J. Tomlinson	398,989	Mar. 5	272	74	46	1167
Wrench	J. Van Anadall	396,970	Jan. 29	2324	651	46	528
Wrench	T. Warren	396,617	Jan. 8	1105	280	46	227
Wrench	W. C. Worthen and G. Pendleton, Jr.	397,954	Feb. 19	1274	340	46	846
Wrench	W. C. Worthen and G. Pendleton, Jr.	400,380	Mar. 26	2329	625	46	1623
Wrench attachment	C. F. Loganke and T. E. Gawn	396,751	Jan. 29	2214	566	46	463
Wrenches. Manufacture of	A. D. Gates	397,794	Feb. 12	1059	282	46	787
Wringer: *See* Clothes-wringer. Mop-wringer.							
Yarn beam or spool	A. Dahlgren	397,539	Feb. 12	661	172	46	711
Yarn-spooling machine	F. Haskell	396,816	Jan. 29	2307	590, 591	46	489
Yoke. Breast	G. Van Camp	398,198	Feb. 19	1692	436	46	916
Zinc. Blast-furnace for reducing	F. Rigaud	397,025	Jan. 29	2602	672	46	543
Zinc from ores containing precious metals. Extracting	H. B. Slater	399,706	Mar. 19	1385	.....	46	1419

Notice to the Patrons of the Patent Office.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 23, 1889.

Attention is called to Rule 9 of the Rules of Practice, requiring that a separate letter should accompany each subject of inquiry or application, and that assignments, final fees, and orders for copies or abstracts must be sent in separate letters. A strict observance of the provisions of this rule would prevent confusion and delay, and would result in expediting the business, and it is urged that proper attention should be given to this matter.

BENTON J. HALL,
Commissioner.

Issue of April 2, 1889.

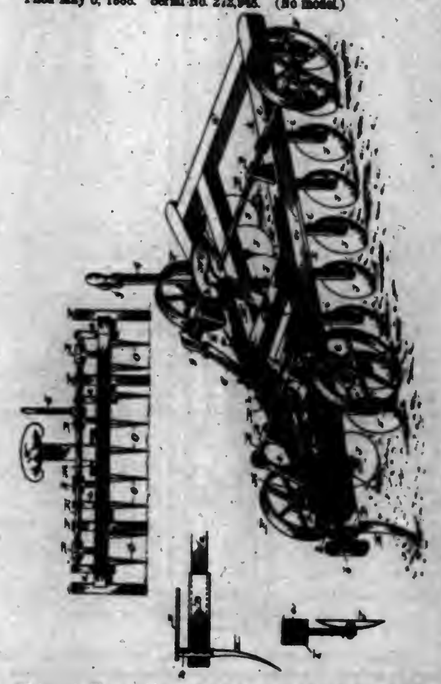
DISCLAIMER.

8,388. (Reissue.)—*Augustus Day*, Detroit, Mich. Original patent, No. 125,547, dated April 9, 1872. Reissue patent dated August 27, 1878. IMPROVEMENT IN TRACK-CLEARERS. Disclaimer filed March 22, 1889, by the patentee.

Enters his disclaimer to claims 1 and 2 of said reissue patent, which are in the following words, to wit:



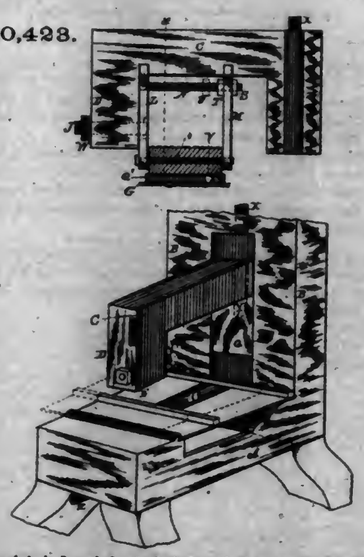
"1. In a railway-car, a pair of independently-acting scrapers, pivotally secured to the floor of the same, and resting upon the track, when in operation, wholly by their own weight, in combination with means for raising and lowering such scrapers simultaneously, substantially as and for the purpose set forth.

"2. In a track-cleaning device, the combination, with an independently-acting scraper, resting, when in operation, wholly by its own weight upon the track, of a draw-bar in the direct line of draft and a supplementary and diagonal draw-bar, which at the same time acts as a brace, the forward ends of both of said draw-bars being secured on the same axial line, substantially as and for the purpose set forth."

PATENTS

GRANTED APRIL 2, 1889.

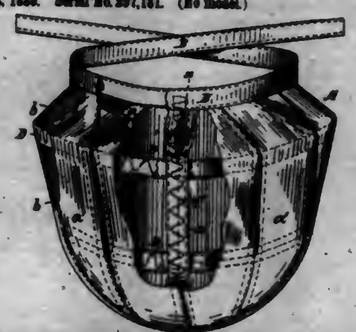
400,422. DISK CULTIVATOR. JOSEPH ALBERTSON, Chicago, Ill. Filed May 5, 1888. Serial No. 272,948. (No model.)



Claim.—1. The combination, with the triangular frame, of a plow at the point of intersection of the longitudinal beams of said frame, provided with a bearing portion journaled in a block, B, a lever for adjusting the plow rigidly secured to the upper end of said bearing portion and at right angles thereto, and a horizontally-disposed segmental rack-bar adapted to be engaged by a clutch upon the lever to retain the plow in adjusted position, substantially as and for the purpose set forth.

2. The herein-described plow, comprising the triangular frame carrying rotatable disks, the horizontally and transversely disposed axles having bearings thereon, crank-arms at the ends of said axles having carrying-wheels mounted thereon, levers rigidly secured to the axles and at right angles thereto, vertically-disposed segmental rack-bars adapted to be engaged by clutches upon the levers to retain the axles in adjusted position, a plow at the front end of the frame having a vertical bearing portion, an adjusting-lever rigidly secured to the latter at right angles thereto, a horizontally-disposed segmental rack-bar adapted to be engaged by a clutch upon said lever to retain the plow in adjusted position, a seat upon the frame, and a clevis at the front end of the latter, all arranged and adapted to be operated substantially as and for the purpose set forth.

400,423. MACHINE FOR ORNAMENTING WOOD. EDWARD W. ALLEN, Minneapolis, Minn. Filed Nov. 24, 1888. Serial No. 291,730. (No model.)

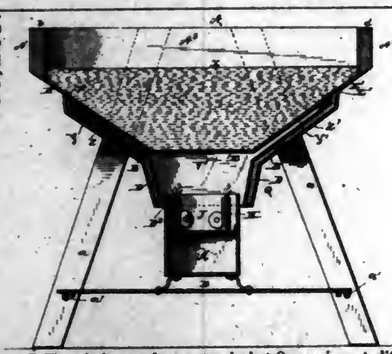


Claim.—In a machine for imprinting wood, the standards L and M, notched out at their top portions, in combination with the arm C D, which they engage, and the arm L, carrying the fixed screw-rod N,

400,428.

the fixed bolt J, and fixed shaft O, and the arm N, provided with bearings to receive the screw-rod N and shaft O, and the screw-rod carrying the jam-nut T, and a clamping-nut, S, with the die R and table D', and feed-roller G of the machine, as specified.

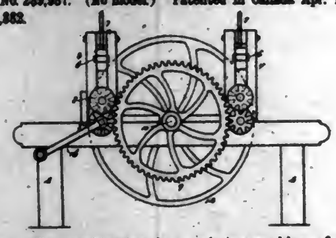
400,424. BUSTLE. CHARLES A. ALLEN, Chicago, Ill. Filed Jan 22, 1889. Serial No. 297,161. (No model.)



Claim.—As a new article of manufacture, a bustle structure consisting of a number of crimped-wire springs arranged vertically, a number of companion springs disposed at right angles with reference to the vertical springs, the pockets in which the series of springs are inserted, the outside covering, and the binding-wire secured in and extending around the edge of said covering, substantially as and for the purpose set forth.

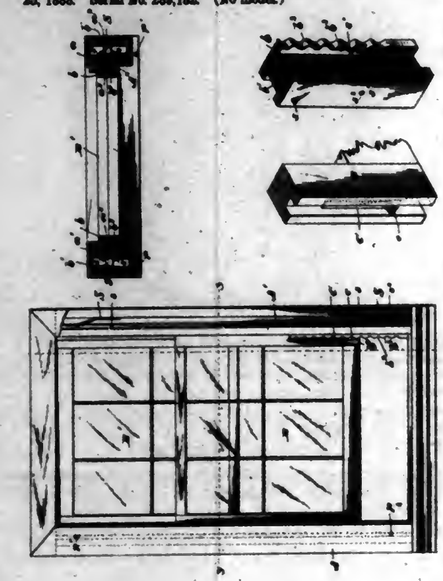
400,425. WASH-BOILER TANK. JOHN W. ANDERSON, Lancaster, Pa. Filed June 10, 1888. Renewed Nov. 23, 1887. Serial No. 256,305. (No model.)

Claim.—1. The combination of the vessel A, having the hipped



400,425.

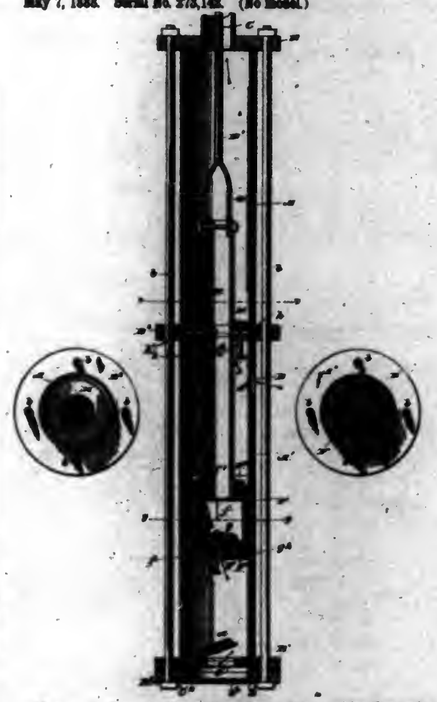
bottom E E', and the pendent water-jacket Q, opening at different levels into vessel A, and comprising the side plates, V V', the fire-plates D D', forming the flues, and the skirting-sections Z Z', substantially as and for the purposes set forth.



2. The combination of supporting-frame *a a'*, vessel A, having hipped bottom E E', depending water-jacket Q, opening into the vessel A at different levels and forming the confine and flues, support R, and the heater projecting into the confine, substantially as and for the purposes herein shown and described.

400,426. SHINGLE OR SHEET-METAL PAINTING MACHINE. GEORGE D. ARMSTRONG, Belleville, Ontario, Canada. Filed Nov. 5, 1888. Serial No. 289,967. (No model.) Patented in Canada Apr. 13, 1888. No. 23,882.

Claim.—The combination, in a painting-machine, of the two series of rollers having intermeshing gear-wheels, the central shaft, 10, wheel 9, secured thereon, pinions 11, with which said wheel gears, the bearing or support 20, secured to said shaft, and the springs having inner flanged or bent ends adjacent said bearing or support, substantially as set forth.

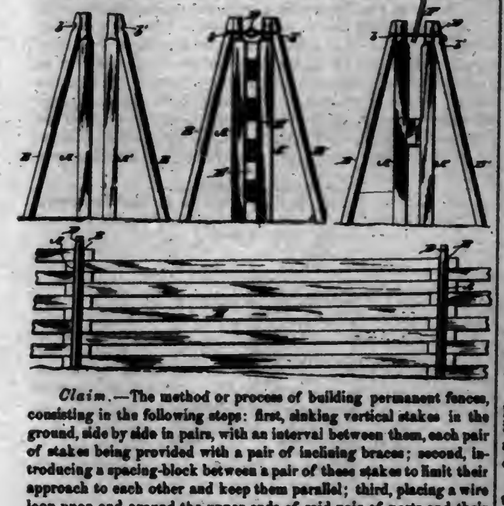


400,427. WINDOW. BRUNO ARCHENBACH, St. Joseph, Mo., assignor of one-half to George L. Herman Mueke, same place. Filed Oct. 25, 1888. Serial No. 289,132. (No model.)

Claim.—1. The combination, substantially as described, of a window-frame the sides of which are provided each with a slot, spring-pressed guide-strips loosely seated therein and having a central groove or channel in their outer faces to form inner and outer flanges, and the upper and lower sash having grooved stiles engaging, respectively, the outer and inner flanges of the guide-strips.

2. In a window, the combination of the slotted jambs having movable grooved or channeled guide-strips therein, having transverse apertures *d'* and *d³*, the springs in rear of and engaging said guides, the pins *e*, the pins *p* and *p'*, and the sash having grooved stiles sliding on the flanges of the channels or grooves in the guides, substantially as described.

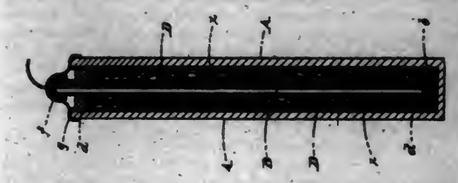
400,428. PUMP. CHARLES BARLEY, Mechanicsville, Iowa. Filed May 7, 1888. Serial No. 273,142. (No model.)



Claim.—1. In a double-acting pump, the combination, substantially as set forth, of a sectional cylinder having heads with a central and peripheral apertures, and the one face of each provided with a chamber or groove fitting, respectively, over the upper and lower ends of the upper and lower sections of said cylinder, the head of the lower section having a central valved opening and the upper part of one side of said section provided with a similar opening, a central disk or flat plate provided with grooves or channels in both face thereof fitting over and unitedly supporting the contiguous ends of the sections of the cylinders, having a valve-recess in its upper face, with a central piston-opening surrounded by valve-openings extending through the bottom of said recess and outer peripheral apertures, a hollow piston-rod or pipe having an open top connected at its upper end to a solid piston-rod, a chambered piston head or plunger attached to and in direct communication with the lower end of the hollow piston-rod, having an opening in the bottom thereof provided with a gravity-valve and dished packings at the upper and lower ends thereof, and the elongated tie-rods secured in connection with and passing through the peripheral apertures in the heads of the cylinders and through the peripheral apertures in the centrally-interposed disk-plate on the outside of the cylindrical sections.

2. In a double-acting pump, the combination, with the sectional cylinder, of the grooved or channeled heads projecting outwardly beyond said sections to provide flanges in which peripheral apertures are formed, the single central valve-disk or flat plate having grooves or channels therein inside of the periphery thereof for the reception and support of the contiguous ends of the cylinder-sections, and by the inner formation of the grooves or channels providing flanges projecting outwardly beyond the circumference of the said cylinders and having peripheral apertures therein, and the elongated tie-rods held in connection with the upper and lower heads of the cylinders and

freely passing through the peripheral apertures in the central disk or plate to secure said heads upon the ends of the cylinders and hold the cylinder-sections in rigid alignment by passing through the disk-plates, substantially as described.

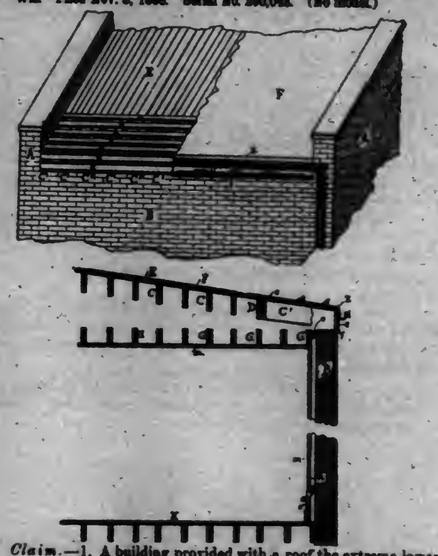


3. In a double-acting pump, the combination, with the lower cylindrical section, of a head, B', having a valved opening, C', therein, and a central recess, C³, in the lower side thereof communicating directly with the said valved opening, and a plate, B³, attached to the plate B', having a recess, *b'*, in its upper side conforming to and with the recess C³ in head B', forming a chamber under valved opening C', the bottom wall of said recess *b'* having a series of vertical apertures, *b³*, formed therein, substantially as described.

400,429. METHOD OF FENCE-BUILDING. DAVID R. BARTON, Centreville, Md. Filed Oct. 12, 1888. Serial No. 288,562. (No model.)

Claim.—The method or process of building permanent fences, consisting in the following steps: first, sinking vertical stakes in the ground, side by side in pairs, with an interval between them, each pair of stakes being provided with a pair of inclining braces; second, introducing a spacing-block between a pair of these stakes to limit their approach to each other and keep them parallel; third, placing a wire loop upon and around the upper ends of said pair of posts and their braces; fourth, twisting said loop to draw said stakes against said blocks; fifth, removing the spacing-block and using it as above with successive pairs of stakes until a sufficient number of them are complete, and, finally, inserting the rails between the pairs of stakes, all substantially as and for the purpose set forth.

400,430. GALVANIC BATTERY. EDWARD H. CROSBY, Boston, Mass. Filed Jan. 10, 1889. Serial No. 295,983. (No model.)



Claim.—1. In an electric battery, the combination of a zinc-containing jar, a carbon pencil disposed within said jar and insulated therefrom by hard-rubber rings, and a packing disposed around said pencil consisting of wool waste saturated with a solution of sal-ammoniac, substantially as described.

2. In an electric battery, the combination of a zinc-containing jar, a carbon pencil disposed in said jar and insulated therefrom, a packing around said pencil consisting of wool waste impregnated with sal-ammoniac, and a wire-connector on said pencil composed of lead and tin, substantially as described.

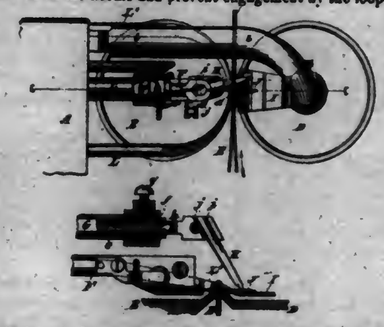
3. In an electric battery, the combination of a zinc-containing jar amalgamated on its inner face, an insulator in the bottom of said jar, a carbon pencil resting therein and provided with insulating-rings, a wire-connector on said pencil composed of lead and tin, an excitant consisting of sal-ammoniac suspended in a sponge-like material around said pencil, and an insulating-cap for said jar, substantially as described.

4. In an electric battery, the combination of the zinc-containing jar A, amalgamated at *x*, and provided with the insulator *b*, the pencil B, having the insulating-rings *d*, the packing D, disposed around said pencil and composed of wool waste saturated with sal-ammoniac, the wire-connector *f*, composed of a compound of tin and lead, and the insulating-cap *g*, all being arranged substantially as described.

400,431. FLAT-ROOFED BUILDING. JAMES G. BERELY, Oshkosh, Wis. Filed Nov. 5, 1888. Serial No. 290,042. (No model.)

Claim.—1. A building provided with a roof the extreme lower edges of which are in contact on one side with a body of air within the building, whereby the temperature of the roof is moderated at all points and snow readily shed.

2. The combination, with the walls of a building, of a roof supported thereby, the lower edges of the roof resting on the walls, an interior air-space being in contact with the roof between the walls and the lower edges, and being in communication with the under side of the roof at its extreme lower edge.



3. A building provided with a roof supported on the walls so that the under side of the roof is in contact throughout its entire surface, including the lower edges, with an interior air-space, and provided with warm-air ducts from lower floors to the air-space.

4. In a building, the combination of the walls, inclined roof supported on the walls and in contact at all points, including the extreme lower edges, with an interior air-space, supports for the roof spaced to permit direct contact with the interior air, and warm-air ducts from the lower stories opening into the air-space.

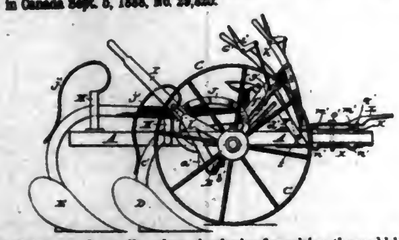
5. In a building, the combination of the walls supporting the roof, the header D, supporting the rear roof-joists, the opposite ends of which rest upon the top of the rear wall, slats across the top and lower end of these joists to support the roof-covering, and an air-space between the roof-covering and the top of the rear wall, connecting with ducts between the plastering and the rear wall extending upwardly from ventilators or openings from inside rooms, as and for the purpose set forth.

400,432. GLOVE-SEWING MACHINE. CLAUDE M. BOLAND, New York, N. Y. Filed May 12, 1888. Serial No. 273,704. (No model.)

Brief.—The looper is made so as to be adjustable as to height or length, so that the point may be accurately adjusted with regard to the needle. A guard-plate, I, has an oblique slot, which acts as a guard to hold down the needle and prevent engagement by the looper.

Claim.—1. In a sewing-machine, the needle guard or protector I, having an oblique slot for the needle, combined with the looper and needle and with fabric-feeding mechanism, substantially as described.

2. The needle guard or protector I, having an oblique slot for the needle, and a lip, *d*, that projects over the needle, combined with a looper and needle and with fabric-feeding mechanism, substantially as described.

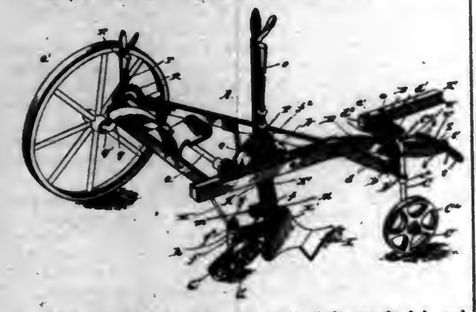


3. In a sewing-machine, the vertically and horizontally adjustable sectional looper A H, combined with complemental stitch-forming and feeding mechanism, substantially as described, and with the guard of protector I, having an oblique slot for a needle, substantially as specified.

4. The looper-bar G, having horizontal socket *e* extending from its end inwardly, combined with the rod *h*, having nearly-vertical socket *i*, the rod *h* passing within the horizontal socket *e*, and with the looper H, that is held in said socket *i*, and with a needle and feeding mechanism, substantially as described.

5. The combination, with the feed-disks B D, of the two guides L L^2 over the disk B, at opposite sides thereof, for keeping the edge of the fabric above the disk B from falling over, and with stitch-forming mechanism, whose needle J enters between the ends of said guides, as specified.

6. The combination of the feed-disks B and D with the needle-guard I and the guides L L^2 over the disk B, at opposite sides of the disk, and with stitch-forming mechanism, substantially as herein shown and described.



400,438. SULKY-PLOW. CHARLES BOULAY, St. Pie, Quebec, Canada. Filed Dec. 26, 1888. Serial No. 294,612. (No model.) Patented in Canada Sept. 5, 1888, No. 29,825.

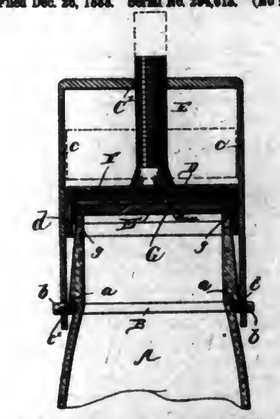
Claim.—1. In a sulky-plow, the device for raising the mold-board, consisting of the bracket F and guide H, lever G, and link *f'*, and the curved beam *c'*, substantially as shown and described.

2. In a sulky-plow, the body A, supported by the swinging axle B, in combination with the slotted lever I, an arm, *l'*, secured to the axle and having a pin to engage with the lever, and an arc, J, all arranged substantially as shown.

400,484. HILLSIDE-PLOW. MARCELLUS J. BUSSELL, Taylor, Tex. Filed Nov. 15, 1888. Serial No. 290,889. (No model.)

Claim.—1. In a plow, the combination of the standard depending from the frame of the plow, the movable arm pivoted to the said standard near its lower end and having the plowshare fixed thereto, and the operating-lever mounted on the plow-frame and provided with a toothed sector meshing with a toothed T-head on the upper end of the said movable arm, substantially as specified.

2. In a plow, the combination, with a standard depending from the frame thereof, of the movable arm pivoted near its lower end and having the plowshare and mold-board affixed thereto, the operating-arm mounted on the said frame and provided with a toothed sector meshing with a toothed T-head on the upper end of the movable arm, and the brace-bar extending from the mold-board to the movable arm and provided at an intermediate point with a loop, *m*, operating on the standard, substantially as specified.



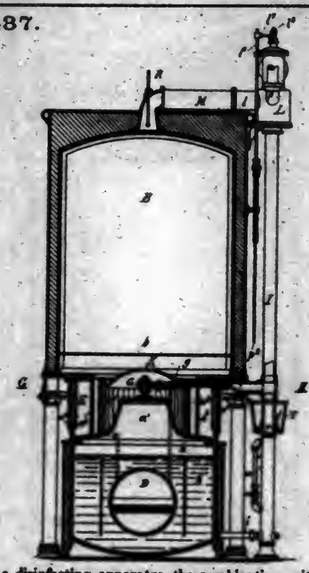
3. In a plow, the combination, with the beam, of the depending standard, the movable arm pivoted to the standard near its lower end, and provided at its lower end with a curved plate, *k*, and at its upper end with a toothed T-head, the plowshare secured to the said curved plate, the operating-lever mounted on a bracket arranged on the said beam and having a toothed sector meshing with the toothed T-head, and the spring-actuated latch mounted on the lever and engaging a toothed rack on the upper extended end of the standard to lock the lever in the desired position, substantially as specified.

400,485. HOLDBACK FOR VEHICLE-THILLS. MILTON R. CAMPANY, Hamilton, Mich. Filed Oct. 3, 1888. Serial No. 287,050. (No model.)

Claim.—In a holdback-strap attachment, the combination, with a base-plate provided near its rear end with a forwardly-projecting hook having an upturned point and formed with a recess in its inner upright portion, of a spring-plate provided with a perforation at its front end, through which it is adapted to be secured by one of the ordinary screws for securing the attachment to the thill, said spring-plate being curved upwardly, rearwardly, and downwardly under the hook, and provided with a contracted rear end projecting and playing within the recess of the hook, substantially as and for the purpose set forth.

400,486. BOTTLE-STOPPER. WILLIAM R. CHAMBERS, Newark, Ohio. Filed Dec. 26, 1888. Serial No. 294,613. (No model.)

Claim.—1. In a bottle-stopper, the combination of the revoluble yoke C, connected to a ring on the neck of the bottle, the cap fitting over the mouth of the bottle and provided with a vertical threaded stud engaging a central tapped aperture in the yoke, and the ground-glass disk E, secured loosely in the cap and adapted to bear on the mouth of the bottle, whereby the yoke may be rotated to raise or lower the cap without rotating the cap or the disk and the disk may be pressed against and removed from the mouth of the jar, substantially as specified.



2. In a stopper, the combination, with a revoluble yoke connected to the neck of the bottle, of the cap provided with a threaded stud engaging a threaded aperture in the yoke, the glass disk arranged in the cap and bearing on the mouth of the bottle, the compressible cushion interposed between the said disk and the upper side of the cap, and the collar arranged below the disk to hold it in place, substantially as specified.

3. In a stopper, the combination, with a revoluble yoke connected to the neck of a bottle, of the cap provided with a threaded stud engaging a threaded aperture in the yoke, the glass disk arranged in the cap and bearing on the mouth of the bottle, the compressible cushion between the glass disk and the top of the cap, and the metallic disk interposed between the glass disk and the cushion, substantially as described.

400,487. DISINFECTING APPARATUS. HUGHS CLARENBACH, Berlin, Germany. Filed Mar. 10, 1888. Serial No. 266,872. (No model.) Patented in Norway Feb. 13, 1888, No. 980; in Italy Mar. 1, 1888, XXI, 22,889, and in Austria-Hungary June 1, 1888, No. 42,435 and No. 10,233.

Claim.—1. In a disinfecting apparatus, the combination, with the disinfecting-chamber, of a steam-generator, a valved duct for conducting the steam from the generator to said chamber, a heater interposed in the passage of the steam, and a deflector for deflecting such steam upon the heated walls of the heater, substantially as and for the purposes specified.

400,487.

2. In a disinfecting apparatus, the combination, with the disinfecting-chamber, of a steam-generator, a valved duct for admitting steam to said chamber, a heater interposed in the passage of the steam from the boiler to the disinfecting-chamber, and a valved air-duct connected with the heater and opening into the atmosphere, whereby steam or air, or both, may be admitted to the disinfecting-chamber and said air heated before its admission thereto, substantially as and for the purposes specified.

3. In a disinfecting apparatus, a disinfecting-chamber and a steam-generator connected with said chamber at one end thereof, and in combination therewith, of an exhaust-pipe connected with the generator and by a branch pipe with the opposite end of the disinfecting-chamber to that where it is connected with said generator, and a liquid seal interposed in the connection between the exhaust-pipe and the branch thereof, substantially as and for the purposes specified.

4. In a disinfecting apparatus, the combination, with the disinfecting-chamber, a steam-generator, and a valved duct connecting the generator with said chamber, of a valved air-duct connected with the heater, an exhaust-pipe connected with the generator, and a three-way cock interposed in the connection between the generator, the disinfecting-chamber, and the exhaust-pipe, whereby steam may be admitted to said chamber from the generator or exhausted from the latter by the manipulation of a single cock, substantially as and for the purposes specified.

5. In a disinfecting apparatus, the combination, with the disinfecting-chamber, a valve-casing, L, a pipe connecting the disinfecting-chamber with the valve-casing, an exhaust branch for said valve-casing, a deflector extending to near the bottom of the valve-casing to divide the same into two communicating chambers connected, respectively, with the exhaust branch thereof and the exhaust-pipe of the disinfecting-chamber, and a pipe projecting through the bottom of the valve-casing beyond the lower edge of the deflector, of a steam-generator, a valved duct connecting the generator with the disinfecting-chamber, and a return-pipe connected with the pipe projecting through the bottom of the valve-casing and with the steam-generator, substantially as and for the purposes specified.

6. In a disinfecting apparatus, the combination, with the disinfecting-chamber, a steam-generator, an exhaust-pipe, ducts connecting the generator with the disinfecting-chamber and exhaust-pipe, a three-way cock interposed in said ducts, and valved air-ducts communicating with the disinfecting-chamber, of a rock-shaft, an operating-lever secured thereto and connected with the three-way cock, and a like shaft and valve connected with the air-duct valves, said parts being arranged and operating substantially as shown and described.

7. In a disinfecting apparatus, the combination, with the disinfecting-chamber, of a steam-generator arranged below the chamber and provided with a steam-dome, a draft-flue connected with the generator-furnace encompassing the steam-dome to form between the two a heating-chamber, said chamber communicating with the disinfecting-chamber, a connection between the draft-flue and a chimney, and a partition, F', in said flue interposed between the inlet and outlet for the products of combustion, substantially as and for the purposes specified.

8. In a disinfecting apparatus, the combination, with the disinfecting-chamber, of a steam-generator arranged below the chamber and provided with a steam-dome, a draft-flue provided on its inner wall with heat-radiating ribs, said flue encompassing the steam-dome and forming a heating-chamber around the same—that is, in communication with the disinfecting-chamber—a furnace, a connection between the furnace and the draft-flue and between the latter and a chimney, and a partition, F', interposed in said draft-flue between the inlet and outlet for the products of combustion, substantially as and for the purposes specified.

9. The combination, with the disinfecting-chamber, of a steam-generator provided with a steam-dome having radiating-ribs on its outer surface, and a draft-flue encompassing the steam-dome having radiating-ribs formed on its inner surface, substantially as and for the purposes specified.

10. In a disinfecting apparatus, the combination, with the disinfecting-chamber, a steam-generator arranged below the same and provided with a steam-dome, a valved steam-duct extending vertically from the dome, and a hood or deflector arranged above the steam-duct, of a flue connected with the generator-furnace and with a chimney surrounding the steam-dome and forming a heating-chamber in communication with the disinfecting-chamber, substantially as and for the purposes specified.

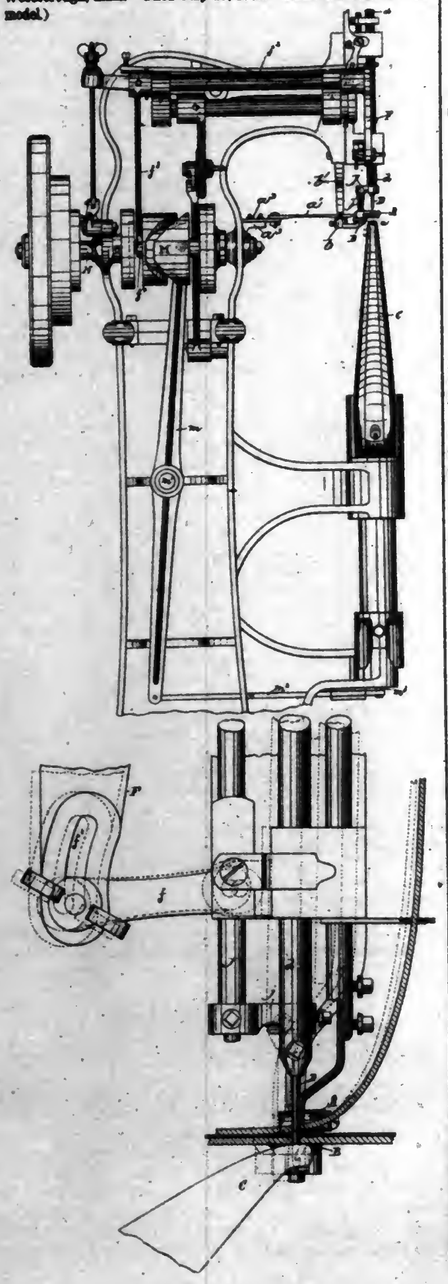
11. In a disinfecting apparatus, the combination, with the steam-generator, an exhaust-pipe connected with both the steam and water spaces of the boiler, said pipe having feed-ports formed therein at a point intermediate of its connections, of a feed-hopper surrounding said ports, and a bell or hollow cone mounted on the pipe, with its open end below the feed-ports, substantially as and for the purposes specified.

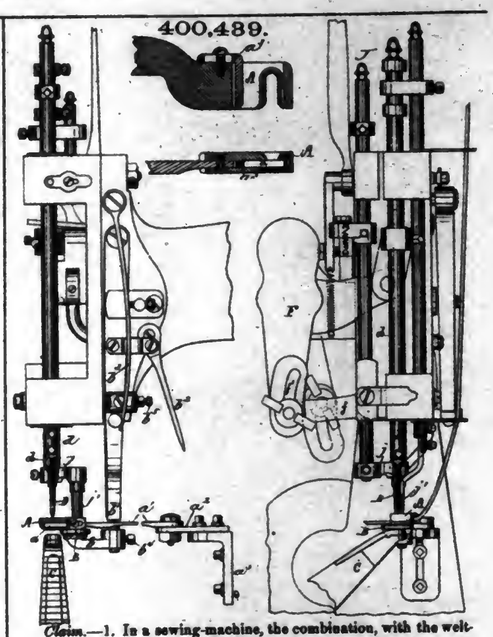
12. In a disinfecting apparatus, the combination, with the disinfecting-chamber having a perforated bottom, of a steam-generator arranged below said chamber and provided with a steam-dome, a valved steam-duct extending vertically from the dome, a hood or deflector arranged over said duct, a flue surrounding the steam-dome and deflector connected with the generator-furnace, and a chimney and cold-air ducts connected with the space between the dome and surrounding flue, substantially as and for the purposes specified.

13. The combination, substantially as described, with the disinfecting-chamber, a steam-generator, a valved steam-duct in communication with the disinfecting-chamber, an exhaust-pipe, and a valved connection between the exhaust-pipe and steam-space of the boiler, of a valve-casing on the exhaust-pipe, into which said pipe projects slightly, a bell-mouthed pipe inclosing the upper end of the exhaust-pipe and opening into the atmosphere, a branch pipe connecting the casing with the disinfecting-chamber at a point above the upper edge of the exhaust-pipe exteriorly of the bell-mouthed pipe, a branch pipe for connection with a chimney, and a valve interposed between the latter pipe and the connection with the disinfecting-chamber, substantially as and for the purposes specified.

14. The combination, substantially as described, with the disinfecting-chamber, valved air-ducts communicating with said chamber, a steam-generator, an exhaust-pipe, connections between the steam-space of the generator, the exhaust-pipe, and the disinfecting-chamber, of a valve-casing on the exhaust-pipe, into which said pipe projects, a connection between the casing and the disinfecting-chamber, a bell-mouthed pipe inclosing the upper end of the exhaust-pipe and opening into the atmosphere, a branch for connecting the casing with a chimney, a valve arranged in the casing between the latter branch and the connection with the disinfecting-chamber, a rock-shaft, levers secured thereto, and connecting-rods connecting the levers with the valve in the valve-casing and the valves in the air-ducts, whereby all of said valves may be set at a single operation of the rock-shaft, substantially as and for the purposes specified.

400,488. ROD-PACKING. JOSEPH COCKFIELD and CLINTON D. HIGGINS, Boone, Iowa. Filed Oct. 23, 1888. Serial No. 288,986. (No model.)



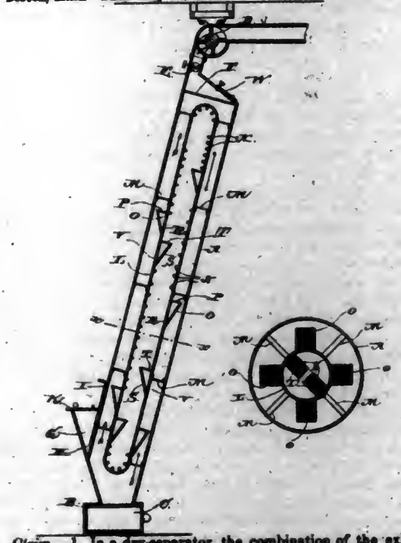


Claim.—1. The combination, with the companion packing-rings, of the backing or filling rings D D', having the adjacent edges beveled, as described, the sectional ring D^2, beveled on both edges to corre-

spond to and wedge in between the rings D D', and the compressing-ring b', inclosing the ring D^4, substantially as and for the purpose set forth.

2. In the metallic packing, the combination of the following elements: the companion sectional packing-rings, the sectional ring c, inclosing said packing-rings, a ring or spring band encircling the ring c, a gland having a recess on the inner end, a flange-sleeve seated in said recess, the backing-rings D D', having the joining edges beveled to form a V-shaped groove between the same, the ring D^3, correspondingly beveled on both edges to wedge into said groove, and the spring-compressing ring b', inclosing the sectional ring D^3, substantially as and for the purpose set forth.

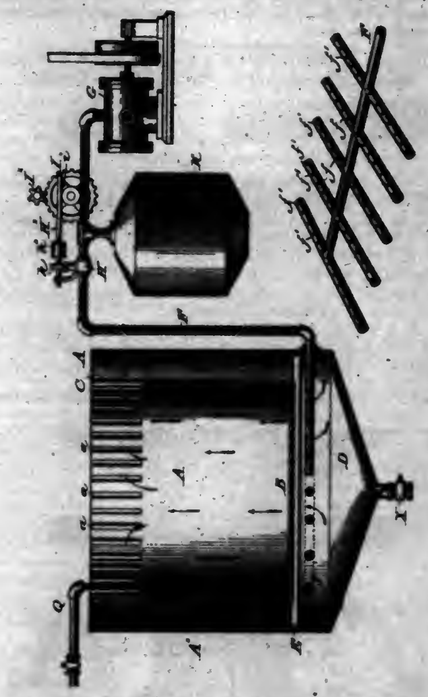
400,439. BOOT OR SHOE SEWING MACHINE. WILLARD CONEY, Westborough, Mass. Filed July 23, 1884. Serial No. 138,670. (No model.)



Claim.—1. In a sewing-machine, the combination, with the welt-guide A, having an orifice through which the welt passes, of the rotary horn C, the edge-guide B, and a presser-bar, all substantially as and for the purpose set forth.

2. In a sewing-machine, the combination of guide A, having a welt-passage through it, the presser *j j'*, bearing upon the welt-guide, the rotary horn C, and the gage B, arranged and operating substantially as and for the purpose set forth.

400,440. ORE-SEPARATOR. JOSEPH COOMBS, Portland, Me., assignor to the Coombs Mining and Dry Mineral-Separator Company, Boston, Mass. Filed May 12, 1888. Serial No. 273,607. (No model.)



Claim.—1. In a dry-separator, the combination of the exhaust-fan, the exterior case, A, and the perforated case L, located within the same and provided with the internal and external pockets, for the purpose set forth, substantially as described.

2. The combination of the exhaust-fan, the exterior case, A, the perforated case L, located within the same, the pockets O on the outside of the interior case and communicating with the interior thereof, and the pockets L and communicating with the exterior thereof, for the purpose set forth, substantially as described.

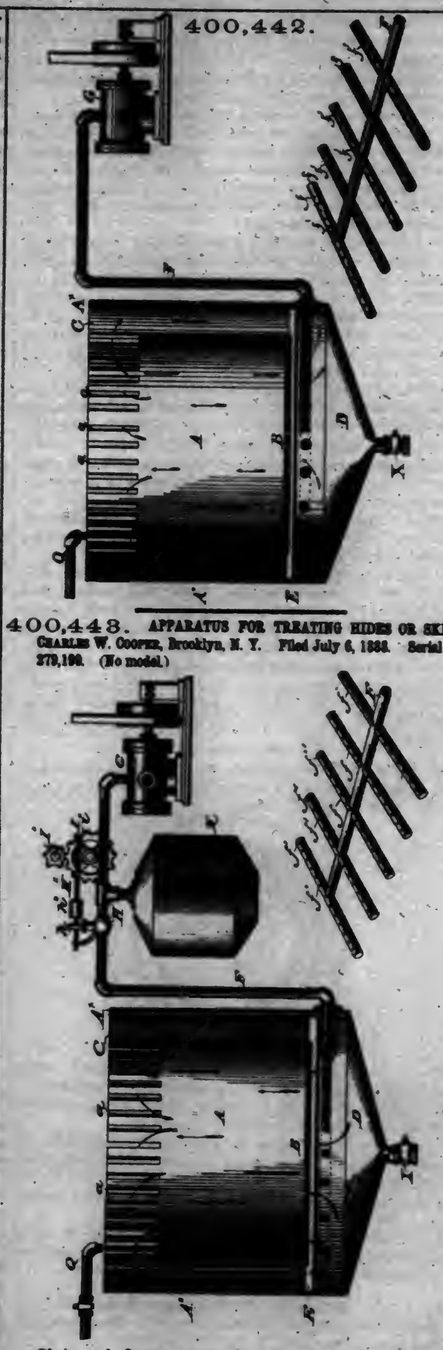
3. The combination of the exterior case, A, having the hopper

G, the box B at the lower end of case A, the screen F in the upper end of said case, the exhaust-fan, the damper E to regulate the strength of the current, the perforated case L, located in the case A, the bars M, connecting the interior and exterior cases, and the pockets O and S on the outer and inner sides of the case L, for the purpose set forth, substantially as described.

400,441. PROCESS OF AGITATING HIDES OR LEATHER SCRAPS. CHARLES W. COOPER, Brooklyn, N. Y. Filed July 6, 1888. Serial No. 279,197. (No model.)

Claim.—1. The method of agitating or treating hides in liquids, which consists in treating said hides in a receptacle through the sides and bottom of which the liquid has egress and ingress, respectively, by alternately elevating said hides therein by the introduction of gaseous fluid beneath them and permitting them to sink by the action of gravity, as specified.

2. The method herein described of agitating hides and liquids contained in a vat, which consists in alternately causing said hides to rise therein by means of a current of air entering the bottom of said vat beneath them, and by the cessation of such current of air permitting them to descend by gravity, substantially as set forth.



3. The method herein described of agitating hides and liquids contained in a vat, which consists in inducing an upward current of said hides and liquor by means of a gaseous fluid introduced into said tank beneath them, permitting part of said liquid to escape from above said hides and to re-enter the vat at a lower point and beneath the hides, and by interrupting the flow of said gaseous fluid and permitting said hides to sink by gravity through the liquid, as specified.

400,442. PROCESS OF AGITATING HIDES OR LEATHER SCRAPS. CHARLES W. COOPER, Brooklyn, N. Y. Filed July 6, 1888. Serial No. 279,198. (No model.)

Claim.—1. The method of agitating or treating hides in liquid, which consists in subjecting said hides in a receptacle (through orifices in the sides or bottom of which the said liquid may flow into and out from a common liquid-reservoir) to the action of currents of air introduced within and at or near the bottom of said receptacle, as specified.

2. The method of treating hides or glue-scraps in water or other liquid in the chemical treatment thereof or for the removal of impurities therefrom, which consists in feeding air or a suitable gas into and at or near the bottom of a vessel containing the mass to be treated, in such manner as to cause the hides or scraps treated to be agitated in contact with each other, and at the same time to cause the water or liquid in said vessel to flow or circulate from the upper part of said vessel to the lower part thereof and under the hides or scraps therein, as specified.

400,442.

400,443. APPARATUS FOR TREATING HIDES OR SKINS. CHARLES W. COOPER, Brooklyn, N. Y. Filed July 6, 1888. Serial No. 279,199. (No model.)

Claim.—1. In an apparatus for treating hides in water or other liquid, in combination, a tank adapted to contain the hides, having liquid-outlet orifices formed therein at or near the top thereof, and provided with a slatted bottom, an exterior tank inclosing said hide-containing tank, means for supporting said inner tank within said inclosing-tank and clear of the walls thereof, and air-pipes discharging into said hide-containing tank at or near the base thereof, substantially as set forth.

2. In an apparatus for treating hides in water or other liquid, a tank adapted to contain the hides, liquid inlet and outlet orifices formed therein at or near the bottom and top thereof, respectively,

an exterior tank inclosing said hide-containing tank, and an air-pipe furnished with outlet-provided branches, situated at the base of the hide-containing tank, all said outlets discharging within a space co-extensive and coincident with the slatted or perforated bottom of said hide-containing tank, substantially as set forth.

3. In an apparatus for treating hides in water or other liquid, a tank adapted to contain the hides, liquid inlet and outlet orifices formed therein at or near the bottom and top thereof, respectively, an exterior containing-tank between the walls of which and the perforated walls of the inner tank are liquid-spaces, an air-pipe discharging into the base of said hide-containing tank, a liquid-supply pipe, and a drawing-off cock, as specified.

4. In an apparatus for treating hides in water or other liquid, a tank adapted to contain the hides, liquid inlet and outlet orifices therein at or near the bottom and top thereof, respectively, and which open exteriorly into a common reservoir, an air-engine, an air-pipe leading from said air-engine to and discharging into the base of the hide-containing tank, a valve applied to the air-pipe, and a reservoir in communication with the air-pipe at a point between the engine and the air-pipe valve, as specified.

5. In an apparatus for treating hides in water or other liquid, a tank adapted to contain the hides, liquid inlet and outlet orifices formed therein at or near the bottom and top thereof, respectively, and which open exteriorly into a common reservoir, an air-engine, an air-pipe leading from said air-engine to and discharging into the base of the hide-containing tank, a valve applied to said air-pipe, a lever-arm attached to said valve, by the raising and lowering of which the valve is operated, a wheel having a pin projecting from its face adapted in the rotation of the wheel to operate said lever, and means for rotating said wheel, as specified.

6. In an apparatus for treating hides in liquor, in combination, a tank adapted to contain the hides, having liquid-outlet orifices formed therein at or near the top thereof, and provided with a slatted bottom, an exterior tank inclosing said hide-containing tank, means for inclosing said inner tank within said inclosing-tank so as to leave spaces between the opposing walls thereof, an air-pipe discharging into said hide-containing tank at or near the base thereof, a valve adapted to open and close said pipe, means for automatically operating said valve, an air-pump, and a reservoir in communication with said air-pump, as specified.

400,444. SULPHUR CANDLE. WILLIAM G. CRISSEY, East Orange, N. J., assignor to Seabury & Johnson, New York, N. Y. Filed Nov. 19, 1888. Serial No. 291,290. (Model.)

Claim.—1. A disinfectant candle comprising sulphur having wicks arranged transversely at the top, substantially as specified.

2. A disinfectant candle comprising sulphur having wicks arranged radially at the top, substantially as specified.

3. A sulphur candle having wicks arranged radially at the top and an intermediate wicking or tuft of fiber, substantially as specified.

4. A disinfectant candle comprising sulphur having at the top radial wicks embedded between their ends in the material of the candle, but exposed at both ends, substantially as specified.

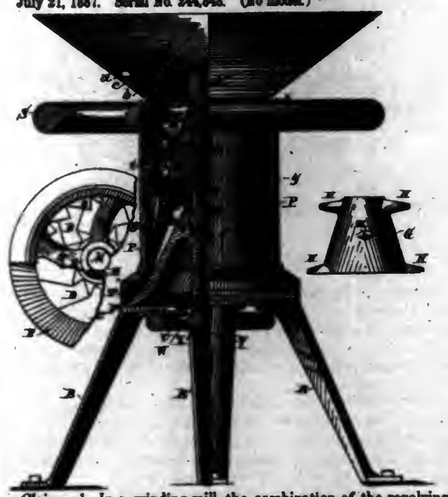
5. A disinfectant candle comprising sulphur having its top or upper surface concaved from the outer wall toward the center and having transversely-extending wicks, substantially as specified.

400,445. SEAL-LOCK. OTIS E. DAVIDSON, Nashville, Tenn., assignor, by direct and mesne assignments, to W. W. Martin, same place. Filed May 12, 1888. Serial No. 273,673. (No model.)

Claim.—1. The combination, with the base having the recess in the under side, the turn-bolt provided with the shoulders for holding the hasp, and the ratchet and pawl for preventing the rotation of the bolt in one direction located in the recess in the base, of the large-headed studs on the turn-bolt and base, respectively, and the seal connecting said studs, for preventing the rotation of the bolt in the opposite direction, substantially as described.

2. The combination, with the base having the large-headed stud thereon, of a turn-bolt pivoting on said base having a corresponding large-headed stud thereon, the seal having the slot therein, with the widened portion at the center for connecting said studs and preventing the rotation of the bolt in one direction, and means, substantially as described, for preventing its rotation in the opposite direction, substantially as described.

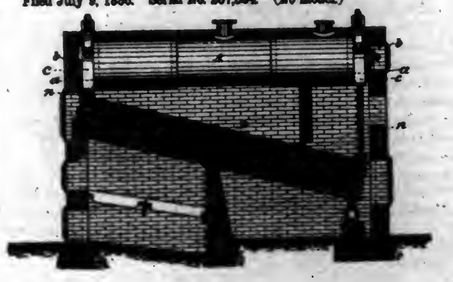
400,446. MOUTH-PIECE FOR CIGARS. THERON S. E. DIXON, Chicago, Ill. Filed June 11, 1888. Serial No. 276,684. (No model.)



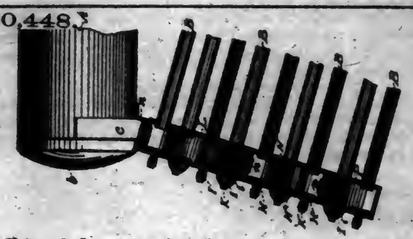
Claim.—1. A flexible mouth-piece for cigars, &c., substantially cylindrical in form and provided with an abrupt integral interior roll or flange, against which the end of the cigar may abut, substantially as and for the purpose set forth.

2. A flexible mouth-piece for cigars, &c., of substantially cylindrical form in the portion thereof which fits over the end of the cigar, and provided with an interior flange and slight exterior enlargement over the flange, substantially as described.

3. A flexible mouth-piece for cigars, &c., provided at one end with an interior annular flange integral with the mouth-piece and with a slight exterior enlargement over the flange, substantially as described.



400,447. FEED-MILL. ADAM L. EFFLEY, Springfield, Ohio. Filed July 21, 1887. Serial No. 244,843. (No model.)

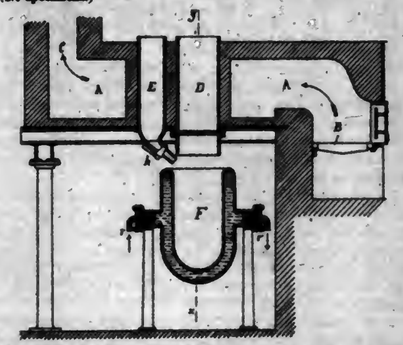


Claim.—1. In a grinding-mill, the combination of the revolving cylinder P, having the hub R formed thereon, the stationary cones G and C, formed with boxes in which the upper and lower ends of said hub work, the grinding-burrs attached, respectively, to the cone C and cylinder P, substantially as described.

2. The shaft M, the hub R, cylinder P, supported on the hub by the radial arms Q, the ring N forming a seat for hub R, and the regulating-wheel U, as and for the purpose set forth.

400,448. STEAM-BOILER. JOHN L. GILL, Jr., Philadelphia, Pa. Filed July 9, 1886. Serial No. 207,534. (No model.)

400,448.



Claim.—1. In a water-tube boiler, a steam and water drum having at each end a head in which the lower half forms on each side the front of a pocket having a level base, or one dipping with the inclination of the tubes, and said pockets having vertical or inclined sides and openings in the base thereof for the reception of nipples or pipes, whereby said drum is brought into communication with the header or headers of the boiler, as shown and described, and for the purposes set forth.

2. In a water-tube boiler, a steam and water drum provided at each end with a pocket or pockets having convex or concave heads and angular sides, pipes or nipples expanded therein and into water-legs composed of headers or boxes, as described, having vertical or horizontal hand-hole openings, caps provided with one or more hubs inserted from the inside of the boxes, and arched dogs and bolts for securing the caps from the outside thereof, substantially as and for the purposes set forth.

3. In a water-tube boiler, a cap provided with one or more hubs projecting beyond the face of each box, in combination with a header or boxes, one or more horizontal oblong hand-hole openings, and arched dogs and bolts for securing the caps to the headers or boxes, substantially as described.

4. In a water-tube boiler, a longitudinal steam and water drum provided with end pockets having vertical sides, or sides inclined in the direction of the circumference of the drum, in combination with a series of pipes or nipples, front and back water-legs composed of a series of headers or boxes having vertical or horizontal oval or oblong hand-hole openings therein, caps with one or more hubs caused to project beyond the faces of the headers or boxes, and dogs and bolts for securing said caps to the headers or boxes, substantially as and for the purposes set forth.

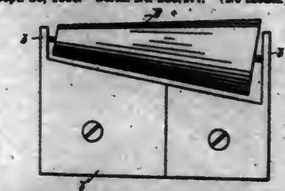
400,449. PROCESS OF MANUFACTURING ALUMINIUM. LUDWIG GRABAU, Hanover, Germany. Filed Nov. 19, 1887. Serial No. 255,599. (No specimens.)

Claim.—1. The herein-described process of producing aluminium from pulverized aluminium fluoride by means of a metal of the alkalies, which consists, first, in infusing a metal of the alkalies; second, in pouring upon the fused metal pulverized aluminium fluoride, and allowing the reaction to take place without further heating and without the use of a flux, substantially as and for the purposes specified.

2. The herein-described process of producing aluminium from pulverized aluminium fluoride by means of a metal of the alkalies, which consists, first, in fusing a metal of the alkalies that will form a readily-fusible salt when combined with pulverized aluminium fluoride; second, heating pulverized aluminium fluoride; third, pouring the heated pulverized aluminium fluoride upon the fused alkali metal, and allowing the reaction to take place without further heating and without the use of a flux, substantially as described.

3. The herein-described process of producing aluminium from pulverized aluminium fluoride by means of a metal of the alkalies, which consists, first, in fusing a metal of the alkalies, and, second, pouring upon the fused metal the pulverized aluminium fluoride and cooling the surfaces of the receiver in which the reaction takes place to congeal a portion of the fused mass and form a lining for said vessel, substantially as and for the purposes specified.

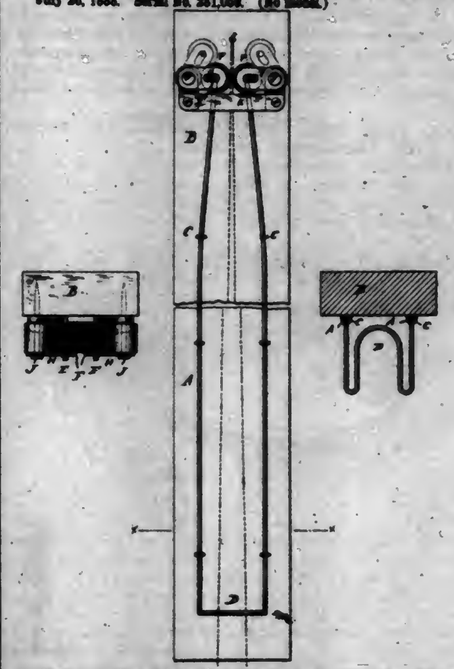
400,450. IMITATION GEM. SAMUEL GROSSCOMB, Les Moussières, near Les Bouchoux, assignor to Richard A. Kipling, Paris, France. Filed July 11, 1888. Serial No. 279,889. (No model.) Patented in France July 2, 1887, No. 184,378.



Claim.—1. The improvement in the manufacture of imitation gems, which consists in fusing upon one surface of a piece of straas a number of pieces of enamel, forming a ring or border within which the surface of the straas is exposed, substantially as described.

2. An imitation gem consisting of a piece of straas surrounded on one face by a border of enamel of darker hue, within which the surface of the lighter glass is exposed, substantially as described.

3. An imitation gem consisting of a piece of straas surrounded with a border of enamel so disposed as to form a design—such as a star—and having facets cut thereon, substantially as described.

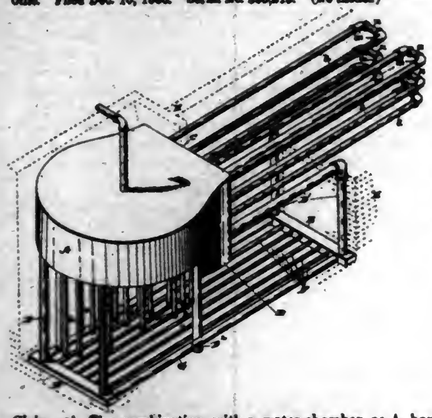


4. The faceted imitation gem composed of straas and enamel, the latter being disposed so as to produce a design—such as a star—of the exposed surface of the straas and having a light-reflecting medium on the back thereof, substantially as described.

400,451. VEHICLE RUB-IRON. DELBERT GILES, Fillmore, Ill. Filed Sept. 26, 1888. Serial No. 286,477. (No model.)

Claim.—The combination, with a wagon-body having an inclined groove or recess in its lower side edges, of the bracket having outwardly and downwardly projecting arms, one of which is longer than the other, and the inclined cone-shaped roll pivoted between said arms and located within said groove or recess, substantially as set forth.

400,452. WHIP-HOLDER. ALBERT HALL, Brooklyn, N. Y. Filed July 26, 1888. Serial No. 281,069. (No model.)



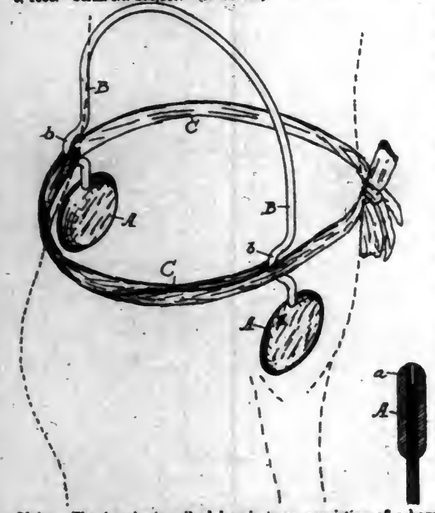
Claim.—1. In a whip-holder, the combination, with the swinging whip-grip, of a longitudinally-movable wire for operating the same, substantially as set forth.

2. In a whip-holder, the combination, with a pivoted link, of a whip-grip on the swinging end of the same, and a longitudinally-movable wire for swinging said link, substantially as set forth.

3. In a whip-holder, the combination, with swinging links, of whip-grips in the swinging ends of the same, a longitudinally-movable U-shaped wire connected with the swinging ends of the links and having its lower end bent outward and provided with a recess for receiving the thicker part of the whip, substantially as set forth.

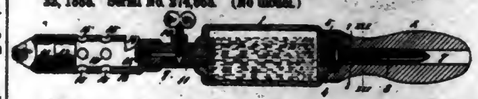
4. In a whip-holder, the combination, with a board, D, of a longitudinally-movable wire, A, having pivots formed at its upper ends, the rollers F, mounted on said pivots, and the links H, substantially as set forth.

400,458. HEATING APPARATUS. LEWIS B. HARTUNG, Canton, Ohio. Filed Dec. 10, 1888. Serial No. 293,213. (No model.)



Claim.—1. The combination, with a water-chamber, as A, having a rearwardly and downwardly projected portion, as B, of the vertical tubes *h* and laterally-projected tubes *k*, substantially as described, and for the purpose set forth.

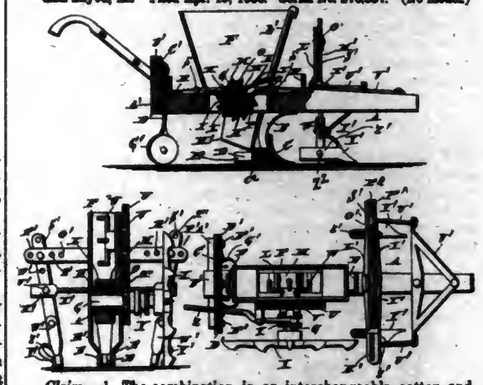
2. The combination, with the water-chamber, as hereinbefore described, having the vertical tubes *h*, having interior open-ended tubes, *k'*, of laterally-projected tubes *k* and supporting-tubes D and D^2, substantially as set forth.



3. The combination, with the water-chamber having a rearwardly and downwardly projected portion, B, of the vertical tubes *h*, laterally-projected tubes *k*, supporting-pipes D D' D^2, and the fire-grate G, composed of the pipes E and F, communicating with chamber A through the pipes D and D', substantially as described, and for the purpose set forth.

400,454. TRUSS. JEREMIAH HAYDEN, Raymond, Me. Filed Nov 6, 1888. Serial No. 290,113. (No model.)

Claim.—The herein-described hernia-truss, consisting of a bow-shaped wire having near each of its ends a loop or bend, said ends having screw-threads cut thereon, pads provided with apertures in their edges adapted to be screwed onto the ends of said wire, combined with a bandage adapted to pass through said loops and thence around the body, whereby said wire is held obliquely up against the side, substantially as shown.



400,455. SELF-HEATING SOLDERING-IRON. GUSTAVUS HEIDEL and GUSTAVE FREY, St. Louis, Mo., assignors, by mesne assignments, to the National Self-Heating Sad-Iron Company, same place. Filed May 22, 1888. Serial No. 274,663. (No model.)

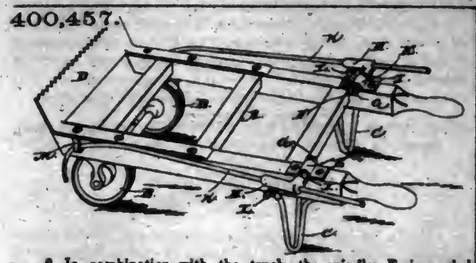
Claim.—1. In a self-heating soldering-iron, &c., the combination of the reservoir, handle secured to one end of the reservoir, pipe secured to the other end of the reservoir, and a cylinder provided with a point secured to the pipe, the handle having a central opening and being connected to the reservoir by means of a shank having wings to allow the circulation of air, substantially as and for the purpose set forth.

2. In a self-heating soldering-iron, &c., the combination of the reservoir, handle secured to one end of the reservoir, pipe secured to the other end of the reservoir, and a cylinder having a point secured to the pipe, the handle having a central opening and connected to the reservoir by means of a shank having wings 6 and notches 8, substantially as and for the purpose set forth.

400,456. PLANTER AND CULTIVATOR. DENNIS B. HENRY, Indian Bayou, La. Filed Apr. 13, 1888. Serial No. 270,537. (No model.)

Claim.—1. The combination, in an interchangeable cotton and corn planter, of the hopper, the revoluble seed disk or wheel H, having the peripheral seed cups or openings, the toothed feed-ring L, loosely mounted on said seed disk or wheel and provided with the discharge-opening N and the removable section M, and means, substantially as set forth, to lock the ring against rotation when the section M is removed, substantially as described.

2. The combination, in a planter, of the hopper, the revoluble seed wheel or disk arranged under the discharge-opening thereof and provided with the peripheral seed cups or depressions, the peripheral tooth-ring L, loosely mounted on the seed wheel or disk, having the opening N and the removable section M, and the slides R, adapted to engage and disengage the teeth of ring L, for the purpose set forth, substantially as described.

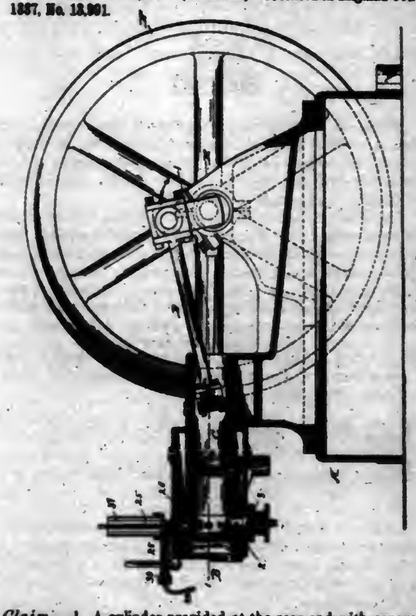


3. The combination, in a planter, of the pivoted link-arm C, the vertically-movable standards connected thereto, and the covering-disks journaled at the lower ends of said standards, substantially as described.

4. The combination, in a planter, of a frame or beam, the furrow-opener, the hopper, the driving-shaft having the operating-wheel engaging the ground, the seed wheel or ring secured to the shaft and arranged in the side opening of the hopper, the pinion loose on the shaft, the clutch to throw the same into or out of engagement with the shaft, the gear-wheel engaged by the pinion, and having the shaft journaled in the hopper and provided with the stirring-arms, substantially as described.

400,457. TRUCK-LOADER. JAMES D. HILL, Nashville, Mo. Filed May 11, 1888. Serial No. 273,612. (No model.)

Claim.—1. In a truck, the independent transverse spindles F, journaled on the truck, and the grappling-hooks pivoted to the outer ends of the spindles, so as to swing laterally of the truck independent of the spindles, the said spindles allowing the grappling-hooks a vertical movement, whereby both a vertical and a lateral movement is imparted to the said hooks, as set forth.



400,457.

2. In combination with the truck, the spindles F, journaled thereon, the sleeves H, pivoted on the outer ends of the spindles, so as to swing laterally independent of the turning of the spindles, and the grappling-hooks K, passed through and adjustable in the said sleeves, as set forth.

3. The combination, with a truck, of the independent grappling-hooks K, provided with laterally-extending spindles which are mounted in suitable bearings on the truck, and the spring clips or hooks M, attached to the truck and adapted to receive the grappling-hooks, substantially as described.

400,458. GAS-ENGINE. ARTHUR HINTON, Yonkers, assignor of one-half to Otis Brothers & Company, New York, N. Y. Filed Apr. 20, 1888. Serial No. 271,283. (No model.) Patented in England Oct. 13, 1887, No. 13,901.

Claim.—1. A cylinder provided at the rear end with separate ports communicating one with the external air and the other with a gas-supply pipe, an exhaust-port arranged to be uncovered on the forward movement of the piston, valves controlling the gas-passage, the air-port, and the exhaust-passage, and connections between the gas and exhaust valves, and an eccentric-rod operated by an eccentric upon the crank-shaft of the engine, substantially as set forth.

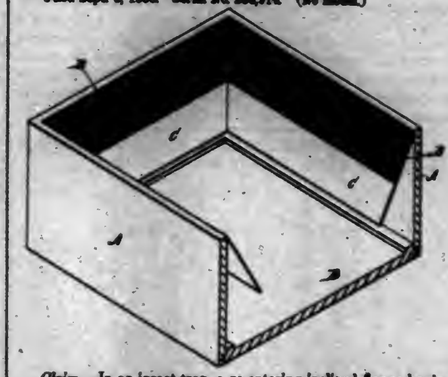
2. The combination, in a gas-engine, of a cylinder and reciprocating piston, an air-inlet in the cylinder provided with a valve, a separate gas-inlet in the cylinder, also provided with a valve, an exhaust provided with a valve, and a reciprocating rod supported in bearings outside of the cylinder, and separate connections between the said rod and both the gas and exhaust valves, substantially as set forth.

3. The combination, with the gas and exhaust valves of a gas-engine, of valve-stems extending through the valve-chests, springs bearing upon said stems to hold the said valves on their seats, a reciprocating rod arranged to contact with the independent stem of the gas-valve, and a lever connecting said rod with the stem of the exhaust-valve, substantially as set forth.

400,459. LATHE-CHUCK. SAMUEL IDE, Medina, N. Y. Filed Jan. 31, 1889. Serial No. 298,196. (No model.)

Claim.—1. A lathe-chuck jaw having clamping-screws, one or more, said screws having the annular biting-edges K at their inner ends, substantially as described.

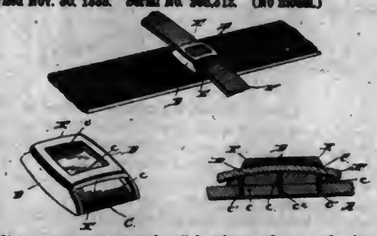
400,459.



2. A lathe-chuck jaw having the clamping-screws G, with their inner ends having the conical sides H, and provided with the conical central recesses, I, whereby the cones H are truncated, and whereby annular biting-edges K are formed between the conical sides H and the sides of the openings I, substantially as described.

3. A lathe-chuck jaw having the steps or shoulders, the clamping-screws G, and the adjustable rods working in openings in said jaw, for the purpose set forth, substantially as described.

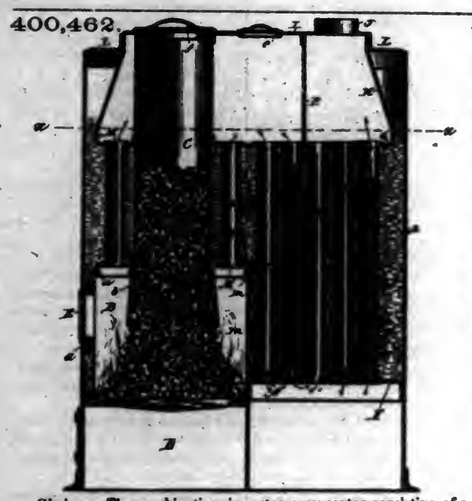
4. A lathe-chuck jaw having the adjustable rods M, one or more, provided with the recesses M, and the set-screws working in threaded openings in the jaw and engaging said recesses, substantially as described.



5. A centering-jaw having a series of steps or shoulders, the clamping-screws G, working through the jaw and communicating with the vertical faces of the steps or shoulders, adjustable rods M, working through the jaw on a level with the horizontal faces of the steps or shoulders, and set-screws to retain the adjustable rods.

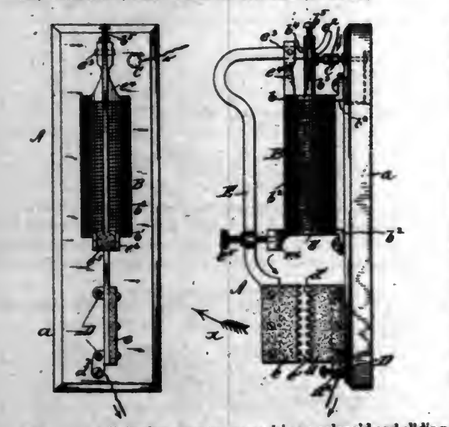
400,460. INSECT-TRAP. CHARLES G. JENNINGS, Detroit, Mich. Filed Sept. 3, 1888. Serial No. 284,914. (No model.)

Claim.—In an insect-trap, a re-entering inclined flange having a roughened zone extending from its outer edge toward the center, and a polished zone extending from the roughened zone to the lower edge of the flange, both of said zones being located upon the same inclined surface.



400,461. HARNESS-LOOP. EDMUND B. KNAPP, San Jacinto, Cal. Filed Nov. 30, 1888. Serial No. 292,212. (No model.)

Claim.—As an improved article of manufacture, the keeper for hip-straps, having a convexly-rounded base provided with a suitable number of perforations to receive rivets, the sides D D, integral with the base and adapted to bear against the edges of the strap, which is passed over the base, and the top bars, E E, connecting the corresponding ends of the sides D and extending over the said strap, the said bars being integral with the sides, all constructed and arranged substantially as specified.



400,462. STEAM-BOILER. HERMAN A. KROESCHELL, Chicago, Ill., assignor to Kroeschell Brothers, same place. Filed July 27, 1888. Serial No. 280,191. (No model.)

400,462.

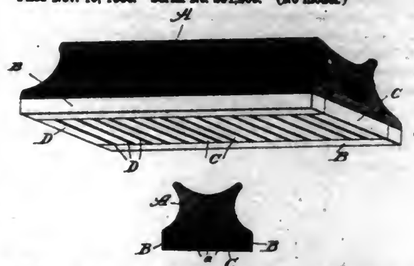
Claim.—The combination, in a steam-generator consisting of a water-jacket composed of an inner and outer shell, the latter extending the full height of the boiler and the former terminating on a line nearly with the grate-bars and the upper tube-sheet, of a second inner upper shell secured to the tube-sheet and to the crown-sheet of the boiler, provided at its lower end with an outwardly-deflecting flange and tapering inwardly to form an increased steam-space, said water-jacket being made of two oblong sections secured by angle-irons, a fire box and magazine surrounded by a nest of fire-tubes, a downward set of tubes, and a nest of upward return-tubes, each set of tubes communicating with a smoke-chamber common to two nests of tubes, the upper chamber being arranged to have the hot gases in contact with the steam-chamber and the tubes submerged, substantially as set forth.

400,463. LIGHTNING-ARRESTER. MYRON D. LAW, Philadelphia, Pa. Filed Oct. 2, 1888. Serial No. 286,962. (No model.)

Claim.—1. A lightning-arrester comprising a solenoid and sliding core having in its upper end an elongated slot, a fixed conductor or contact-plate located below the solenoid, a gravity-lever pivoted above the solenoid and having its upper end in engagement with said core-slot and at its lower end a companion contact-plate for said fixed plate, and circuit-connections, substantially as set forth.

2. In a lightning-arrester, the combination of a solenoid and its core, a bifurcated lug, c^4, on the end b' of the solenoid, fixed contact-plate d, gravity-lever E, pivoted to the upper end of the solenoid, and having an upper end engagement with the solenoid-core, a set or adjusting screw, c^4, on lever E, in contact with lug c^4, and a contact-plate, e, and circuit-connections, substantially as set forth.

3. A lightning-arrester comprising a low-resistance solenoid in a branch circuit having a fixed contact-plate, d, and a ground-connection, a pivoted gravity-lever, E, having an end engagement with the solenoid-core, and a contact-plate, e, and circuit-connections, substantially as set forth, whereby said lever E is moved by the solenoid to separate said contact-plates, and returns by gravity to its normal position to restore said contact-plates, as set forth.



4. The combination of solenoid B, having end plates, b b', standard or arm c^4 on plate b, bifurcated bracket c^4 on plate b', lever E, pivoted to arm c^4 and having set-screw c^4, engaging with bracket c^4, electrode e on said lever, fixed electrode d, solenoid-core b^3, engaging with said lever, and circuit-connections, substantially as set forth.

400,464. LIGHTNING-ROD AND COUPLING. SPENCER R. LAWRIE, Chicago, Ill. Filed Oct. 15, 1888. Serial No. 288,176. (No model.)

Claim.—A coupling-burr provided at its ends with serrated flanges C C, having shoulders d d, which shoulders lock with the shoulders b b of the tenon A upon the flanges C C being forced down on the rod, all substantially as and for the purpose set forth.

400,465. CHALK-ERASER. WILLIAM H. LOUDENBACK, Lake, Ill. Filed Nov. 19, 1888. Serial No. 291,209. (No model.)

Claim.—1. An eraser comprising a handle-block having its under surface grooved or otherwise roughened, strips of felt or similar material secured lengthwise thereon at the side margins, and short strips of felt or similar material secured crosswise thereon between the long strips, substantially as described.

2. An eraser comprising a handle-block having little ribs or ridges in its under surface, two long strips of felt or similar material secured lengthwise thereon, and short strips of felt or similar material secured crosswise thereon at suitable distances apart, the cross-strips at each end coming up close to the side strips, whereby the erasing-surface is formed with square corners, tight joints at its corners, and spaces or crevices to receive the chalk-dust, substantially as described.

400,466. WELL-BORING APPARATUS. ABRAHAM L. LOWERY and JASPER H. WYATT, Francis, Nebr. Filed June 27, 1888. Serial No. 278,364. (No model.)

Claim.—1. The combination, with the main casing-pipe having an open-work extension and provided with a boring-tool, of an inner perforated pipe, C, provided with valves d, and a valve at its discharge end, which is adapted to be closed by contact with water in a well, substantially as set forth and described.

2. The combination, with the main casing-pipe, of the induction-pipe G, provided with an arm, p, and a swivel-connection with the main pipe, and a fixed vertical guide, which is provided with a slide which is connected with arm p, substantially as set forth and described.

3. The combination, with pipe A, having pipe F coupled thereto, of the pipe G, provided with band g, Babbitt-metal filling h, packing i, and perforated cap k, provided with arms m, connected with band n, substantially as set forth and described.

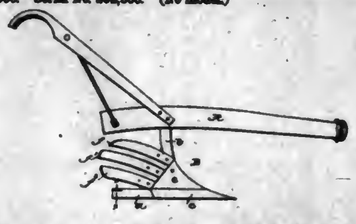
4. The combination of the main pipe with pipe G, which is provided with band g, suitable filling and packing around pipe G above said band, and a perforated cap, through which pipe G extends, said cap being adjustable in elevation, substantially as and for the purposes described.

400,467. YIELDING SHOVEL FOR CULTIVATORS. EDWARD P. LYNCH, Davenport, Iowa. Filed Sept. 27, 1888. Serial No. 286,554. (No model.)

Claim.—1. In a cultivator, the combination of a shank or support, a shovel connected thereto by an approximately vertical axis that it may turn horizontally from its operative position, and a spring resisting said motion, whereby the shovel is permitted to yield and pass obstructions encountered at the side.

2. In combination with a shank or support, a shovel-supporting block mounted thereon to rock both vertically and horizontally, in

400,467.



combination with a spring and intermediate connections tending to prevent said motions.

3. A shovel standard or support having vertical bearings at its two sides, in combination with the shovel-block seated on said bearings, the link acting on the block between the bearings, and a spring acting to urge the link rearward, whereby the shovel is held normally in operative position, but permitted to turn horizontally to the right or left under excessive strain.

4. The shovel-supporting block and the standard connected thereto by the horizontal trunnions and the vertical side bearings, in combination with the central link, the pivoted arm or plate E, rod F, and spring G.

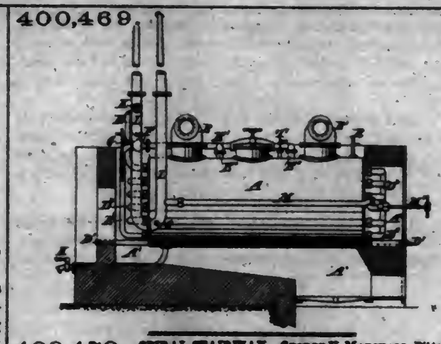
5. In combination with the shank and the shovel-block journaled thereon to tip in a vertical plane, the substantially-horizontal link, the plate E, overlying the link and jointed thereto and to the shank, the rod jointed to the middle of the plate, and the spring, applied as shown.

400,468. PLOW. EDWARD P. LYNCH, Davenport, Iowa. Filed Dec. 6, 1888. Serial No. 292,800. (No model.)

Claim.—1. A mold-board plow comprising the foundation-plate C, with the share, the landside, the arms f f', and the plate e, independently and removably bolted thereto, the plate e being formed, as shown, to serve as the forward portion of the mold-board for erecting the slice in advance of the arms f f'.

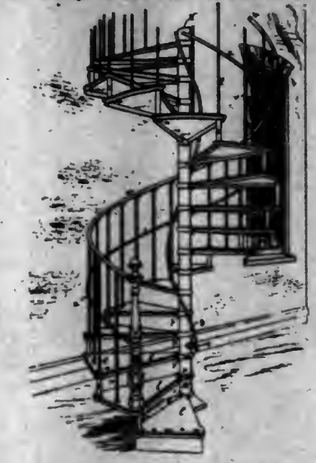
2. A mold-board having the share, the solid portion e, immediately above the share to erect the slice, and the slatted portion at the rear to complete the turning over of the slice.

3. In a mold-board plow, a sustaining-plate, C, the share c, removably secured to its lower forward edge, the series of arms f f', removably secured to its rear edge, the independently-removable mold-board section e, located between the share and the arms f, as shown.

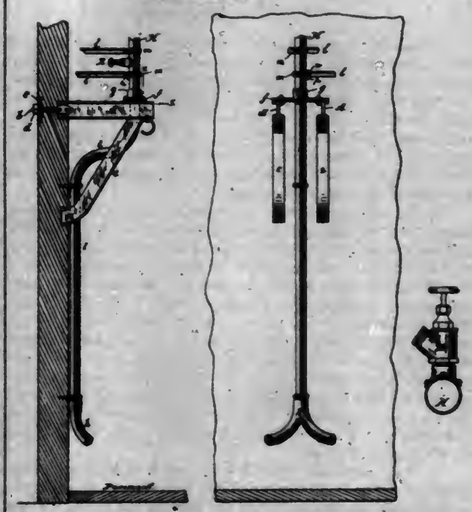


4. In combination with the notched landside and the sustaining-arm to which it is bolted, the wearing-plate having the body portion confined between said arms and landside, and the thickened base portion projected through the notch in and beyond the base of the landside, as shown.

5. In combination with the landside and the stationary arm to which it is bolted, the intermediate wearing-plate having projections h^3 on opposite faces and both opposite edges, and the through-bolt, said parts constructed and arranged, as shown, to permit the reversal of the wearing-plate, in the manner described.



400,469. APPARATUS FOR DISTILLING FAT ACIDS. PAUL MARIX, Paris, France, assignor to the Société Industrielle des Glycerine et Acides Gras, same place. Filed June 27, 1888. Serial No. 278,317. (No model.) Patented in France Oct. 11, 1886, No. 178,973; in Belgium Oct. 14, 1886, No. 74,636; in Luxemburg Aug. 16, 1887, No. 574, and in Spain Mar. 7, 1888, No. 12,082.

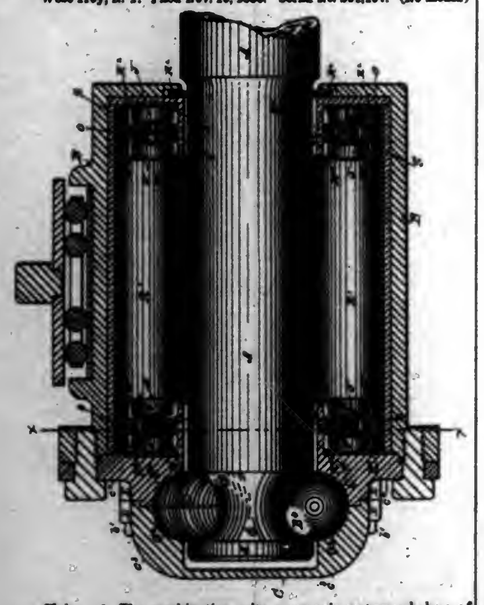


Claim.—The combination, in an apparatus for distilling fat acids, of a horizontal cylindrical boiler, A, and a furnace within the fires of which both ends of the said boiler are exposed, a train of steam-pipe for receiving steam from a source outside of said boiler and delivering the said steam thereinto, said steam-pipe comprising a coil of which straight portions D run lengthwise of the said boiler from end to end thereof, and of which bends D^a, for superheating the steam passing through said coil, are arranged within the flues outside the ends of the said boiler, a pipe, E', from the outlet of said coil, and a perforated steam-distributing tube, D', connected with said coil and arranged within and near the bottom of the boiler, substantially as and for the purpose herein described.

400,469

400,470. SPIRAL STAIRWAY. GEORGE V. MARSHALL, Pittsburg, Pa. Filed Apr. 30, 1888. Serial No. 271,330. (No model.)

Claim.—1. The combination, with a building, of a spiral stairway outside the building, a continuous pipe constituting the direct support of said stairway and extending below the foot of the stairway and inwardly toward the building and ending at a point within reach from the ground, and a bracket attached to the building at a height out of ordinary reach, forming the sole support from below for said pipe, whereby the structure can be erected on the front of a building without obstructing the sidewalk.



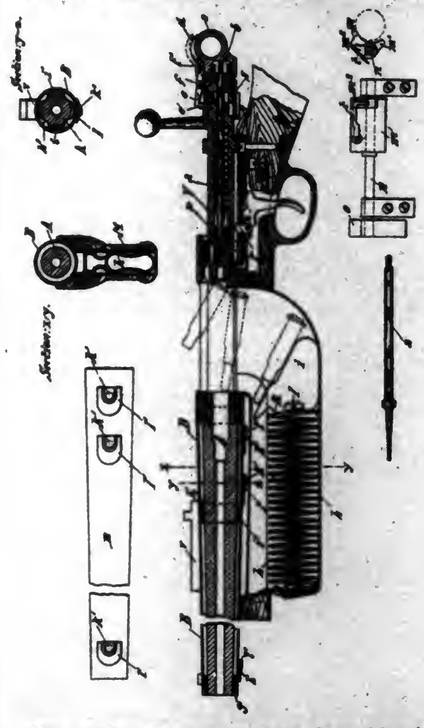
2. The combination, with a building, of a spiral stairway outside the building, a continuous pipe, constituting the direct support of said stairway, each step being independently and directly clamped to said

pipe, which extends below the foot of the stairway and inwardly toward the building to a point within reach from the ground, and a bracket attached to the building at a height out of ordinary reach, forming the sole support from below for said pipe, substantially as described.

3. The combination of the steps *l*, having baluster-slots at the outer corners for connection, step to step, with balusters *t*, and intermediate slots for and with the balusters *v*, substantially as described

4. The combination of pipe H, supporting the stairway, with I-beams A, plate *f*, and braces *e*, substantially as described.

400,471. ROLLER-BEARING. CHARLES D. MENEELY, Albany, and JOHN GIBSON, West Troy, assignors to the Meneely Bearing Company, West Troy, N. Y. Filed Nov. 19, 1888. Serial No. 291,197. (No model.)



Claim.—1. The combination, with a car-axle and an axle-box, of anti-friction rollers having end journal-bearings smaller than the body of the rollers and formed with annular grooves in said bearings, interior tube-form tracks surrounding the axle at each end, separating-rollers formed with annular grooves and arranged at each end of the anti-friction rollers between the journal ends of the same, and a guide-ring arranged circumferentially about the journal ends of the anti-friction rollers and the separating-rollers and within the grooves in the same, substantially as described.

2. The combination, with a bearing-box that is made with an interior track at each end, and constructed with a cap at its outer end containing interiorly an encircling concave groove, substantially as described, of an axle made with an encircling concave groove at its outer end arranged to be in line with and correspond in reversed and opposite concavity with the groove made in the cap, an end-thrust ball arranged within the coincidently-made grooves of the cap and axle, friction-rollers having grooved and journaled ends arranged between the inner surface of said bearing-box and axle, a separating-roller having a grooved roller-face arranged at each end of the bearing between each two of the friction-roller journals and the adjacent end track, and a ring made to encompass said separating-rollers and to be within the grooves thereof, substantially in the manner as and for the purposes set forth.

3. The combination, with the axle A, made with the encircling-grooves G', of the bearing-box B, made with the cap C, having the interior encircling-groove, G^2, and the interior end tracks, T T, the end-thrust ball, B^4, arranged within the coincidently-placed grooves of the axle and bearing box cap, the friction-rollers R', made with end journals, J, arranged between said axle and bearing-box, and the separating-rollers R^3, each made with the groove g^3, with one of said separating-rollers arranged between each two of the friction-roller journals, and the adjacent inside track at each end of the bearing, and the rings O at each end of the bearing within the grooves of the separating-rollers, substantially in the manner as and for the purposes set forth.

400,472. MAGAZINE FIRE-ARM. ARNAUD MIEG, Leipsic, Saxony, and HUGO BSCHOFF, Berlin, Germany. Filed Oct. 13, 1887. Serial No. 252,249. (No model.) Patented in Germany Aug. 31, 1887, Nos. 43,491 and 43,576, and Jan. 13, 1888, No. 43,600; in France Sept. 22, 1887, No. 186,004; in Belgium Sept. 22, 1887, No. 78,966; in Portugal Nov. 9, 1887, No. 1,193; in Italy Nov. 30, 1887, XXI, 22,894, XLIV, 111; in Spain Jan. 2, 1888, No. 11,850; in Austria-Hungary Feb. 17, 1888, No. 37,068 and No. 2,754, and in England Sept. 22, 1888, No. 12,882.

Claim.—1. The combination, with the supplemental breech-bolt S, of the firing-pin *a* and a nut, *b*, secured to the end of the firing-pin, and having a flange lying against the end of the breech-bolt, said flange having lateral tappets *b' b'*, engaging the supplemental breech-bolt, substantially as shown and described.

2. The locking attachment consisting of a lever, *d e*, pivoted to the supplemental breech-bolt, one arm, *d*, of the said lever forming a handle, and the end of the other arm, *e*, having a cam which fits into a recess, e^2, of the main breech-bolt V, so that by turning the lever *d e* the cam *d* is pressed into a recess, e^2, to lock the supplemental breech-bolt, substantially as described.

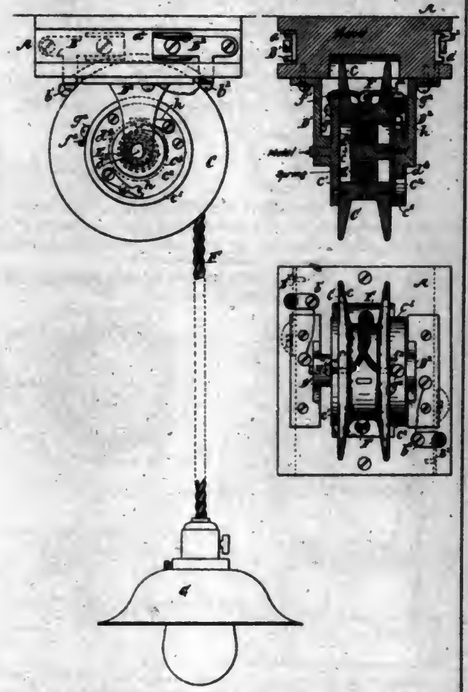
3. The combination, with the supplemental breech-bolt, of the handle *c*, having an annular or other similar form, the firing-pin, and a nut, *b*, tapped on the firing-pin, and having a flange lying against the end of the breech-bolt, said flange having tappets *b' b'*, engaging with the supplemental breech-bolt, and a detent-lever attached to the supplemental breech-bolt, for the purpose of cocking the same without opening the breech-bolt, substantially as shown and described.

4. The combination, with a curved magazine for containing the cartridges arranged in an oblique position and having their pointed ends turned upward, of a spring, *h*, and a follower, *i*, of the form shown, having a loose pivotal connection at or about its middle portion with the spring *h*, substantially as shown and described.

5. In a magazine-gun, the combination, with the magazine-chamber M, of the coiled spring *h*, having an oblong form in cross-section, contracted at the central portions, and the follower *i*, pivotally connected to said spring at a point between the ends of said follower, substantially as described.

6. In combination with the gun-frame and breech-bolt, the head-piece P, having cams *p*, the levers *o o*, rigidly mounted on spindles *n n* within the path of said cams, the pawls *m m*, mounted on said spindles over the rear end of the magazine, and a feeding-spring acting upon the cartridges, substantially as described.

7. The combination, with the frame and breech-bolt, of the pawls *m m*, arranged in the rear end of the magazine and rigidly mounted on spindles *n n*, the head-piece P, having cams *p*, the levers *o o*, rigidly mounted on said spindles and having their ends lying in the path of said cams, and stops pivotally mounted in proximity to said levers *o o*, whereby the latter may be locked in position to arrest the cartridges in their passage to the breech, substantially as described.



8. The combination, with the frame and breech-bolt, the former having the magazine M, of the head-piece P, having cams *p*, the spring *h*, the compound pawls *m m*, each composed of the part *m'* m^2, the part m^3 being mounted on and turning with spindles *n n*, and lying partly within the part *m'*, and a spring, *i*, whereby the part m^3 is normally thrown inward, substantially as described.

9. The combination, with the barrel A, of the tube B, surrounding said barrel, said tube being rigidly connected at its rear end to the barrel, and having at its forward end a ring, *g'*, fastened within the mouth of the tube and loose upon the end of the barrel, substantially as described.

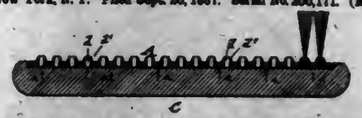
10. The combination, with the barrel A, of the inclosing-tube B, having the ring *k'*, having bearing against both the tube and the barrel, and provided with openings *i'*, substantially as described.

11. The combination, with the barrel A, of the inclosing-tube B, having upon its under side openings *k'*, provided with protecting-caps *l'*, which overhang without closing said openings, substantially as described.

400,473. DEVICE FOR SUPPORTING ELECTRIC LAMPS. ALEXANDER T. MOORE, Jr., New Bedford, Mass., and HORACE A. PITCH, Schenectady, N. Y. Filed May 16, 1888. Serial No. 274,333. (No model.)

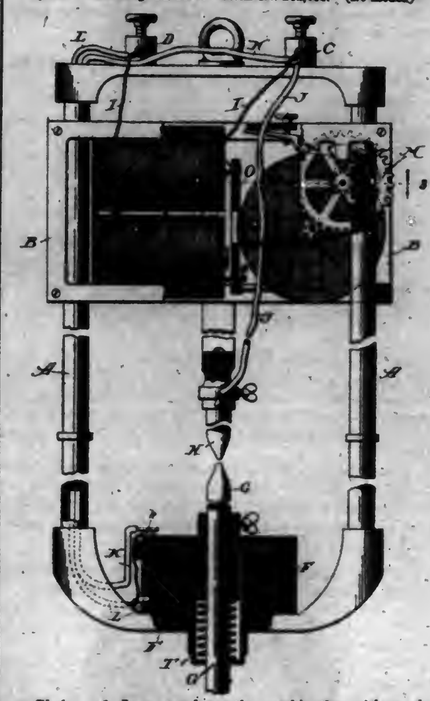
Claim.—1. In a fitting for a pendent electric lamp, the combination of an insulated block or wall-piece, metallic bracket-arms depending therefrom, one of said bracket-arms having a bearing-stud and notched flange, the other bracket-arm having a bearing for a trunnion, wires connecting the main wires and the bracket-arms, a rotary drum having a recess, metallic side pieces secured to said drum, one of said side pieces having an opening for the stud of the bracket-arm, and the other of said side pieces having a trunnion, a spring connected at one end to the stud and at the other end to the drum within the recess, pivoted dogs automatically engaging the notch of the notched flange, and a cable secured to said drum and in electrical connection with the side pieces, substantially as specified.

2. In a fitting for a pendent electric lamp, the combination of an insulated block or wall-piece, metallic bracket-arms secured thereon, wires electrically connecting the main wires and said bracket-arms, a rotary drum of insulating material having a central recess and metallic side pieces rotating therewith, one of said side pieces affording one of the bearings for said drum and a bracket-arm affording the other bearing, a spring connected at one end to the axle and at the other to the drum, said spring being located within said central recess, and a cable secured to said drum and in electrical connection with said cheek-pieces, substantially as specified.



400,474. YOKE FOR DRAW-HEADS. ROBERT MORRIS, La Crosse, Wis. Filed July 27, 1888. Serial No. 281,182. (No model.)

Claim.—1. The combination, with a draw-head having grooves on its opposite sides, of a yoke having tongues at or near its free ends to enter said grooves, and a bolt passing through the draw-head and both members of the yoke, substantially as set forth.



2. In a car-coupler, the combination, with a draw-head having two transverse grooves formed near its inner end, of a yoke having tongues integrally formed on it to mate the grooves and interlock therewith, and a bolt located between this interlocking connection of the yoke with the draw-head and the extremities of the yoke which project beyond its integral tongues, substantially as set forth.

400,475. MANUFACTURE OF BRUSHES. LOUIS W. HIRSCHEL, New York, N. Y. Filed Sept. 20, 1887. Serial No. 250,171. (No model.)

Claim.—A brush composed of a back, a metallic base-plate secured to said back, said base-plate having openings with tapering rims, and tufts of bristles inserted into said openings and retained by compressing the upper portion of the rims upon the bristle tufts, substantially as set forth.

400,476. ELECTRIC-ARC LAMP. SAMUEL R. HUTTING, Chicago, Ill., assignor to the Hutting Electric Manufacturing Company, same place. Filed Aug. 14, 1888. Serial No. 282,755. (No model.)

Claim.—1. In an arc lamp, the combination, with an electro-magnet consisting of two coils having their cores connected at one end, of an armature loosely attached at one end to the end of one of the cores and movable at the other end toward or from the end of the other one of the cores, a smooth-surfaced brake-wheel, a smooth-surfaced brake mounted on the armature, and a spring drawing the brake into contact with the brake-wheel against the attraction of the magnetism, substantially as described.

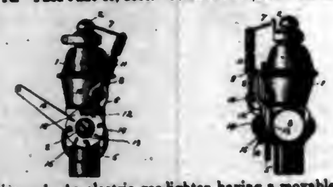
2. In an arc lamp, the combination, with an electro-magnet consisting of two coils having their cores connected at one end, of an armature loosely attached at one end to the end of one of the cores and movable at the other end toward or from the end of the other

one of the cores, a smooth-surfaced brake-wheel, a smooth-surfaced brake mounted on the armature, a spring drawing the brake into contact with the brake-wheel against the attraction of the magnetism, and a series of pinions and gears engaging with the brake-wheel and the main frame in which the parts are arranged, substantially as described.

3. In an arc lamp, the combination of a frame having a toothed bar, a frame movable up and down on the first-mentioned frame, a pinion engaging with the toothed bar, a gear-wheel mounted on the pinion-shaft with its teeth engaging a brake-pinion, a brake-pinion with its teeth engaging the gear-wheel, a smooth-surfaced brake-wheel mounted on the brake-pinion shaft, an electro-magnet, an armature loosely hung at one end and movable at the other end toward or from the electro-magnet, a smooth-faced brake connected with the armature and adapted to bear on the smooth-surfaced brake-wheel, and means for drawing the brake into contact with the brake-wheel against the attraction of the magnetism, substantially as described.

400,477. PAVING TILE OR BRICK. CHARLES M. O'CONNER, Lock Haven, Pa. Filed Oct. 22, 1888. Serial No. 288,786. (No specimens.)

Claim.—A paving-block having semi-spherical sockets within its edges and loose balls or spheres fitting within the sockets, as and for the purpose set forth.



400,478. ROCKING-CHAIR. WILLIAM L. PAINE, Argenta, Ark. Filed June 6, 1888. Serial No. 276,288. (No model.)

Claim.—1. In combination with the front and rear legs of a rocking-chair and a rack secured to said rear legs, a lever pivoted to the front leg and having its rear end in engagement with said rack, and an arm attached to said lever and having its lower end adapted to rest upon the supporting-floor, substantially as and for the purpose described.

2. In combination with the front and rear legs of a chair and a rack secured to said rear legs, a lever pivoted to the front leg and having its rear end in engagement with said rack, and an arm pendent from said lever and bearing against the chair-support, substantially as and for the purpose described.

400,479. ELECTRIC GAS-LIGHTER. JOHN Y. PARKE, Philadelphia, Pa. Filed June 15, 1888. Serial No. 277,209. (No model.)

Claim.—1. An electric gas-lighter having a movable electrode adapted to be brought into contact with another electrode to create a spark, and a feathering carrier for the electrode, arranged to prevent contact between the electrode except when the gas is turned on, substantially as described.

2. An electric gas-lighter having a movable electrode adapted to make contact with another electrode to produce a spark, a lever for moving the first electrode, and a feathering electrode-carrier controlling the contact between the electrodes, substantially as described.

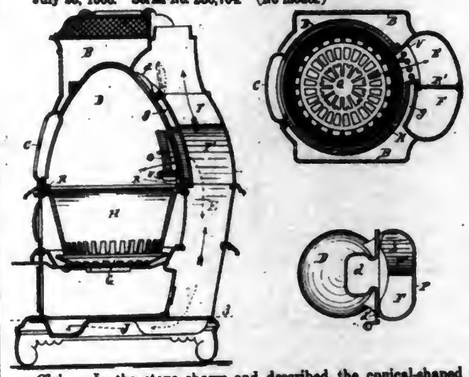
3. An electric gas-lighter having a movable electrode adapted to make contact with another electrode, a lever for moving the first electrode, a feathering carrier for the movable electrode, and a cam for controlling the position of the carrier, substantially as described.

4. An electric gas-lighter having a reciprocating electrode and a stationary electrode, a feathering carrier for the movable electrode, and a cam controlling the carrier, the said cam also operating to move the cock controlling the flow of gas, substantially as described.

5. In an electric gas-lighter, a stationary electrode, a cock, a ratchet-cam secured to the cock, a lever, and a movable electrode mounted on a carrier and controlled by the cam, substantially as described.

6. In an electric gas-lighter, a moving arm and a feathering electrode-carrier mounted on said arm in bearings formed integral with the arm, substantially as described.

7. In an electric gas-lighter, a feathering electrode-carrier and a controller therefor provided with projections on its side and notches on its edge, substantially as described.



8. In an electric gas-lighter, the combination, with a fixed electrode, of a feathering moving electrode, substantially as described.

400,480. SCISSORS. EMIL PETERS, Merscheid, Germany. Filed June 4, 1888. Serial No. 275,934. (No model.)

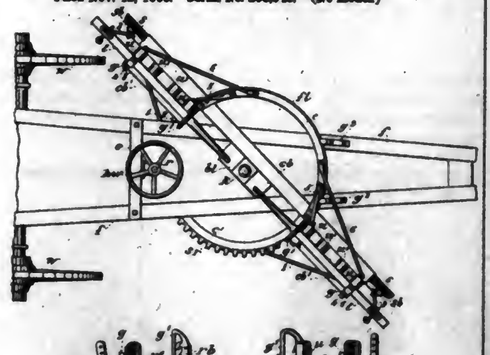
Claim.—The combination of a pair of scissors with a blade, *c*, pivoted to scissor-blade *a*, and with the face-plate *e* and spring *d*, the spring being confined between the parts *a e*, substantially as specified.

400,481. HEATING-STOVE. ANDREW S. PHELPS, Chicago, Ill. Filed July 23, 1888. Serial No. 280,704. (No model.)

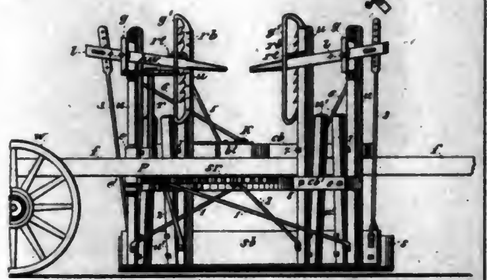
Claim.—In the stove shown and described, the conical-shaped dome D, forming the combustion-chamber and having a front feed opening or door, an opening leading to the indirect downflue E, opposite the feed-opening, and a direct-draft opening above said downflue-opening, leading to the upflue F and controlled by a damper, in combination with the perforated frame B, surrounding said dome, ring R, having the annular channel for dome D to rest in, fire-pot H, having a grate, downflue E, and upflue F, arranged to leave the air-space *g* between it and said dome, substantially as and for the purpose set forth.

400,482. CONDUIT FOR CABLE RAILWAYS. ELWOOD C. PHILLIPS, Garden City, Kans., assignor to the Phillips Economical Cable Grip Construction Company, Chicago, Ill. Filed Dec. 26, 1888. Serial No. 294,705. (No model.)

Claim.—1. A conduit for cable railways, having an opening in the top for the shank of the cable-grip and a pocket in the upper part of the conduit below said opening for catching the earth and rubbish which fall through the latter and preventing them from descending to the cable and the gripping devices, and the space for the latter being separated from said pocket by a wall inclining obliquely upward and also inwardly with regard to said space, substantially as set forth.



2. A conduit for cable railways, having the main space A for the cable and gripping devices, the pocket B in the upper part of said conduit, the curved wall C, extending obliquely between them and the opening *a* in the top of said conduit above said wall, substantially as set forth.

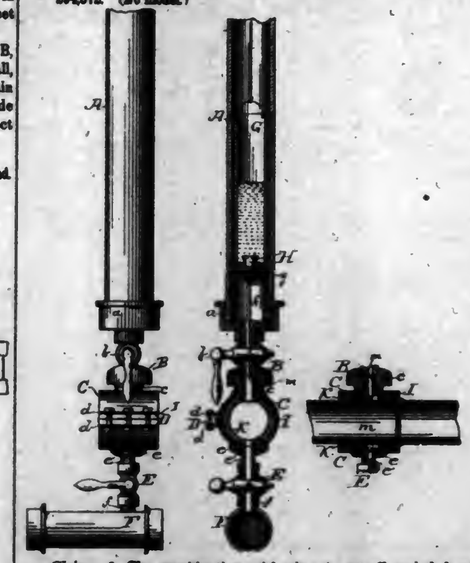


3. A conduit having an opening in its top and an inwardly-extending wall below said opening integral with said conduit, the hollow interior of said conduit being enlarged on one side above said wall to form a pocket, into which said wall directs the earth and rubbish falling through said opening, substantially as set forth.

4. A conduit having an opening in its top, a pocket for receiving the earth and rubbish which may fall through the same, and a downwardly-extending lip or corner on one side of said opening to aid in directing said earth or rubbish into said pocket, substantially as set forth.

5. A conduit having a main space, A, for the cable, a pocket, B, obliquely above the same, an opening, *a*, above said pocket, a wall, C, extending obliquely upward between said pocket and the main space of said conduit, and a lip extending downward on the same side of opening *a*, in order that said lip and wall may combine to direct dirt and rubbish into said pocket, substantially as set forth.

400,488. ROAD-SCRAPER. PETER RAAB, near Indianapolis, Ind. Filed Nov. 12, 1888. Serial No. 290,546. (No model.)



Claim.—1. A road grader and scraper comprising a frame-work mounted on trucks, the scraper sustained by such frame-work between the fore and aft wheels at any suitable angle to the line of draft, lever mechanism for raising and lowering the scraper, a ratchet device connected to the posts of the frame for locking the levers at different heights, a circular frame-work composed of two sections, the upper half resting upon the main frame-work of the machine having a metal flange at the bottom which is adapted to rotate beneath guides bolted to the frame-work, which hold it in place, the lower half sustained beneath such main frame-work provided with a segment-gear for engaging with a pinion mounted on a hand-wheel, the latter moving in bearings connected to a cross-bar of the frame, whereby the entire scraper mechanism may be rotated to change the angle of the scraper to the line of draft, all combined substantially as described.

2. In a road-grading machine, a frame-work mounted on trucks, a scraper carried thereon and adjustable in a vertical plane by means of lever mechanism for regulating the depth of the cut of the scraper-blade, such scraper mechanism connected to a secondary frame-work which is supported upon the frame-work that unites the truck and rotatable upon such frame-work by means of a circular frame, one half of which is supported upon the frame-work that unites the trucks, and the other beneath the same and provided with a segmental gear which engages with a pinion mounted upon a hand-wheel for rotating the scraper mechanism, all combined substantially as shown and described.

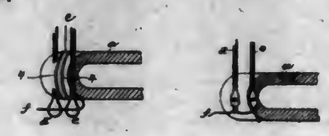
3. In a road-grading machine, the main frame *f*, uniting the fore and aft trucks of the wagon, the scraper-bar *ob*, having a scraper attached, and movable in a vertical plane by means of the levers *l l* and their connection to the scraper-bar, ratchet mechanism for locking the same in position, the circular segment *c*, fastened to the cross-bar *ob*, the whole resting upon the frame *f*, such segment having a flange, *fl*, moving beneath guides *g*, bolted to the frame-work *f*, the lower segment, *c*, having a segment-rack, *sr*, a hand-wheel, *hw*, moving in bearings connected to the cross-bar of the main frame, the pinion *p*, mounted on the lower end of the rod of the hand-wheel and engaging with the segment rack *sr*, the block *bl*, bolted to the cross-bar *ob*, and a king-bolt *kb*, uniting the parts, all combined substantially as shown and described.

400,484. SUBMARINE APPARATUS FOR SOLDERING PIPE-JOINTS. FRANK RAHN, Chicago, Ill. Filed Dec. 26, 1888. Serial No. 294,572. (No model.)

Claim.—1. The combination, with pipe A, cut-off cock *b*, band C, and packing therein, of the bucket G, having a valve, H, in its bottom, as and for the purpose set forth.

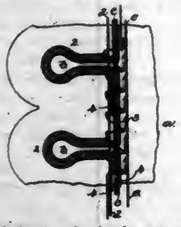
2. A pipe, A, cut-off cock connected to its lower end, band C, and packing therein, cut-off cock E, and drip-box F, in combination with a bucket, G, having a valve in its bottom, as and for the purpose set forth.

3. Pipe A, a coupling, *a*, screwed onto its lower end, cut-off cock *b*, nut B, as described, boss *c*, band C, and packing therein, in combination with the cock E and drip-box, as set forth.



4. Pipe A, cut-off cock *b*, nut B, as described, boss *c*, band C, and packing therein, in combination with the cock E and drip-box, as set forth.

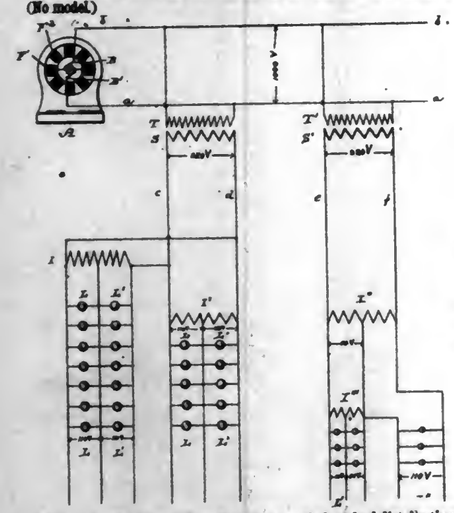
5. Pipe A, cut-off cock *b*, nut B, as described, boss *c*, a nipple having its lower end edges serrated, and band C, in combination with cock E and drip-box, as set forth.



6. The combination, with pipe A, cock *b*, band C, and packing I and K therein, as described, of the cock E and the box F, as and for the purpose set forth.

7. The combination of pipe A, cock *b*, band C, and packing therefor, said band having an opening therein for draining therefrom the water which is inclosed in said band when it covers and is clamped around a pipe-joint, as and for the purpose set forth.

400,485. BUTTON-HOLE PIECE FOR BOOTS OR SHOES. JOHN REDIK, Boston, Mass. Filed Sept. 25, 1888. Serial No. 286,226. (No model.)



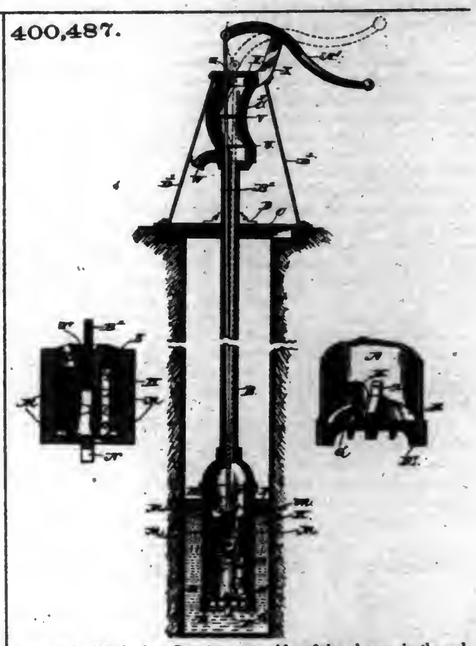
400,485.

Claim.—A button-hole piece having its stay-cord and thrum ends confined to the under side of the material by a thread interlocked with two other threads inserted in and showing only at the under side of the button-hole piece at opposite sides of and parallel to the stay-cord, where it extends from one to the next button-hole, substantially as described.

400,486. TRANSFER SYSTEM OF ELECTRIC DISTRIBUTION. EDWIN W. RICE, Jr., Lynn, Mass. Filed Oct. 31, 1888. Serial No. 289,653. (No model.)

Claim.—1. The herein-described system of electrical distribution, comprising alternating-current mains leading from a point of alternating-current supply, one or more converters or transformers of the ordinary description connected to said mains, leading wires or mains connected with the secondaries of said converters, and one or more induction transfer-coils connected across said leading wires and having connected with them two or more sub-circuits or distributing-wires, each two sub-circuits having a fraction of the transfer-coil included between them, as and for the purpose described.

2. The herein-described system of alternating-current distribution, comprising alternating-current mains leading from a suitable source of current-supply, converters or transformers connected in multiple across said mains, leading wires or mains connected to the secondaries of said converters, induction transfer-coils connected across said leading wires, and sub-circuits or distributing-wires leading from and including a fraction of said transfer-coils, said leading-wires supplying current to still other transfer-coils for the purpose of still further subdividing the potential, as and for the purpose described.



3. In an alternating-current system of distribution, the combination, with suitable transformers, of a system of induction transfer-coils supplied from the secondaries thereof, and other transfer-coils of smaller size supplied by wires, including a fraction only of the first-named coils, the subdivision of circuits and transfer-coils being carried to any desired extent, for the purpose of subdividing the potential.

400,487. LIFT-PUMP. ROBERT H. ROACH, Monroe, Iowa. Filed Dec. 18, 1888. Serial No. 294,007. (No model.)

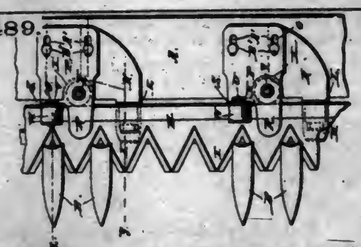
Claim.—1. The pump having the submerged cylinder, the valve-seat E, screwed to the lower end thereof and having the strainer G, the clack-valves H and the lugs I on its upper side, the hollow plunger K in the cylinder having the clack-valves O in its lower side, the depending lugs N, for the purpose set forth, the opening S and flared opening T, communicating therewith, and the plunger-rod adapted to be screwed into the opening S, substantially as described.

2. The combination, with the cylinder having the valve-seat in its

400,487.

lower end with the lugs I on its upper side, of the plunger in the cylinder, and the lugs N on the plunger to engage the lugs I, said plunger being further provided with the threaded opening S, and the plunger-rod adapted to be screwed in the said opening, substantially as described.

400,488. MATCH-SAFE. JOHN K. ROBINSON, Chicago, Ill. Filed Nov. 14, 1887. Serial No. 255,164. (No model.)

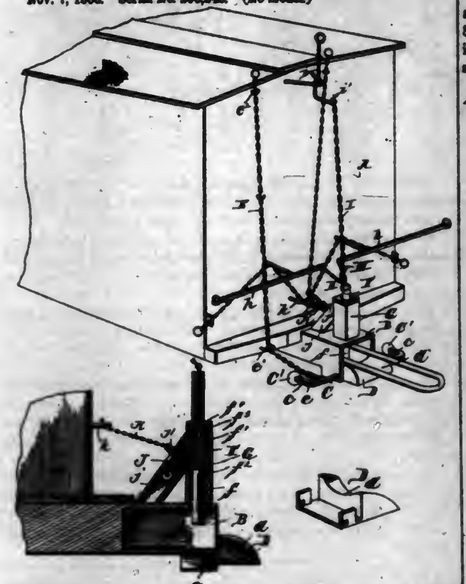


Claim.—1. A match-safe comprising a receptacle for matches and a receptacle for stubs, the receptacle for stubs having its sides permanently connected with the back and having a hinged portion curved to form its front and bottom when closed, and a chute discharging the match-stubs forwardly and downwardly when opened, substantially as described.

2. A match-safe comprising a receptacle for matches and a receptacle for stubs, the receptacle for stubs having its sides permanently connected with the back and having a hinged portion curved to form its front and bottom when closed, and a chute discharging the match-stubs forwardly and downwardly when opened and having lugs at its edges fitting into depressions in the sides of the box, substantially as described.

400,489. CUTTING APPARATUS FOR HARVESTERS. ROBERT J. ROBINSON and CYRUS F. COLLIER, Linneus, Mo. Filed June 28, 1888. Serial No. 278,430. (No model.)

Claim.—1. The combination, with the finger-bar and the fingers secured thereto, of the cutter-bar, the plates P, secured to and adjustable on the finger-bar, and having the vertical slotted arms S, the spindles U, adjustable in said slotted arms, the rollers W, journaled on said spindles and bearing on the cutter-bar, the plates K, secured to and adjustable on the finger-bar and having the downwardly-bent front sides, L, and the horizontal arms M, extending forward there-



400,489.

from with the vertical arms m^2 near their front end, the rollers N, journaled in the sides and arms m^2 and bearing under the cutter-bar, the spindles Y, depending from said plates P, and the rollers Z, journaled on said spindles and bearing against the rear side of the cutter-bar, substantially as described.

2. The combination of the finger-bar, the fingers secured thereto, the cutter-bar supported on the fingers, the guide-bar secured on the fingers and bearing against the front side of the cutter-bar, the adjustable plates secured to the finger-bar, and the anti-friction rollers journaled to the said plates and bearing against the upper, lower, and rear sides of the cutter-bar, substantially as described.

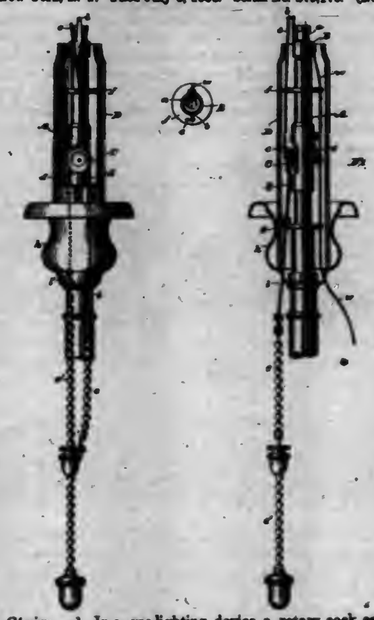
400,490. CAR-COUPLING. FREEMAN T. ROGERS, Linton, Ky. Filed Nov. 7, 1888. Serial No. 290,240. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw-head, of the shaft journaled in bearings depending from the lower outer corner of the draw-head, and having the weighted arms e at its ends on the sides of said draw-head, and the guide-block for the link secured on said shaft between the bearings thereof, and having its upper side concave and inclined inward and upward from its free edge, and extending in a direction opposite to and in the same plane as said weighted arms, whereby the guide-block will normally hold the link in the proper position preparatory to coupling, substantially as specified.

2. In a car-coupler, the combination, with the draw-head, of the shaft C, journaled in bearings depending from the outer lower corners of the draw-head, and provided with the arms c c and c, the guide-block D for the link, which block stands downward when said arms stand upward, and outward when the arms stand inward, and the chain E, extending downward from the end of the arm c to the staple d, and then upward through the staples d' d^2 to the top of the car, substantially as specified.

3. In a car-coupler, the combination, with the draw-head having the openings b b' in its roof and floor, respectively, and the sleeve G, standing vertically from the draw-head around the opening b, and rectangular in cross-section, of the coupling-pin F, having the lower cylindrical portion, f, the upper portion, f', rectangular in cross-section and fitting in the sleeve G, and the circumferential shoulder f^3, the chains H H and I, and the levers h h and i, all constructed and arranged substantially as and for the purpose specified.

4. In a car-coupler, the combination, with the draw-head, the sleeve G, rectangular in cross-section, the tube j, extending downward and inward from the sleeve, the detent J, pivoted in said tube, with its free end extending through a slot into the sleeve G, and provided with a staple, j', extending out of a slot in the tube j, and the chains K, passing through the staples k to the top and sides of the car, of the coupling-pin having the part f' rectangular in cross-section, fitting in the sleeve G, and provided on its rear or inner side with the transverse notch f^4, and means, substantially as described, whereby said pin can be raised, as specified.



400,491. COMBINED SYRINGE AND MEDICINE-CASE. GEORGE R. ROSS, Buffalo, N. Y. Filed Dec. 20, 1888. Serial No. 294,914. (No model.)

Claim.—1. In a pocket medicine-case, the combination of an outer case, a syringe-body having a reduced end or nozzle adapted to fit the holding-case, a hollow cylindrical plunger for holding the medicine and operating the syringe, and having an opening at the outer end provided with a stopper for closing it, and a packing of soft material for insuring a tight joint for the piston within the body of the syringe, substantially as described.

2. The combination of the holding-case 1, provided with a cover and an elastic washer, 4, a syringe-case, 5, a hollow plunger or piston, 8, provided with a packing, 10, for holding the medicine and operating the syringe, and a stopper for closing the open end of the plunger, substantially as described.

400,492. ELECTRIC GAS-LIGHTING DEVICE. DAVID ROUSSEAU, New York, N. Y. Filed July 6, 1888. Serial No. 278,176. (No model.)

Claim.—1. In a gas-lighting device, a rotary cock carrying a pulley to which is pivoted a rod or stem bearing a wiping-electrode, said rod or stem having a sliding fulcrum in a yoke or arm attached to a gas-burner, in combination with a fixed electrode, also carried by the burner, and a manipulating cord or chain attached near its center to the pulley, substantially as described.

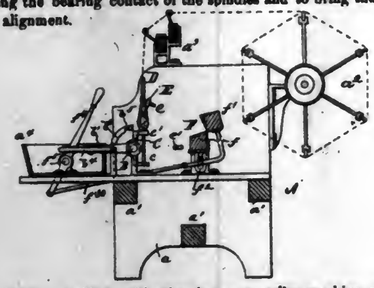
2. In a gas-lighting device, the combination of a fixed and a wiping electrode, the latter being pivoted to the gas-cock and having a sliding fulcrum or bearing through a fixed yoke or collar, substantially as described.

3. In a gas-lighting device, the combination of a fixed and a wiping electrode, the latter being pivoted to the gas-cock and having a sliding fulcrum or bearing through a fixed yoke or collar, all of said parts being surrounded by a protecting or concealing shield, substantially as described.

400,493. CLEVIS. ARTHUR W. RUSSELL, Kiowa, Kans. Filed June 5, 1888. Serial No. 276,158. (No model.)

400,493.

Claim.—1. In a clevis, the combination, with the clevis bars or sections provided with extended portions lapped together and having coincident openings, of an elongated link secured in said openings and constructed to secure the sections snugly together or to permit their movement apart when adjusted relatively thereto, substantially as described, and for the purposes specified.



2. The herein-described improvement in clevises, consisting of the bars or sections provided at one end, the one with a bolt and the other with an opening or socket to receive said bolt, and having at their opposite ends extended portions provided with coincident openings and one having a flange or lip extended along the end of the other, and the elongated link secured in said openings and having a hook, substantially as set forth.

3. An improved clevis comprising bars or sections separable at one end and provided at their opposite ends with portions having coincident openings, and an elongated link passed through said openings and adjustable, whereby it may be set to secure the said portions together or to permit their movement apart, all substantially as and for the purposes specified.

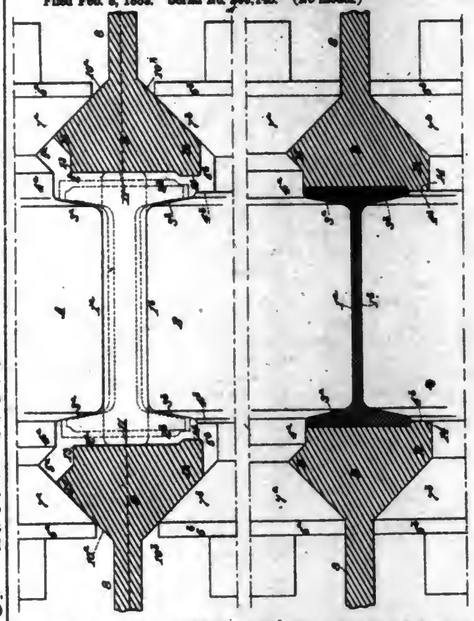
4. A clevis consisting of bar or section A, having end portion, A', the bar or section B, having end portion, B', lapped against portion A', and provided at its end with a lip or flange, B^3, extended along the end of portion A', the parts A' and B' being provided with coincident openings, and the elongated link passed through said openings and adjustable, all substantially as and for the purposes specified.

400,494. YARN-REELING MACHINE. WILLIAM SCHOFIELD, Philadelphia, Pa. Filed Jan. 2, 1889. Serial No. 295,140. (No model.)

Brief.—The invention relates to yarn-reeling machines in which the cop-bearing spindles are moved to different positions to facilitate the unwinding of the yarn, and has for its object particularly to provide a support for the outer ends of the spindles, and devices for regulating the bearing contact of the spindles and to bring the spindles into alignment.

Claim.—1. The combination, in a yarn-reeling machine, of the reel a^3, the yarn-guides a^2, the movable bar B, having a number of spindles mounted thereon, actuating mechanism for moving bar B and locking it in its adjusted positions, and a movable supporting device, F, for the outer ends of the spindles, substantially as shown and described.

2. In a yarn-reeling machine, a movable spindle-supporting bar, B, in combination with a supporting device, F, for the outer ends of the spindles when moved to contact therewith, and actuating devices for said bar B and supporting device F, substantially as set forth.



3. In a yarn-reeling machine, the combination, with a movable spindle-supporting bar, B, and its actuating device, of the supporting device F, comprising a fixed bar, *f*, and a movable bar, *f'*, and actuating mechanism for the latter, substantially as set forth.

4. In a yarn-reeling machine, the combination, with movable spindle-supporting bar B and its actuating mechanism, of the arms E E, having set-screws *e* secured to bar B, stops *d'* on the frame of the machine, and a supporting device, F, and actuating mechanism therefor, substantially as set forth.

5. In a yarn-reeling machine, the combination, with a movable spindle-supporting bar, B, and its actuating mechanism, of the vertically-adjustable bar *f'*, brackets f^3, composed of sections, one of which is a sliding section having a set-screw attachment with the other section for adjusting bar *f*, bar *f'*, hinged to bar *f*, and actuating mechanism for bar *f'*, substantially as set forth.

6. In a yarn-reeling machine, the combination, with a movable spindle-supporting bar, B, of the spindle-end-supporting device F, having all-around bearings for the spindle ends, substantially as set forth.

400,495. ROLLING-MILL. JOSEPH S. SEAMAN, Pittsburg, Pa. Filed Feb. 5, 1889. Serial No. 299,143. (No model.)

Claim.—1. In a metal-rolling machine, a vertical roll having a shouldered extension, 14, and operatively arranged between the ends of a pair of horizontal rolls, substantially as set forth.

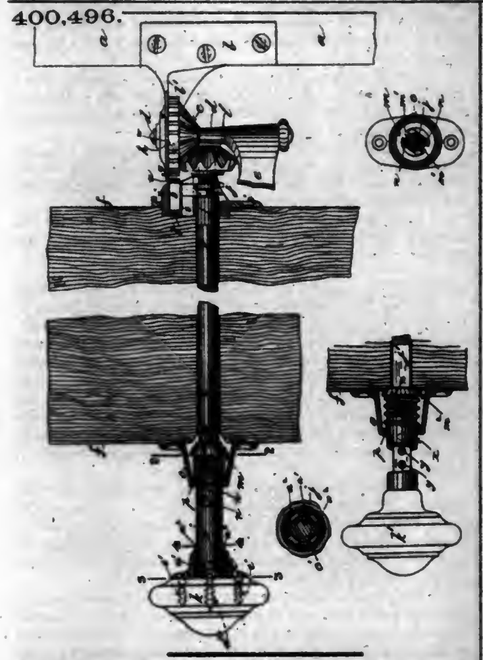
2. In a metal-rolling machine, a vertical roll having a shouldered extension, 14, in combination with a pair of horizontal rolls, one of the horizontal rolls having a shoulder, 4^c, at the end of its operative portion 1^c, substantially as set forth.

3. In a metal-rolling machine, a vertical roll having a shouldered extension, 14, in combination with a pair of horizontal rolls having shoulders 4^c and 4^b at the ends of the operative portions 1^c and 1^b, respectively, substantially as set forth.

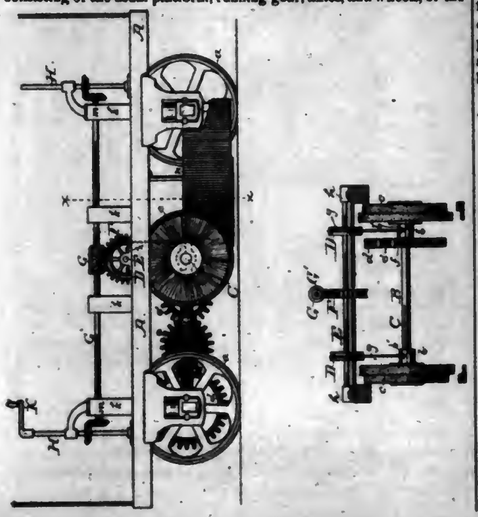
4. In a metal-rolling machine, a vertical roll having a shouldered extension, 14, and inwardly-beveled rims, in combination with a pair of horizontal rolls having beveled collars at or near their ends, one of the horizontal rolls having an edging-shoulder, 4^a, substantially as set forth.

5. In a metal-rolling machine, a vertical roll recessed at its ends and having extensions 14 and 15, in combination with a pair of horizontal rolls having grooves 2^a and 2^b and auxiliary grooves 5^a and 5^b, one of the horizontal rolls having an edging-shoulder, 4^a, substantially as set forth.

400,496. SHUTTER-WORKER. JOHN F. SHATUCK and ARTHUR O. SHATUCK, St. Louis, Mo. Filed Dec. 17, 1888. Serial No. 293,529. (No model.)



Claim.—1. In mechanism for opening and closing window-shutters, the combination of a longitudinally-movable spindle mounted horizontally within the window-frame and provided with a handle, a bolt operated by said spindle, and which is normally held in gear with a toothed spur-wheel or segment on the shutter by a spiral spring located between a collar adjustably fixed to the spindle, a shoulder or fulcrum projecting from the window-frame, a bevel-wheel fixed on said spindle with the bevel-wheel segment carried by the shutter, substantially as described.

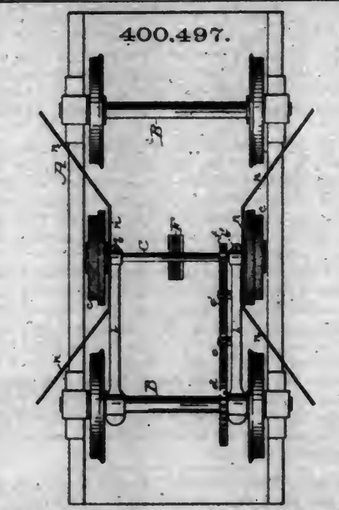


2. The combination of a bevel wheel or segment, *c*, carried by hinged shutter-blind *a*, and engaged by bevel-wheel *l* on spindle *j*, mounted in window-frame, and having adjustable ring or collar *m*, and spiral spring *p*, inclosed by casing *o*, groove *q* in spindle *j*, bolt *s*, having projection *r* and teeth *u*, and mounted between guides in window-frame, and spur wheel or segment *h* on bevel-segment *c*, with knob or handle *k*, substantially shown, and for the purpose described.

3. The combination of spindle *j*, having T-shaped end *d'*, and screw d^2, flange *d'*, having thoroughfare-slotway d^3, recesses d^4, and holes d^5, with knob or handle *k*, and screws *d'*, substantially as shown, and for the purpose described.

4. The combination of spindle *j*, having T-shaped end *d'*, flange *d'*, having thoroughfare-slotway d^3, and recesses d^4, with means for securing said flange to a knob or handle, substantially as described.

400,496.



400,497. CAR-TRACK SWEEPER. CHARLES R. SHREVE, Chicago, Ill. Filed Nov. 13, 1888. Serial No. 290,604. (No model.)

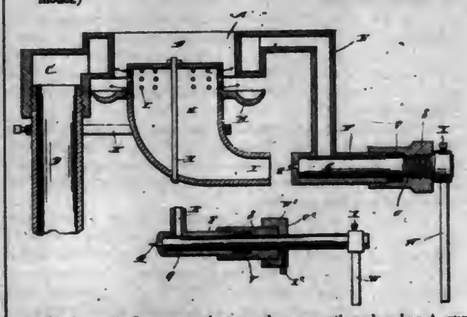
Claim.—1. In a track-sweeper, the combination, with a car-truck consisting of the usual platform, running-gear, wheels, and axles, of the links *b*, loosely journaled on one of said axles, shaft C, journaled in extremities of said links, said axle and shaft extending entirely across the machine, and the axle carrying two of the carrying-wheels fast upon the same, and the shaft actuated therefrom, circular brushes *c* on the extremities of said shaft, whose peripheries are greater in diameter next their inner edges than next their outer edges, and devices for suspending the outer ends of said links, in which shaft C is journaled.

2. In a track-sweeper, the combination, with a car-truck consisting of the usual platform, running-gear, wheels, and axles, of the links *b*, loosely journaled on one of said axles, transverse shaft C, journaled in suitable bearings in the ends of said links, a train of gear for imparting the motion of the axles to said shaft, brushes *c c* on the extremities of said shaft, and cables *g g*, connected to the ends of said links extending beyond the bearing of shaft C, as set forth.

3. The combination, in a street-car-track sweeper, of the truck consisting of the usual platform, running-gear, axles, and wheels, of the

400,497.

links *b b*, loosely journaled on one of said axles and extending parallel to each other a corresponding distance to and under the center of length of said truck, shaft C, journaled in the end of said links, brushes *c c*, having the outer part of their peripheries less in diameter than the inner part thereof, said shaft and brushes being actuated through the medium of said axle, and cables *g*, for suspending the ends of the links in which shaft C is journaled.



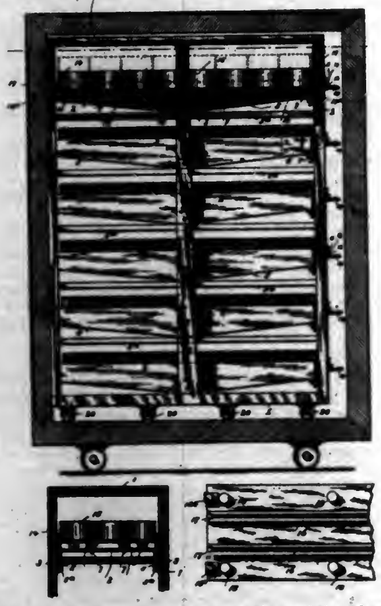
4. The combination, with a street-car truck consisting of the usual platform, running-gear, and axles and wheels, of the links *b*, loosely journaled on one of said axles, shaft C, journaled in the free extremities thereof, brushes *c c* on the ends of said shaft, cables *g g*, for suspending said free ends of the links, wheels D D, shaft E, worm-gear F, and worm G, as set forth.

5. The combination, with a street-car truck consisting of the usual platform, running-gear, axles, and wheels, of the links *b*, shaft C, journaled in the free ends of said links, brushes *c c* on the ends of said shaft C, cables *g g*, for suspending the free ends of said links, wheels D D, shaft E, worm-gear F, worm G, longitudinal shaft G', vertical shafts H, and bevel-gear for connecting said vertical and longitudinal shafts.

6. The combination, with a car-truck consisting of the usual platform, running-gear, axles, and wheels, of the links *b*, loosely journaled on one of the said axles, shaft G, journaled in the end of said links, gear *d*, fast on said axle, pinion *f*, fast on said shaft in alignment with gear *d*, and intermediate idle-gear, *e* and *e'*, for connecting gear *d* with pinion *f*, brushes *c c* on the ends of shaft C, having a stepped periphery, and cables *g*, for suspending the free ends of said links.

7. The combination, with a street-car truck consisting of the usual platform, running-gear, axles, and wheels, of the links *b*, shaft C, gear for imparting the motion of said axle to said shaft, brushes *c c* on the ends of said shaft, having a stepped periphery, and cables *g*, for suspending said links *b*, and shields *n*, as described, interposed obliquely across the tracks, said truck moving on in front of each brush *c* and between them and the wheels on corresponding sides, as set forth.

400,498. VAPOR-BURNER. CHARLES H. SHULTZ, St. Joseph, Mo. Filed May 17, 1887. Renewed Feb. 23, 1889. Serial No. 300,965. (No model.)



Claim.—1. In a vapor-burner, the generating-chamber A, surrounding a central space, B, which is entirely open both at the top

and bottom, combined with the burner-head arranged below the generating-chamber and having its upper end inserted part way into the open space B, the top of the burner being closed and imperforate, and two or more series of jet-openings, L, in the sides of the burner-head, one series being above the other, so that the openings L are both above and below the bottom of the generating-chamber, as set forth.

2. In a vapor-burner, the generating-chamber A, surrounding a central space, B, which is open at the top and bottom, and the combined mixing-chamber and burner H, arranged below the generating-chamber, the burner-head being inserted into the space B, and having a removable cap provided with a flanged extension, which forms an oil-cup, M, the top of the cap being imperforate, and the perforations L in the sides of said cap, as set forth.

3. In a vapor-burner, the generating-chamber A, surrounding a central space, B, which is open at the top and bottom, and the vapor-pipe E, extending from the chamber, in combination with the combined mixing-chamber and burner H, made separate from the generating-chamber and having its upper end inserted part way into the space B and its lower end formed with an integral tube, I, which is turned to one side toward the pipe E, and the needle-valve at the lower end of pipe E, adjacent to the end of tube I, and the jet-openings L in the sides of the burner, said openings being both above and below the bottom of the generating-chamber, the top of the burner being imperforate, as set forth.

400,499. SAFE OR VAULT. MICHAEL SIEBDORFER, Louisville, Ky. Filed Aug. 4, 1888. Serial No. 281,980. (No model.)

Claim.—1. A money or security receptacle consisting of one or more shelves, suitably secured and pivoted in a frame-work, in combination with a corresponding number of removable trays, as and for the purposes set forth.

2. A safe or vault for money, securities, &c., which consists of a suitable frame-work having cross-bars, as shown, and permanent shelves pivoted in the frame just above the cross-bars and provided with triangular-shaped sides projecting downwardly, which are adapted to seat on the cross-bars, as described, in combination with removable money-trays, as set forth.

3. In a safe or vault for money, securities, &c., the combination of the frame-work, and the shelves pivoted therein and provided with anti-friction wheels or rollers, with a corresponding number of removable money-trays, provided with grooved ways for traveling on the rollers, as shown and described.

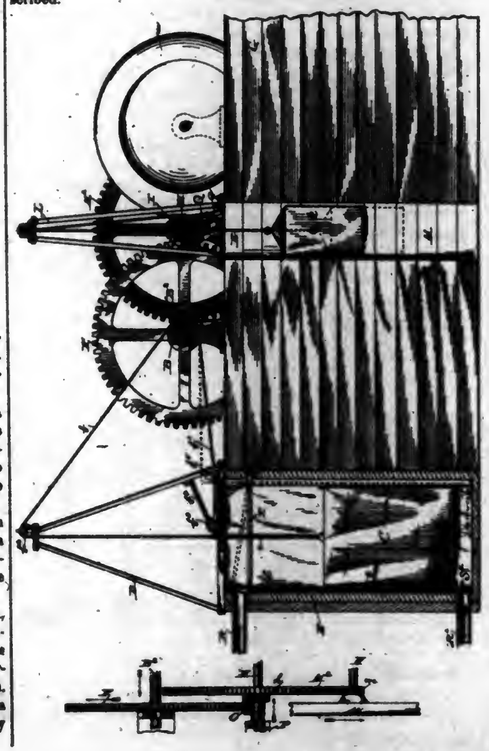
4. In a safe or vault for the storage of money, securities, &c., the combination of a suitable frame-work, one or more shelves pivotally secured within the frame, means for tilting the pivoted shelves and locking them in either position, and a series of money-trays corresponding in number to the shelves, as and for the purposes set forth.

5. A device for storing money, securities, &c., which consists of a frame-work, preferably open and mounted on wheels, and which may be inserted in any vacant safe, vault, or closet, in combination with pivoted or tilting shelves and removable trays, as and for the purposes set forth.

6. The combination of a suitable frame-work, pivoted or tilting shelves hung therein, and the removable trays for the reception of money, &c., and subdivided, as shown, for indicating the exact amount contained within any one tray.

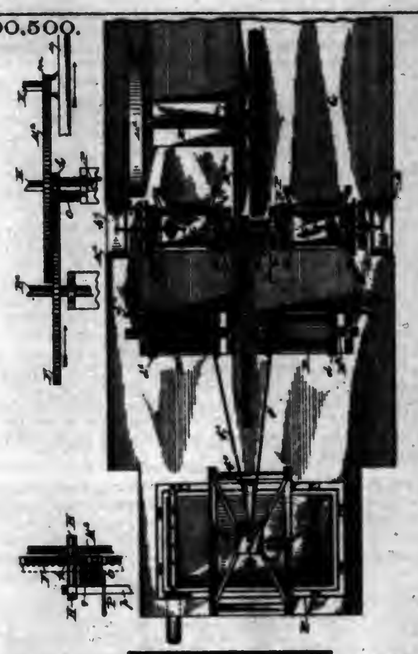
7. In combination with the safe or vault, substantially as herein-before described, the coin-receiving tray made removable for the purposes set forth, and provided with rubber or other padding upon the end and bottom to prevent jarring or scratching.

8. The safe for storing money, securities, &c., and provided with the stationary shelves having a tilting movement within the said safe, for the purposes set forth.



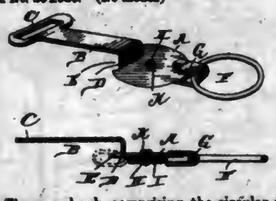
400,500. TIDE AND LOCK POWER ENGINE. ADA F. SMITH, Brooklyn, N. Y. Filed Nov. 15, 1888. Serial No. 290,911. (No model.)

Claim.—1. The herein-described machine for utilizing the buoyant properties of fluids and the varying level of the same as a power medium, the same being composed of a float, the two drums, the cables connecting the float with the drums and wound around the said drums in reverse directions, the power-shaft geared with the drums, and means, as the pinion O and the endwise-movable shaft B^3, for maintaining a continuous rotary movement of the power-shaft in the same direction whether the said float be rising or falling, substantially as described.



2. The herein-described mechanism for converting the buoyant properties of fluids and the change of level of the same into available power, consisting of the float, the two drums, the cables wound in reverse directions on the drums and connected with the said float, the power-shaft geared with the drums, and the shaft H, for storing the power, substantially as and for the purpose specified.

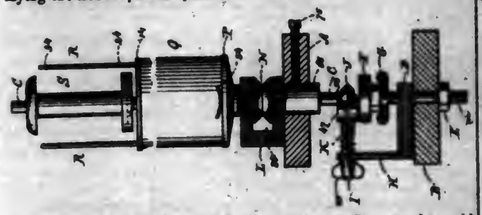
3. The combination of the float, the endwise-movable shaft B^3, the drums on the said shaft B^3, the cables wound in reverse directions on the drums and connected with the said float, the shaft H, the drums on the said shaft H, the weighted cables adapted to be wound on the said drums, the clutches for gearing the drums to the shaft H, the power-shaft geared with the said shaft H, the gear-wheel F, pinion *h*, and movable pinion O, substantially as and for the purpose specified.



4. The combination, with the shaft H, the drums on the said shaft, the weighted cables wound in reverse directions on the drums, means for keying the drums to the shaft at will, and the power-shaft in gear with and revolved from the said shaft H, substantially as described.

400,500.

400,501. HOOK. CHARLES SMITH, Rogers, Ark. Filed Dec. 20, 1888. Serial No. 294,920. (No model.)

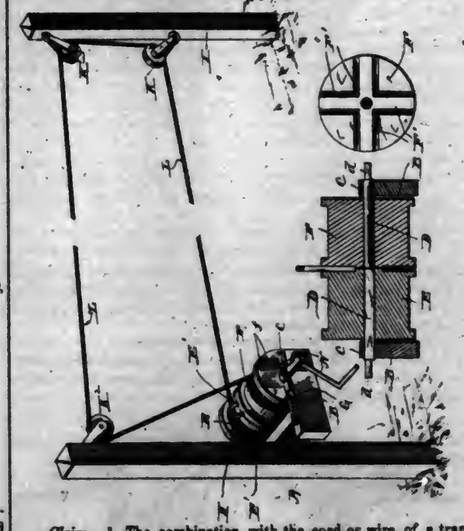


Claim.—1. The snap-hook comprising the circular disk A, having the notch E in one side, the shank B, projecting from the disk and having the offset or shoulder D at its inner end attached to the disk at the notched portion thereof, whereby the said shank extends over the notch and is in a different plane from the disk, and the hook G, having its inner end pivoted to the center of the disk, the point of the hook being adapted to sweep on and in contact with the disk until it reaches the notch E, substantially as described.

2. The snap-hook comprising the circular disk A and the integral shank B, said disk having the notch E in one side, and said shank having the offset or shoulder D and being arranged over the notch, and the hook G, having its inner end pivoted under the center of the disk, and having its point adapted to sweep on and in contact with the disk until it reaches the notch E, substantially as described.

400,502. SPINNING-SPINDLE. SAMUEL SMITH, Lawrence, and RICHARD GILL, Methuen, assignors to themselves, and WILLIAM H. BUTLER, Lawrence, Mass. Filed Oct. 9, 1888. Serial No. 287,609. (No model.)

Brief.—The invention relates to spindles designed for worsted spinning, and consists in the devices for regulating the drag and for laying the fibers upon the yarn as it is spun.



Claim.—1. The lifting-rail B, the spindle-step D, secured to said rail by the nut E and exteriorly screw-threaded at its upper end, the oil-cup F, having a screw-threaded hole at its bottom and mounted on the step D, and the felt ring 64, disposed in said cup, in combination with the spindle C, resting in said step and provided with the collet J, whereby friction may be exerted on the spindle by turning said cup upward to bring said ring in contact with the collet and the movement of the spindle thereby regulated, substantially as set forth.

2. The lifting-rail B, the step D, secured in said rail and provided with the bracket H, the upper portion of said step being exteriorly screw-threaded, the oil-cup F, having a screw-threaded hole in its bottom and mounted on said step, the pad or ring 64, disposed in said cup, and the rod I, fitted to slide in said bracket and provided with the nut 45, spring K, and head 47, in combination with the spindle C, provided with the collet J, substantially as described.

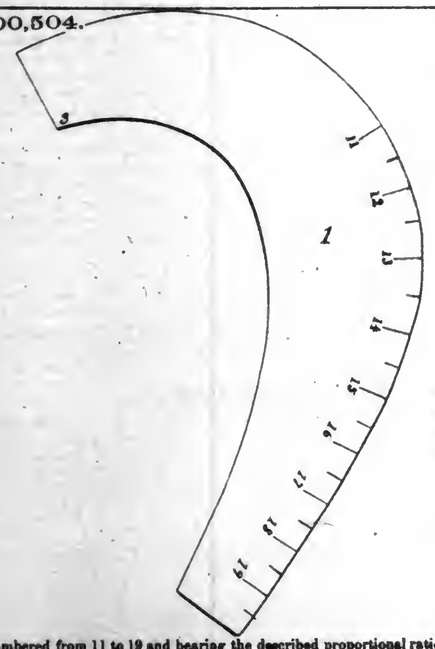
3. The cylinder Q, provided with an opening or openings through its side, in combination with the disk P, sleeve O, whirl N, spindle C, and flier-arm R, substantially as described.

4. The cylinder Q, provided with one or more crescent-shaped or curved openings, as 54, in combination with the disk P, sleeve O, whirl N, spindle C, and flier-arm R, substantially as described.

400,503. CLOTHES-LINE. FRANK P. STANLEY, Spencer, Iowa. Filed Aug. 21, 1888. Serial No. 283,337. (No model.)

Claim.—1. The combination, with the cord or wire, of a transverse shaft carrying a rigid reel to which is attached one end of the cord or wire, the loose reel mounted on the said shaft and having the other end of the cord or wire attached thereto, and the key engaging registering grooves in the contiguous ends of the said reels, substantially as specified.

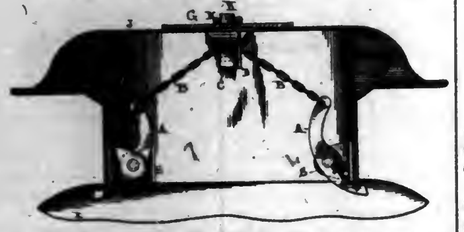
2. The combination, with the cord or wire, of the transverse shaft D, provided with a squared portion and a round portion, the reel E, mounted on the squared portion of the shaft and adapted to turn with the same, the reel F, mounted on the round portion of the shaft, the contiguous ends of the reels being provided with radial grooves E' F', which are adapted to register, and the loop-shaped key H, having its arms A A inserted in the said registering grooves, substantially as specified.



3. The combination, with a cord or wire, of the shaft having the rigid reel E and the movable reel F mounted thereon, and having the ends of the cord or wire attached respectively thereto, the key adapted to engage registering grooves in the contiguous ends of the reels, and the hook or latch adapted to engage a socket in the free end of the reel F, substantially as specified.

400,504. DRESS-CUTTER'S RULE. TERESSA I. STOCKMAN, Council Bluffs, Iowa. Filed Nov. 7, 1888. Serial No. 290,194. (Model.)

Claim.—A dress-cutter's rule having one side edge convex and the other concave, the curves of the said edges being partially elliptical, the ends being straight-edged and narrower than the midway portion, the convex edge being provided with a scale of graduations

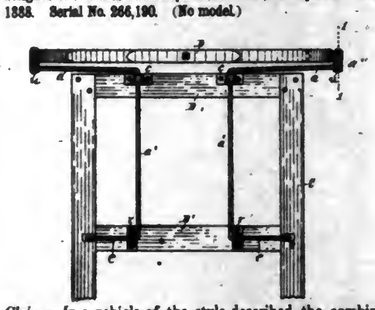


400,504.

numbered from 11 to 19 and bearing the described proportional ratio to the whole length of the rule, substantially as shown and described, whereby the concave curve of the rule may be located as a guide to draw an arm-scye on a dress, as set forth.

400,505. SEALED LOCK FOR CANS. WILLIAM H. STOOPS, Boonton, N. J., assignor to Joshua S. Salmon, same place. Filed Sept. 10, 1888. Serial No. 285,037. (No model.)

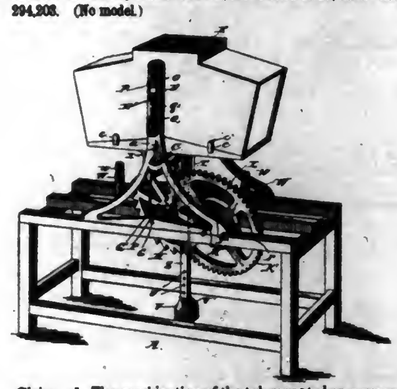
Claim.—1. The combination, with a can, of two or more levers pivoted to the inside of the cover, their lower ends being adapted to project under the shoulder of the can, and means for drawing toward each other the upper ends of the levers and retaining them in that position, substantially as described.



2. The combination, with a can, of the levers A, pivoted to the inside of the cover and adapted to engage with the shoulder of the can, a chain, B, loosely uniting the ends of the levers, and means for putting and retaining a tension on the chain, substantially as described.

3. The combination, with a can, of two or more levers, A, pivoted to the inside of the cover and adapted to engage with the shoulder of the can, a chain, B, loosely uniting the levers, a tongue, C, fastened to the inside of the cover and adapted to receive the chain B, and a safety-catch for retaining the chain upon the tongue, substantially as described.

4. The combination, with a can, of a cover having an opening therein, two or more levers pivoted to the inside of the cover and adapted to engage with the shoulders of the can, a chain, B, loosely uniting the levers, a tongue, C, fastened to the inside of the cover adjacent to the opening and adapted to receive the chain, B, a lid, G, for closing the opening in the cover, and means for sealing it when closed, substantially as and for the purpose set forth.



5. The combination, with a can, of the levers A, pivoted to the inside of the cover and adapted to engage with the shoulder of the can, a chain, B, loosely uniting the ends of the levers, means for putting and retaining a tension on the chain, and means for securing the chain from being tampered with without detection, substantially as described.

400,506. VEHICLE-SPRING. LUTHER STOUFFER, St. Joseph, Mo., assignor of two-fifths to Joseph W. Stouffer, same place. Filed Mar. 5, 1888. Serial No. 266,190. (No model.)

Claim.—In a vehicle of the style described, the combination of the torsions provided with the embossed eyes, the bolts larger in diameter at one end than the other, the larger ends being firmly driven into the eyes of the torsions, and the semi-elliptical springs having the eyed ends loose on the smaller ends of the bolts and the bolt-nuts, substantially as set forth.

400,507. MOTOR FOR CHURNS. WILLIAM H. STRICKLER and JAMES S. BRADDOCK, Mount Pleasant, Pa. Filed Dec. 20, 1888. Serial No. 294,208. (No model.)

Claim.—1. The combination of the tub mounted on a verge which is provided with a pallet engaging a suitable scape-wheel, and the power-shaft geared to the shaft of the scape-wheel, substantially as specified.

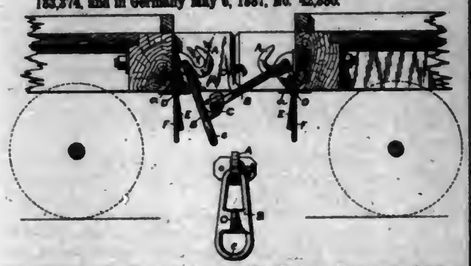
2. The combination of the verge carrying a churn-tub and having a pallet which engages a suitable scape-wheel, the power-shaft geared to the shaft of the scape-wheel and provided with a power-spring to rotate the shaft, the drum mounted on the power-shaft and adapted to be locked rigidly thereto, and the cord coiled on the drum and provided at its opposite end with a weight, substantially as specified.

3. The combination of the verge carrying a churn-tub and having a pallet which engages a suitable scape-wheel, the power-shaft provided with a spring and geared to the shaft of the scape-wheel, and the buffers arranged under the ends of the churn-tub and provided at their upper ends with coiled springs *w w*, which are adapted to be alternately compressed by the churn-tub, substantially as specified.

4. The combination of the verge provided with the rigid vibrating arms C C, the churn-tub removably secured to the said arms, the pallet arranged on the verge and engaging a suitable scape-wheel, and the power-shaft geared to the arbor of the scape-wheel, substantially as specified.

5. The combination of the verge provided with the arms C C, beveled on their upper sides from their centers toward the ends, the churn-tub provided with a double inclined bottom fitting on the upper edges of the said arms and removably secured thereto, the escapement arranged as described, and the power-shaft geared to the arbor of the scape-wheel, substantially as specified.

6. The combination, with the verge having the churn-tub attached thereto and provided with a pallet engaging a suitable scape-wheel, and the power-shaft geared to the arbor of the scape-wheel, of the pendulum suspended loosely on a suitable pivot-pin and the depending arm at the verge fitting at its lower end in a slot in the pendulum, substantially as specified.



7. The combination, with the verge having a churn-tub attached at its center thereto and provided with a pallet engaging a suitable scape-wheel, and the power-shaft geared to the arbor of the scape-wheel, of the pendulum pivoted at its upper end and provided with a series of perforations, U, the depending arm T on the verge provided with a finger, *t*, fitting in a vertical slot in the pendulum, the pendulum-bob fitting on the lower end of the pendulum and provided with a perforation registering with one of the perforations U, and the pin engaging in the said perforations, substantially as specified.

8. The verge provided with the vibrating arms C C and the depending arm T, the churn-tub secured to the arms C, the pallet on the said verge engaging a suitable scape-wheel, and the power-shaft geared to the arbor of the scape-wheel, in combination with the pendulum pivoted at its upper end and connected to the lower end of the arm T, and the pendulum-bob fitting on the lower end of the pendulum and vertically adjustable thereon to counterbalance the weight of the contents of the churn-tub, substantially as specified.

9. The combination, with a verge carrying a churn-tub and provided with a pallet engaging a suitable scape-wheel, and the power-shaft geared to the arbor of the scape-wheel and carrying an actuating-spring, of the drum loosely mounted on the power-shaft and having a weighted cord wound thereon, and the pawl engaging a ratchet-wheel on the drum to lock the latter to the power-shaft, substantially as specified.

10. The combination, with a verge carrying a churn-tub and provided with a pallet which engages a suitable scape-wheel, and the power-shaft geared to the arbor of the scape-wheel and carrying an actuating-spring, of the drum mounted loosely on the power-shaft and having a weighted cord wound thereon, the pawl engaging a ratchet-wheel on the drum to lock the latter to the power-shaft, and the supplemental shaft R, adapted to be engaged by a key and geared to the drum, substantially as and for the purpose specified.

400,508. CAR-COUPLING. WILLIAM G. STUART, Hunhead, County of Surrey, assignor of one-half to Albert Henry Bellingham, Peckham, England. Filed Nov. 6, 1888. Serial No. 290,149. (No model.) Patented in England Mar. 14, 1887, No. 3,830; in France May 6, 1887, No. 183,374, and in Germany May 6, 1887, No. 42,380.

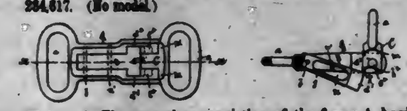
Claim.—In a car-coupling, the link B, depending from a hooked draw-bar head, A, having a link end, *e*, and hook C, in combination with a cranked rod, D, for raising same, having handles E, and being suitably attached to the car, substantially as described.

400,509. SOLDERING-IRON. ALFRED SUDDEN and SWAN B. MOLANDER, Mora, Minn. Filed Dec. 3, 1888. Serial No. 292,959. (No model.)

Claim.—The improved soldering-iron herein described and shown, comprising a body having a longitudinal internal recess, D, and a small longitudinal passage, E, leading from said recess, a hollow handle secured to the body, the wick arranged in the handle and entering the recess D, the valve mounted in the upper side of the body and entering the longitudinal passage E, the hollow soldering-point connected to and communicating with the body and having an open upper end, the cover pivoted to the body and adapted to close the open upper end of the point, and the cup hung on the body, as specified.

400,510. CIRCULAR-KNITTING MACHINE. CHARLES F. SWAIN, Methuen, Mass. Filed July 19, 1888. Serial No. 280,410. (No model.)

Claim.—1. The combination of the stationary frame, the needle-cylinder and spring-bearded needles, the plush-looper, the binder-looper, the blending-wheel, and the push-back provided in its lower edge with a recess having outwardly and downwardly inclined ends

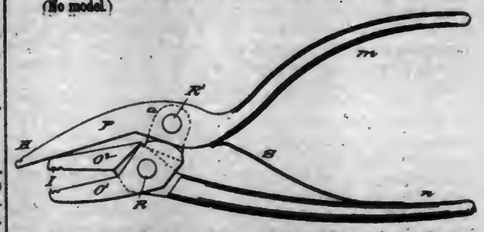


and arranged to operate after the binder-looper and before the blending-wheel to allow the fabric after passing the binder-looper to rise on the needles, carrying with it the plush-thread to a position just below the beards of the needles and to push said fabric down before reaching the blending-wheel, whereby said blending-wheel may operate upon said plush-thread and said binder-thread without interfering with said fabric, as and for the purpose specified.

2. The combination of the stationary frame, the needle-cylinder and spring-bearded needles, the plush-looper, the binder-looper, the blending-wheel, the push-back provided in its lower edge with a recess having outwardly and downwardly inclined ends, a riser arranged on the inner side of said push-back and having its upper edge above the lower edge of said push-back within said recess and having its ends inclined downwardly and outwardly, and a fabric-strainer arranged on the inner side of said riser and having its lower edge below the upper edge of said riser, and having its ends inclined upwardly and outwardly, said riser and said fabric-strainer being concentric with said push-back, and said push-back, riser, and fabric-strainer being arranged to operate after the binder-looper and before the blending-wheel to cause the fabric after passing the binder-looper to rise on the needles, carrying with it the plush-thread to a position just below the beards of the needles and to push said fabric down before reaching the blending-wheel, whereby said blending-wheel may operate upon said plush-thread and said binder-thread without interfering with said fabric, as and for the purpose specified.

3. The combination of the stationary frame, the needle-cylinder and spring-bearded needles, the plush-looper, the binder-looper, the blending-wheel, the face-looper, the landing-wheel and its presser, the knock-over wheel, the push-back provided in its lower edge with a recess having outwardly and downwardly inclined ends and arranged to operate after the binder-looper and before the blending-wheel to cause the fabric after passing the binder-looper to rise on the needles, carrying with it the plush-thread to a position just below the beards of the needles and to push said fabric down before reaching the blending-wheel, whereby said blending-wheel may operate upon said plush-thread and said binder-thread without interfering with said fabric, as and for the purpose specified.

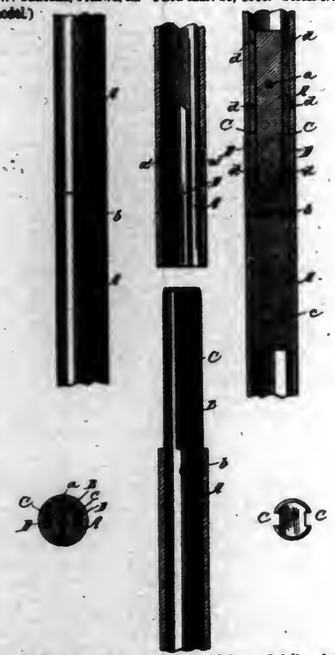
400,511. SNAP-HOOK. JEREMIAH R. TAINTER, Menomonee, and NATHAN P. NOBLE, Rice Lake, Wis. Filed Sept. 5, 1888. Serial No. 284,617. (No model.)



Claim.—1. The snap-clasp consisting of the frame A, having the recesses d^3 d^3 and cavities d', spring-tongue B, supported within said frame, and a head, C, having projections c^3 fitting said cavities, whereby said parts A and C are capable of being connected and disconnected, substantially as and for the purpose set forth.

2. In a snap-clasp, a frame, A, having recesses d^3 d^3 and cavities d', tongue B, supported within said frame, and a head, C, having projections c^3 fitting said cavities, and with prongs $k' k^3$, and adapted to depress said tongue when said head is oscillated upon said studs, substantially as and for the purpose set forth.

3. The snap-clasp consisting of the frame A, having the recesses d^3 d^3 and cavities d', head C, having projections c^3 fitting said cavities, and a tongue, B, supported within said frame, and with internal cavity, *u*, whereby the clogging of the tongue is prevented, substantially as and for the purpose set forth.



400,512. PLIERS FOR APPLYING COUPLINGS OF WIRE. HARVEY D. TAYLOR, Keeseville, N. Y. Filed Dec. 3, 1888. Serial No. 292,565. (No model.)

Claim.—The pliers described, consisting of two main members or arms and a short connecting member, the upper member, *m*, having

the extension P, and provided with a notch, H, the lower member, n, having an upper jaw, O², the connecting member having the jaw O and being pivoted to the lower member and also to the head of the upper member, as set forth.

400,513. LOCKING DEVICE FOR TUBE OR PIPE SECTIONS. JOHN W. TESTREL, Ottawa, Ill. Filed Mar. 23, 1888. Serial No. 268,247. (No model.)

Claim.—1. The plug B, having one end formed full and the other end provided with recesses C, for uniting tube or pipe sections, substantially as specified.

2. The combination, with tube or pipe sections having one end provided with splines or keys, of the plug D, having the grooves or recesses C, substantially as and for the purposes specified.

3. The combination, with the tube or pipe sections having one end provided with splines or keys, of the plug D, having the grooves or recesses C, and securing-rivets *a b c*, substantially as specified.

400,514. HORSESHOE AND PAD. SAMUEL THOMPSON, Chicago, Ill. Filed Mar. 24, 1888. Serial No. 268,440. (No model.)

Claim.—1. The combination, with a horseshoe, of a pad of elastic material the edges of which extend and are secured between the shoe and hoof and which is provided with a frog that projects down between the heels of the shoe to a plane below that of the bearing-surface thereof, and the projection of which gradually diminishes as said frog approaches the toe, and a spring-bar, D, secured to the toe of the shoe next the hoof and extending longitudinally to and terminating under the heel of the hoof, said bar having no other connection to said shoe except at the toe thereof and pressing upward against the frog of said pad to support the same, as set forth.

2. The combination, with a horseshoe and a leather sole secured between said shoe and the hoof, of an artificial frog of elastic material, the front end of which reaches to or under the toe of the shoe and which gradually increases in thickness as it extends longitudinally from the toe to between the heels of said shoe until it depends at the heel to a plane below that of the tread of said shoe, and a spring-bar which is secured next the hoof to the toe of shoe and which extends to the rear, resting within a longitudinal depression or groove in the outer surface of said frog, which it holds rigidly in place.

400,515. APPARATUS FOR REGULATING CURRENT OR POTENTIAL IN SECONDARY OF TRANSFORMERS. ELIHU THOMSON, Lynn, Mass. Filed Jan. 10, 1889. Serial No. 296,018. (No model.)

Claim.—1. An induction-coil or transformer having a partial magnetic shunt of determinate capacity for the magnetism threading the coils, whereby the potential of the secondary current may be automatically lowered on an increase of such current, as and for the purpose described.

2. In an induction-coil or transformer, a partially-closed magnetic circuit consisting of polar extensions or magnetic carriers from the parts of the core between the primary and secondary brought into close proximity, as and for the purpose described.

3. The combination, with an induction-coil or transformer having a magnetic shunt, of a conductor suspended or movable in the shunting-lines of force, as and for the purpose described.

4. The combination, with constant-potential mains, of a transformer, a secondary for said transformer feeding translating devices in series, and a magnetic shunt for the transformer having a definite or determinate capacity, such as described, proper for limiting the currents in the secondary, so as to keep or tend to keep the same of constant amount, as and for the purpose described.

5. The combination, with an iron core threading two alternating-current coils, of magnetic carriers or extensions for said core brought into close proximity and forming a magnetic shunt variable in amount automatically by the increase or decrease of current in one of said coils, as described.

6. The combination, with two alternating-current coils placed in inductive relation upon a suitable core, of a magnetic shunt for the magnetism threading said coils and of definite or determinate strength increasing automatically with an increase of current in the coil.

7. The combination, with two alternating-current coils wound on different parts of the same core, of iron masses tending to form a magnetic shunt for the portions of core between the coils and adjustable for the purpose of determinating the amount of the magnetic shunting.

8. The combination, with constant-potential mains, of a transformer having its primary fed therefrom, a secondary on a different portion of core, and a partial magnetic shunt for the portion of core between the coils.

9. The combination, with the primary, of two secondaries connected in series and applied to different parts of the same core, one near to and the other more remote from the primary, and a partial magnetic shunt for the core, as and for the purpose described.

10. The combination, with two alternating-current mains, of transformers having a variable resistance in their secondaries and partial magnetic shunts for the portion of cores threading the secondaries, as and for the purpose described.

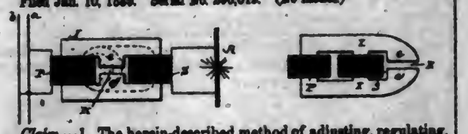
11. A system of distribution for arc lighting, comprising constant-potential mains, transformers in multiple on said mains, arc-light circuits connected to the secondaries, and potential-regulators consisting of partially-closed magnetic circuits set up by the currents of either or both of said coils.

12. The combination, with primary and secondary alternating circuits in inductive relation, of an iron core forming a seat of alternating magnetism developed by one of said circuits, and having extensions brought into close proximity to form a partially-closed magnetic circuit of determinate amount variable automatically with the currents flowing.

13. The combination, with primary and secondary alternating-current circuits in inductive relation, of an iron core forming the seat of alternating magnetism developed by the current in the secondary and extensions from said core brought into proximity to form a partially-closed magnetic circuit of definite or determinate amount.

14. The combination, with an alternating-current main, of a transformer having a variable resistance in its secondary and a core which forms the seat of magnetism developed by the secondary currents, and is provided with extensions brought into proximity to form a partially-closed magnetic circuit of determinate amount, as and for the purpose described.

15. The combination, with an induction-coil or converter, of a partially-closed magnetic circuit excited by the current in each or either of the electric circuits and a conducting-plate movably suspended in a gap in such magnetic circuit, as and for the purpose described.



16. The combination, with an induction-coil or converter, of magnetic carriers—such as iron-core extensions—from a core excited by the current which flows in one of the coils of the converter, and means for adjusting the magnetic resistance between the parts of the core

partially shunted by said carriers or extensions, as and for the purpose described.

17. An induction-coil or converter having an endless iron core or magnetic circuit on which the primary and secondary coils are disposed at different points, and having parts or extensions of said core brought into determinate magnetic inductive proximity to form a partially-closed magnetic circuit of definite capacity independent of the closed magnetic circuit over the iron core and through the coils.

18. An induction-coil or converter having primary and secondary conductors wound on different parts of the core, and having parts of said core brought into proximity but separated by a magnetic shunting-space of definite or determinate capacity, as described, proper for keeping the current in the secondary approximately constant when the primary is supplied from a constant-potential source.

400,516. METHOD OF REGULATING CURRENT OR POTENTIAL IN SECONDARY OF TRANSFORMERS. ELIHU THOMSON, Lynn, Mass. Filed Jan. 10, 1889. Serial No. 296,019. (No model.)

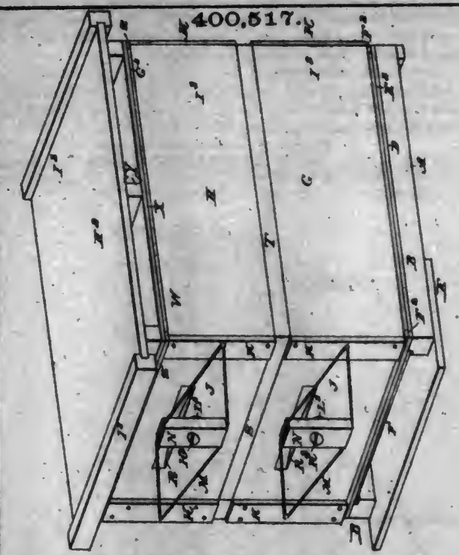
Claim.—1. The herein-described method of adjusting, regulating, or determining the current or potential in the secondary of two coils or circuits placed in inductive relation, consisting in developing alternating magnetism through the action of the current in each or either of said circuits in a suitable iron core and variably closing the magnetic circuit of said core through a path independent, in whole or in part, of the core or portion of core in which magnetism is developed by the other coil or circuit.

2. The herein-described method of obtaining a fall of potential in the secondary circuit of an induction-coil fed from a constant-potential source, consisting in magnetizing a core by one of said circuits and partially closing the magnetic circuit of said core through a path of determinate or set value independent of the core or portion of core which is excited by the other circuit.

3. The herein-described method of regulating the current in the secondary circuit of a transformer, which consists in developing a magnetism by current in each or either circuit of the transformer and variably closing the magnetic circuit through a path independent of the core or portion of core carrying the coil or the other circuit of the transformer.

4. The herein-described method of obtaining a substantially-constant current in the variable-resistance circuit of a transformer fed from a constant-potential source, consisting in shunting the magnetism threading the two coils of the transformer in variable amount, as and for the purpose described.

5. The herein-described method of obtaining a constant current in a variable-resistance circuit from a constant-potential source, consisting in passing the current from said source through the primary of an induction-coil whose secondary is connected to the variable-resistance circuit, setting up rapid alternations of magnetism in a suitable core by current in each or either of said circuits, and causing a variable closure of the magnetic circuit for said core through a partial magnetic circuit which is independent of the core for the other.



6. The herein-described method of regulating the current in the secondary circuit of an alternating transformer, consisting in setting up alternations of magnetism by the current in each or either of the coils of said transformer, partially closing the magnetic circuit, and adjusting a conducting plate or body transversely in a gap of such circuit to vary the closure.

7. The herein-described method of regulating the current in the secondary of an induction-coil, consisting in disposing the primary or secondary on different parts of an endless iron core and magnetically shunting the magnetism of the iron core in increased amount with an increase of current in the secondary.

400,517. BEE-HIVE. GEORGE L. TINKER, New Philadelphia, and WINFIELD S. KLINE, Bolivar, Ohio. Filed Aug. 27, 1887. Serial No. 248,063. (Model.)

Claim.—In a bee-hive, a brood or surplus-honey chamber composed of the side board, I, attached to the short end boards, J, the removable side board I², the cleats K, and the frames O, clamped between the side boards by suitable clamp devices, the said frames hav-

ing end bars of a total width exceeding the length of the end boards, the parts being combined for the purposes set forth.

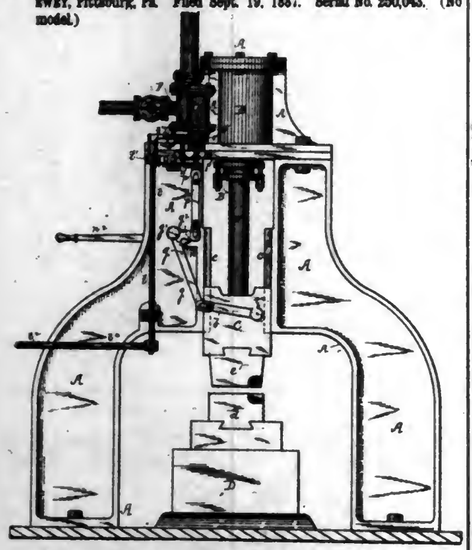
400,518. PUSH-BAR FOR LOCOMOTIVES. MATTHEW D. TOOMEY, Galveston, Tex. Filed Dec. 21, 1888. Serial No. 294,221. (No model.)

Claim.—1. A push-bar for locomotives, comprising a horizontally-swinging draw-head and a coupling-bar carried by said draw-head and adapted to slide longitudinally therein, as set forth.

2. A push-bar for locomotives, comprising a draw-head having a vertical sleeve or cylinder on its upper side, a coupling-bar sliding in the draw-head and having an opening in its inner end, and a locking-pin mounted in the sleeve or cylinder and adapted to engage the opening in the coupling-bar, as set forth.

3. The combination, with the support E, of the draw-head pivoted thereto, the coupling-bar carried by the draw-head, the spring projecting from the upper end of the pivot-pin of the draw-head, and the supporting-pin secured to said spring and extending downward through the draw-head, and provided at its lower end with an annular shoulder bearing against the under side of the draw-head, as set forth.

4. The combination of the draw-head, having slots in its sides and provided with the vertical shoulders N, and the coupling-bar sliding in the draw-head and having lateral extensions projecting through the slots in the draw-head, and provided with the wings O, bearing against the sides of the draw-head and adapted to contact with the shoulders N, as set forth.



5. A push-bar for locomotives, comprising a horizontally-swinging draw-head pivoted to the front end of the locomotive, and carrying a coupling-bar which is adapted to slide longitudinally within the draw-head.

6. The improved push-bar for locomotives herein described and shown, comprising the support E, the horizontally-swinging draw-head, the coupling-bar carried by the draw-head and adapted to slide longitudinally therein, the casting adapted to receive the end of the coupling-bar when not in use, the pin pivoting the end of the draw-head to the support E, the spring projecting from the upper end of said pivot-pin, and the supporting-pin depending from said spring and supporting the draw-head, as specified.

7. A push-bar for locomotives, comprising a horizontally-swinging draw-head carrying a coupling-bar, and the pin for locking the draw-head to hold it from swinging, as set forth.

8. A push-bar for locomotives, comprising a horizontally-swinging draw-head carrying a coupling-bar, and the pin for locking the draw-head to hold it from swinging, and the castings C on either side to lock the draw-head when swung around, as set forth.

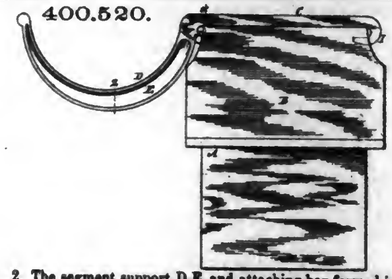
400,519. VALVE-GEAR FOR STEAM-HAMMERS. SAML. TRETHEWEY, Pittsburg, Pa. Filed Sept. 19, 1887. Serial No. 250,043. (No model.)

Claim.—1. The combination of the valve-chest and the cylindrical lining H, fitting within the valve-chest and having the ports L L' formed therein, and the annular recesses forming annular passages within said valve-chest, substantially as and for the purposes set forth.

2. The combination of the valve-chest having the cylindrical valve-chamber, the valve-rod M', having the collar m^2 and cup-valve m', sleeve m^3, and inverted cup-valve m, forming the cylindrical valve M, substantially as and for the purposes set forth.

3. In valve apparatus for steam-hammers, the combination of the steam-chest having the cylindrical valve-chamber therein and cylindrical sliding valve fitting within said steam-chest, automatic connections for reciprocating said valve, a link or arm connected to the valve-rod and carrying a socket at one end thereof, a gear-wheel mounted at the base of the valve-chest, and a pin extending down from said gear-wheel and passing through the socket of said arm, substantially as and for the purposes set forth.

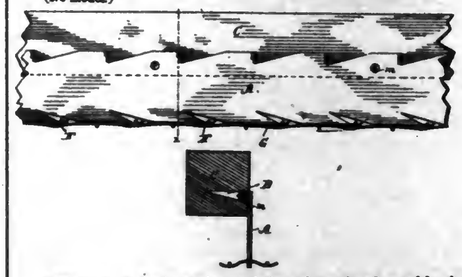
4. In valve apparatus for operating steam-hammers, the combination of the steam-chest having the cylindrical valve-chamber therein and cylindrical reciprocating valve located in said chamber, a gear-wheel mounted on the steam-chest, connections between said gear-wheel and the valve-rod, and a segmental gear, T, meshing with said gear-wheel, and means for operating the same, substantially as and for the purposes set forth.



5. In valve apparatus for steam-hammers, the combination of the hammer-head, the steam-chest, lever mechanism between said hammer-head and steam-chest for imparting a reciprocating motion to the valve within said steam-chest, and a swivel-connection between said lever mechanism and the valve-rod, substantially as and for the purposes set forth.

6. In a valve apparatus for steam-hammers, the combination, with the hammer-head and the valve-chest having the sliding valve therein, of the valve-lever mechanism having a crank-lever, a crank-arm to which said crank-lever is pivoted, journaled in bearings in the frame of the hammer, and a friction-disk on said crank-arm for holding the same in whatever position it is placed, substantially as and for the purpose set forth.

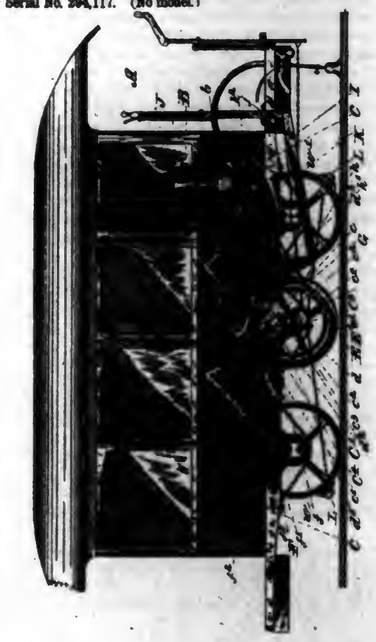
400,520. ARM-SUPPORT FOR TELEPHONES. CLARENCE R. TUTTLE, Chicago, Ill. Filed Feb. 4, 1888. Serial No. 263,505. (No model.)



Claim.—1. An arm-support for telephones, consisting of the segment portion D E, terminating in an attaching-bar, and a hook at each end of the same for engaging the lid of the jar-box, as and for the purpose specified.

400,520.

2. The segment support D E, and attaching-bar formed in cross-section of a horizontal and vertical rib, and the bar provided with hooks at its under end portions, and the hooks projecting inward from the vertical rib, substantially as specified.

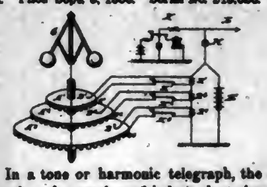


400,521. FURRING-STRIP FOR WALLS OR CEILINGS. JEROME TWICHELL, Kansas City, Mo. Filed Nov. 23, 1888. Serial No. 292,049. (No model.)

Claim.—1. A furring-strip consisting of a strip of metal having retaining-prongs cut from one edge and lath-holding prongs cut from the other edge, substantially as set forth.

2. The herein-described furring-strip, consisting of a strip of sheet metal having a series of prongs partially severed from one edge and turned out of the plane of the body portion of the holder to enter a support, and having a series of lath-holding prongs partially severed from its opposite edge and bent away from the edge to receive the lath, substantially as set forth.

400,522. RAILWAY-MOTOR. JOSEPH R. VALENTINE and ALEXANDER T. GRIGG, Pueblo, Colo., assignors to the Valentine & Grigg Motor Company, same place. Filed Apr. 23, 1888. Renewed Dec. 19, 1888. Serial No. 294,117. (No model.)



Claim.—1. The combination, with a car, of an engine which is fixed upon the car, a pair of driving-wheels mounted in the frame of the car impelled by such engine and movable in ways which are concentric with the axis of the engine-shaft, and a compound lever operable from the engine-platform either to lift the wheels from the track or to hold them in positive and rigid engagement therewith.

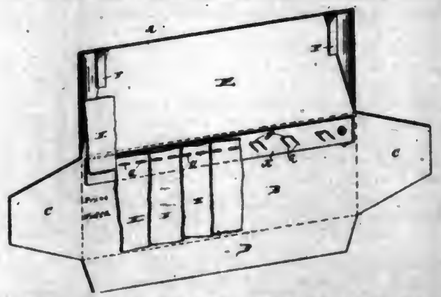
2. The combination, with a car, of an engine mounted upon such car, a pair of driving-wheels mounted upon such car and adjustable up or down in ways thereon, a connection between the driving-shaft of the engine and the axle of the driving-wheels, and a lever whereby the driving-wheels are movable either into or out of engagement with the car-track.

3. In a car which is provided with a brake-rod and with brake-chains and brakes, the combination of driving-wheels, an engine, a lever which is operable to adjust such wheels either upon or away from the track, and a chain which connects such operating-lever with the brake-chains, whereby both the driving-wheels and the supporting-wheels are controlled by a single operator.

400,523. HARMONIC TELEGRAPHY. FRANÇOIS VAN RYSSELBERGHE, Brussels, Belgium, assignor, by direct and mesne assignments, to himself and the Phono-Multiplex Telegraph Company, Baltimore County, Md. Filed Sept. 3, 1886. Serial No. 213,023. (No model.)

Claim.—1. In a tone or harmonic telegraph, the combination, with a rotating axis and a number of independent circuit-controlling wheels mounted thereon, normally out of circuit, of a number of brushes making contact with the wheels, a normally-open branch circuit for each wheel, and a key for closing each branch, substantially as described.

2. The combination, with a rotating axis, of a number of circuit-controlling wheels mounted thereon and insulated therefrom and from each other, a normally-open branch circuit for each wheel, and a key for closing each branch, substantially as described.

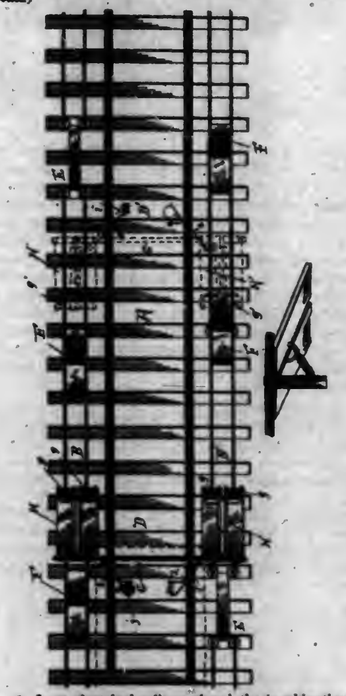


3. The combination, with a rotating axle and a number of insulated circuit-controlling wheels mounted thereon, of a branch circuit, including a series of resistances, and a shunt-circuit around each resistance, including one of the circuit-controlling wheels, substantially as described.

4. The combination, with a rotating axle and a number of circuit-controlling wheels mounted thereon and insulated therefrom and from each other, of normally-open branch circuits, including the wheels, a key for closing each branch, and an isochronic governor regulating the rotation of the wheels, substantially as described.

5. The combination of a magnetized tuning-fork, and one or more electro-magnets connected in the line-circuit for operating it, and a spherical resonator arranged in juxtaposition to the magnetized fork, substantially as described.

6. The combination, with a resonator, one end of which is covered with a diaphragm, of a pendulum in contact with the diaphragm a battery, and a circuit, one branch including the diaphragm and pendulum and the other branch including a sounder, substantially as described.



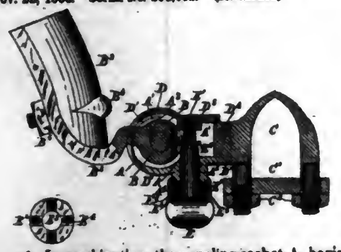
400,524. SAMPLE-ENVELOPE. GEORGE S. VAN WORMER, Catskill, N. Y. Filed Feb. 26, 1888. Serial No. 265,617. (No model.)

Claim.—1. The envelope having the main fold B, lower flap, D, and covering-flap E connected to the upper edge of the main fold, combined with the pliable spurs or points G, secured to the main fold near its upper edge to engage samples of fabrics, the lower flap, D, being adapted to fold upward over the lower ends of the said samples, substantially as specified.

2. In a sample-envelope, the main fold provided with a lower flap, D, and side flaps, C C, and having pliable points or spurs G, attached thereto, and the covering-flap E, closing over the main fold and covering the said flaps D and C, combined with the clips or hooks F, secured to the free edge of the covering-flap and engaging the lower edge of the main fold, substantially as specified.

400,525. ELECTRICAL RAILWAY-SIGNALING. WILLIAM H. WADDELL, Lexington, Va. Filed Aug. 21, 1888. Serial No. 283,367. (No model.)

Claim.—1. In an electrical railway-signal, the combination, with a track, of two parallel pairs of conductors normally out of circuit insulated from the ground and located on opposite sides of the track, each pair of conductors having no electrical communication with the other pair, and the conductors of each pair being parallel and insulated from each other and divided into non-communicating sections, the breaks between the sections of the pair of conductors on one side of the track being located approximately opposite the centers of the sections of the pair on the opposite side, for the purpose set forth.



2. An electrical railway-signal comprising two pairs of parallel conductors insulated from each other and from the ground and located on opposite sides of a railroad-track, said conductors being normally out of circuit and the conductors of each pair insulated from each other and divided into non-communicating sections, two pairs of contacts carried by and on opposite sides of a car or engine, said contacts being insulated from each other and each electrically engaging and sliding on a separate conductor, the two contacts on one side being connected, respectively, with the opposite poles of a battery carried by the engine, and the two contacts on the opposite side being included in a circuit containing a bell or alarm, all operating in the manner and for the purpose substantially as set forth.

3. An electrical caution-signal for railways, comprising two pairs of parallel conductors located on opposite sides of a track and insulated from each other, two pairs of contacts carried on opposite sides of a car or engine and electrically engaging said conductors, and inclined circuit-breakers located a suitable distance apart along and rising above said conductors to momentarily throw the contacts from engagement with the conductors as they pass over them for the purpose of intermittently sounding the alarm, substantially as set forth.

4. In an electrical caution-signal for railways, two pairs of hinged or pivoted arms located in opposite sides of a car or engine and each carrying a contact insulated from the others, and each adapted to electrically engage a separate conductor extending along the track the two contacts on one side being electrically connected with the opposite poles and forming the terminals of a battery carried by the

car or engine, and the two contacts on the opposite side forming the terminals of a circuit including a bell or alarm, all operating substantially as set forth.

400,526. THILL-COUPLING. BRYANT E. WADE, Rockford, Ill.
Filed Nov. 22, 1888. Serial No. 291,602. (No model.)

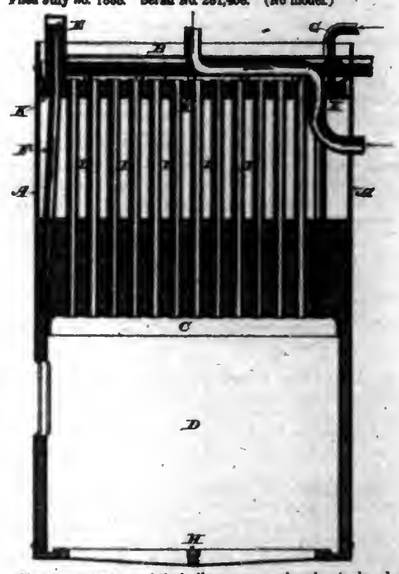
Claim.—1. In combination, the coupling-socket A, having end plates provided with pintle-bearings A^3, and slots A^2 opening out of the latter, and a bearing, A^4, having a tubular passage therethrough, a coupling-knuckle of proper form and dimensions to be contained in said socket A, and provided with pintles B', adapted to enter the bearings A^3 in the end plates, A'; through the slots A^2 therein, a thill-iron integral with said knuckle, a coupling-socket cap having end plates, D', provided with curved recesses D^2 in their inner faces, adapted to admit the free ends of the pintles B', and furnish upper bearings, D^4, for the same, said cap also having a threaded recess, D^3, therein, and being hinge-jointed to the coupling-socket A, and a set-screw inserted through the passage in the bearing A^4 into the recess D^3 in the cap D, and securing all of the aforesaid parts together to prevent them from rattling, substantially as set forth.

2. In combination, the coupling-socket A, having end plates provided with pintle-bearings A^3 and slots A^2, the coupling-socket cap D, having end plates provided with curved recesses D^2, to receive said pintles, the set-screw E, the cap E^3, the washers E^5 E^6, and clip C, with its tie C'; substantially as described, and for the purpose set forth.

400,527. COMPOSITION FOR PIPES. JOHN H. WALSH, Boston, Mass. Filed Dec. 2, 1887. Serial No. 256,732. (No specimens.)

Claim.—The herein-described improved composition for pipe, composed of sand, Portland cement, Rosendale cement, and sulphur, as stated.

400,528. PIANO-STOOL. HENRY WALTHER, Brooklyn, N. Y. Filed June 27, 1888. Serial No. 278,358. (No model.)



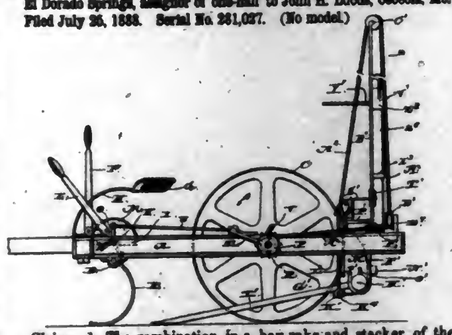
Claim.—1. In a piano-stool, the combination, with a support, of a rotative plate or disk, a screw secured to said plate or disk, a screw on the support, on which latter screw the screw secured to the plate works, a seat resting upon said plate, and a rod secured to the seat and preventing the same from turning, substantially as herein shown and described.

2. In a piano-stool, the combination, with a socket, of a fixed tubular screw extending upward from the bottom of the same, a vertical movable and rotative screw screwed on the outside of said fixed screw, a plate on the upper end of the rotative screw, a seat resting upon said plate, and a rod projecting from said seat into the opening of the fixed screw, in which it cannot turn, substantially as set forth.

3. The combination, with a socket, of a fixed tubular screw extending from the bottom of the socket and provided with longitudinal grooves in its bore, a rotative vertically-movable screw on the fixed screw, a plate on said rotative screw, a seat resting upon said plate, and a bar projecting from said seat through the rotative plate into the bore of the fixed screw, said bar having longitudinal ribs or splines that enter the longitudinal grooves in the bore of the fixed screw, substantially as herein shown and described.

4. The combination, with a socket, of a fixed tubular screw extending upward from the bottom of the same, a rotative and vertically-movable screw on the fixed screw, a plate fixed on said vertically-movable screw, a seat resting upon said plate, and a rod projecting from the seat through said plate into the bore of the fixed screw and shaped so as not to turn in said tubular fixed screw, substantially as herein shown and described.

400,529. BOILER. FREDERICK I. WATERBURY, South St. Paul, Minn.
Filed July 30, 1888. Serial No. 281,408. (No model.)

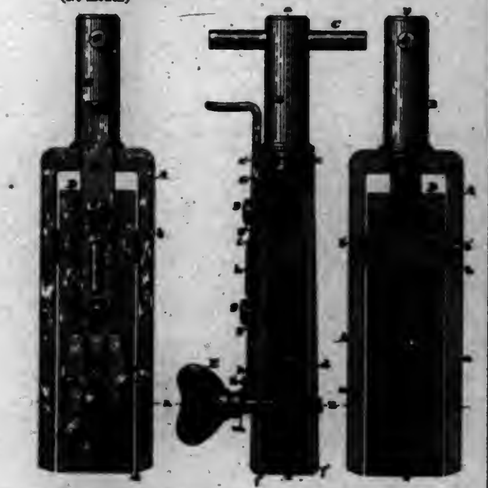


Claim.—1. In an upright boiler, a water-chamber inclosed around the upper end of the flues by the upper flue-sheet, and a diaphragm located a little below it, an overflow opening from said chamber above said flue-sheet, whereby water is maintained constantly in contact with said flue-sheet and the upper ends of the flues, substantially as and for the purposes set forth.

2. In an upright boiler, the combination, with the upper flue-sheet, of a diaphragm located a little below and inclosing therewith around the upper ends of the flues a water-space, a supply-pipe opening into said chamber, and an eduction-pipe leading out therefrom above said flue-sheet, substantially as and for the purposes set forth.

3. In an upright boiler, a water-chamber around the upper ends of the flues formed by a double head, consisting of the upper flue-sheet and a diaphragm located a little below it, a water-supply pipe leading into said chamber, a stand-pipe opening at its lower end into and extending above said chamber, and an eduction-pipe leading out of said stand-pipe above the upper flue-sheet into the lower part of the boiler, substantially as and for the purposes set forth.

400,530. HAY RAKE AND STACKER. WILLIAM D. WATKINS, El Dorado Springs, assignor of one-half to John H. Logue, Osceola, Mo.
Filed July 30, 1888. Serial No. 281,037. (No model.)

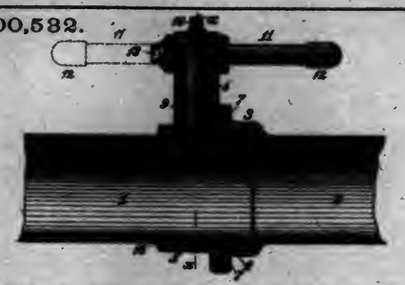


Claim.—1. The combination, in a hay rake and stacker, of the frame having the vertical standard, vertical guide-rod, the stacking-fork having the suspending bail guided on the guide-rod, the trip-lever pivoted to the bail and engaging the head of the fork, the arm pivoted to the bail and carrying a pulley engaging the guide-rod, the spring connecting said arm, and the bail to keep its pulley in contact with the guide-rod, an arm projecting from the standard to engage the bail, and an arm to strike the trip-lever, and thereby swing the stacking-fork to one side and discharge the same, and means, substantially as set forth, to raise and lower the stacking-fork, substantially as described.

2. The combination, in a hay rake and stacker, of the frame having the vertical standard, the slide movable on said standard and having the eccentric cam-lever, and the trip-arm Z', the vertical guide-rod, the stacker-fork having the supporting-bail guided on the guide-rod, an arm projecting from the standard to engage the bail, and the trip-lever pivoted to the bail and adapted to engage the stacking-fork, and means, substantially as set forth, to raise and lower the stacking-fork, substantially as described.

3. The combination, in a hay rake and stacker, of the main frame having the depending curved hooks at its rear end and the rake at its front end, the stacking-fork having the head adapted to be supported in the hooks when said stacking-fork is lowered, and the elevating devices to raise and lower the stacking-fork, substantially as described.

400,531. DEVICE FOR REMOVING CALKS FROM HORSESHOES. GEORGE W. WEMPLE, Boston, Mass., assignor of nine-twentieths to Brainard W. Child, same place. Filed July 2, 1888. Serial No. 278,290 (No model.)



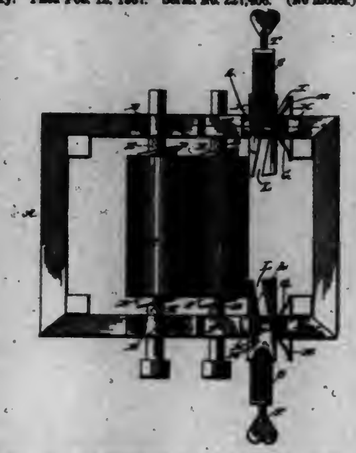
Claim.—1. In a device for removing calks from horseshoes, the combination of a frame having two standards, the ends of which rest upon the shoe when said device is in use, a jaw-piece mounted in said frame and provided with two jaws, a clamping-screw for clamping said jaws upon the calk, the inner end of the head of said screw being provided with a beveled surface, means for moving said jaw-piece lengthwise of the frame, two spring-actuated levers pivoted to said jaw-piece, and a bar mounted upon said jaw-piece and adapted to slide thereon and engage with said levers to force their inner sides into contact with the shank of the clamping-screw when the calk is being removed from the shoe or to be disengaged from contact with said levers to immediately release the jaws from the calk by moving said bar toward the handle.

2. In a device for removing calks from horseshoes, the combination of a frame having two standards, the ends of which rest upon the shoe when said device is in use, a jaw-piece mounted in said frame and provided with two jaws adapted to spring away from each other, a clamping-bolt for clamping said jaws upon the calk, the inner end of the head of said bolt being provided with a beveled shoulder, and a movable abutment adapted to be interposed between the head of said bolt and one of said jaws when it is desired to clamp said jaws upon the calk, and which may be readily disengaged from contact with said clamping-bolt to allow said jaws to spring away from each other, and thereby release their hold upon said calk.

400,532. SERVICE-PIPE CONNECTION FOR GAS-MAINS. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed Sept. 13, 1888. Serial No. 285,334. (No model.)

Claim.—1. The combination of two pipe-sections forming a joint, a casing closed at its ends around the pipe-sections adjacent to the joint and forming an annular chamber inclosing the same, and having a

400,532.



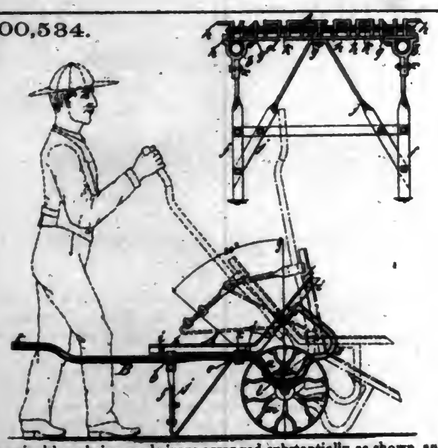
communicating vertical chamber provided with one or more end openings, and a gas-supply pipe wholly within said casing and leading directly from the adjacent pipe-section into the upper portion of said vertical chamber, substantially as set forth.

2. The combination of two pipe-sections forming a joint, an inclosing-casing, a liquid packing or hydraulic seal inclosed in the casing, a gas-supply pipe wholly within said casing and leading from one of the pipe-sections into the casing above the level of the packing, and a service-pipe leading out of the casing above the level of the packing, substantially as set forth.

3. The combination of two pipe-sections forming a joint, a casing inclosing the joint and having a vertical extension, said casing being adapted to contain liquid packing by being closed at its ends around the pipe-sections adjacent to the joint, a gas-supply pipe leading directly from one of the pipe-sections into the upper portion of said vertical extension, and a service pipe or pipes each connected to an opening in the upper portion of said vertical extension in line with the pipe-sections, substantially as set forth.

400,533. GRINDING-MILL. EDWARD T. WILLIAMS, Carrollton, Ky. Filed Feb. 12, 1887. Serial No. 227,408. (No model.)

Claim.—The combination of the case A, the roller C, and the roller O, the movable bearings F for said roller O, provided with the arms G, having the upwardly-projecting studs I, the keepers H, secured to the upper edges of the casing and guiding the arms G, the slide-blocks K, resting transversely in the keepers and provided with oblique slots L to receive the corresponding studs, I, the bearing-brackets S, secured to and standing out from the sides of the casing, the adjusting-screws T, passing through threaded openings in said brackets and having their inner ends swiveled in the outer ends of the blocks K, so that they will move the blocks either inward or outward, and the leaf-springs M, bearing against the keepers and the slide-blocks, substantially as specified.



400,534. METALLIC WHEELBARROW. JOSEPH ANNIN, Brooklyn, N. Y. Filed Mar. 5, 1888. Serial No. 266,186. (No model.)

Claim.—1. A wheelbarrow having its tray or platform made of a series of parallel iron bars, set up edgewise and secured together, substantially as set forth.

2. A wheelbarrow having its tray or platform made of a series of iron bars, A A, set up edgewise and secured together in parallel lines, but bent at or about the middle, so that one half of the bars extends inclined to the other half, substantially as set forth.

3. A wheelbarrow having its tray or platform made of a series of parallel iron bars set up edgewise and secured together, the outer or

400,534.

marginal bars being angle-irons arranged substantially as shown and described.

4. A wheelbarrow having its tray or platform made of a series of parallel iron bars set up edgewise and secured together, the middle bar being a T-iron and the outer marginal bars angle-irons, arranged substantially as shown and described.

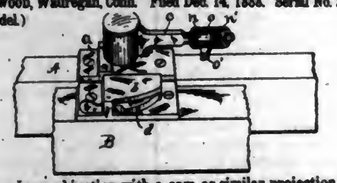
5. In a wheelbarrow, the combination, with the side bars or tubes, B, and cross-bars *d e*, secured thereto, of the tray-bars *h*, set up edgewise thereon in parallel files and secured thereto, substantially as shown and described.

6. The combination of the side bars, B B, clips *b c*, cross-bars *d e*, and tray-bars *h h*, secured together, substantially as shown and described.

7. In a wheelbarrow or its equivalent, the combination, with axle clips or bearings formed with a recess or socket, of the removable axle-boxes *o o*, arranged to fit into said sockets, and a fastening to hold the same in place and permit the removal and renewal of said boxes, substantially as herein set forth.

8. In a wheelbarrow or its equivalent, the combination with the side bars or tubes, B B, and bisected clips *l l*, embracing said bars to support the wheel-axle with the removable axle-boxes *o*, arranged to engage with said clips, substantially as and for the purpose set forth.

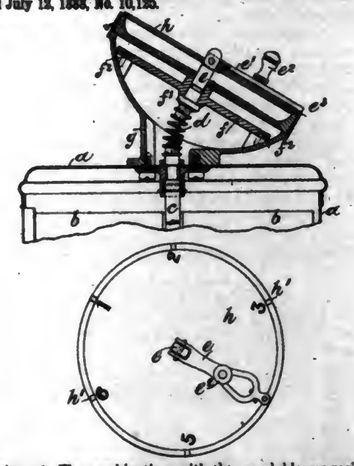
9. In a truck or barrow, the combination, with the side bars, B, of the bearing-clips *l*, arranged to be clasped thereon and formed with a recess or socket, *q*, of the removable axle-boxes *o o*, having a waist to fit said socket and overlapping flanges *p p* to embrace the clip, and a fastening to secure the box in place and permit of its removal and renewal, substantially as shown and described.



10. In a truck or barrow, the combination, with metallic handle-bars, of paper tubes incasing the bars at the handle ends and tightly secured thereon and forming the grasping portion of the handles, substantially as and for the purpose set forth.

11. In a truck or barrow, metallic handle-bars rolled down or reduced in diameter at the handle or grasping end, in combination with a tube or sheath of non-conducting material incasing the reduced end and secured thereto flush, or nearly so, with the remainder of the bar, substantially as shown and described.

12. In a truck or barrow, the combination, with the metallic tubular side bars, B B, rolled or reduced in diameter at the handle ends, of the paper tubes *t*, secured on said reduced parts and forming non-conducting handles thereon, substantially as shown and described.

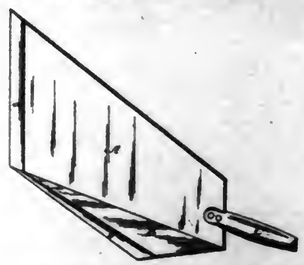


13. In combination with the metallic side or handle bars of a truck or barrow, sections of toughened paper, of the nature of parchmentized, vulcanized, or gelatinized fiber, secured to the ends of the metallic tubes and forming non-conducting, tough, and durable grasping-handles thereon, substantially as set forth.

400,535. FASTENER FOR MEETING-RAILS OF SASHES. JOHN W. ATWOOD, Wauregan, Conn. Filed Dec. 14, 1888. Serial No. 293,696. (No model.)

Claim.—In combination with a cam or similar projection on one sash, a lever-arm bearing an angular projection adjustable on said lever-arm, and adapted to swing into engagement with said cam, as set forth, and a check-nut on said lever-arm for retaining said angular projection in a given position, all substantially as and for the object specified.

400,536. APPARATUS FOR THE DELIVERY OF PREPAID GOODS. WILLIAM H. BAILEY, Salford, County of Lancaster, England. Filed Dec. 31, 1888. Serial No. 295,073. (No model.) Patented in England July 12, 1888, No. 10,125.

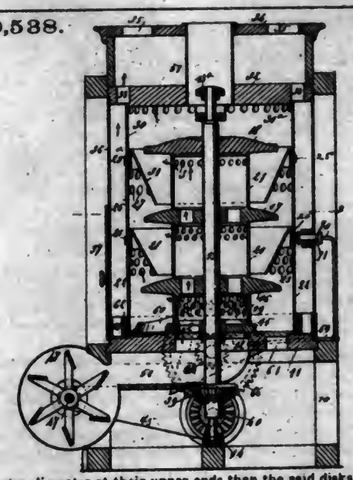


Claim.—1. The combination, with the revoluble magazine-shaft of a coin-freed apparatus, of an indicator-dial set at an oblique angle to the apparatus, an inclined spindle projecting through the dial and carrying a handle, and a connection between the inclined spindle and the magazine-shaft, substantially as described.

2. The combination, with the revoluble magazine-shaft of a coin-freed apparatus, of an indicator-dial set at an oblique angle to the apparatus, an inclined spindle projecting through the dial and carrying a handle, and a swiveled coupling connecting the spindle with the magazine-shaft, substantially as described.

3. The combination, with the magazine-shaft *c*, connected, substantially as herein shown and described, to the spindle *e*, of the handle-bar *e'*, having the projection e^3 thereon, and the obliquely-set indicator-dial *h*, having a series of notches, *h'*, in its periphery, substantially as herein set forth.

400,537. CHEESE-CUTTER. BERNARD BARRY, Schenectady, N. Y. Filed Nov. 13, 1888. Serial No. 290,761. (No model.)



Claim.—As an article of manufacture, the improved cheese-knife formed of the triangular base-flange B, having its outer edge sharpened, and the body or main plate A, provided with the aligned handle C and arranged at right angles to the said flange, its sharpened front edge being vertical and meeting the apex of the flange, as shown and described.

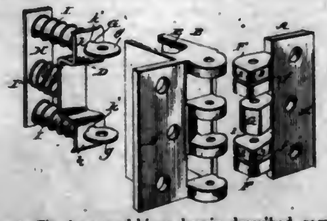
400,538. MIDDLINGS-PURIFIER. GEORGE W. BELL, River Falls, Wis. Filed Feb. 15, 1888. Serial No. 264,096. (No model.)

Claim.—1. A middlings-purifier comprising the frame, the flooring 11, having openings 12, 61, and 65, the ring 15 around the opening 12, the vertical shaft 13, journaled in the frame, passing through said ring, and provided with the vertically-apertured disks 16 17 18, the series of apertured cylinders 19 20 21 between said disks, the apertures increasing in number from the top cylinder downward, a blower delivering upwardly through the ring 15, the outer series of perforated cylinders having separating-rings and apertures also increasing in number from the top to the bottom cylinder, the downwardly and inwardly tapering hoppers supported by said rings and

400,538.

of greater diameter at their upper ends than the said disks surrounding casing 36, the cover 32, having openings 33 between the said casing 36 and the top cylinder, 30, upper cover, 34, having apertures 35, and the delivery-tube 51, extending through said covers to deliver upon the disk 18, substantially as set forth.

2. The combination, with a middlings-purifier of the character described, of a crank-shaft, 69, having an upwardly-projecting hammer-arm at one end and an operating-arm, 73, at its opposite end, a plate-spring, 72, bearing on said crank, and a wheel having a pin into the path of which said arm 73 projects, substantially as set forth.

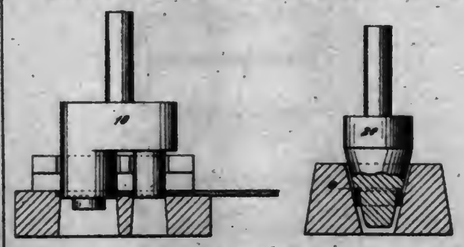


400,539. CRYSTALLIZING-FRAME. ALBERT E. BELLER, Ogden City, Utah. Filed Apr. 14, 1888. Serial No. 270,612. (No model.)

Claim.—1. A crystallized monogram or other like frame consisting of an open frame provided with the stripe *b*, arranged within the frame to support and form the characters of the design, and crystals applied to the frame and to the design thereof, substantially as described.

2. As an improved article of manufacture, a crystal-incased monogram or other like frame consisting of an open frame provided with stripe *b*, arranged to support and form the characters of the design, a fibrous covering for the portions of the frame intended to be incased with crystals, and the crystals applied to the said covered portions, as set forth.

400,540. LOCK-HINGE. BENJAMIN F. BOUGHS, Randolph, Nebr., and WILLIAM CASSNER, Pleasant Hill, Mo., assignors of one-third to Lewis Gates, Garden City, Mo. Filed Nov. 27, 1888. Serial No. 292,043. (No model.)



Claim.—1. The improved hinge herein described, comprising a section having a knuckle or knuckles exteriorly non-circular in cross-section, a second section, a pintle connecting such sections, a back plate, a bearing-plate arranged to engage the non-circular knuckles, a spring bearing between said back and bearing plates, and a rod, as G, connected with the pintle, extended through the bearing-plate, and threaded in the back plate, substantially as set forth.

2. In a hinge substantially as described, the combination of the section A, having knuckles F, provided with slots *f*, the section B, having box-like casing E, the back plate and the bearing-plate in such casing, a spring or springs between said plates, the rods G, having perforated heads *g* fitted in slots *f*, such rods being passed through the bearing-plates and connected with the back plate, and the pintle passed through the knuckles of sections A B and through the heads of rods G, substantially as set forth.

3. The combination of the section A, having a knuckle or knuckles exteriorly non-circular in cross-section, the section B, the pintle connecting said sections, the bearing-plate, the back plate, the spring or springs bearing between said bearing and back plates, and the rod or rods G, connected with the pintle, passed through the bearing-plate, and extended between the same and the back plate, substantially as set forth.

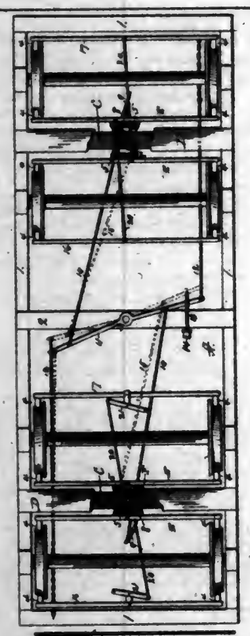
400,541. METHOD OF FORMING RINGS. JOSEPH B. BOWDEN, Brooklyn, N. Y. Filed Jan. 14, 1889. Serial No. 296,311. (No model.)

Claim.—1. The herein-described method of forming rings from flat annular blanks, which consists in first forming a ring having a convex outer side and an opposing inwardly-inclined inner side, in then manipulating the ring so that its inner side will be more closely aligned with the axis of the ring, and in finally holding the upper edge of the ring and subjecting it to pressure, substantially as described.

2. The herein-described method of forming rings from flat annular blanks, which consists in striking up the blank to form a flat inwardly-inclined surface on one side and a convex surface on the other side, then further manipulating the blank or ring so that the flat surface shall assume substantially a plane at right angles to its position in the blank, with one edge of the ring shaped, and in then shaping the other edge without enlarging the diameter of the ring, substantially as described.

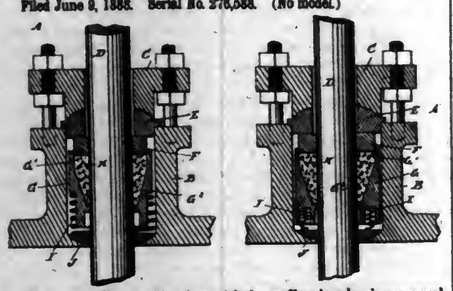
3. The herein-described method of forming rings from flat annular blanks, which consists in bending the blank and shaping the metal thereof at one step, so that one flat side of the blank is at an inward angle and the opposing side convex, in then further striking up the blank so that one edge of the ring is shaped and the inner periphery substantially in the line of the axis of the blank, and in then striking up the other edge to finish without enlarging the diameter of the ring, substantially as described.

4. The herein-described method of forming solid rings from flat annular blanks, which consists in swaging a flat annular blank at one operation to have a flat face at an angle to the axis of the ring and an opposing convex face, in then further swaging the same until one edge is shaped and the said flat face brought substantially to the line of the axis of the ring, and in then holding the other edge of the ring and subjecting it to pressure, substantially as described.



400,542. CAR-BRAKE. RASHLER BOYER, Lebanon, Pa. Filed Feb. 2, 1889. Serial No. 298,495. (No model.)

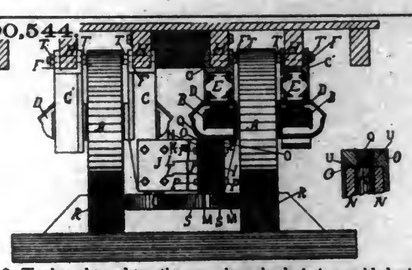
Claim.—1. The combination of the pivotally-supported rotary elliptical disks, the inner suspended brake-bars arranged between the wheels of the truck, a lever to rotate the disks on their axis, the outer suspended brake-bars arranged to brake against the outer faces of the wheels of the trucks, and connecting-rods from the inner brake-bars to the opposite outer brake-bar, substantially as described.



2. The combination, with the rotatable elliptical disk, and means, substantially as described, for turning it on its axis, of inner and outer brake-bars arranged to brake on both sides of the wheels, and rods connecting the inner and outer brake-bars, whereby all the brake-bars move synchronously on and off brakes, substantially as described.

400,542.

400,543. STUFFING-BOX. WILLIAM E. BROCKETT, Berlin, Wis. Filed June 9, 1888. Serial No. 276,583. (No model.)

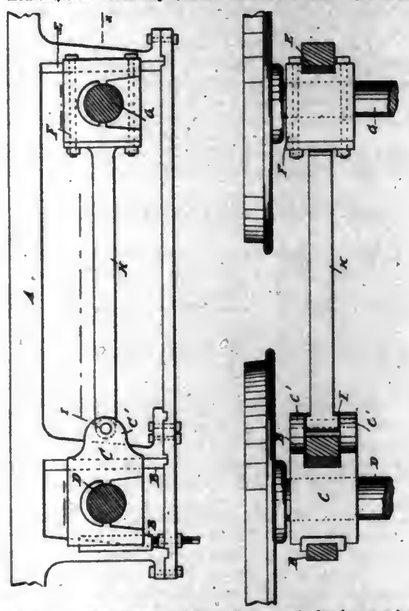


Claim.—1. The combination, with the stuffing-box having a rounding bottom or inner end, of the washer rounded to fit said rounding bottom and to form a ball-joint therewith, and having an aperture through which rod D loosely passes, the spring-seated casing G, closely fitting said rod at its inner end, and having the conical packing-receiving opening, cylindrical at its outer end, as shown at G', the follower F, snugly fitting the rod D and said cylindrical part G', the block E, through which the rod D loosely passes, and having a reduced portion on its lower or inner face snugly fitting the outer end of the stuffing-box, and a rounding outer or upper face, and the gland C, bolted to the stuffing-box and having a concave inner end fitting the rounding face of the block E, substantially as set forth.

2. The combination, with the stuffing-box having its bottom or inner end rounded, of the washer J, rounded on its lower face, provided with pins J' on its upper face, and having a central aperture through which the rod D freely passes, the casing G, apertured at its lower end to snugly fit the rod, apertured on its lower face to receive said pins, and formed with the conical packing-receiving opening cylindrical at its upper end, the spiral springs I, the follower F, snugly fitting the rod D and said cylindrical part of the packing-opening, the block E, through which the rod D loosely passes, provided with a reduced portion on its lower face snugly fitting the outer open end of the stuffing-box, and having a rounding outer or upper face, and the gland bolted to the stuffing-box and having a conical inner end receiving the said rounding face, substantially as set forth.

400,544. RAILWAY AND RAILWAY-VEHICLE. GAY W. BROWN, Los Angeles, Cal. Filed Aug. 1, 1888. Serial No. 281,711. (No model.)

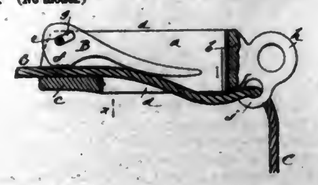
Claim.—1. The broad level-faced wooden rails R R, in combination with equally broad-tread traction carrying-wheels and the pendent guide-wheels running in contact with each other, supported in horizontally-grooved boxing secured on frame C, (represented in Fig. 6,) substantially as described.



400,544.

2. The broad-tread traction carrying-wheels A A, provided with independent axles and trucks, in combination with the rails R R and the pendent guide-wheels running in contact with each other and connected to the car or locomotive by the mechanism, substantially as described.

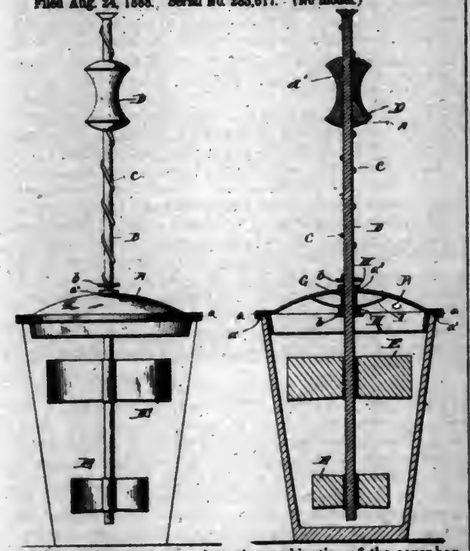
3. The railway organized as specified, consisting of the combination of the single broad-tread flangeless wheels independently journaled on separate trucks, the pendent flat-faced guide-wheels in contact with each other, the mechanism described, and shown in Figs. 2, 6, and 10, for supporting the guide-wheels and connecting them to the car or locomotive, and a single pair of broad-faced rails, substantially as described.



400,545. AXLE-BOX FOR LOCOMOTIVES. RAMSFORD T. CHASE, Houston, Tex. Filed July 7, 1888. Serial No. 279,270. (No model.)

Claim.—1. The combination, with a truck having vertically-sliding axle-boxes and ways therefor, of a vertically-swinging rod rigidly secured at one end to one box and hinged at its opposite end to the other box, substantially as set forth.

2. The combination, with a pedestal, of an axle-box mounted to slide vertically in the said pedestal, a second axle-box mounted with one side in a bearing in the said pedestal, and a connecting-rod secured to the last-named axle-box and pivotally connected with the first-named axle-box, substantially as shown and described.

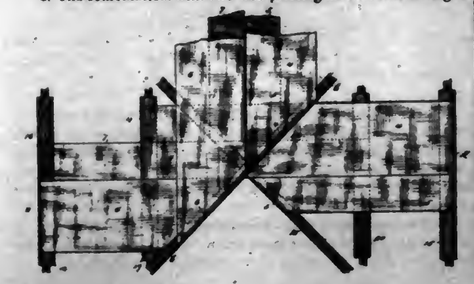


400,546. CLAMP FOR CLOTHES-LINES, TENT-ROPES, &c. STEPHEN W. CONKLIN, Yonkers, N. Y. Filed June 20, 1888. Serial No. 277,618. (No model.)

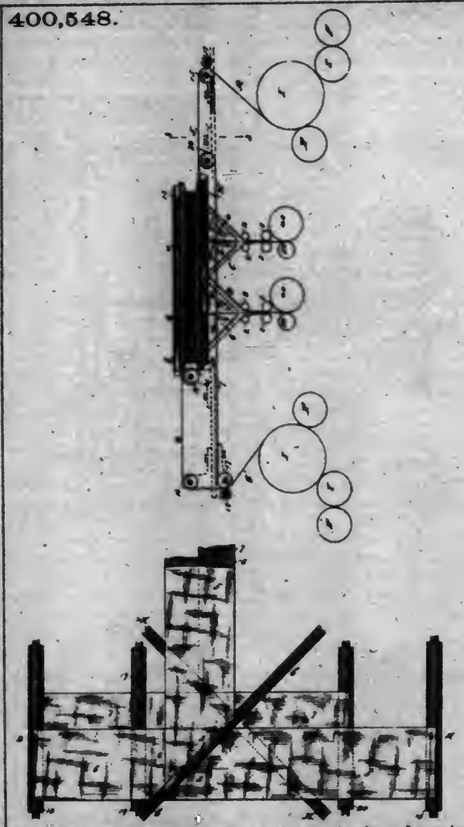
Claim.—1. The rope-clamp herein shown and described, comprising the side pieces, *a a*, bridge *c* at the front and cross-piece *b* at the rear end, reaching above the bridge *c*, having the open space at the bottom between the said bridge and cross-piece, and formed with the two rings or eyes *h j* at the outer surface of the cross-piece *b*, in combination with the eccentric lever B, pivoted between the side pieces, *a a*, over the bridge *c*, and formed with the incline slot *g*, substantially as described.

2. The rope-clamp composed of the side pieces, *a a*, bridge *c*, and cross-piece *b*, in combination with the eccentric lever B, formed with the upwardly and rearwardly inclined slot *g* and pivoted between the side pieces over the bridge *c*, substantially as described.

400,547. BEVERAGE-MIXER. CHARLES B. CRAFTON, Mason City, Ill., assignor to Otho S. King and William Y. McLemore, same place. Filed Aug. 24, 1888. Serial No. 283,617. (No model.)



Claim.—In a beverage-mixer, the combination of the cover having a central aperture, the downwardly-convexed web I, having a central aperture registering with the aperture in the cover, the bearing a^3, consisting of the vertical barrel G, arranged in the said registering apertures and provided at its upper and lower ends with flanges H H, which bear respectively against the cover and the web, the vertical rod or shaft mounted in the said barrel and provided with collars *b b*, which bear, respectively, against opposite ends of the barrel, a wire, C, being wound spirally on that portion of the rod or shaft above the said collars, the beater-wings secured to the rod or shaft below the collars, and the spirally-bored knob or handle sliding on the spirally-wound wire on the upper portion of the rod or shaft, substantially as specified.



400,548. WEB PRINTING AND DELIVERY MECHANISM. LUTHER C. CROWELL, Brooklyn, assignor to R. Hoe & Co., New York, N. Y. Filed Jan. 24, 1888. Serial No. 261,763. (No model.)

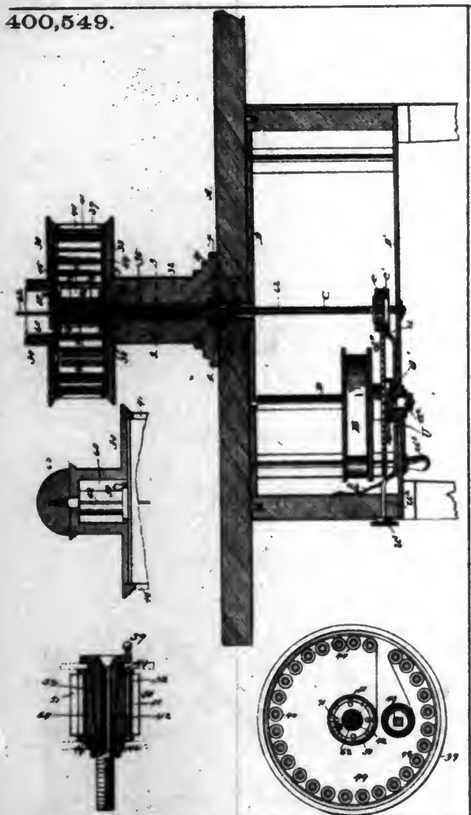
Claim.—1. The combination, with two web-printing mechanisms arranged end to end and each capacitated to perfect a web, of a web turning and associating mechanism consisting of two turning-bars arranged crosswise of each other and in position to receive the perfected webs from the two printing mechanisms and turn and associate them, substantially as described.

2. The combination, with two web-printing mechanisms arranged

400,548.

end to end and each capacitated to perfect a web, of a web turning and associating mechanism consisting of two turning-bars, G H, arranged crosswise of each other and in position to receive the perfected webs from the two printing mechanisms and turn and associate them, and two register-rolls, 19 20, located upon opposite sides of the turning-bars, substantially as described.

3. The combination, with two web-printing mechanisms arranged end to end and each capacitated to perfect a web, of a web turning and associating mechanism consisting of two turning-bars arranged crosswise of each other and in position to receive the perfected webs from the two printing mechanisms and turn and associate them, and two longitudinal folders arranged to receive the associated webs, substantially as described.



4. The combination, with two web-printing mechanisms arranged end to end and each capacitated to perfect a web, of a web turning and associating mechanism consisting of two turning-bars, G H, arranged crosswise of each other and in position to receive the perfected webs from the two printing mechanisms and turn and associate them, and two register-rolls, 19 20, located upon opposite sides of the turning-bars, and two longitudinal folders arranged to receive the associated webs, substantially as described.

5. The combination, with two web-printing mechanisms arranged end to end and each capacitated to perfect a web, of a web turning and associating mechanism consisting of two turning-bars, G H, arranged crosswise of each other, and a third bar, K, arranged parallel with one of the other bars, and a register-roll, 19 or 20, substantially as described.

400,549. ADVERTISING OR DISPLAY DEVICE. ANDREW DAHLSTROM, Ashton, Mich. Filed Aug. 24, 1888. Serial No. 283,668. (No model.)

Claim.—1. The combination, with the shaft C, connected at its upper end with and adapted to operate the display devices, a gear, *e*, and a notched hub, *e'*, mounted upon the lower end thereof, said gear *e* engaging with the spring-operated gear d^2, whereby the shaft C is revolved, said hub *e'* provided with notches e^2 e^2, arranged in diametrically-opposite edges of said hub, of the spring-actuated sliding plate U, provided with a hand-hold at one end, its opposite end adapted to normally engage either of said notches e^2, substantially as and for the purpose set forth.

400,549.

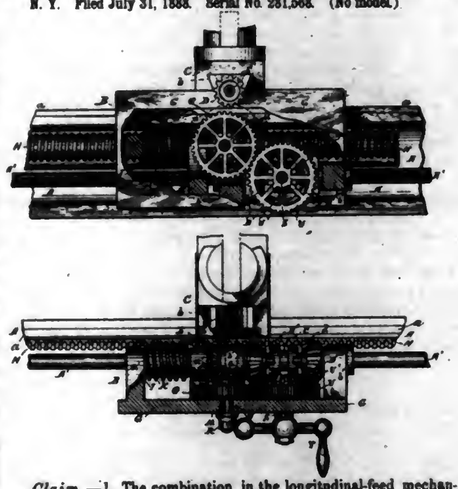
2. The combination, with the shaft C, connected at its lower end with and adapted to be revolved by the spring-actuated gearing, and the tubular shaft 35, connected to the display devices, of the coupling-section 36, connected at its lower end to the upper end of shaft C and at its upper end to the tubular shaft 35, whereby the same revolution of shaft C is communicated to the tubular shaft 35, substantially as and for the purpose set forth.

3. The combination, with the shaft C, means, substantially as shown, for operating said shaft, the tubular shaft 35, connected with the shaft C, said shaft 35 disposed within the column 32 of the display device 30 and provided with a squared recess in its upper end, of the core 42, provided with a central squared hub, 46, fitting the squared recess in the shaft 35, said core disposed centrally with the casing 33 and having one end of the display-ribbon connected thereto and adapted to wind the said tape upon itself, substantially as shown and described.

4. The combination, with the main table or frame, of the display device 30, said device consisting of a base, 31, a central hollow column, 32, projecting upwardly therefrom, an enlarged horizontal casing, 33, formed at the upper end of said column, provided with sight-openings 39 in the circular vertical rim thereof, said case adapted to receive the tape or winding mechanism, the hollow shaft 35, operating in the tubular column, said ribbon devices connected to the shaft 35, said shaft 35 connected to the shaft C, and means for operating the several shafts and ribbon devices, substantially as shown and described.

5. The combination, with the tubular shaft 35, disposed within the column 32, and the casing 33, arranged above said column, of the central core, 42, connected with the upper end of the tubular shaft 35, the spool 43, mounted within the casing 33 and adjacent to the core 42, the rollers 44, arranged within the casing 33, near the circular rim 40 and concentric with the central core and the ribbon, said ribbon connected at one end to the spool 43, passed about the rollers, between them and the vertical rim of the casing, and connected at its other end to the core 42, and means for revolving the said core, substantially as shown and described.

6. The combination, with the display-casing 33, a ribbon-winding spool, 43, mounted therein, guide-rollers 44, disposed in a circle near the vertical rim of the casing, a ribbon wound upon the spool 43 and passing about the rollers 44, said casing provided with a hollow column, 31, and a tubular shaft mounted in said hollow column, of the contractile core 42, said core disposed centrally within said casing and connected to the upper end of said shaft 35, and connected with the free end of the ribbon, and means for revolving the shaft 35 and the core, substantially as and for the purpose set forth.



7. The combination, with the tubular shaft 35, the display-casing 39, the ribbon spool or roller 43, the ribbon-guide rollers 44, said rollers 43 and 44 disposed within said casing, of the contractile core 42, disposed centrally of said display-casing, said core formed of segmental sections, said sections adapted to be contracted and expanded, the lower end of said core connected to the tubular shaft 35, and means for operating said shaft, all arranged substantially as and for the purpose hereinbefore described.

8. The combination, with the tubular shaft 35, provided with a screw-threaded portion, the contractile core 42, formed substantially as described, and the casing 33 and cap-piece, 38, said cap-piece 38 provided with a recess, 60, of the conical screw-plug 55, said plug adapted to be screwed at its lower end into the tubular shaft 35, its upper end formed conical and arranged to hold the several sections of the core in concentric circular alignment, said plug adapted to be automatically fed upward by the revolution of the tubular shaft, said plug 55 held from turning by its upper end projecting in the recess 60, said shaft 35 connected with and operated by the shaft C, and means for operating said shaft, substantially as shown and described.

9. The combination, with the contractile core 42, the tubular shaft 35, connected therewith, said core and shaft disposed within the casing 33 and column 31 of the display device, and the ribbon-roller 43 and guide-rollers 44 arranged within said casing 33, said ribbon connected at one end to the roller 43, wound thereon, and passed between the rollers 44 and the casing-wall 40, of the ribbon-fastening device, consisting of a recess, 70, formed in one of the sections 50 of the core 42, a rod passed through the heads 48 and 49 of the core-body and the recess 70, said rod formed with a cam portion, 80, adapted to press the free end of the ribbon against the side of the section, and means for operating said ribbon-moving devices, substantially as hereinbefore described.

10. The combination, with the main frame, the hollow shaft C, the tubular shaft 35, connected with the upper end of said shaft C, the display device disposed above the frame, said device provided with a hollow column surrounding the tubular shaft 35, an enlarged casing adapted to receive the ribbon winding and unwinding devices, and a cap-piece, 30, of the tie-rod 62, said rod passing centrally through the shafts C and 35, the central core of the ribbon-display device, and the cap-piece, said rod screwed into the frame below the base of the table and provided with a squared end entering the cap-piece and provided with a securing-nut, 63, at its upper end, whereby the several parts are securely held together, substantially as shown and described.

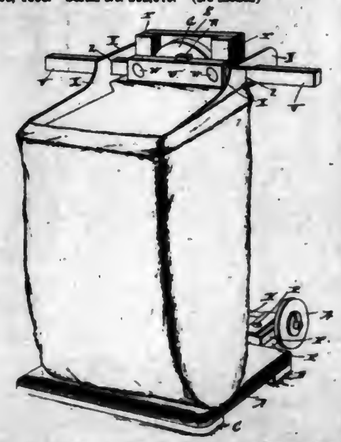
400,550. TURNING-LATHE. ROBERT F. DARLING, Seneca Falls, N. Y. Filed July 31, 1888. Serial No. 281,568. (No model.)

Claim.—1. The combination, in the longitudinal-feed mechanism of a lathe, of a short or comparatively short rotary screw, worm, or spiral turning in suitable bearings extending from the carriage, and a long or comparatively long rack engaging the said screw and secured to the frame or bed of the lathe, substantially as and for the purpose specified.

2. The combination, in the longitudinal-feed mechanism of a lathe, of a short or comparatively short screw, worm, or spiral turning in suitable bearings extending from the carriage, a long or comparatively long rack engaging the said screw and secured to the frame or bed of the lathe, and shifting-gear constituting a part of the longitudinal-feed mechanism and arranged to engage alternately a gear or pinion on the shaft or spindle of the said worm and a pinion or gear in the cross-feed mechanism, substantially as and for the purpose specified.

3. In the feed mechanism of a lathe, the hereinbefore-described means for reversing the feed-movement, the said means consisting of the shaft A', the bevel-gears B B', turning loosely on the said shaft and having clutch-engaging teeth, the sliding clutch C', mounted on and turning with the said shaft and arranged between the said gears, the wheel or gear U', engaging the said bevel-gears, an arm for shifting the said clutch, and the apron of the lathe, substantially as and for the purpose specified.

4. A lathe in which the longitudinal feed-movement and the cross-feed movement are produced independently by means of a shifting-gear in continuous engagement with driving-gear constituting a part of the means for producing both the said movements, and alternately in engagement with the gear directly employed for moving the carriage and the gear for moving the tool-block, substantially as and for the purpose specified.



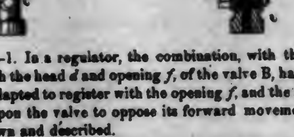
5. A rack made in sections arranged end to end in a line and having an inwardly-curved outer face on which are inclined alternate grooves and ribs, in combination with the frame or bed of a lathe and the carriage-moving mechanism, substantially as and for the purpose specified.

6. A lathe in which the longitudinal-feed gearing and the cross-feed gearing are combined with supplemental-feed gearing for simultaneously operating the longitudinal-feed gear and the cross-feed gear, substantially as and for the purpose specified.

7. The combination, in a lathe, of the wheel D, constituting a part of the cross-feed gearing, the gears H' and I' and their shaft, the gear E', having thereon one or more sets of teeth, *e e*, the latter being in operative engagement with the wheel D through the medium of the gears H' and I', and the longitudinal-feed gearing, substantially as and for the purpose specified.

8. The combination, in a lathe, of the wheel D, constituting a part of the cross-feed gearing, the gears H' and I' and their shifting-shaft F', the gear E', having thereon one or more sets of teeth, *e' e'*, the latter being in operative engagement with the wheel D through the medium of the gears H' and I', and the longitudinal-feed gearing, substantially as and for the purpose specified.

400,551. BAG-HOLDER. GRIFF DE OWENS, Loyalton, Dak. Filed Nov. 23, 1888. Serial No. 292,079. (No model.)



Claim.—1. In a bag-holder, the base or platform A, the standard G, secured thereto, the guide-bar R, secured to the standard, the adjustable cross-head S, having the metallic loop or guide U, which is notched to receive the guide-bar, the horizontal supporting-arms V, for receiving the loop, and the bag-holding arms X, fitted on the said arms V, substantially as described.

2. In a bag-holder, the combination of the standard and cross-head, and arms V, attached to the latter, with the bag-holding arms X, having the ears Y and transverse openings Z at their inner ends to receive the arms V, for the purpose set forth, said bag-holding arms being further provided with the flanges A', projecting outward from their lower edges to engage the mouth of the bag, said flanges being in lower planes than the inner ends of the bag-holding arms, substantially as described.

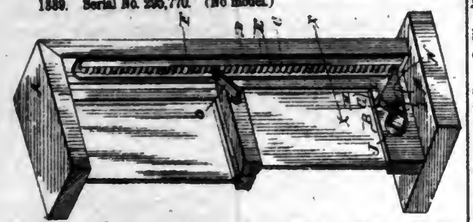
3. In a bag-holder, the standard G, having the guide-bar R on one side, the cross-head on the opposite side of the standard, and having the cleats T, engaging the side edges thereof, the metallic loop or guide U, notched to receive the guide-bar and bolted on the cleats T, the arms V, secured in the said loop or guide by the same bolts, and the bag-holding arms X, fitted and laterally adjustable on the arms V, substantially as described.

400,552. TELEGRAPH-WIRE CARRIER. ROBERT S. DONALDSON, Wilkinsburg, Pa. Filed Dec. 16, 1887. Renewed Feb. 11, 1889. Serial No. 299,559. (No model.)

Claim.—1. The combination, with the cross-arms of telegraph-poles, of temporary carriers provided each with adjustable sheaves mounted thereon, one at each cross-arm, and the wire placed in said carriers between the sheaves, as described, whereby an old wire may be readily drawn out and at the same time the new wire attached thereto drawn into place in long sections, as described.

2. The combination, with the standard and means for readily attaching the same to the cross-arms, of the sheaves mounted on their pins, respectively, said sheaves being placed opposite one another, so that their grooves will form a space for holding the wire, one of said pins being readily adjustable to separate the sheaves to admit or take out the wire, substantially as described.

3. The combination, with the standard provided with a point for insertion in the cross, of the grooved wheels mounted upon pins secured to the standard, said sheaves being placed so as to form a space between them for the wire, said sheaves being readily adjustable to permit the wire to be taken out or placed between the rollers, substantially as described.



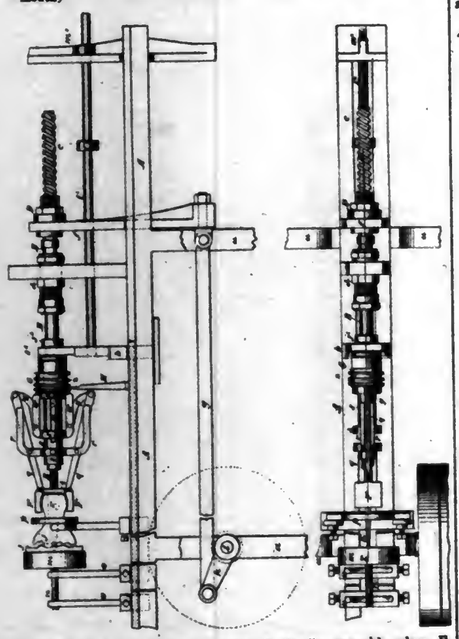
400,553. PRESSURE-REGULATOR. CHARLES DUBOIS, Leadville, Colo. Filed Oct. 20, 1888. Serial No. 288,679. (No model.)

Claim.—1. In a regulator, the combination, with the casing A, provided with the head *d* and opening *f*, of the valve B, having a spiral groove, *g*, adapted to register with the opening *f*, and the spiral spring C, bearing upon the valve to oppose its forward movement, substantially as shown and described.

2. In a regulator, the combination of the casing A, having the partition *a*, chambers *b c*, and aperture *f*, the cap *d*, closing the chamber *c*, the chambered valve B, having the spiral slot *g*, the spring C, abutting against the partition *a* and resting upon the closed end of the valve B, the spindle *l*, and the cap D, substantially as specified.

3. In a regulator, the combination of the casing A, having the partition *a*, chambers *b c*, and aperture *f*, the cap *d*, closing the chamber *c*, the chambered valve B, having the spiral slot *g*, and provided with the packing-ring *j*, the spring C, abutting against the partition *a* and resting upon the closed end of the valve B, the spindle *l*, and the cap D, provided with graduations on its periphery, substantially as specified.

400,554. SASH-FASTENER. WILLIAM F. ELKINS, Comanche, Tex., assignor of one-half to J. R. Thomas, same place. Filed Jan. 8, 1889. Serial No. 295,770. (No model.)



Claim.—1. In a sash-holder, the rack-bar comprising the strip D, having transverse corrugations, and the strip F, having one edge bent over the adjacent edge of the strip D, and its other edge bent past the edge of said strip at right angles, as specified.

2. In a sash-holder, the pawl consisting of a metallic strip bent into substantially triangular form, one of the angles forming the engaging-point, while the other angles form the pivotal and operating ends, as set forth.

3. In a sash-holder, the combination of the rack-bar, the pawl consisting of a metallic strip bent into substantially triangular form, one of the angles engaging the rack-bar, the pivot-screw passed through an eye formed at the upper angle of the pawl, and a handle at the remaining angle of the pawl, a stop-pin inserted through the pawl in rear of the engaging-point, and a spring to hold the pawl normally in engagement with the rack-bar, as set forth.

400,555. MACHINE FOR SHAPING BOTTLE-NECKS. EDWARD H. EVERETT, Newark, Ohio. Filed Mar. 30, 1888. Serial No. 268,959. (No model.)

Claim.—1. A rotating and longitudinally-movable plug, E, adapted to enter a bottle-neck, combined with rotating jaws F, adapted to shape a bottle-neck during rotation, substantially as described.

2. A rotating and longitudinally-movable plug, E, adapted to enter a bottle-neck, combined with rotating and longitudinally-movable shaping-jaws F, as specified.

3. A rotating and longitudinally-movable plug, E, for entering a bottle-neck, combined with rotating and longitudinally-movable jaws F, and with movable supports for a bottle that advance with the plug, as specified.

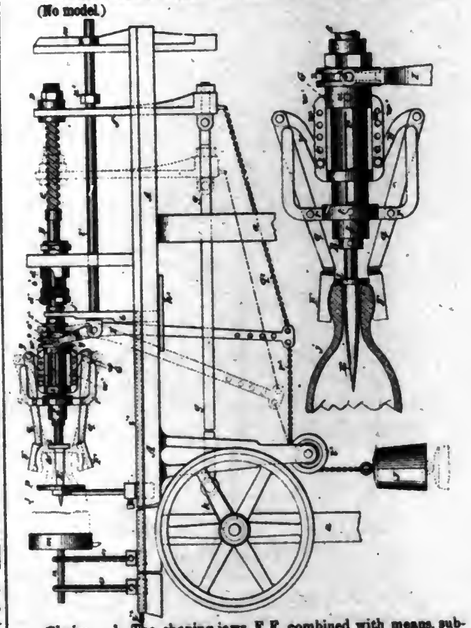
4. The rotating spindle B, having the plug E, and sleeve *s*, surrounding said spindle, combined with the shaping-jaws F and sleeve G, which is flexibly connected to said jaws, substantially as described.

5. The spindle B, having plug E, sleeve, and supporting-arms *r* on said sleeve, combined with the shaping-jaws F, levers *q*, carrying said jaws and pivoted in the arms *r*, and with the sleeve G and links *y*, substantially as described.

6. The rotating spindle B and rotating opening and closing clamping-jaws F, combined with the bottle-support *o* and the gaging and centering ring *p*, substantially as described.

7. The spindle B, having worms *c* and d^3, combined with the sleeve D, having internal threads that fit said worm *c*, means, substantially as described, for reciprocating said sleeve D, and with the stationary bearing *d*, having internal threads, b^3, that fit the worm d^3, whereby said spindle will be rotated and advanced simultaneously, substantially as described.

8. The spindle B, having worm *c*, reciprocating sleeve D, having internal threads meshing with the worm *c*, and means, substantially as described, for reciprocating said sleeve, combined with the rotating opening and closing jaws F, that are carried by the spindle B, substantially as described.

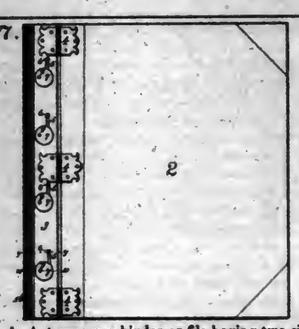


9. The rotating advancing spindle B, combined with the movable bearing *b*, that is actuated during the advance of said spindle, movable supports *o* and *p*, and the rod i^3, connecting said supports with the bearing *b*, substantially as described.

10. The combination of the rotating and advancing spindle B, movable bearing *b*, that is actuated with the advance of the spindle, supports *o* and *p*, connected with the bearing *b*, arm *f*, and rod i^3, substantially as described.

11. The spindle B, means substantially as described, for longitudinally moving and revolving the same, the bottle-supports *o o*, connected to said spindle to move longitudinally together therewith, and plug E on said spindle, combined with the jaws F, carried by said spindle, and means, substantially as described, for opening and closing said jaws while they revolve with said spindle, as specified.

12. The combination, with a rotating and advancing plug, E, adapted to enter a bottle-neck, of opening and closing jaws F, that are adapted to press upon the bottle-neck, as specified.

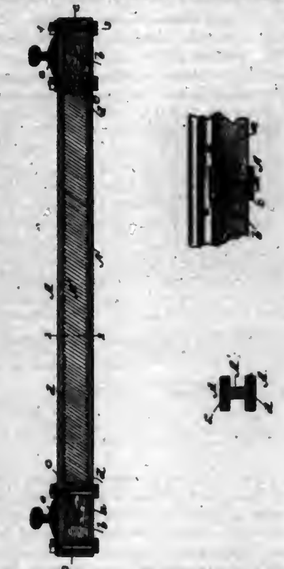


400,556. MACHINE FOR SHAPING BOTTLE-NECKS. EDWARD H. EVERETT, Newark, Ohio. Filed Nov. 9, 1888. Serial No. 290,370. (No model.)

Claim.—1. The shaping-jaws F F, combined with means, substantially as described, for revolving and for opening and closing them, the closing mechanism having a weighted member, I, which will allow the jaws, when closed and in the act of closing, to yield to pressure from within, as specified.

2. The spindle B, opening and closing jaws F, and sleeve G, jointed to said jaws, combined with the lever I, connected with the sleeve G and with the weight J on the lever I, and means, substantially as described, for rotating the jaws F, all arranged to render the jaws yielding to internal pressure when closed and when closing, as specified.

400,557. TEMPORARY-BINDER. TOBY FAIFER, Denver, Colo. Filed Sept. 14, 1888. Serial No. 285,416. (No model.)

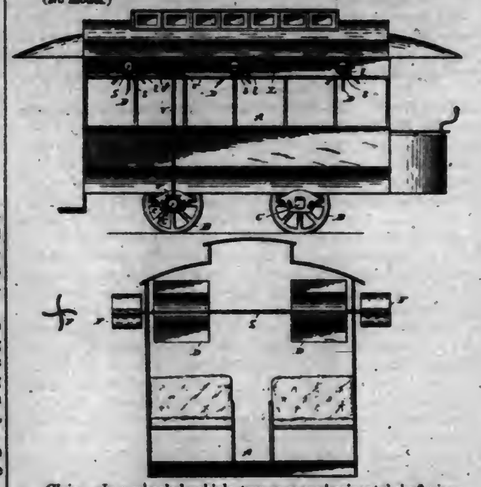


Claim.—1. A temporary binder or file having two sides or covers, one provided with flexible wires extending inwardly, a rigid metal bar hinged to the edge of the other cover or side and having apertures corresponding in location to the location of the wires, and means upon the bar for clamping the free ends of such wires thereupon, substantially as set forth.

2. A temporary binder or file comprising two sides or covers, one somewhat broader than the other and having flexible wires extending from its rear edge toward the narrower side or cover, a rigid metallic bar hinged to the edge of the narrower side or cover and having perforations for such wires to pass through, and means secured upon such bar for locking or clamping thereto the free ends of the wires, substantially as set forth.

3. A temporary binder or file comprising the side or cover 1, with wires 5, the side or cover 2, secured to rigid bar 3 by hinges 4, the metal fastening-disks 7, and the back 10, substantially as set forth.

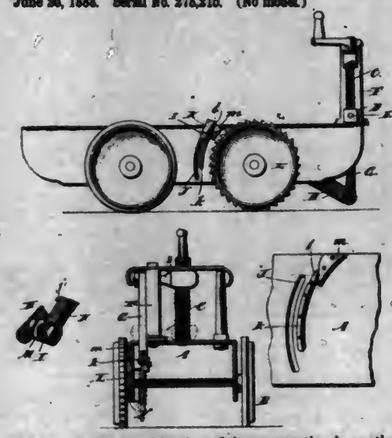
400,558. RAILROAD-RAIL TIE AND FASTENING. JACOB FRYSINGER, Milan, Ill. Filed June 25, 1888. Serial No. 278,189. (No model.)



Claim.—1. The railroad-rail tie-fastening consisting of the upper and lower bars and an intermediate bar interposed between and edgewise to the aforesaid bars and endwise to the sleepers, substantially as set forth.

2. The railroad-rail tie consisting of the upper and lower plate-like bars and an intermediate edgewise-disposed plate-like bar let into grooves or channels in the aforesaid bars, substantially as set forth.

3. The railroad-rail tie consistieg of the upper and lower plate-like bars and an intermediate edgewise-disposed plate-like bar let into grooves or channels in the upper and lower bars, the upper and lower bars being arranged one above and let into transverse grooves or recesses in the upper surfaces of the stringers, and the lower one below the stringers, substantially as specified.



4. The railroad-rail tie comprising the upper and lower plate-like bars and an intermediate edgewise-disposed plate-like bar let into grooves or channels of the upper and lower bars, and the chairs consisting of clamp-plates resting upon the upper bar and held in place by bolts passing through said upper and lower bars, substantially as set forth

400,559. VENTILATING APPARATUS FOR VEHICLES. JOHN J. GERAGHTY, Streator, Ill. Filed June 29, 1888. Serial No. 278,547. (No model.)

Claim.—In a wheeled vehicle, two or more horizontal shafts journaled in bearings near the top thereof and in parallelism with each other, fans keyed upon each of said shafts, a longitudinal shaft, bevel-gears on each of said transverse shafts, and bevel-gears on said longitudinal shaft intermeshing therewith, in combination with a bevel-gear upon one of the axles of the vehicle, a vertical shaft, a bevel-gear at the lower end of said shaft intermeshing with that on the axle, a bevel-gear at the upper end of said vertical shaft, and a bevel-gear upon said longitudinal shaft, intermeshing with that at the upper end of said vertical shaft, for conveying rotary motion from the axle to the longitudinal shaft, and thence to the several fans, substantially as described.

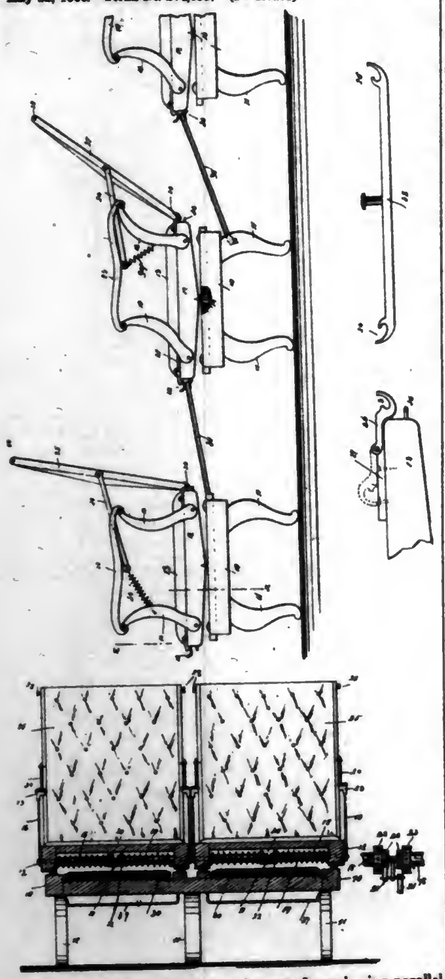
400,560. CAR-STARTER. RUDOLF O. GERDES, Augusta, Ga. Filed June 26, 1888. Serial No. 278,215. (No model.)

Claim.—1. The combination of the car-starting lever, the brake-rod, and connections between the brake-rod and the lever, operated by the brake-rod, as set forth.

2. The combination of the worm-shaft forming the brake-rod, the car-starting lever, and the nut mounted on the worm-shaft and connected to the lever, as set forth.

3. The combination of the worm-shaft, the nut mounted thereon and having an outwardly-projecting arm, the car-starting lever, and the link connecting said arm and lever, as set forth.

4. The combination of the worm-shaft, the slotted standard arranged at one side of the same, the nut mounted on the shaft and having an arm playing in the slotted standard, the link connected to said arm, and the car-starting lever connected to said link, as set forth.



5. The combination of the car-starting lever and devices for oper-

ating the same, the pawl carried by said lever, and the spring connected to said pawl, as set forth.

6. The combination of the car-starting lever and devices for operating the same, the pawl pivoted thereto, and the rib and plates for releasing the pawl from its operative position, as set forth.

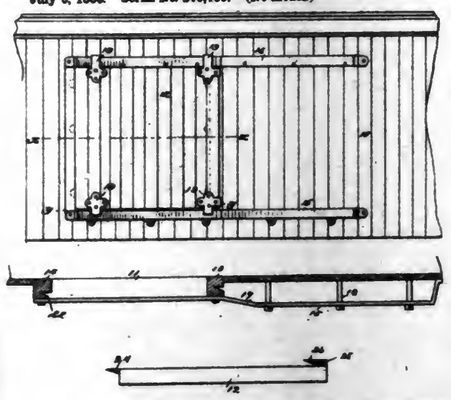
7. The combination of the car-starting lever and devices for operating the same, the pawl pivoted to said lever and having a pin on its inner side, the curved rib, pivoted plate at the upper end of the rib, and the rigid plate adjacent to the pivoted plate, the pin on the pawl riding in said rib and plates, as and for the purposes set forth.

400,561. CAR-SEAT. EDWARD B. GOELET, Fort Worth, Tex. Filed May 22, 1888. Serial No. 274,655. (No model.)

Claim.—1. The combination, with a seat-frame having parallel transverse front and rear rock-shafts and oppositely-acting springs connected to and rotating said shafts toward each other, of supports rigidly secured to the ends of said shafts and normally held in an upwardly-projecting position, arm-rests pivotally connecting said supports at their upper ends, and a reversible back pivotally connected to said rests, whereby the back will be yieldingly supported in either of its two positions against the action of one of said spring-controlled shafts, substantially as set forth.

2. The combination, with a seat-frame having parallel transverse rock-shafts, each shaft having a torsion-spring tending to rotate it toward the other, of the front and rear supports rigidly attached at their lower ends to the ends of the said shafts and held normally in an upwardly-projecting yielding position by the force of said springs, the arm-rests pivoted at their ends to said supports, and the reversible seat-back having links pivotally connecting its ends with the said arm-rests, whereby the back may be inclined against the action of one of the said torsion-springs in either of its positions, substantially as set forth.

3. The combination, with the seat-frame having front and rear back-supporting hooks or bearings, parallel front and rear transverse rock-shafts, two coiled torsion-springs on each shaft connected at their outer ends with the seat-frame, the springs on one shaft being coiled oppositely to those on the other to rotate the shafts toward each other, collars loose on the shafts and connected to the inner ends of the springs, and pawl-and-ratchet mechanisms connecting the said shafts and collars, of the supports 16, rigidly connected at their lower ends to the ends of the shafts to rock them against the torsion of one pair of said springs, according to the position of the seat-back, arm-rests pivotally connecting the upper ends of the said supports, and the reversible seat-back having links or arms pivotally connecting its ends to the said arm-rests, substantially as set forth.

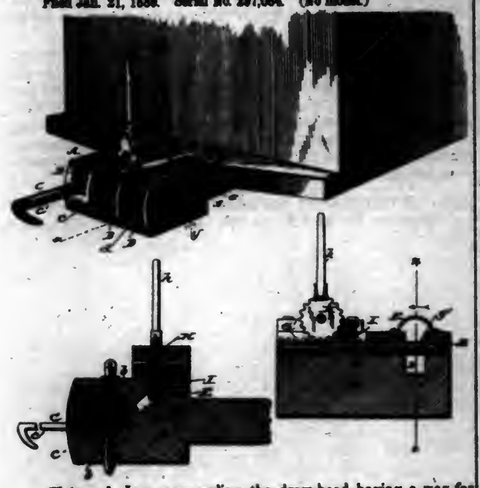


4. The combination, with the seat-frame, front and rear rock-shafts provided with torsion-springs to rotate them toward each other, the supports rigidly secured to the ends of said shafts, and the arm-rests pivoted at their ends to the upper ends of the said supports, of the spring 34, secured at its upper end to the arm-rest, and means for connecting its lower end to either the front or rear support at different heights, substantially as set forth.

5. The combination, with the seat-frame and its reversible back, of the sliding bars mounted on the seat-frame and having hooks at their ends to receive either longitudinal edge of the back, substantially as set forth.

6. The combination, with a seat-frame and its reversible back, of the sliding bars mounted on the seat-frame and having upward-projecting hooks at their opposite ends to receive either longitudinal edge of the back, and each having an intermediate handle projection on its upper side between its ends, substantially as set forth.

7. The combination, with the main support 10, having inwardly bowed or curved springs 33 on the inner faces of its side bars, of the removable rest 30, having recesses in its sides to receive the bowed portions of said springs and be thereby held in place, substantially as set forth.



400,562. CAR-DOOR. EDWARD B. GOELET, Fort Worth, Tex. Filed July 6, 1888. Serial No. 279,169. (No model.)

Claim.—1. The combination, with a car having a door-opening, top and bottom tracks, and perpendicular door-posts, one post provided with a series of recesses in its side next to the opening and the other having recesses in its outer side or side nearest the end of the car, of the door sliding on said tracks and having forwardly-projecting cleats on its front edge to enter the recesses in the first-named post, and provided on its inner side at its opposite end with cleats projecting toward its front edge to enter the recesses in second-named strip, substantially as set forth.

2. The combination, with the car having the door-opening, perpendicular post 14 at one side of the opening, provided on its side next to the opening with recesses 21, and having a vertical rabbet forming a shoulder, 22, at the outer corner of its recessed edge intersecting said recesses, the opposite post, 13, projecting beyond the side of the car and having recesses 20 in its outer side, or side next to the end of the car, of the car-door having a vertical groove, 23, and forwardly-projecting cleats 24 on its front edge, to engage the shoulder 22 and recesses 21, respectively, and provided on its opposite end on its inner side with a perpendicular projection, 25, having forwardly-projecting cleats 26 on its side nearest the front edge of the door, to enter the recesses 20, the said recesses and cleats being wedge-shaped to force the door inwardly, substantially as set forth.

400,563. CAR-COUPLING. WILEY M. GERMAN, Winchester, Ill. Filed Jan. 21, 1889. Serial No. 297,064. (No model.)

Claim.—1. In a car-coupling, the draw-head having a way for the coupling-hook formed with an incline up which to direct such hook, and having a transverse horizontal opening or guide for the coupling-pin, and the coupling-pin movable in said guide and provided with a flange or wing arranged in the closed position of the pin to form an extension or continuation of the incline for the coupling-hook, substantially as set forth.

2. The combination of the draw-head having a way for the coupling-hook and a transverse guide or opening for the coupling-pin, the coupling-pin having a rack or series of teeth, and the toothed wheel, substantially as and for the purposes specified.

3. In a car-coupling, the draw-head having a transverse guide or opening for the coupling-pin and formed with an incline, *d*, leading up thereto, and with an incline, *d'*, leading rearwardly and down from the upper end of incline *d*, combined with the coupling-pin, substantially as set forth.

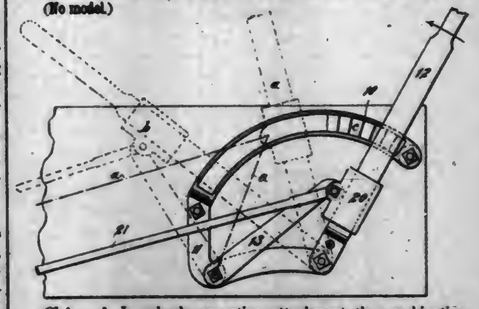
4. The improvement in car-couplings, comprising the draw-head having a way for the coupling-hook formed with an inclined bottom and having a transverse pin-opening, E, formed with a slot-like extension, *e*, and the coupling-pin having a wing or flange, *g*, all substantially as set forth.

5. The improved car-coupling herein described, comprising the draw-head having opening E, formed with extension *e*, the way D, having inclines *d d'*, and a shield or cover, F, and the central link-mortise, the coupling-hook pivoted to said draw-head, the coupling-pin G, having flange or wing *g* and provided with the rack or teeth, and the toothed operating-wheel meshing said teeth, substantially as set forth.

400,564. ROCKING-CHAIR. LEWIS C. GUNN, San Diego, Cal. Filed Apr. 21, 1888. Serial No. 271,396. (No model.)

Claim.—1. The combination, with the chair-base comprising two connected parallel recessed boxes having slots 10 through their upper faces, of the curved rockers 7, mounted on transverse pivots within the said boxes above the bottoms thereof and provided with arms 11 at their ends extending up through said slots, and longitudinally-extending springs 22 22 in the bottoms of said boxes and bearing at their adjacent ends upwardly against the lower faces of the rockers at opposite sides of and below their pivots, substantially as set forth.

2. The combination, with the recessed or slotted chair-base, of the curved rockers pivoted between their ends within said recesses, and having upwardly-projecting arms at their ends passing through said slots and curved thereat to correspond with the arcs described by the ends of the rockers, and springs bearing against the lower faces of the rockers at opposite sides of their pivotal points, substantially as set forth.



3. In a chair, the curved rocker 7, having upwardly and inwardly projecting arms 11 at its ends, curved at their junction with the rocker, and the vertical stop or brake 16, projecting from the upper face of the rocker in line with the axis or pivotal point, substantially as set forth.

4. The combination, with the chair-base comprising two connected parallel recessed boxes having slots 10 through their upper faces and a central or intermediate recess, 8, having cushions 18, of the rocker 7 within the recessed boxes, and having arms 11 at their ends projecting up through the slots 10 and curved thereat, and a vertical central stop or brake, 16, extending up into the recess 8, the transverse bearings 12, extending through the rockers below their stops or brakes, and the longitudinally-extending springs 19, resting in the bottoms of the recessed boxes and having their ends bent back upon themselves, as shown at 22, and bearing at their free ends against the lower face of the rockers at opposite sides of the bearings 12.

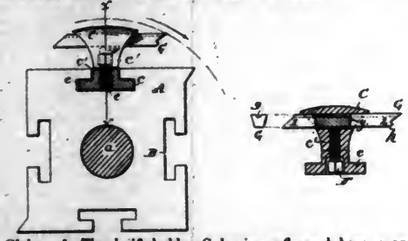
5. The combination, with the boxes 3, having longitudinally-extending recesses or spaces 6, slots 10, and intermediate upper recess, the front and rear walls of which form stops 17, and cushions 18 on said walls, of the rockers 7 within the said recesses 6, and having upwardly-projecting curved arms 11 at their ends extending through the slots 10, and vertical brakes or stops 16 on their upper faces extending up between the cushions 18, and transverse bearings extending through the said rockers under their brakes or stops 16, substantially as set forth.

6. The rocking-chair 24, having the inclined and curved legs 11 and rockers 7, with brake 16, mounted on a base consisting of the boxings 3, connected by cross-bar 2 and formed with slots 10, recess 8, and stops 17, with elastic cushions 18, and having the steel strip 19, with elastic projections 22, covered with soft material 23, located beneath the rocker 7, the brake 16 being located in recess 8 between cushioned stops 17, substantially as described.

400,565. WAGON-BRAKE LEVER. WILLIAM A. HANEY and ENOCH G. HANEY, Media, Kans. Filed Jan. 11, 1889. Serial No. 296,072. (No model.)

Claim.—1. In a brake-operating attachment, the combination, with a rack, of a toothed lever, a slide mounted upon the lever, a pivotally-mounted link that is pivotally connected to the slide, and a rod pivotally connected to the slide and arranged for connection with a brake, substantially as described.

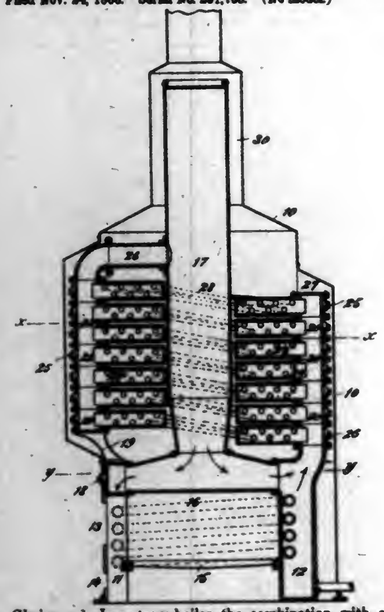
2. In a brake-operating attachment, the combination, with a rack the teeth of which are formed only at the forward edge, of a toothed lever arranged to engage the rack, a spring carried by the lever and arranged to bear upon the rear face of the rack-bar, a slide carried by the lever, a pivotally-mounted link that is pivotally connected to the slide, and a rod pivotally connected to the slide and arranged for connection with a brake, substantially as described.



400,566. TANK. HUGH W. HARRY, Dallas, Tex. Filed Dec. 6, 1888. Serial No. 292,797. (No model.)

Claim.—As an improvement in tanks, the combination of the wooden bottom having cross-braces on its under side, the sheet-metal

bottom arranged over the wooden bottom and having an annular flange nailed or secured to said wooden bottom, and the metallic body, the lower end of which is connected to the bottom by nails, while the extreme lower edge of said body is turned under the wooden bottom between the cross-braces of the latter, substantially as set forth.



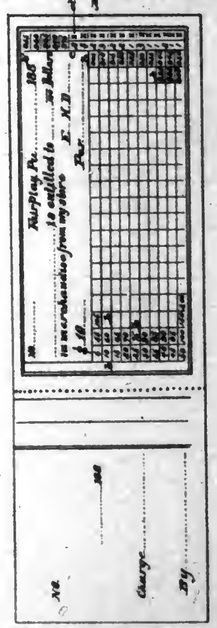
400,567. CUTTER-HEAD. HENRY L. HASKELL, Ludington, Mich. Filed May 21, 1888. Serial No. 274,339. (No model.)

Claim.—1. The knife-holder C, having a flanged base, c, and a head, c', having a transverse knife-receiving slot, and a threaded aperture extending up through the base and head into the knife-slot and enlarged at its lower end, substantially as set forth.

2. The knife-holder C, having a flanged base, c, a central transversely-slotted head, c', provided with a threaded aperture extending upwardly through the base into said slot and enlarged at its lower end, a bolt, F, working in said aperture, with its head in the enlarged lower end thereof, and the set-bolts e, extending through the base from its upper side at opposite sides of the head, substantially as set forth.

400,568. STEAM-BOILER. SAMUEL P. HEDGES, Greenport, N. Y. Filed Nov. 24, 1888. Serial No. 291,763. (No model.)

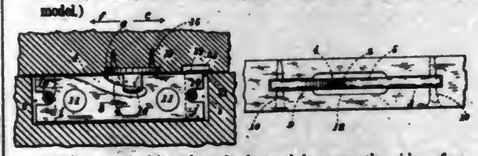
Claim.—1. In a steam-boiler, the combination, with opposing series of horizontally non-aligning manifolds or headers, of inclined concentric tubes connecting the corresponding manifolds of each series, substantially as shown and described.



2. In a steam-boiler, the combination, with opposing series of horizontally non-aligning manifolds or headers provided with a series of alternating apertures in the sides, of inclined semicircular tubes having their ends inserted in the equivalent apertures of the corresponding manifolds of each series, substantially as shown and described.

3. In a steam-boiler, the combination, with an essential U-shaped water-leg at the front of the fire-box and an essentially perpendicular water-leg at the rear of the said fire-box, of a series of inclined semicircular tubes connecting the members of the front water-leg with the rear leg, substantially as shown and described.

4. In a steam-boiler, the combination, with a front and rear water-leg and inclined semicircular tubes connecting the said legs, of opposing series of horizontally non-aligning manifolds or headers, inclined tubes uniting the corresponding manifolds, and a connection between one series of manifolds and the rear water-leg, substantially as shown and described.

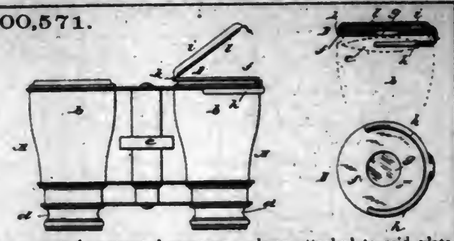


5. In a steam-boiler, the combination, with a front and rear water-leg, an inverted-T-shaped stand-pipe connecting the water-legs at the top, and a series of semicircular inclined tubes uniting the said legs below the stand-pipe, of a series of front and rear horizontally non-aligning manifolds or headers, a series of inclined tubes connecting the corresponding manifolds of each series, and a connection between the rear manifolds and the rear water-leg and between the front manifolds and the stand-pipe, substantially as shown and described.

400,569. CREDIT OR STORE ORDER. CHARLES S. HEMPSTEAD, Fairchance, Pa. Filed Mar. 2, 1888. Serial No. 265,908. (No model.)

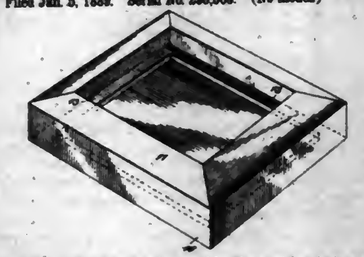
Claim.—In credit or store orders having upon the face of them a series of columns of regular progressive amounts, omitting intermediate fractions, the combination with a series of such columns, the last one of which stops short of the full amount of the order, of a supplementary column of intermediate fractions amounting in the aggregate to the balance necessary to complete the full value of the order, and an additional column of symbols arranged opposite or by the side of said supplementary column of intermediate fractions, essentially as herein shown and described, and for the purposes specified.

400,570. COFFIN-FASTENER. EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y. Filed July 25, 1887. Serial No. 245,179. (No model.)



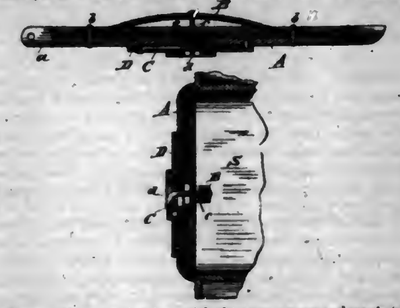
Claim.—A locking-plate, 3, clamped between the sides of an opening in the side of the casket, and having a pointed catch, 6, projecting horizontally in a line with the top of the plate, or substantially so, and a curved opening leading to and under the pointed catch, in combination with a loop-locking portion, 16, secured to the casket-lid, a spring, 19, having its fixed end secured to the inside of a casket-lid having a depression, 23, and the free end of the spring provided with a thumb-piece, and a downwardly-projecting catch, 21, for catching over the end of the plate 3 and locking the casket.

400,571. MIRROR ATTACHMENT FOR TELESCOPIC GLASSES. AUGUST JANSEN, Iron Mountain, Mich. Filed Oct. 19, 1888. Serial No. 288,557. (No model.)



Claim.—1. A reflector or mirror attachment for telescopes, including opera-glasses, consisting of a metal or other suitable plate having a central contracted aperture, a clamp attached to said plate adapted to hold the latter upon the outer end of the telescope, with its contracted aperture in concentric position over or on the outside of the object-lens of the telescope, and a mirror hinged to the one side of said plate for operation, substantially as specified.

400,571.

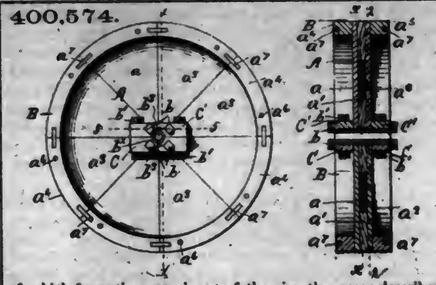


2. In a reflector or mirror attachment for telescopes, including opera-glasses, the removable reflector or mirror attachment D, composed of a metal or other suitable plate, f, adapted to close the outer end of the telescope, and provided with a central aperture, g, an elastic clamp or clip, h h, attached to said plate and adapted to hug the outer tube or case of the telescope, and a reflector or mirror-provided cover hinged to the one side of said plate, essentially as shown and described.

400,572. INSECT-TRAP. JENNIE G. F. JOHNSON, Mount Vernon, N. Y. Filed Jan. 5, 1889. Serial No. 295,503. (No model.)

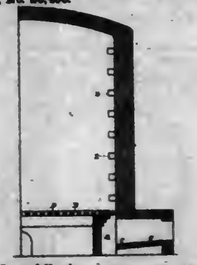
Claim.—In an insect-trap, the combination, with a bait-receptacle, of a surrounding-trough and a hood which overhangs the bait receptacle, substantially as described.

400,573. OVEN-THERMOMETER. CAMILLA JULIER and JAMES O. ROBINSON, Hanging Rock, Ohio, assignors of one-third to Henry D. Miller, same place. Filed Nov. 23, 1888. Serial No. 291,619. (No model.)



Claim.—The combination, with the stove or oven door A, of the strip B, of more expansible metal than that of said door, attached at or near its opposite ends to the door on its interior, the index-actuating stem c, secured to said strip intermediately of its ends and arranged to slide through the door, and the index C and graduated dial D, both upon the exterior of the door, essentially as shown and described.

400,574. SPLIT BAND-PULLEY. AMOS KEELER, Warsaw, Ind. Filed Oct. 23, 1888. Serial No. 288,982. (No model.)

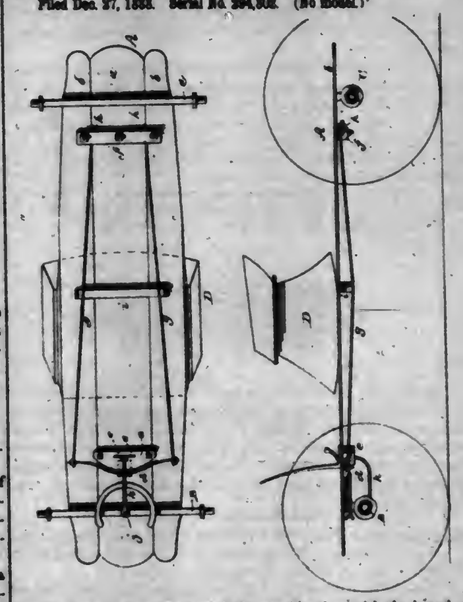


Claim.—1. In a split pulley, the web composed of a number of layers, the two outer layers consisting of a number of triangular-shaped sections, and the inside or center layer of a number of rectangular pieces arranged transversely to the triangular pieces, substantially as and for the purpose set forth.

2. A separable or split pulley the web whereof is composed of a number of layers, the two outer layers consisting of a number of triangular-shaped sections, and the inside layer of a number of rectangular pieces arranged transversely to the triangular parts, the segment rim-pieces secured to the respective sides of said web, the periphery of which forms the central part of the rim, the means described for securing said parts together, the clamping-bars forming the hub, the bolts for securing said bars to the web, the clamping-bolts passing through said bars and locking the two parts forming the pulley together, and the bushing divided longitudinally and provided with a feather or rib on each part, substantially as set forth.

400,574.

400,575. BRICK-KILN. DAVID LARNELS, Fort Wayne, Ind. Filed Nov. 24, 1886. Serial No. 219,339. (No model.) Patented in Canada Oct. 22, 1884, No. 20,408.



Claim.—1. In a kiln, lugs or supports separated on all sides by intervening spaces projecting into the kiln-chamber from the face of the inside wall sufficiently near one another to prevent the material to be fired from falling against the wall, substantially as set forth.

2. In a kiln, the lugs or supports 2, in combination with the inlets B, substantially as described.

3. In a kiln, the combination of combustion-chambers A, inlets B, and supports 2, substantially as set forth.

400,576. BUCKBOARD. JAMES W. LAWRENCE, New York, N. Y. Filed Dec. 27, 1888. Serial No. 294,802. (No model.)

Claim.—1. In a buckboard, the combination, with the board, of a spring attached to the board near one end, two rods connected with the spring and extending to the opposite end, supports for the

rods secured to the board, and a bridge-piece interposed between the rods and the board, substantially as specified.

2. In a buckboard, the combination of the board A, the convex cleat *c*, secured to the board, the spring *d*, resting upon the cleat *c*, two threaded rods, *g*, connected with the ends of the spring, the cleat *f*, secured to the board A and adapted to receive the ends of the rods *g*, nuts *h*, placed upon the threaded ends of the rods *g* and bearing upon the cleat *f*, and the bridge-piece *i*, attached to the board A at or near its center and bearing upon the rods *g*, substantially as specified.

3. In a buckboard, the combination of the board A, the convex cleat *c*, secured to the board, the spring *d*, resting upon the cleat *c*, two threaded rods, *g*, connected with the ends of the spring, the cleat *f*, secured to the board A and adapted to receive the ends of the rods *g*, nuts *h*, placed upon the threaded ends of the rods *g* and bearing upon the cleat *f*, the bridge-piece *i*, attached to the board A at or near its center and bearing upon the rods *g*, and the brace *k*, connected with the king-bolt and attached to the cleat *c*, substantially as specified.

400,577. MEDICAL COMPOUND.

NOAH LEVERING, Los Angeles, Cal., and MARY E. CURRY, Pacific, Mo. Filed Jan. 12, 1887. Serial No. 224,146. (No specimens.)

Claim.—The herein-described composition of matter to be used as a remedy for consumption in its early stages, coughs, colds, sore throat, and similar afflictions, consisting of honey, *Schinus molle* or pepper-tree berries, alcohol, glycerine, water, and alum, in the proportions specified.

400,578. BRACELET.

ADOLPH LUTHY, New York, N. Y., assignor to Adolph Luthy & Co., same place. Filed Nov. 21, 1888. Serial No. 291,432. (No model.)

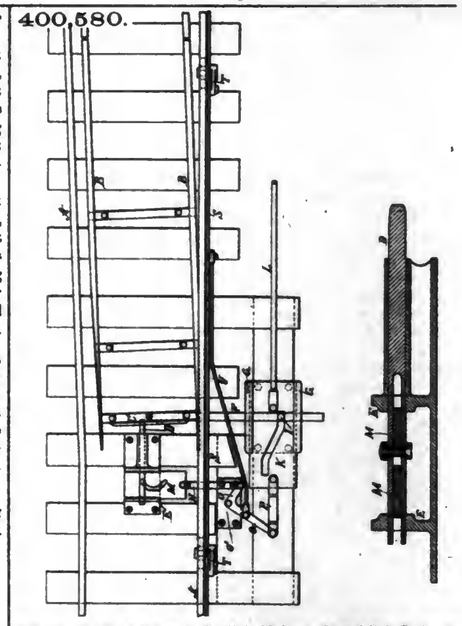
Claim.—1. A bracelet comprising a major member of elastic material, constructed to encircle the wrist and to close by its own elasticity, and a minor member connected at both ends telescopically with the opposite ends of the major member, substantially as described, whereby, when the major member is expanded, the minor member serves as a bridge across the gap between its ends.

2. A bracelet comprising a major and a minor member telescopically connected, one of said members being constructed of two bars or wires and the other of a single bar or wire which telescopes between said bars and with stops on the respective members to limit their play.

3. In a bracelet, the combination of a member consisting of two or more elastic wires united by perforated cross-bars at their ends, and another member consisting of a wire sliding through the perforations in said cross-bars, and having on its end a cross-bar having perforations embracing the wires of said other member, whereby the two members are connected telescopically, and the cross-bars serve as stops to limit the expansion of the bracelet.

400,579. FABRIC FOR MACHINE-BELTING, &c.

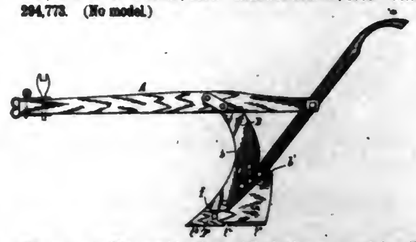
JOSHUA P. MADDOX, Portland, Me. Filed Mar. 1, 1889. Serial No. 301,594. (No specimens.)



Claim.—The herein-described fabric for machine-belting and for other like purposes, having an inner ply composed of a wire warp and a fibrous weft, and one or more plies of facing material of fibrous material on each side of said inner ply and bound thereto by binders extending from said facing-plies to the said inner ply and back through said facing-plies and interlocking with the weft of said inner ply, substantially as shown.

400,580. LOCK FOR SWITCHES.

ISAAC MAY, Brooklyn, and CHARLES SPIKING and THOMAS SPIKING, New York, N. Y. Filed Jan. 3, 1887. Serial No. 223,167. (No model.)



Claim.—The combination, with the track-rail and switch-rail, of the cam-plate K and bar F, for moving the switch-rail, and the stock E and bolt D, the shank of which slides through the stock, the cam-slide M, supported in the stock E and having a mortise with inclined

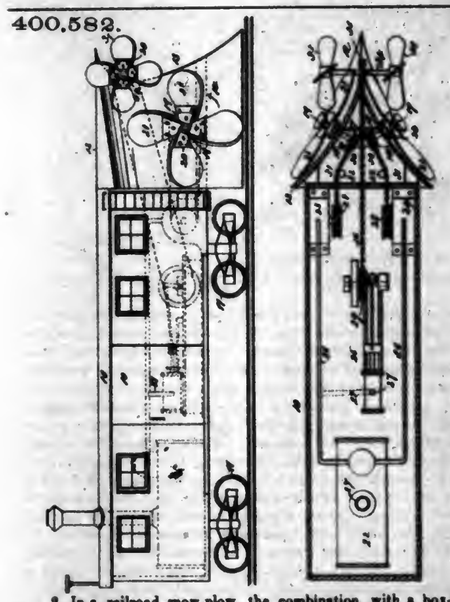
ends to act upon the bolt, the link N, lever O, and link P, for connecting the plate K to the cam-slide M, substantially as set forth.

400,581. PLOW AND PLOW-POINT.

JOHN W. MCAHULEY, Concord, N. C. Filed Feb. 23, 1888. Renewed Dec. 27, 1888. Serial No. 294,773. (No model.)

Claim.—1. The combination, with the beam A and handles *a*, of curved foot B, having the sharp edge *b* and elbow *b'*, landside F, its front end sharp and flush with the said edge *b*, the front half of its base, f^3, turned in and its rear half, f^4, turned out, its wing G extending up and secured to said foot, share C, having the short perforated wing *c* and long slotted and perforated wing *c'*, movable invertible reversible self-sharpening point D, and movable wing E, substantially as shown and described.

2. The combination, with the beam A and handles *a*, of curved foot B, having the sharp edge *b* and elbow *b'*, landside F, its front end sharp and flush with the said edge *b*, the front half of its base, f^3, turned in and its rear half, f^4, turned out, its wing G extending up and secured to said foot, share C, having the short perforated wing *c* and long slotted and perforated wing *c'*, movable invertible reversible self-sharpening point D, movable wing E, and section H, substantially as shown and described.



3. The combination, with the beam A and handles *a*, of curved foot B, having the sharp edge *b* and elbow *b'*, landside F, its front end sharp and flush with the said edge *b*, the front half of its base, f^3, turned in and its rear half, f^4, turned out, its wing G extending up and secured to said foot, share C, having the short perforated wings *c* and long slotted and perforated wings *c'*, movable wings E, and sweep I, having the wings *i*, substantially as shown and described.

400,582. RAILROAD SNOW-PLOW.

CHARLES A. MCCARTHY and JOHN P. MORAN, Sault de Ste. Marie, Mich. Filed Oct. 5, 1888. Serial No. 287,313. (No model.)

Claim.—1. In a railroad-snow-plow, the combination, with the body having a vertical wedge-shaped mold-board at its front end, of vertically-rotating snow-wheels on the two faces of said mold-board and the smaller vertically-rotating snow-wheels in front of and above the lower wheels, substantially as set forth.

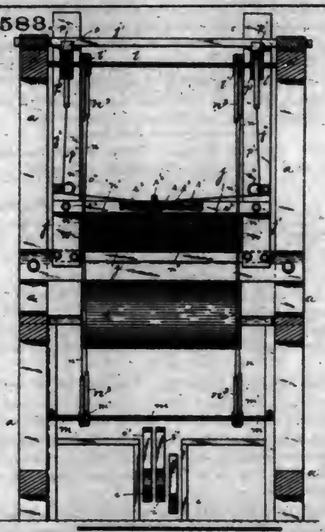
400,582.

2. In a railroad snow-plow, the combination, with a box-like body and a triangular mold-board secured to the forward end of the same, provided with concave sides and a concave forward cutting-edge, of horizontal shafts journaled in the sides of the mold-board, a hub secured to the outer extremity of each shaft, twisted spaced arms radiating from said hubs, twisted blades detachably attached to the said arms, a boiler and two engines located within the body, said engines being connected with the said boiler, and means, substantially as shown and described, of connecting the several engines with the several shafts, as and for the purpose specified.

3. In a railroad snow-plow, the combination, with a box-like body and a triangular mold-board attached to the forward end of the same, provided with concave sides and a concave cutting-edge, of a snow-wheel provided with twisted blades journaled in the sides of the mold-board at the center, a shaft journaled transversely in the forward upper edge of the said mold-board, small snow-wheels also provided with twisted blades attached to the extremities of the said shaft, and means, substantially as shown and described, for independently rotating the side wheels and the upper shaft carrying the small snow-wheels, as and for the purpose specified.

4. In a railroad snow-plow, the combination, with a box-like body containing a boiler and three independent engines and a triangular mold-board secured to the forward end of the said body, provided with concave sides and a concave forward cutting-edge, of a longitudinal shaft journaled in each side of the mold-board at the center, a hub secured to the outer extremity of each of said shafts, twisted spaced arms projected from the hub, and twisted blades detachably attached to the said arms, a single transverse shaft journaled in the forward end of the mold-board near the top, provided at each extremity with an attached snow-wheel provided with detachable twisted blades, and a connection, substantially as shown and described, between the several engines and the boiler and the several shafts and the several engines, as and for the purpose specified.

400,583. SELVAGE-SHEDDING DEVICE FOR HAND-LOOMS.



HUGH S. MCKEAN, Allegheny, Pa., assignor to Edward S. Wright, trustee, same place. Filed Oct. 25, 1888. Serial No. 289,066. (No model.)

Claim.—1. The combination, with the lathe, of two wires or cords at each side of the loom for carrying the selvage-threads, a hand-actuated device on the lathe, and connections therefrom to the selvage-thread wires or cords for operating said wires or cords, substantially as and for the purposes set forth.

2. In a hand-loom, the combination, with the lathe, of two wires or cords carrying the selvage-threads on each side of the loom, a slide mounted on the upper part of the lathe, and connections from said slide to said wires carrying the selvage-threads, substantially as and for the purposes set forth.

3. In a hand-loom, the combination, with the lathe *j'*, of the wires or cords *n* for carrying the selvage-threads, the shafts *l m*, on which they are mounted, the pulleys *o'* on the lathe, the slide-rod *r*, and the cords extending from said slide over said pulleys *o'* to shaft *l*, substantially as and for the purposes set forth.

400,583.

400,584. LAMP-EXTINGUISHER.

ALEXANDER E. MCLEOD, Hallock, Minn. Filed Mar. 26, 1888. Serial No. 268,493. (No model.)

Claim.—The combination, with the burner A, provided with the bracket G, of the sleeve C, fitting loosely on the wick-tube and provided with the pins D, the U-shaped plate E, apertured to receive the pins D and having its ends pivoted to the bracket G, and the forked rod I, pivoted on the pins D and extending downward through the top plate of the burner, substantially as herein shown and described.

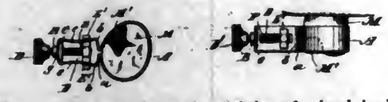
400,585. METHOD OF PROTECTING DENTAL FILLINGS.

DANIEL C. MCNAUGHTON, Jersey City, N. J. Filed Aug. 3, 1887. Serial No. 246,060. (No model.)

Claim.—The herein-described method of protecting a tooth and arresting decay without destroying the healthy part of the tooth, which consists in lining a band having free ends with a plastic or cement, passing said band about the part of the tooth to be protected, having previously removed any decay, and then drawing the band tightly in position and securing its free ends permanently together, the plastic or cement being interposed between the band and the tooth, substantially as hereinbefore set forth.

400,586. SYRINGE.

DANIEL C. MCNAUGHTON, Jersey City, N. J. Filed Sept. 3, 1888. Serial No. 284,445. (No model.)

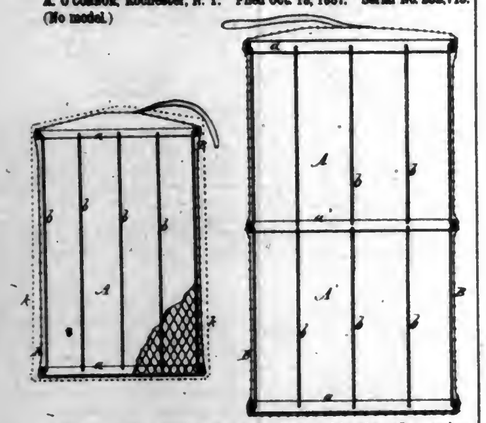


Claim.—1. A syringe having disposed therein a storage bottle or receptacle communicating solely with the exterior of the syringe, and in which a substance may be stored and from which it may be drawn, substantially as and for the purpose set forth.

2. The combination, with a flexible bulb, of a tube extending through the bulb and having a partition dividing the tube into a bottle and a nozzle, the bottle provided with a stopper and the nozzle communicating with the interior of the bulb, substantially as and for the purpose set forth.

3. The combination, with the flexible bulb 4, having the opening 5 for the nozzle, of the nozzle 7, extending through the opening 5, and formed with the opening 8, communicating with the interior of the bulb, and provided with the extension 9, which is attached to the bulb and acts to steady the nozzle under the compression and expansion of the bulb, substantially as and for the purpose set forth.

400,587. DENTAL MATRIX. CHRIST. A. MEISTER, Allentown, Pa. Filed Aug. 15, 1888. Serial No. 282,795. (No model.)



Claim.—1. A matrix for teeth, consisting of a band having a body for engaging a tooth, an integral extension of said band, consisting of slotted inclined side pieces, a cross-head engaged in the slots of said sides, and means for actuating the cross-head, substantially as described.

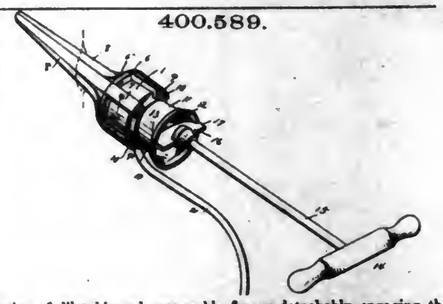
2. A matrix for teeth, consisting of a band having a body for engaging a tooth, an integral extension of said band, consisting of slotted inclined side pieces, the outer united ends of said extensions being provided with a screw-threaded opening, in combination with a screw-threaded stem having a cross-head swiveled thereto, said cross-head being mounted in the slots of the side pieces aforesaid, substantially as described.

3. A matrix for teeth, comprising a tooth-grasping band having extensions projecting from its adjacent ends, a nut between outer ends of said extensions, a cross-head sliding upon said extensions to force them toward and from each other, and thereby contract or expand the ring, and a screw passing through the nut into engagement with the cross-head, substantially as set forth.

400,588. FISHERMAN'S PAIL. CHARLES F. METHERD and JAMES A. O'CONNOR, Rochester, N. Y. Filed Oct. 18, 1887. Serial No. 252,715. (No model.)

Claim.—1. In a fisherman's pail, the combination of a spring frame consisting of heads and spring-wires connecting them, and a flexible reticulated covering to said frame, the whole forming a receptacle that can be collapsed by turning the upper head axially, as shown and described, and for the purpose specified.

2. In a fisherman's pail, the combination of a spring-frame consisting of heads and spring-wires connecting them, and a flexible reticulated covering to said frame, the heads being constructed with flanges, so that when the device is collapsed said heads will shut together in box form, as herein shown and described.



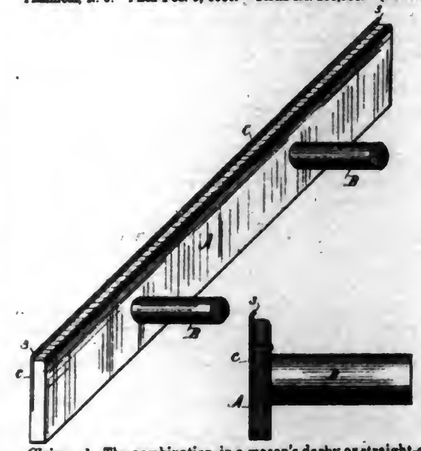
3. In a fisherman's pail, the combination of a spring-frame composed of two or more sections, each consisting of heads and spring-wires connecting them, and each folding independently, and a flexible reticulated covering to said frame, the whole forming a receptacle that can be collapsed by turning each section axially, the whole folding in compact form, as herein shown and described.

4. In a fisherman's pail, the combination of a collapsible spring-frame, a flexible covering inclosing the frame, and a water-proof bag inclosing both the frame and covering, in the manner and for the purpose specified.

400,589. SPECULUM. WILLIAM MOLESWORTH, Brooklyn, N. Y. Filed June 9, 1888. Serial No. 276,583. (No model.)

Claim.—1. The combination, with the dilatable fingers of a speculum, of removable shields, substantially as described.

2. A speculum consisting of a ring and supporting-handle, and a



400,589.

series of dilatable and removable fingers detachably engaging the ring, in combination with a tube having a screw-threaded connection with the ring and movable therein to operate the fingers, and a handle for screwing and unscrewing the tube and detaching and withdrawing the fingers, substantially as shown and described.

3. A speculum consisting of an internally-screw-threaded ring, 1, having rear projections, 10, lateral flange 5, with slots 6, and a handle for supporting ring 1, and a series of dilatable and detachable fingers, 8, with shanks 7, having holes 22, and slotted lips 9 engaging projections 10, in combination with tube 11, engaging screw-thread of ring 1, and having flange 12 with slots 13, and the detachable handle 14, with rod 13, having at its end a plate, 16, with lugs 17, and a projection, 20, with bent arm 21, substantially as shown and described.

4. In a speculum substantially as herein described, a dilatable and detachable finger, 8, in combination with shield 23, having a rounded surface and outer end, and a sleeve, 24, with which finger 8 is held in engagement, substantially as shown and described.

400,590. STRAIGHT-EDGE OR DARBY. EUGENE MOORE, North Plainfield, N. J. Filed Feb. 9, 1889. Serial No. 299,318. (No model.)

Claim.—1. The combination, in a mason's darby or straight-edge, of the wooden strip A, handles B, fastened to the back thereof, and the metallic strip C, attached upon the surface of the darby and forming one edge thereof, substantially as set forth.

2. The wooden straight-edge A, having the handles B projecting at the back thereof, and the metallic strip C, having one edge bent backwardly to form a rounding surface, and the strip of metal attached to the wooden straight-edge, the whole forming an improved mason's darby, substantially as set forth.

400,591. TELEPHONE-TRANSMITTER. WILLIAM J. MORTON, New York, N. Y. Filed Feb. 17, 1888. Renewed Feb. 7, 1889. Serial No. 299,068. (No model.)

Claim.—1. A telephone containing a fixed electrode having an opening, a movable electrode entering and loosely moving in said opening, an independently-vibrating support carrying said movable electrode, the said electrodes each having a surface disposed substantially in the same plane, and a mass of comminuted conducting material in contact with said surfaces, substantially as described.

2. A telephone containing a fixed electrode having an opening, a movable electrode entering and loosely moving in said opening, an independently-vibrating support carrying said movable electrode, the said electrodes each having a surface disposed substantially in the same plane, a mass of comminuted conducting material in contact with

400,591.

said electrodes, and a body of insulating material extending across the interval between said electrodes, but not attached to both electrodes, substantially as described.

3. A telephone containing an inclosing case or ring of insulating material, a plate-electrode supported therein, a diaphragm, an electrode projecting from said diaphragm and entering an opening in said plate-electrode, and contained within said case or ring a loose mass of comminuted conducting material in contact with said electrodes, substantially as described.

4. A telephone containing an inclosing case or ring of insulating material horizontally disposed and having a downwardly-inclined inner periphery, a horizontal plate or partition of conducting material having a central opening and secured at the lower portion of said case, a diaphragm supported below and parallel to said plate, a block of conducting material on the upper side of said diaphragm loosely entering said opening in said plate, and a mass of comminuted conducting material resting upon said block and said plate, substantially as described.

5. A telephone containing an inclosing case or ring of insulating material horizontally disposed and having a downwardly-inclined inner periphery, a horizontal plate or partition of conducting material having a circular central opening and secured at the lower portion of said case, a diaphragm supported below and parallel to said plate, a cylindrical block of conducting material on the upper side of said diaphragm and loosely entering said opening in said plate, a ring of insulating material resting upon said cylinder and said plate, and a mass of comminuted conducting material resting upon said cylinder and said plate, substantially as described.

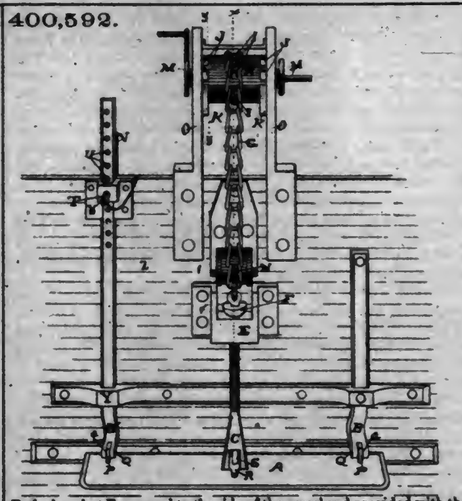
6. The combination of the ring or case A, carbon plate B, containing a central opening, diaphragm D, carbon cylinder E therein, loose ring F of non-conducting material, and a loose mass, G, of comminuted carbon in contact with said cylinder and said plate, substantially as described.

7. The combination of the ring or case A, carbon plate B, having a central opening, diaphragm D, carbon cylinder E therein, loose ring of non-conducting material, F, a mass, G, of comminuted conducting material in contact with said plate and said cylinder, and cover H, substantially as described.

8. The combination of the box M, hinged door L, having opening K, tube J, secured to said door, cup-shaped receptacle N, supported by said tube and having a central opening communicating with said tube, and the ring or case A, containing carbon plate B, having a central opening, diaphragm D, carbon cylinder E thereon, loose ring F of non-conducting material, and a mass, G, of comminuted conducting material in contact with said plate and cylinder, substantially as described.

400,592. FIN FOR VESSELS. GEORGE W. NAPIER, Los Angeles, Cal. Filed June 16, 1888. Serial No. 277,334. (No model.)

Claim.—1. In combination with the vessel, a fin pivotally secured to the side of the vessel by one edge, an arm pivotally secured to the fin near the other edge thereof, and mechanism for raising and lowering the arm.



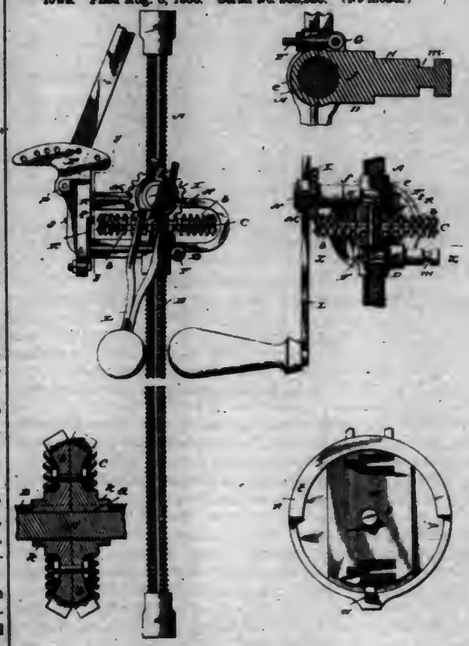
2. In combination with the vessel, the arm B, affixed thereto, the arm B', adjustably attached to the vessel, the fin A, pivotally attached to the arms B B', the rod C, hinged to the fin A, mechanism for raising and lowering the arm B', and mechanism for raising and lowering the rod C.

3. In combination with the vessel, the fin A, the arm B, fixed upon the side of the vessel and pivotally connected with one end of the fin, the arm B', connected with the other end of the fin and adjustably attached to the vessel, the rod C, attached to the fin, and mechanism for raising and lowering the rod C.

4. In combination with the vessel, the arm B, fixed upon the side of the vessel, the arm B', adjustably attached to the vessel, the fin A, pivotally attached near one edge thereof to the arms B B', the arm C, pivotally attached to the fin near the other edge thereof, and mechanism for raising and lowering the arm C.

5. In combination with the vessel, the arms B B', attached to the side of the vessel, the fin A, pivotally attached thereto, the rod C, pivotally attached to the fin and provided at its upper end with the head

400,592.



F, the bracket E, secured to the side of the vessel and provided with the hole D, the endless chain connected to said rod C, the drum provided with cogs I, and means for rotating the drum.

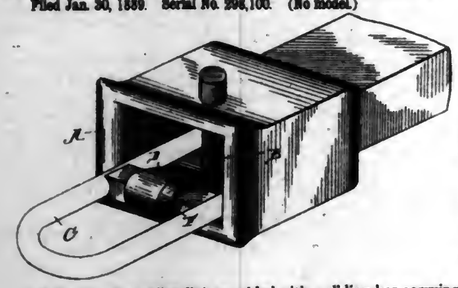
6. In combination with the vessel and with each other, the arms B B', attached to the side of the vessel, the fin A, pivotally attached thereto, the point of attachment being near one edge of the fin, the rod C, pivotally attached to the fin near the other edge thereof, the bracket E, embracing the rod C and secured to the side of the vessel, the endless chain passing over the pulley N and connected at one end to the rod C and at the other end to the drum H, provided with cogs I, and mechanism for rotating the drum.

7. In combination with the vessel and with each other, the arms B B', attached to the side of the vessel, the fin pivotally attached thereto, the point of attachment being near one edge of the fin, the rod C, pivotally attached to the fin near the other edge, the bracket E, embracing the rod C and secured to the side of the vessel, the endless chain passing over the pulley N and connected at one end to the rod C and at the other end to the drum H, provided with the cogs I, and at each end with the peripheral notches J, pawls engaging therewith, and mechanism for rotating the drum.

400,593. COAL-DRILLING MACHINE. JOSEPH NOICE, What Cheer, Iowa. Filed Aug. 8, 1888. Serial No. 282,223. (No model.)

Claim.—1. The bracket P, having the fixed disk R, which is provided with a central aperture, and also having a semicircular flange, as *l*, in combination with the fixed clamp-section having a fixed head or plate, E, also perforated, and having its edge adapted to engage the flange of said disk, a bolt for pivotally connecting the said head with the disk, and the pivoted clamping-jaw adapted to co-operate with the rigid jaw in sustaining a drive-gear, substantially as specified.

2. The clamp composed of the rigid jaw *e*, having the internally-threaded portions *g*, separated by an interspace, in combination with the pivoted jaw, also having threaded portions *g*, separated by an interspace, and both jaws having corresponding recesses *i* to form journal-boxes, the sectional gear C, having annular grooves *k*, to enter the said boxes in the clamping-jaws, the said jaws also having journals to receive a beveled pinion, whereby motion may be imparted to the main drive-gear, substantially as specified.



3. The pinion I, having an extension, M, and also having a journal-aperture, said pinion also having one or more apertures traversing the journal-aperture, in combination with the hinge-clamp, each section of which is provided with a journal having a groove, whereby the operating-handle may serve as a means of securing a pinion to either of the journals, substantially as specified.

4. In a coal-drilling machine, the combination, with the hinge-clamp comprising a rigid and a pivoted jaw, said jaws being respectively provided with the threaded portions *g* and the journal-boxes *i*, of the main drive-gear, comprising two separable sections secured together, and having the extensions, as *k*, and the spline *d*, substantially as specified.

5. In a coal-drilling machine, the combination, with a clamp constructed as described and provided with the two journals, of a pinion having an extension provided with apertures to receive a crank-arm, and the journals, also having a groove to receive the said arm, and suitable means for securing the arm to the pinion, substantially as specified.

400,594. CAR-COUPLING. WINFIELD S. PALMER, Glenburn, Pa.

Filed Jan. 30, 1889. Serial No. 298,100. (No model.)

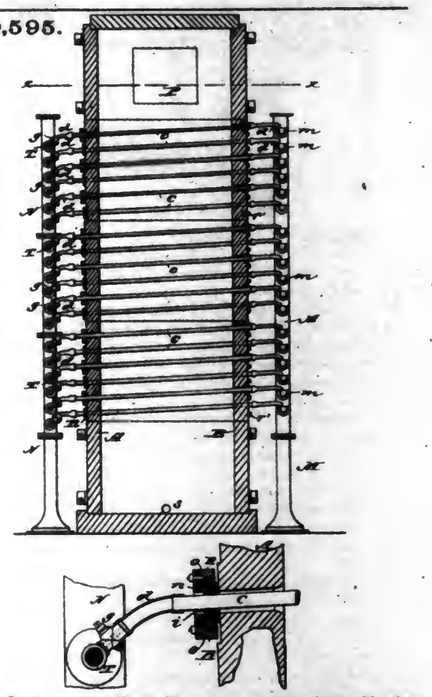
Claim.—1. A coupling-link provided with a sliding bar carrying a supporting-tongue, as set forth.

2. The combination, with the coupling-link, of the transverse sliding bar within the same, having concave ends engaging the sides of the link, and the tongue loosely mounted on said bar and adapted to bear against the floor of the draw-head, as set forth.

3. The combination, with the coupling-link of the transverse bar composed of two sections loosely connected, the supporting-tongue carried by said bar, and the cushion to hold the bar in engagement with the link, as set forth.

4. The bar or shaft E, having the pivoted tongue D, as set forth.

5. The bar or shaft E, having the pivoted tongue D, oval-shaped in outline, as set forth.



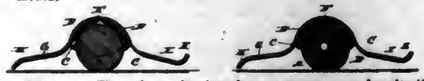
400,595. REFRIGERATING-TOWER. ALFRED R. PECHINEY, Salindres, France, assignor to Weldon's Chlorine Processes Company, (Limited,) Burstow, England. Filed July 14, 1887. Serial No. 244,291. (No model.) Patented in France Apr. 25, 1885, No. 163,507; in England May 18, 1885, No. 6,066; in Belgium May 26, 1885, No. 69,011; in Germany May 31, 1885, No. 34,397, and in Austria-Hungary Aug. 18, 1885 No. 21,753.

Claim.—1. The combination, with the tower, of cooling-tubes extending transversely through the walls thereof, each tube having a separate supply-connection exterior to the outer walls of the tower, whereby any tube may be removed and replaced without interfering with the flow through any other tube, substantially as set forth.

2. The combination, with the tower and the series of cooling-tubes extending transversely through its walls, of a vertical water-supply column outside of the tower, a series of transverse pipes communicating therewith, and separate valved connections leading from a pipe to each tube of the adjacent series, substantially as set forth.

3. The combination, with the tower A B, of the tubes *c*, packing *i*, bar R, and glands *n*, held to the bar R by screws *o*, substantially as described.

400,595.



4. In an apparatus for cooling gases or vapors, the combination of the following elements, viz: tower A B, tubes *c c*, column N, pipes T, stop-cocks *g*, and tubes *d*, substantially as described.

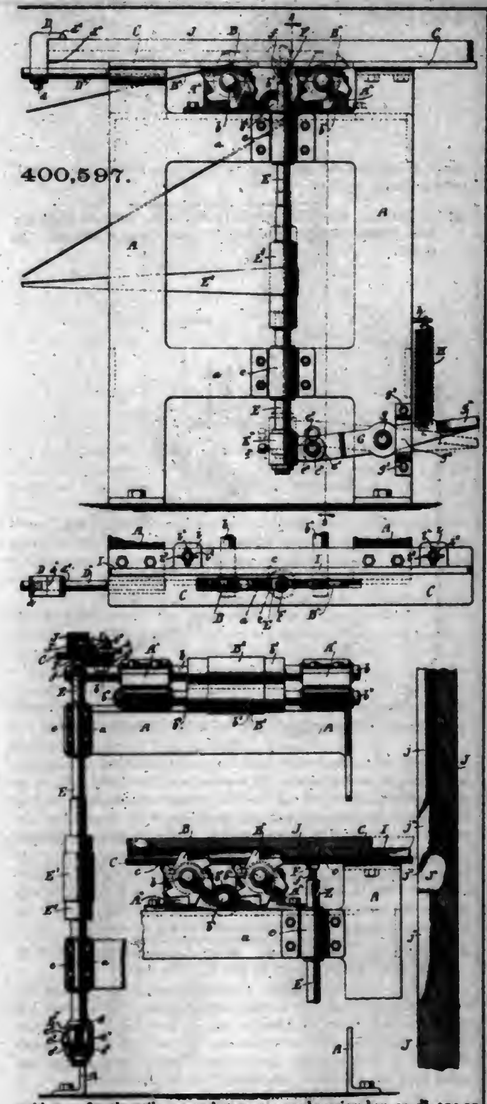
5. In an apparatus for cooling gases and vapors, the combination of the following elements, viz: tower A B, tubes *c c*, column N, pipes T, stop-cocks *g*, tubes *d* and *d'*, and column M, supporting gutters *m*, substantially as described.

6. The combination, with the tower, of the transverse cooling-pipes extending therethrough with their delivery or outlet ends higher than their inlet ends, whereby the pipes when supplied will be always completely filled, substantially as set forth.

400,596. PARALLEL-RULER. NIEL S. PHELPS and CHARLES L. ELLER, Eureka, Cal. Filed Oct. 26, 1888. Serial No. 289,570. (No model.)

Claim.—1. The ruler A, having the concavo-convex longitudinal central portion, F, the bearings at the ends of said portion F, the downwardly-curved sides G I, extending in opposite directions from portion F, the said side G having the downwardly-inclined straight edge H, and said side I having the upwardly-curved straight edge K, and the cylindrical roller arranged under the portion F and having journals at its ends mounted in the bearings of the ruler, substantially as described.

2. The ruler A, having the concavo-convex longitudinal central portion, F, and the downwardly-curved sides G I, the former having the downwardly-inclined straight edge H and the latter having the upwardly-curved straight edge K, substantially as described.



3. The blank rectangular in shape and of suitable length and width, and having the extensions B at its ends provided with the openings D and the salient-angle portions C, the latter and said extensions B being divided by aligned longitudinal slits E, substantially as described.

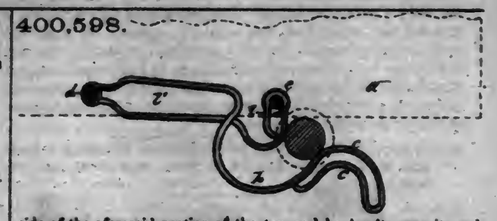
4. The ruler having the concavo-convex central portion, F, the overlapping end portions, B, having the aligned openings D, and the lips C, the latter being clinched on the overlapping portions B to secure the same together, in combination with the cylindrical roller having its journals engaging the openings B, substantially as described.

400,597. MACHINE FOR GROOVING WINDOW-SASH. FRANCIS V. PHILLIPS, Chicago, Ill., assignor to the Chicago Sash Pulley Company, same place. Filed July 9, 1888. Serial No. 278,361. (No model.)

Claim.—1. In a machine for grooving and recessing window-sash stiles at one operation, the combination of a table provided with a

400,597.

guideway for the stile, an end-stop, an overhanging lug, as *d*², one or more rotating groove-cutters in the path of the stile, and a recessing-tool movable into and out of the path of the stile, substantially as and for the purposes specified.



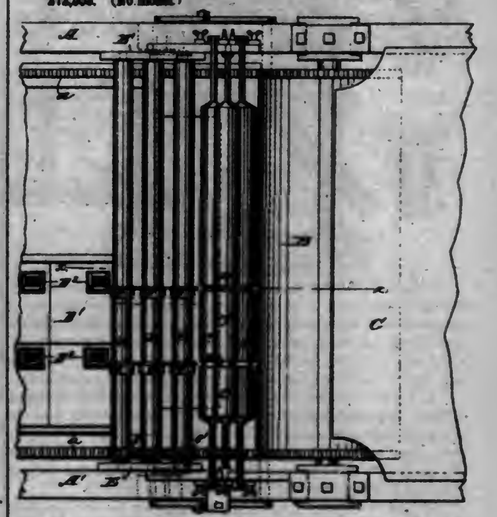
2. In a machine for grooving and recessing window-sash stiles at one operation, the combination of a stile-guide, two grooving-cutters of unequal thickness mounted in line with each other in the path of the stile, and a recessing-cutter movable sidewise with respect to the path of the stile into and out of said path, substantially as described.

3. The combination of a table, revolving groove-cutters B B', a stile-guide adjustably secured to the table, an adjustable end-stop having a projection which overhangs the path of the stile, a recess-cutter supported by a neck which is narrower than the cutter itself and is arranged between the cutters B B', a rotating and lengthwise-movable shaft carrying the recess-cutter at its end, and a foot-lever connected to said shaft for giving lengthwise movement thereto, substantially as specified.

400,598. HOLDER FOR UMBRELLAS OR ANALOGOUS ARTICLES. ANDREW C. PORTER, Utica, N. Y., assignor of one-half to Charles W. Higgins, same place. Filed Dec. 17, 1888. Serial No. 293,796. (No model.)

Claim.—1. In combination with the projecting portion of the top of a counter or stand, a clasp pivoted at one end to the under

400,598.



side of the aforesaid portion of the top and having its opposite end adapted to swing outwardly therefrom, a stop for limiting the said movement of the clasp, and an arm on said clasp adapted to grasp between it and the edge of the counter or stand the article to be held, substantially as set forth.

2. In combination with the projecting portion of the top of a counter or stand, a clasp pivoted at one end to the under side of the aforesaid portion of the top, and provided at the opposite end with an arm adapted to grasp the article to be held, and provided between its ends with a transverse slot, and a stop passing through said slot and secured to the aforesaid portion of the top, substantially as described and shown.

3. As a new article of manufacture, the within-described holder A, formed of a continuous piece of spring-wire bent at one end into the elongated loop *l*, thence into the elongated loop *l'* at right angles to the loop *l*, thence into the outward bow, *b*, and thence into the reversed bow *c*, and terminated with the end *d* bent back along the side of the latter bow, substantially as described and shown.

400,599. NUMBERING ATTACHMENT FOR PRINTING-PRESSES. TUNIS ROBERTSON, New York, N. Y. Filed May 2, 1888. Serial No. 272,553. (No model.)

Claim.—1. The combination, in a printing-press, with impression-cylinder, the bed, the numbering-heads, and their operating mechanism, of an auxiliary depressor or actuator in the path of the said head-operating mechanism to actuate it independently of the impression-cylinder, substantially as set forth.

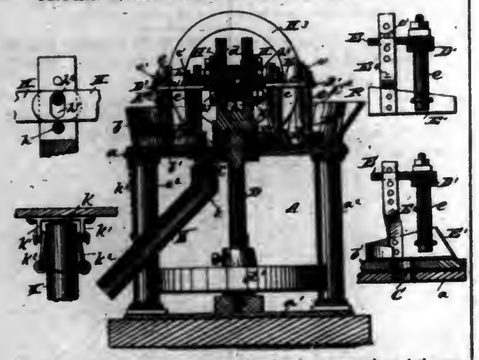
2. The combination, in a printing-press, with the impression-cylinder, the bed, the numbering-heads, and their operating mechanism, of auxiliary depressors or actuators in the path of said head-operating mechanism, and mechanism, substantially as described, for automatically moving one of the said depressors or actuators out of the path of the head-operating mechanism as the bed is moved in one direction, substantially as set forth.

3. In a printing-press, the combination, with numbering-heads, their operating mechanism, and the impression-cylinder, of a series of transverse depressing-rolls journaled in advance of said cylinder, substantially as and for the purposes specified.

4. In a printing-press, the combination, with the numbering-heads, their operating mechanism, and the impression-cylinder, of a series of transverse depressing or actuating rollers to one side of the cylinder in the path of the said head-operating mechanism, vertically-movable bearings for one of said rollers, and a cam for automatically raising said bearings and the roller carried thereby when the numbering-heads are moved away from the cylinder, substantially as set forth.

5. In a printing-press, the combination, with numbering-heads provided with unite-wheels, and a plunger operating the same, of a series of depressing-rolls journaled in advance of the cylinder, and collars upon said rolls engaging the plunger of numbering-heads, one of said rollers being vertically movable, and a cam for automatically raising said roller when the heads are carried away from the cylinder, as and for the purposes specified.

400,600. INSULATING PIPE-COUPLING. FREDERICK C. ROCKWELL, Hartford, Conn. Filed Jan. 26, 1889. Serial No. 297,650. (No model.)



Claim.—1. The herein-described pipe-coupling, consisting of a tubular core of rigid material and an exterior body of insulating material, the ends of the dielectric body being threaded to receive the ends of pipes, as specified.

2. The herein-described pipe-coupling, consisting of a cylindrical metallic core with an exterior body of insulating material compressed around the core, as specified.

3. The herein-described pipe-coupling, consisting of a perforated metallic core, *a'*, a body, *a''*, of insulating material, and an integral insulating-diaphragm, *d*, substantially as specified.

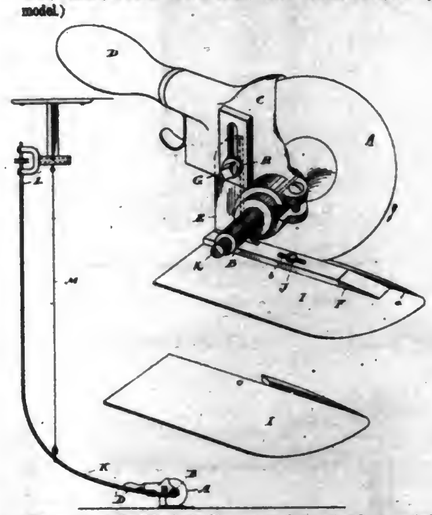
400,601. ORE-CRUSHER. JACOB RODERMOND, New York, N. Y. Filed Mar. 17, 1888. Serial No. 267,495. (No model.)

Claim.—1. The combination, with the ore-receptacle and the vertical shaft bifurcated at its upper end, of the axles H, overlapped at their inner ends and having vertical aligned slots *k'*, the bolt h^3, passed through the said bifurcated end and slots, a second bolt, *h*, below the bolt *k'*, and on which the under sides of the slotted ends of the axles rest, and the crushing-rollers on said axles, substantially as set forth.

2. The combination, with the ore-receptacle, the crushing-rollers, and their operating-shaft, of a horizontal arm, D', projecting from the said shaft, a plate, E, secured to the said arm at an angle thereto, the vertical rod *e*, depending from arm D', and the shovel on the lower end of said rod and having a vertical plate, E^3, extending up through the plate E and secured thereto, substantially as set forth.

3. The combination, with the ore-receptacle, the vertical shaft and the crushing-rollers, of the horizontal arms D', projecting from said shaft between the rollers, the vertical spaced rods *e*, having shovels on their lower ends and extending at their upper ends through the arms D', the slotted plates E, adjustable horizontally on said upper ends, and the apertured vertical plates E^3, extending from the shovels up through the slots in plates E, and the securing-pins *e'*, substantially as set forth.

4. The combination, with a receptacle having an open top and outlet-aperture, a spout therefor, a chute suspended from the bottom of the receptacle, engaging the spout, a vertical shaft journaled in the receptacle, provided with a bifurcated upper end, and crushing-rollers provided with independent axles pivoted in the bifurcated shaft end, of opposing horizontal arms secured to the shaft between the rollers, and adjustable shovels carried by said arms, adapted to follow the rollers, substantially as and for the purpose specified.

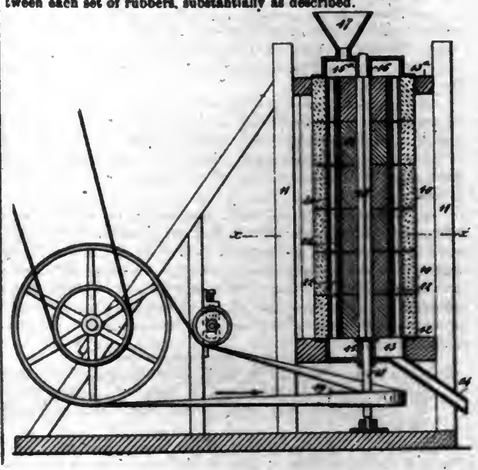


400,602. GAS OR VAPOR BURNER FOR HEATING. OTTO ROTTH, Brooklyn, N. Y. Filed Nov. 7, 1887. Serial No. 254,463. (No model.)

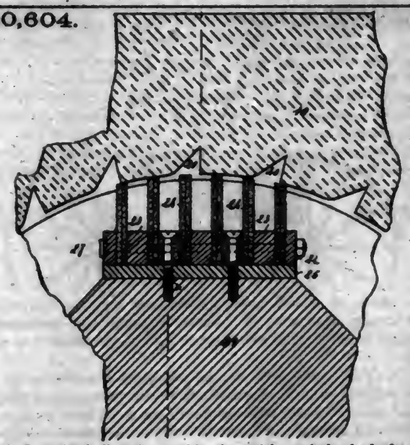
Claim.—In an apparatus for burning gas or hydrocarbon vapor, the combustion plate or burner herein described, consisting of a disk composed of a ring or band and a fagot of parallel fine wires or pieces of metal, through the interstices of which the vapor or gas

passes, and on the end surfaces of which ignition takes place, substantially as herein set forth.

400,603. MACHINE FOR CUTTING CLOTH. RICHARD SCHOFIELD, Paris, Ontario, Canada. Filed Feb. 27, 1888. Serial No. 265,397. (No model.)



Claim.—1. A flexible shaft, K, connected at one end to a spindle, L, deriving a rotary motion from some suitable motor, and at its other end to a spindle, B, of the disk A, and suitably supported, as described, in combination with the elastic band M, arranged to support the flexible shaft K, substantially as and for the purpose specified.

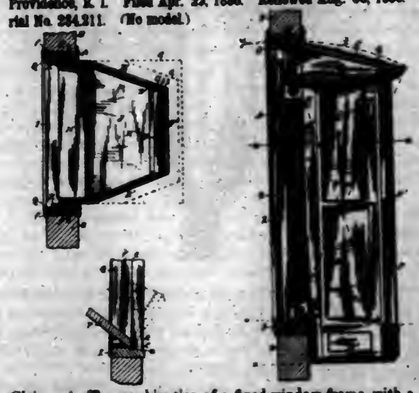


2. The combination, with the foot F and the standard E, of the bracket C, adjustably connected to said standard, the plate I, adjustably connected to said foot and formed with ledge *a*, forming a support for the cloth on the side of the disk opposite that on which the cloth is supported by the said foot, substantially as described.

400,604. RICE-HULLER. HENRY SCHOLFIELD, New York, N. Y. Filed Mar. 12, 1888. Serial No. 266,955. (No model.)

Claim.—1. In a rice-huller, the combination, with a tubular sectional body provided with vertical angular grooves, of a rotary hub within the body, a series of flexible and spaced rubbers, each section being secured in an arc of a circle to the hub and extending the length of one of the body-sections, and a series of guide-plates arranged between each set of rubbers, substantially as described.

400,604.



2. In a rice-huller, the combination, with a tubular body formed of a series of stone cylinders having vertical angular grooves, a rotary polygonal hub within the body, a series of flexible and spaced rubbers, each section being secured in an arc of a circle to the several sides of the said hub and extending the length of one of the cylinders, and a series of guide-plates between the several sets of rubbers and extending to within a short distance of the inner wall of the body, substantially as described.

3. The combination, with a body consisting of a series of cylindrically-bored stones the inner walls whereof are provided with a series of angular vertical grooves, of a spindle revolving in said body, a sectional polygonal hub secured to the spindle, a series of rubbers detachable connected to the hub-sections, provided with spaced leather blades, having their ends adapted to the inner contour of the body, deflecting or guide plates intervening the abutting ends of the rubbers, and means, substantially as shown and described, for laterally adjusting the rubbers, as herein set forth.

4. In a rice-huller, the combination, with a hub, of a series of strips, 23, of hard material, blades 24, of leather, inserted between the said strips, the blocks 26, inserted between the said strips and the hub, and screws for securing the whole to the hub, substantially as herein shown and described.

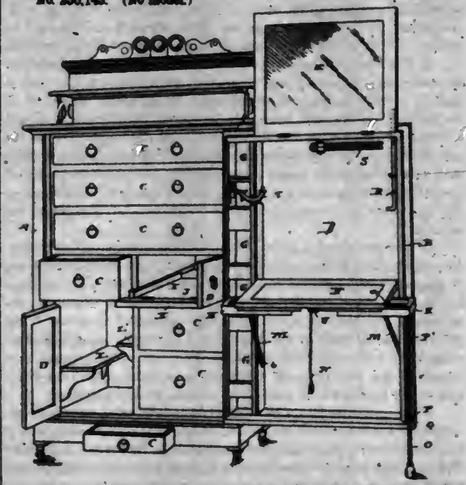
400,605. REMOVABLE BAY-WINDOW. SOLOMON SCHOLFIELD, Providence, R. I. Filed Apr. 22, 1886. Renewed Aug. 30, 1888. Serial No. 284,211. (No model.)

Claim.—1. The combination of a fixed window-frame, with a removable bay-window, comprising a window-light or sash-holding frame, floor, and roof or ceiling in one structure, and having when in its normal position in the window-frame a vertical height greater than the shortest distance between the window-stool and the head-rail of the opening for the bay-window, and being also adapted for a tilting inward movement from its normal position under the head-rail, substantially as described.

2. The combination of a fixed window-frame with a removable bay-window, comprising a window-light or sash-holding frame, floor, and roof or ceiling in one structure, which is adapted for a tilting inward movement from its normal position in the window-frame, the lowest point or extension of the removable bay-window being located below a horizontal plane extending outward from the upper surface of the window-stool, substantially as described.

3. The combination of a fixed window-frame, with a removable bay-window comprising a window-light or sash-holding frame, floor, and roof or ceiling in one structure, and having its extreme outward and downward diagonal measurement in a vertical plane greater than the extreme outward and upward diagonal measurement of the same, the former distance being greater than the distance between the window-stool and the head-rail of the opening for the bay-window, and the latter less than the same, and also being adapted for a tilting inward movement upon a fulcrum from its normal position under the head-rail, substantially as described.

400,606. TENSION DEVICE FOR WIRE FENCES. DWIGHT H. SCOTT, Flora, Dak. Filed June 27, 1888. Serial No. 278,311. (No model.)

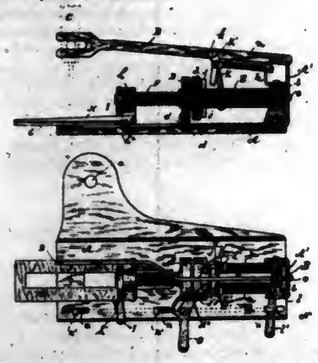


Claim.—1. A wire-tension device consisting of a single piece of wire bent to form an essentially U-shaped body, an outwardly-extending lip integral with the extremity of one member, and an outwardly and oppositely extending arm integral with the other member terminating in a hook at right angles to the arm, substantially as shown and described.

2. As an improved article of manufacture, a wire-tension device comprising two parallel arms of approximately equal lengths connected by an integral bow, the upper end of one arm having an outwardly and oppositely extending arm integral therewith, whereby the bow may be inserted in a suitable wrench and the wire twisted about both of said arms throughout their lengths, substantially as set forth.

3. A wire-tension device, A, consisting in the bow-shaped section a^2, having its ends drawn in or contracted, and the members *a a'*, extending from said point of contraction in parallel lines, the outward-projecting lip *b* at the free end of one arm, and the arm *b'*, extending from the other member and terminating in a hook, B, substantially as set forth.

400,607. COMBINATION FOLDING SECRETARY AND DRESSER. ANDREW SHIELDS, Grand Rapids, Mich. Filed Sept. 19, 1887. Serial No. 250,143. (No model.)



Claim.—1. The combination, with the door B, of the folding leaf F, an eye, U, thereon, a brace to support said leaf in its raised position, and a cord, N, connected with the brace and passing through the eye, substantially as described.

2. In an article of compound furniture, the combination, with a case, A, of the door or portion B, hinged to said case, the mirror E, hinged at its lower edge to the upper edge of said door or portion B, so as to be folded downward flat upon the door and to be turned upward into a plane parallel to or coincident with that of the door, and means for locking the same in open position, substantially as and for the purposes explained.

3. The case A, provided with drawers C and a large recess for the reception of a wash-bowl, the wash-bowl stand consisting of the piece J, provided with cleats I, placed and adapted to slide in the lower portion of said recess, and the hinged piece K, and an independent door, D', hinged at the side of said recess, whereby the opening may be closed, substantially as shown.

400,608. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. GEORGE D. SPIELMAN, Cincinnati, Ohio. Filed Oct. 24, 1887. Serial No. 253,170. (No model.)

Claim.—1. The combination of the base-plate, the laterally-adjustable perforated standard, the male and female screws passing through the standard, a cloth-carrier connected to the male screw, a cam secured upon the female screw and engaging a part of the standard, whereby a lateral vibratory movement is imparted to the feed-screws and cloth-carrier when the female screw and its cam are revolved, and means, substantially as shown, to impart an intermittent rotary motion to the cam and female screw, substantially as set forth.

2. The combination of the base-plate, the laterally-adjustable perforated standard carrying lugs, the feed-screws E and F, passing through the standard, a cloth-carrier connected to one of the screws, a wheel mounted upon the other feed-screw, and having a cam on one face engaging the lugs on the standard and projections on the other face, and suitably-actuated pawls engaging such projections.

3. The combination of the base-plate, the perforated standard, the feed-screws E F, arranged to vibrate laterally in said standard, the cloth-clamp connected to the forward end of the screw F, and means suitable for connecting the screw E to the needle-bar, whereby an intermittent rotary motion is imparted to the screw E and a lateral vibratory motion to both screws and the clamp, substantially as specified.

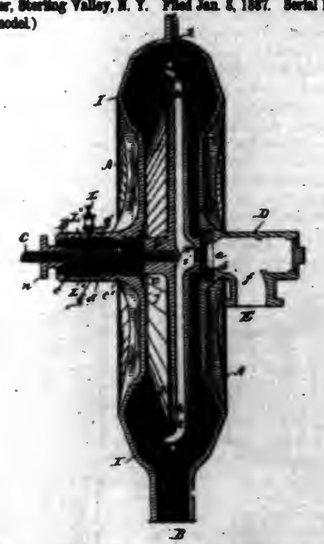
4. The combination of the base-plate and laterally-adjustable perforated standard having lugs projecting from it, the feed-screws E and F, passing through the standard, a cloth-carrier connected to the screw F and screw E, having its forward bearing in said standard, a wheel mounted upon the female screw, and having a cam on one face to engage the lugs on the standard and projections on the other face, suitably-actuated pawls engaging such projections, the pin d^3, projecting from the standard, and the slotted cam-lever O, pivoted on the base-plate and engaging said pin to change the position of the standard.

5. The combination of the base-plate, the laterally-adjustable perforated standard D and stationary standard A', the feed-screws E and F, passing through the standard D, the screw E having a pivotal bearing in the stationary standard and lateral play in its bearing in the adjustable standard D, the cloth-carrier connected to screw F, the vibrating bar pivoted in standard A' and having its opposite end arranged for connection with the needle-bar, and suitable means connected to the vibrating arm to impart an intermittently rotary motion to the feed-screw E, substantially as shown and described.

6. The combination of the base-plate and vibrating and longitudinally-reciprocating feed-screws, a cloth-carrier connected to one of said screws and a wheel mounted upon the other feed-screw, said wheel having projections, a vibrating arm actuated by the needle-bar and pawls depending from said arm and engaging said projections, the pivoted chair, and spring-links connecting said chair and the pawls, said chair having a lateral extension, whereby the chair is turned to bring the pawls alternately into and out of engagement with the projections on the feed-screw wheel, substantially as hereinbefore set forth.

7. In a button-hole attachment, the combination of the vibrating and longitudinally-reciprocating feed, the vibrating bar and its dependent pawls, the pivoted chair, and spring-links connecting the pawls and chair, said chair having a lateral extension, the sliding bar having an upper slotted extension to receive the extension of the chair, said sliding bar having also upwardly-extending lugs x' x', projecting through slots in the base, and the cloth-clamp having a lateral extension to alternately engage said lugs to change the feed from forward to backward movement, and vice versa, substantially as shown and described.

400,609. SIDE CURTAIN FOR BUGGIES. JOSEPH W. THOMAS, Sargent, Nebr. Filed Nov. 19, 1888. Serial No. 291,221. (No model.)



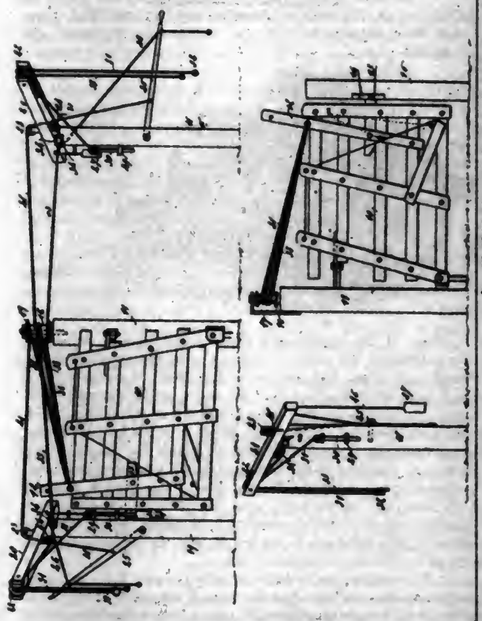
Claim.—1. In side curtains for buggies and other like vehicles, the curtain constructed of independent upper and lower sections adapted for separate or united use, as desired, substantially as specified.

2. In side curtains for buggies and other like vehicles, the curtain constructed of independent upper and lower sections provided with a series of button-holes along their upper and lower margins, and constructed the one to overlap the other when applied to the buggy or vehicle, essentially as shown and described, and for the purpose herein set forth.

3. In side curtains for buggies and other like vehicles, the combination, with the vehicle, of the independent upper and lower curtain-sections, D D', arranged the one to overlap the other, and constructed each with a series of button-holes, *b*, along their upper and lower margins, essentially as specified.

400,610. WATER-MOTOR. FREDERICK W. TUBBS, Jr., Syracuse, N. Y., assignor of two-thirds to James G. Hunter, same place, and John Hunter, Sterling Valley, N. Y. Filed Jan. 5, 1887. Serial No. 223,726. (No model.)

Claim.—1. A case for a water-motor, provided on its interior with an annular inclined plate forming a water passage or duct at one side of the case, and with a peripheral shield the inner edge of which projects toward said plate, so that water thrown on said shield will be directed into said duct, substantially as described.



2. In a water-motor, the combination, with the case and rotary hollow hub and radial arms, of an annular ductor-block fitted in the open side of the case between it and the open hub for directing the water thereto and preventing it from entering the portion of the case in which said arms move, substantially as described.

3. In a water-motor, the combination, with the case and rotary hollow radial water-conducting arms, of an annular ductor-block in the case at the inlet sides of the said arms, and an annular shield projecting from the peripheral portion of the interior of the case toward the path of the discharge ends of the aforesaid arms, substantially as and for the purpose set forth.

4. In a water-motor, the combination, with the rotary hollow water-conducting arm, of a discharge nozzle on the free end of said arm and deflected laterally therefrom, a valve in the said nozzle, a lever hinged on the aforesaid arm and carrying the valve, and a spring connected with said lever and arranged to normally sustain the valve in its open position, substantially as described and shown.

5. The combination of the case N, provided with the water-passages 1 1, intermediate port, 2, hub 3, projecting into said port and provided with the screw-threaded socket 4 and opening 9 in the side of the case, the strainer 5, spanning the port 2 and seated upon the hub 3, and the cap 6, having the screw-threaded stem 7 entering the socket 4, and having also the shoulder 8, bearing on the portion of the strainer resting on the hub, substantially as described and shown.

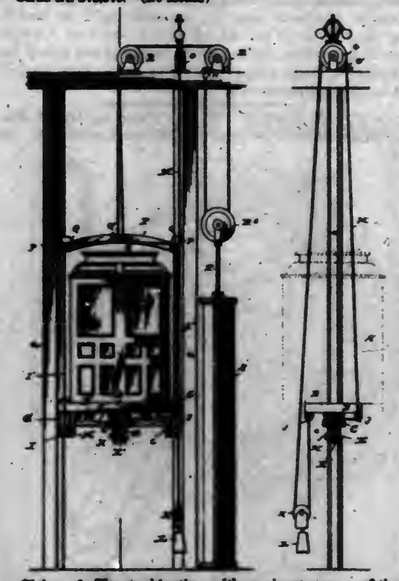
400,611. GATE. THOMAS TYBUS, Mound City, Mo. Filed June 4, 1888. Serial No. 276,015. (No model.)

Claim.—1. The combination, with a gate-post provided with pulleys upon the upper end and a gate having its upper hinge forward of the vertical line of the lower hinge and adapted to open in two directions, of a standard at each side of the gate-post, a lever pivoted to said standards, a rope or chain attached to the levers, passing over the pulleys and secured to opposite sides of the latch-bar, a latch pivotally secured to said bar, a latch-pin vertically supported upon the standards in line of the said latch, and a rope attached to said latch-pin and supported from the standards, by means of which the latch-pin may be raised out of operative contact with the latch, as and for the purpose described.

2. The combination, with a gate-post provided with pulleys upon the upper end, a gate having its upper hinge forward of the vertical line of the lower hinge and adapted to open in two directions, and a latch-bar pivoted to said gate and extending above the same, of a standard at each side of the gate-post, a lever pivoted to each standard, a rope or chain attached to each lever, passing over the pulleys on the gate-post and secured to opposite sides of the latch-bar, a latch pivotally secured to said bar, a latch-pin vertically supported upon the standards in line of the horizontal movement of the said latch, and a rope attached to said latch-pin and supported from the standards, by means of which the latch-pin may be raised out of operative contact with the latch, as and for the purpose specified.

3. The combination, with a gate-post provided with pulleys upon the upper end, a gate having its upper hinge forward of the vertical line of the lower hinge and adapted to open in two directions, and a latch-bar pivoted to said gate, extending above the upper end, of a standard at each side of the gate-post, a counterbalanced lever pivoted to each standard, a rope or chain attached to each lever, passing in opposite directions over the pulleys on the gate-post, and secured to opposite sides of the gate-latch bar, a latch pivotally secured to said bar, a latch-pin vertically supported upon the inner side of each standard in line of the horizontal movement of said latch, and a rope attached to each latch-pin and supported from the standards, by means of which the latch-pin may be raised out of operative contact with the latch, as and for the purpose specified.

400,612. STOVE. FREDERICK VEIL, Allegheny, Pa. Filed Sept. 26, 1888. Serial No. 286,276. (No model.)



Claim.—1. The combination of an open grate, an upwardly-tapering zigzag flue supported on said grate, and a metallic casing in which said grate and flue are located and which constitutes a closed air-chamber around the zigzag flue, substantially as and for the purpose specified.

2. In a stove, the combination of an open grate, an upwardly-tapering zigzag flue supported thereon, and a metallic casing in which said parts are located, said casing being formed in two sections and having a shelf between them, substantially as and for the purpose specified.

3. In a stove, the combination of an open grate, a flue or uptake leading therefrom, a metallic casing in which said parts are located, and a downdraft space which connects the chamber inclosing the uptake with the ash-pit, substantially as and for the purpose specified.

4. In a stove, the combination of a basket grate, a tapering uptake, and a metallic casing inclosing the same, the grate being suspended within the casing, so as to form a posterior air-flue leading from the casing to the rear of the grate, substantially as and for the purpose specified.

400,618. ELEVATOR. ISAAC H. VEIL, Yonkers, N. Y., assignor of one-half to Hiriam G. W. Bartlett, same place. Filed May 2, 1888. Serial No. 272,573. (No model.)

Claim.—1. The combination, with an elevator-cage, of the brake, a sheave-nut movable upon a screw, connections between the said nut and brake to move and apply the latter as the nut is moved, an endless governor-rope passing around the said sheave-nut, and a governor which may arrest the movements of the rope, substantially as described.

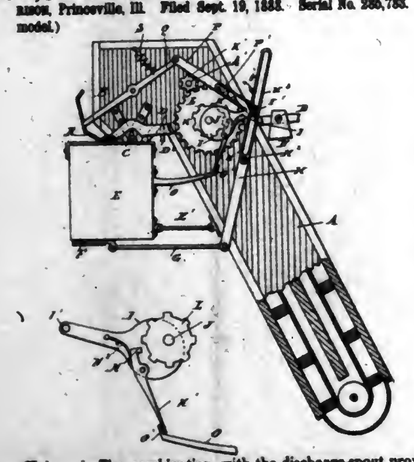
2. The combination, with an elevator-cage, of the brake, an endless governor-rope, a governor to retard the motion of the rope upon an undue increase in the speed thereof, a sheave on the cage normally stationary and around which the rope is wound, but to which it is not secured, whereby the rope is caused to move with the cage when traveling at normal speeds, but turns the sheave when the cage travels too rapidly, and connections between the said sheave and brake, whereby upon the rotation of the former the latter are applied, substantially as described.

3. The combination, with an elevator-cage, of the brake, a sheave-nut, connections between the said nut and the brake, a governor, and a governor-rope extending from the governor to the sheave-nut, which latter forms the sole connection between the rope and the cage, substantially as described.

4. The combination, with an elevator-cage movable between the upright bars *a*, of brakes arranged loosely between the said bars and

the cage, the levers C, fulcrumed to the cage and pivoted at their outer ends to the brakes, and having their inner ends arranged in proximity to a screw-stud, E, a sheave-nut, D, mounted upon the stud and resting upon the inner ends of the levers, a spring which holds the levers against the nut, the governor-rope passing around the sheave-nut, and the elevator-governor, substantially as described.

400,614. COLUMNAR CLOSET. EMMA H. WATSON, Elizabeth, N. J. Filed Oct. 31, 1888. Serial No. 289,610. (No model.)

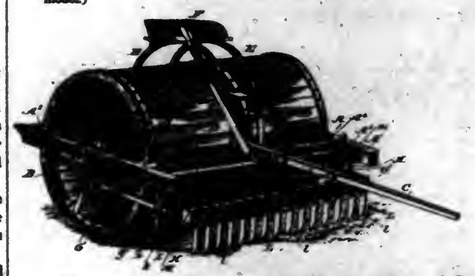


Claim.—1. A columnar closet in the form of an obelisk with an uneven number of sides, one or more of the sides being hinged to form a door, the inner sides of the door and column being provided with a series of pockets to contain flat articles, and the two sides adjacent to the edges of the door being inclined toward one another at their rear edges to facilitate the exposure of the pockets fixed thereon, substantially as herein set forth.

2. A columnar closet in the form of an obelisk having three equal sides, one of the sides being hinged to form a door, and all the inner sides of the column, including the door, being provided with pockets, as and for the purpose set forth.

3. The columnar closet consisting in the hollow obelisk formed with an uneven number of sides, the pyramidal cap E, the head K, separating the interior of the cap and obelisk, the door D, hinged at one side of the obelisk, and the lid F, formed of one side of the cap and having its hinge arranged at a different side from the door D, as and for the purpose set forth.

400,615. GRAIN-METER. VALENTIN WEBER and JAMES R. HARRISON, Princeville, Ill. Filed Sept. 19, 1888. Serial No. 285,783. (No model.)

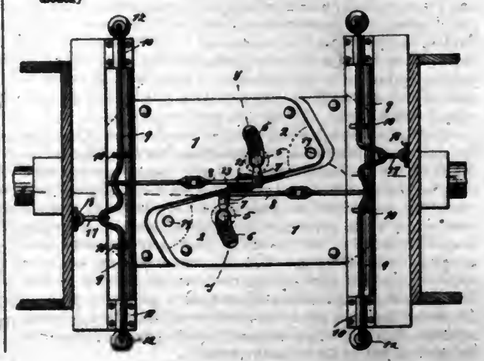


Claim.—1. The combination, with the discharge-spout provided with a gate, the grain-box under the spout and having a gate at its lower end, and the scale-beam supporting the box, of the toothed wheel, a crank-arm mounted on the axle of said wheel, a pawl pivoted to said arm, a spring pressing the pawl into engagement with said toothed wheel, an arm projecting from the grain-box and having a lug to engage the outer end of the pawl, an arm pivoted between its ends and operated by said crank-arm, and connections between the pivoted arm at opposite sides of its pivot and said gates, substantially as set forth.

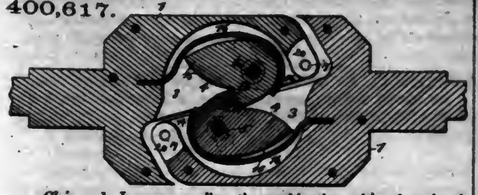
2. In a tripping device for grain-weighing machines, the combination, with the gate for the discharge-spout, the gate for the grain-box, and a toothed wheel having a rotary motion, of a tripping-pawl adapted to engage the said toothed wheel, an arm secured to the grain-box and having a lug adapted to engage the said tripping-pawl, a crank-arm fulcrumed on the axle of the said toothed wheel and carrying the said tripping-pawl, and slotted arms connected with the said crank-arm and operating, respectively, the gate for the grain-box and the gate for the discharge-spout of the elevator, substantially as shown and described.

3. In a tripping device for grain-weighing machines, the combination, with the gate for the discharge-spout, the gate for the grain-box, and a toothed wheel having a rotary motion, of a tripping-pawl adapted to engage the said toothed wheel, an arm secured to the grain-box and having a lug adapted to engage the said tripping-pawl, a crank-arm fulcrumed on the axle of the said toothed wheel and carrying the said tripping-pawl, a spring held on the said crank-arm and pressing against the said tripping-pawl to throw the latter in contact with the toothed wheel when the said lug disengages the said tripping-pawl, and slotted arms connected with the said crank-arm and operating, respectively, the gate for the grain-box and the gate for the discharge-spout of the elevator, substantially as shown and described.

400,616. HARROW ATTACHMENT FOR LAND-ROLLERS. JAMES W. WEIR, Princeton, Ind. Filed Dec. 7, 1888. Serial No. 292,944. (No model.)



Claim.—1. The combination, with the main frame A, the axle B, journaled therein, the rollers D, mounted on said axle, arched bars E, secured to the frame and extended over the rollers D, and the driver's seat F, mounted on said bars over the rollers, of the harrow attachment G, disposed below the frame in advance of the rollers D, said attachment consisting of the harrow-bar H, provided with depending harrow-teeth, carrier-arms G' G', secured to said bar, extended rearwardly and journaled on the axle B, as shown, a flexible connection, N, secured at one end to the bar, and a bell-crank lever, O, mounted at its lower end on the front beam of the frame, its crank end connected with the flexible connection N, its handle portion extended upward in close proximity to the driver's seat, all arranged substantially as and for the purpose described.



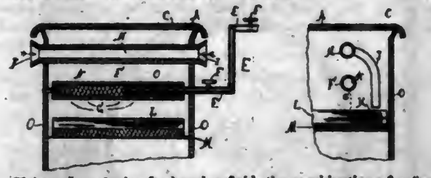
2. The combination, with the frame A, the axle B, the rollers D, mounted thereon, and the adjustable stops K, secured to the frame, as shown, of the harrow attachment G, disposed below the frame and in advance of the rollers, said attachment consisting of a transverse bar, H, having depending harrow-teeth, carrier-arms G', secured to said bar and adapted to rest in the stops *k* and extending upwardly and rearwardly, the upper ends, *g*, of which are journaled upon the axle B, as shown, and a flexible connection between the harrow-bar and the front end of the frame, substantially as and for the purposes described.

3. The herein-described attachment for land-rollers, consisting of the transverse bar H, provided with depending harrow-teeth having curved and sharpened front edges, angle-plate connections I, secured one at each end of said bar to the rear side thereof, and carrier-arms G' G', the lower ends, *g'*, thereof secured to the arms *i* of the plates I, all arranged substantially as and for the purpose hereinbefore described.

400,617. CAR-COUPLING. ISAAC L. WHEDDON and JULIAN S. RAMAW, Chipley, Fla. Filed June 13, 1888. Serial No. 277,155. (No model.)

400,617.

Claim.—1. In a car-coupling, the combination, with a draw-head, of a spring-actuated catch mounted in the draw-head to have a laterally sliding and rotary movement, substantially as described.



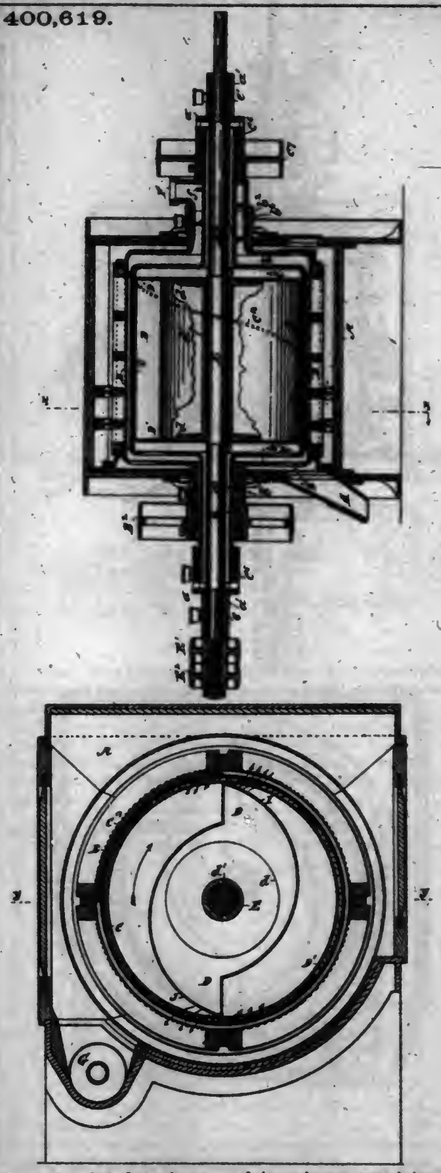
2. In a car-coupling, the combination, with the draw-heads having overlapping portions, of laterally sliding and rotary catches mounted in the said draw-heads, and springs for holding the catches in engagement, substantially as herein shown and described.

3. In a car-coupling, the draw-heads 1, formed with the inclined overlapping portions 2, having recesses 3, the rotary catches 4, mounted on pins 5, having their ends located in inclined slots 6 in the top and bottom of draw-heads 1, and formed with shoulders 13, oval portion 14, and projection 15, the reacting-spring 16, extending over the side of projection 15 and oval portion 14, and the crank-rods 9, with weighted crank-handles 11 at the sides of a car, and rods 8, connecting crank-rods 9 with arms 7 on pins 5, substantially as described.

4. In a car-coupling, the draw-heads 1, formed with recess 20 and hole 19 at their outer ends, and with the overlapping inclined portions 2, having recesses 3, the rotary catches 4, mounted on pins 5, having their ends located in curved slots 6 in the top and bottom of draw-head 1, and formed with shoulder 13, oval portion 14, and projection 15, the reacting-springs 16, extending over the side of projection 15 and oval portion 14, the rods 8, connecting arm 7 on pins 5 with crank-rods 9, and the operating-rod 17, connected with crank-rod 9 and extending to the top of a car, substantially as described.

5. In a car-coupling, the draw-heads 1, formed with the inclined overlapping portions 2, having vertical recesses 22 in their abutting surfaces, recesses 3, with rotary catches 4, mounted on pins 5, having their ends located in inclined slots 6 in the top and bottom of draw-heads 1, and formed with shoulders 13, oval portion 14, and projection 15, the reacting-spring 16, extending over the side of projection 15 and oval portion 14, and the crank-rods 9, with weighted crank-handles 11 at the sides of the car, and rods 8, connecting crank-rods 9 with arms 7 on pins 5, substantially as shown and described.

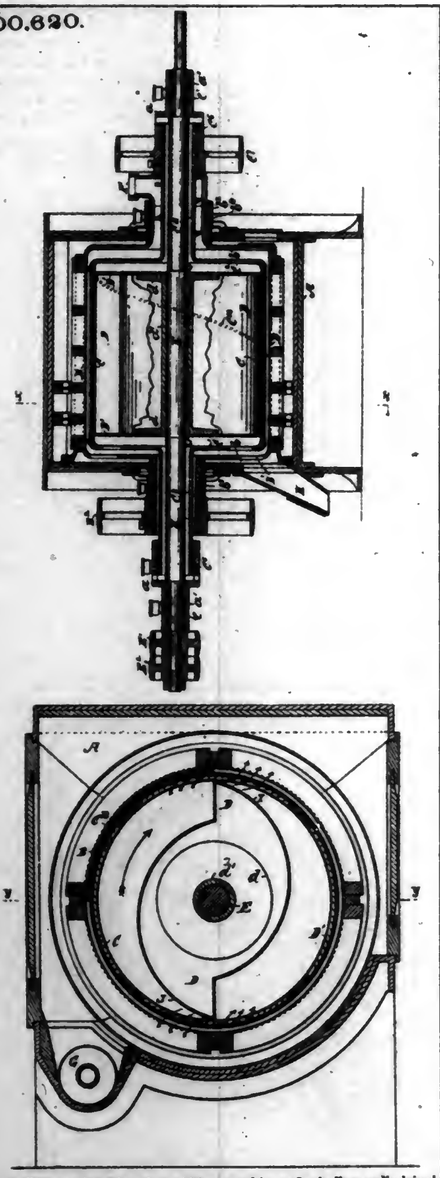
400,618. DEVICE FOR BURNING FLUIDS. WILLIAM H. WIBGARDNER, Chicago, Ill., assignor to Margaret R. Flagg, same place. Filed Aug. 27, 1887. Serial No. 248,090. (No model.)



Claim.—In a device for burning fluid, the combination of a furnace with a pan therein, said pan provided with a lining or coating of indestructible material, a deflector above the surface thereof and within said pan, an air-supply pipe extending entirely through and above the furnace and provided with downwardly-curved discharge-pipes which discharge said air against said deflector, a fluid-supply pipe extending across said furnace beneath the air-supply pipe filled with a non-combustible material and provided with discharge-apertures along its lower edge, and a pipe leading from the oil-reservoir and discharging within such discharge-pipe so that the fluid to be consumed drops from the apertures in the discharge-pipe into the pan where it is burned, the heat thereof heating the air as it is supplied, substantially as and for the purpose specified.

400,619. METHOD OF SIFTING GRANULAR MATERIAL. FRIEDRICH G. WINKLER, Zschoppau, Saxony, Germany, assignor to Robert R. Lester, New York, N. Y. Filed Aug. 24, 1887. Serial No. 247,705. (No model.) Patented in Germany Apr. 3, 1886, No. 38,576, July 8, 1886, No. 40,257, and Oct. 22, 1886, No. 39,709.

Claim.—The herein-described method of sifting flour or other granular material through a sieve or bolting-cloth forming the curved wall of a cylindrical drum, which consists in the subjection of all parts of such sieve or bolting-cloth, and hence the subjection of all portions of the granular material contained within the sieve or bolting-cloth, successively to the influence alternately of a relatively-strong current of air moving transversely outward through a prescribed area of the sieve and a relatively-weak current of air moving transversely inward through a larger area of the sieve.

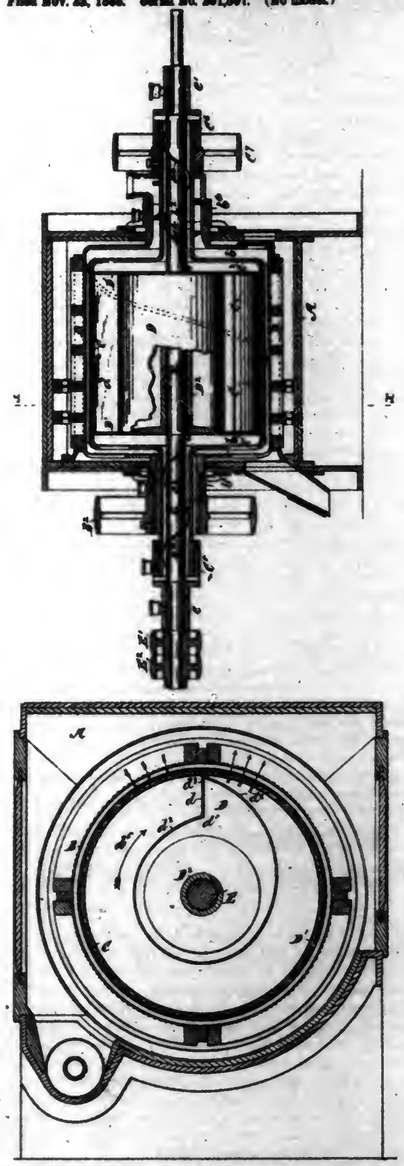


400,619.

400,620. ROTATING WAVE-GENERATING SIFTER. FRIEDRICH G. WINKLER, Zschoppau, Saxony, Germany, assignor to Robert R. Lester, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,542. (No model.) Patented in Germany July 8, 1886, No. 40,207, and Oct. 22, 1886, No. 39,709; in Sweden Aug. 27, 1887, No. 1,627; in Luxemburg Aug. 30, 1887, No. 883; in Norway Sept. 1, 1887, No. 670; in France Sept. 1, 1887, No. 170,762; in Belgium Sept. 1, 1887, No. 73,745; in England Sept. 1, 1887, No. 11,881; in Finland Sept. 13, 1887, No. 268; in Italy Sept. 30, 1887, No. 18,970; in Portugal Nov. 3, 1887, No. 1,186; in Austria-Hungary Feb. 13, 1888, No. 34,417; in Spain Apr. 30, 1888, No. 12,425; in India May 1, 1888, No. 10, and in Argentine Republic May 30, 1888, No. 654.

Claim.—1. The combination, in a sifting-machine, of a hollow cylindrical sieve, a rotating wave-generator within said sieve, and an annularly-arranged system of deflecting-bars interposed between the path of motion of the wave-generator and the interior surface of the said cylindrical sieve, substantially as set forth.

400,620.



2. The combination, in a sifting-machine, of a hollow cylindrical sieve, a rotating wave-generator within said sieve, and a rotating deflecting-grate composed of an annularly-arranged system of deflecting-bars interposed between the path of motion of the rotating wave-generator and the interior surface of the said cylindrical sieve, substantially as set forth.

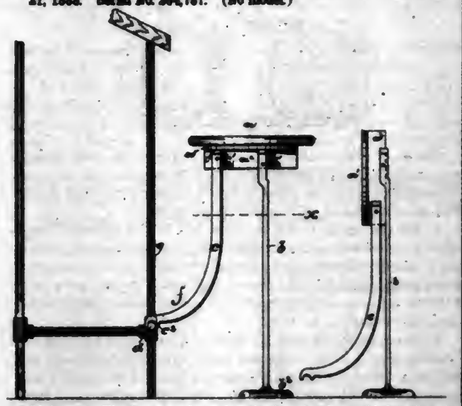
3. The combination, in a sifting-machine, of a rotating hollow cylindrical sieve, a rotating wave-generator within said sieve, and an annularly-arranged system of deflecting-bars interposed between the path of motion of the wave-generator and the interior surface of the said cylindrical sieve, substantially as set forth.

4. The combination, in a sifting-machine, of a rotating hollow cylindrical sieve, a rotating wave-generator within said sieve, and a rotating deflecting-grate composed of an annularly-arranged system of deflecting-bars interposed between the path of motion of the wave-generator and the interior surface of the said cylindrical sieve, substantially as set forth.

5. The combination, with a hollow cylindrical sieve, of a rotating wave-generator consisting, essentially, of two parallel disks affixed to a central shaft and of partitions or fans extending longitudinally across the wave-generator from one of said disks to the other, whereby there are established in said generator longitudinal spaces or pockets open only toward the periphery of the wave-generator, substantially as set forth.

400,621. SIFTING-MACHINE. FRIEDRICH G. WIESLER, Bischoppau, Saxony, Germany, assignor to Robert H. Lester, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,697. (No model.)

Claim.—1. The combination, with a cylindrical sieve, of a single rotating wave-generator for continuously propagating a single wave of air around the entire circumference of said cylindrical sieve, the said generator consisting, essentially, of two parallel disks affixed to a central shaft and of a fan extending inwardly from one side of the periphery of the generator, and extending longitudinally across the generator from one of said disks to the other.



2. In combination with a cylindrical sieve and means for establishing outward and inward currents of air through said sieve, a hollow cylindrical deflecting-grate composed of a system of slats inclined diagonally with relation to the radial lines, which centrally intersect them, respectively, and shaped in cross-section substantially as described, whereby the widths of the outer ends of the spaces between the slats are prevented from exceeding the widths of the inner ends of the said spaces.

3. The combination, as herein set forth, of the hollow hubs C^3 and C^4, of the cylindrical deflecting-grate and the spiral blades c^2 and c^3, affixed to the portion of the fan-shaft E which is surrounded by the said hubs, respectively.

400,622. PROCESS OF DEPHOSPHORIZING IRON ORE. THOMAS F. WITHERBEE, Port Henry, N. Y. Filed Dec. 22, 1887. Serial No. 259,257. (No specimens.)

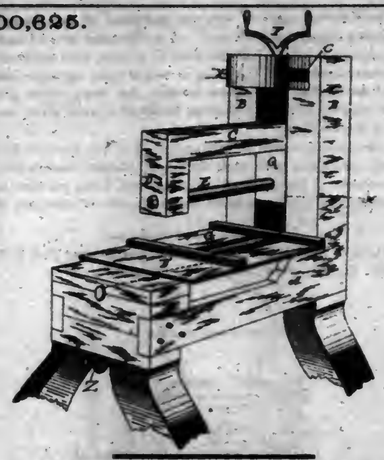
Claim.—The process of dephosphorizing iron ore, which consists in mechanically separating apatite or phosphorus-holding compounds from iron ore, then dissolving the remaining small percentage of apatite with dilute sulphuric acid, and finally washing the ore with water, substantially as described.

400,623. SEAT. GUSTAVE J. WOLBER, Newark, N. J. Filed Feb. 21, 1888. Serial No. 264,787. (No model.)

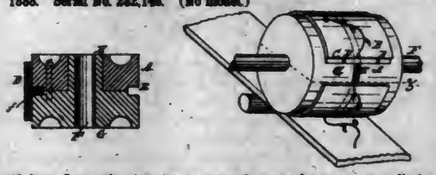
Claim.—1. The improved seat herein described, combining therein a seat, *a*, having pivotal bearings, a rear leg, *b*, pivoted on said bearings, and short legs *c c*, extending forward and having on their under side depending fingers c^2 c^2, adapted to hold the legs to said bar when said legs rest on said bar, substantially as and for the purposes set forth.

2. In combination with a seat, *a*, pivotal legs *b* and *c*, having lateral extensions b^2 at their upper extremities, c^2, adapted to engage the under side of the said seat to give greater firmness to said seat, the forward extremities of said legs being adapted to engage the raised fixture *d* and to hold the same, substantially as and for the purposes set forth.

400,624. SATCHEL ATTACHMENT. JOHN A. YARGER, New Hampton, Iowa. Filed Feb. 6, 1887. Serial No. 226,642. (No model.)



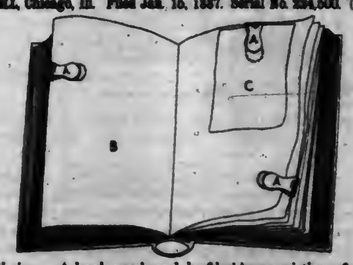
Claim.—The described attachment for satchels, consisting of a base-plate having a loop formed upon one side for the attachment of the strap and a pin on its upper surface adapted to engage with the perforations on the other end of the strap, suitable guiding-flanges on each side, and a hinged cover under spring-tension having ears projecting from its rear part, substantially as described.



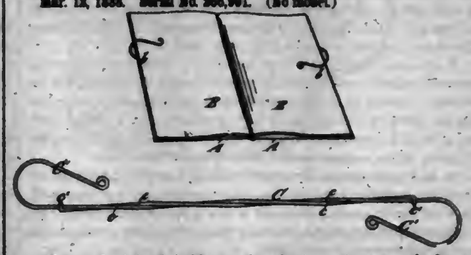
400,625. MACHINE FOR ORNAMENTING WOOD, &c. EDWARD W. ALLISON, Minneapolis, Minn. Filed Aug. 7, 1888. Serial No. 282,145. (No model.)

Claim.—In machines for ornamenting wood, the arm C, provided with the depending guide Q, carrying the ribs K K and the depending portion D, and each depending portion provided with a bearing for the shaft E and the die Y thereon, in combination with bed A and standards B B at the sides of the guide portion Q, with grooves therein to engage the ribs K, the table D', and roller G, projecting through it, the screw I, gears *b c*, and lever F, as and for the purpose specified.

400,625.



400,626. TWO-PART CYLINDER AND DIE FOR ORNAMENTING WOOD, &c. EDWARD W. ALLISON, Minneapolis, Minn. Filed Aug. 7, 1888. Serial No. 282,146. (No model.)

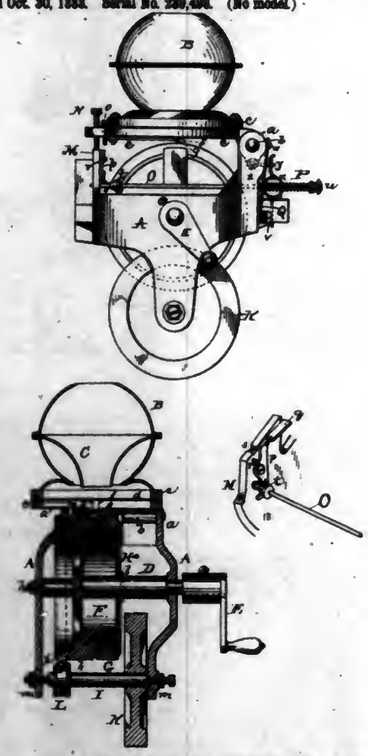


Claim.—In mechanism for ornamenting wood, a two-part cylinder consisting of the part G, provided with the hub H, and the part A, placed on the said hub, and the part G, with its hub H, provided with a continuous bearing for a supporting-shaft, and the periphery of the cylinder provided with an annular groove between said parts, in combination with a segment-die, B, provided with a rib engaging said groove and fastened at one end to the two-part cylinder, as specified and shown.

400,627. BOOK-LEAF OR PAPER HOLDER. EDWARD P. ARNELL, Chicago, Ill. Filed Jan. 16, 1887. Serial No. 224,500. (No model.)

Claim.—A book-mark and leaf-holder consisting of a piece of flat metal bent or folded to form two lips of unequal length, the shorter lip curved upwardly and the longer lip flat, as described.

400,628. BOOK-HOLDER. WILLIAM H. ASH, Brooklyn, N. Y. Filed Mar. 12, 1888. Serial No. 266,991. (No model.)



Claim.—1. A book-holder made of wire and composed of two portions having a sliding connection with each other, each of said portions at its outer end being bent into the form of a hook, the connections between the two portions preventing the rotation of the two portions relatively to each other, substantially as specified.

2. A book-holder made of wire and composed of two portions having a sliding connection with each other, the outer ends of each of said portions being bent into the form of a hook, said hooks extending toward each other, but being arranged upon opposite sides of the book-holder, the connections between the two portions preventing the rotation of the two portions relatively to each other, substantially as specified.

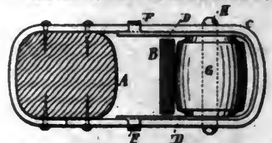
3. A book-holder made of wire composed of two portions having a sliding connection with each other, said portions intermediate of their connections being twisted together and being provided at their outer ends with bent portions forming hooks, substantially as specified.

400,629. PHONOGRAPH. CHARLES BATCHELOR, New York, N. Y. Filed Oct. 30, 1888. Serial No. 289,498. (No model.)

Claim.—1. In a phonograph, the combination of a revolving phonogram, a movable reproducer in contact therewith, means for feeding said reproducer forward by the revolution of the phonogram, a catch for holding said reproducer at the end of its movement, a tripping device for said catch, and a spring for returning the reproducer to its original position, substantially as set forth.

2. In a phonograph, the combination of a revolving phonogram, a movable reproducer in contact therewith, means for feeding said reproducer forward by the revolution of the phonogram, a catch for holding said reproducer at the end of its movement, a tripping device for said catch, a spring for returning the reproducer to its original position, and means for raising the reproducer off the record during such return movement, substantially as set forth.

3. In a phonograph, the combination of a revolving phonogram, a movable reproducer in contact therewith, means for feeding said reproducer forward, a spring for returning said reproducer, a guide-plate for the forward motion of the reproducer, and a device operated by hand for raising said reproducer off the record and guide-plate during its return movement, substantially as set forth.



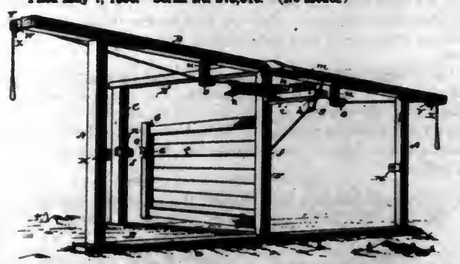
4. In a phonograph, the combination of a revolving phonogram, a movable reproducer whose reproducing-point has a hooked end, means for feeding said reproducer forward by the movement of the phonogram, and means for returning said reproducer to its original position, substantially as set forth.

5. In a phonograph, the combination of a revolving shaft, a shell mounted thereon, a ring placed on said shell and bearing a sound-record, a spiral thread on another portion of said shell, a movable reproducer whose reproducing-point engages said sound-record, and a tooth carried by the reproducer engaging said spiral thread, substantially as set forth.

6. In a phonograph, the combination of a revolving phonogram, a movable reproducer, means for feeding said reproducer forward by the revolution of the phonogram, a catch for holding said reproducer at the end of its movement, a spring for returning said reproducer to its original position, and a sliding rod for tripping said catch, substantially as set forth.

7. In a phonograph, the combination of a revolving shaft, a shell mounted thereon, a ring placed on said shell and bearing a sound-record, a clamp for securing said ring on said shell, a spiral thread on another portion of said shell, a movable reproducer whose reproducing-point engages said sound-record, and a tooth carried by the reproducer engaging said spiral thread, substantially as set forth.

400,630. TRACE-LOOP FOR VEHICLES. OSCAR V. BLAHER, Gillette, N. J. Filed Nov. 6, 1888. Serial No. 290,097. (No model.)



Claim.—1. The combination, with the shaft, of the loop projecting inwardly and nearly horizontally, and a roller within the loop, and a vertical pivot-pin for the roller passing through the loop, and against which the trace passes, substantially as set forth.

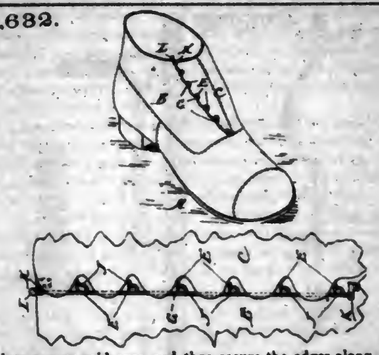
2. The combination, with the shaft, of a loop of leather or other flexible material attached to the shaft and projecting inwardly, a metal plate within the loop and bent to a corresponding shape, cross-bars or fastenings for connecting the plate to the leather, a roller, and a vertical axis for the same within the plate, and against which roller the trace passes, substantially as set forth.

3. The combination, with the shaft, of a horizontal and inwardly-projecting loop, a roller within the outer curvature of the loop, said roller being enlarged or bulging in the middle, and a vertical axis passing through the loop and through the roller, substantially as set forth.

400,631. SWINGING GATE. TILDEN R. BRODT, Brodtville, Wis. Filed May 7, 1888. Serial No. 273,016. (No model.)

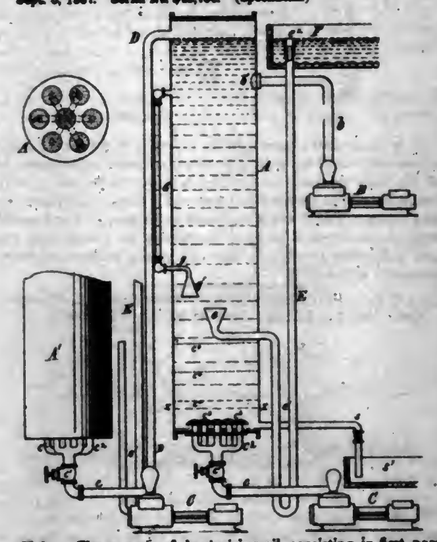
Claim.—1. In a swinging gate, the combination, with the posts A and cross-beam B, of the post C, the gate having the outer post, G, and the extended inner post, F, which is pivoted in the beam B and in a suitable base, the spring-latch C on the outer post of the gate, a wire, *t*, attached to said latch and extending through the post F, an arm, *i*, extending out from the post F near its top, a lever, *g*, centrally pivoted in the outer end of the arm *i*, pulleys on the arm in the rear of the lever, the brackets *u* on the beam B, having pulleys mounted thereon, pulleys on the ends of the beam B, the ropes, and catches on the posts A and C, substantially as described.

2. The combination of the posts A A and C, having catches H, the cross-beams B B', the gate consisting of posts F and G, connected by boards or wires, the spring-catch *c*, the wire *t*, lever *g*, arm *i*, hood *n*, pulleys *m*, fish-tail piece *z*, brackets *u* and *v*, pulleys *o* and *x*, and ropes or wires for operating the lever *g*, substantially as herein set forth.



3. The combination, with the posts A and C and the beam B, of the gate-post F, having arm *i* extending therefrom, the lever *g*, centrally pivoted in the end of the arm, its arms being above and below the arm *i*, respectively, the latch on the gate, the flexible connection between the same and the lever *g*, the pulleys on the arm and ends of the beam, and the catches on the posts A and C, substantially as described.

400,632. SHOE. PAUL CASPARY, Chicago, Ill. Filed Dec. 14, 1888. Serial No. 293,645. (No model.)



Claim.—1. A shoe having on one of its engaging edges a series of eyes and on the other a movable rod provided with a series of hooks adapted to engage said eyes, and thus secure the edges along their lengths, and keepers or guides in which the rod reciprocates.

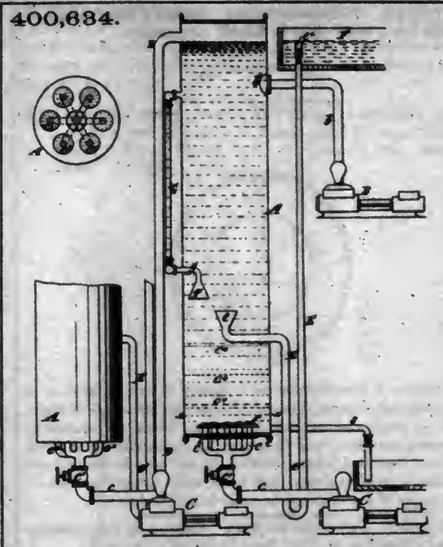
2. A shoe having on one of its engaging edges a series of eyes and on the other a movable rod provided with a series of upwardly-turned hooks adapted to engage said eyes, and thus secure the edges along their lengths, and keepers or guides in which the rod reciprocates.

400,632.

400,633. METHOD OF REFINING AND DEODORIZING COAL OIL OR PETROLEUM. FRANCIS M. F. CAZIN, New York, N. Y. Filed Sept. 3, 1887. Serial No. 248,756. (Specimens.)

Claim.—The process of deodorizing oil, consisting in first passing the same in a finely-divided state through water; second, passing the same through an alkaline solution; third, passing the same through a solution of a salt of a heavy metal; fourth, passing the same through a solution of sulphuric acid; fifth, passing the same through an alkaline solution and ultimately washing the same, substantially as herein described.

400,634. APPARATUS FOR REFINING PETROLEUM. FRANCIS M. F. CAZIN, New York, N. Y. Filed Aug. 29, 1887. Renewed Feb. 6, 1889. Serial No. 299,938. (No model.)



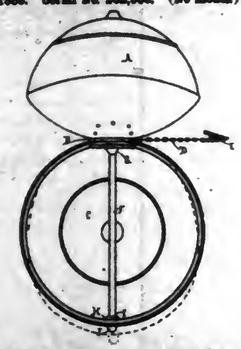
Claim.—1. The combination, with a series of upright vessels provided each with a water-supply pipe and with a water-overflow leading upward from a point between its ends and terminating at a point near its top, of an oil-supply pipe leading to the bottom of the first vessel, an oil-overflow pipe leading from each vessel at a point at about the level of the water-overflow to the bottom of the next vessel in the series, and distributers in the lower part of each vessel, whereby the entering oil is finely divided or diffused prior to its ascent through the water in the vessel, substantially as herein described.

2. The combination, with an upright vessel having a water-supply pipe and an oil-supply pipe leading to its lower part, of a water-overflow pipe leading from a point between the ends of the vessel, first downward and thence upward to a point near the top of the vessel, thus forming a loop to permit the oil entering the pipe with the water to escape back to the vessel by reason of its lighter specific gravity, oil-distributers arranged in the lower part of the vessel, whereby the entering oil is finely divided or diffused prior to rising through the water, and an oil-overflow pipe at about the level of the water-overflow, substantially as herein described.

3. The combination, with an upright vessel having a water-supply pipe, and an oil-supply pipe leading to its lower part and communicating by several branches with its bottom, of oil-distributers covering the outlet ends of said branches, and screens placed one above another in the lower part of the vessel and of gradually-increasing fineness from the bottom up, a water-overflow extending from the vessel between its ends and terminating at a point near the top of the vessel, and an oil-overflow leading from the vessel at about the level of the water-overflow, substantially as herein described.

4. The combination, with the upright vessel A, a water-supply pipe, *b*, leading to its upper part, and an oil-supply pipe, *c*, leading to its lower part, and oil distributers or diffusers in the vessel above the oil-inlet, of the oil-overflow pipe D, the water-overflow pipe E, leading from the lower part of the vessel and of gradually-increasing fineness from the bottom up, a water-overflow extending from the vessel between its ends and terminating at a point near the top of the vessel, and an oil-overflow leading from the vessel at about the level of the water-overflow, substantially as herein described.

400,634.



400,635. TEA-KETTLE. CHARLES E. COATS, Chicago, Ill. Filed Feb. 21, 1888. Serial No. 264,769. (No model.)

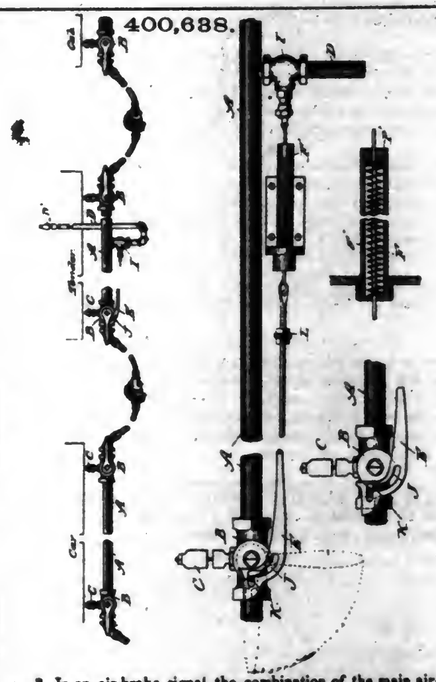
Claim.—1. In a tea-kettle, a hanger provided with a float which closes the spout-opening, and a steam-exit tube extending downward near one side of the kettle, and an alarm to indicate when the water has receded to a predetermined point, substantially as described.

2. In a tea-kettle, a hanger provided with a float which closes the spout-opening, a steam-exit tube extending downward near one side of the kettle to a point below the spout-opening, and a signaling device to indicate when the water has receded to a certain predetermined point, substantially as described.

400,636. THREAD-PROTECTOR. EDWARD J. COLBY, Chicago, Ill. Filed Feb. 1, 1888. Serial No. 262,692. (No model.)

Claim.—A thread-protector consisting of two hemispheres of spring sheet metal hinged together, a spindle hinged to one of them, a catch for the free end of such spindle, into which it is received by compressing the sides of and thus enlarging the hemisphere to which the spindle is pivoted, a spring-catch, whereby the two hemispheres are locked together opposite their hinge, and a suspending-chain attached to one of the hemispheres, substantially as shown.

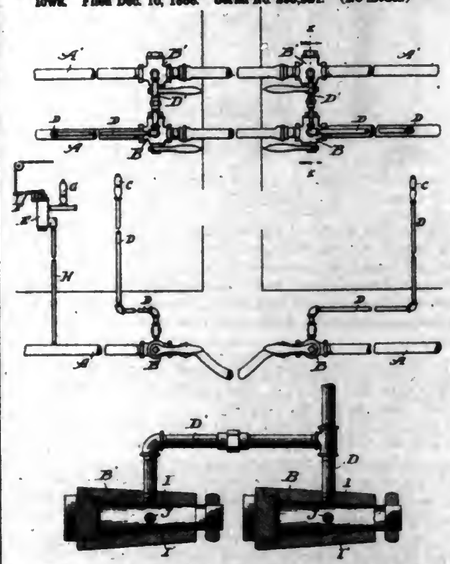
400,637. WASHING-MACHINE. SHERMAN M. COLE, Adamson, Iowa. Filed Nov. 10, 1887. Serial No. 254,798. (No model.)



Claim.—In a washing-machine, the combination of the upright frame, the body formed of three radial equidistant wings, a portion of one of which is removable, a wringer-frame hinged to the upright frame and provided with cross-pieces Z and Z', one arranged to engage one of the wings and the other to rest on the seat of the movable wing, and a fastener to secure the wringer-frame to the upright frame when the wringer is in use, all substantially as specified.

400,638. AIR-BRAKE SIGNAL. ALLEN B. COLLINS, Burlington, Iowa. Filed Nov. 23, 1888. Serial No. 291,711. (No model.)

Claim.—1. In an air-brake signal, the combination of the main air-pipe running lengthwise of the train beneath the cars, cocks for closing such pipe, and whistles attached to the cocks and adapted to be blown when the cocks are turned to close the main air-pipe, substantially as described.



2. In an air-brake signal, the combination of the main air-pipe provided with cocks for closing the same, a branch pipe connecting with the main pipe and provided with a whistle, and a valve for opening and closing the pipe, and a spring-lever connected with the handle of one of the cocks in the main air-pipe and moved thereby to open and close the valve in the branch pipe, substantially as described.

400,638.

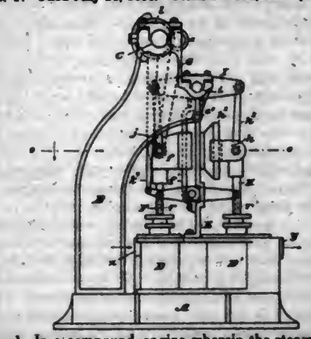
3. In an air-brake signal, the combination of the main air-pipe provided with cocks for closing the same, a branch pipe connected with the main air-pipe and provided with a whistle, and a valve whereby the pipe is opened and closed, and a slotted spring-lever attached to the handle of one of the cocks in the main pipe, and moved thereby in one direction to open the valve in the branch pipe, and moved in the other direction by means of a spring to close such valve, substantially as described.

400,639. AIR-BRAKE SIGNAL. ALLEN B. COLLINS, Burlington, Iowa. Filed Dec. 10, 1888. Serial No. 293,221. (No model.)

Claim.—1. In an air-brake signal, the combination of the main air-pipe running lengthwise of the train beneath the cars, cocks for closing such pipe, and whistles located above the roof of the car connected to the cocks by means of tubes and adapted to be blown whenever the cocks are turned to close the main air-pipe, substantially as described.

2. In an air-brake signal, the combination of the signal-pipe and main train-pipe extending lengthwise of the train, cocks for closing such pipes, tubes running from the cocks in the main air-pipe through the car-roof and connected with the cocks in the signal-pipe, and whistles located at the upper end of such tubes and adapted to be blown when the cocks are turned to close the pipes or either of them, substantially as described.

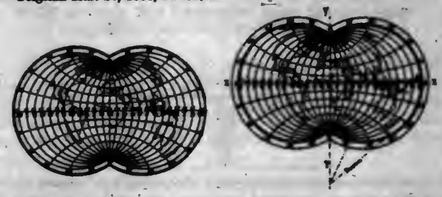
3. In an air-brake signal, the combination of the main air-pipe running lengthwise of the train beneath the cars, cocks for closing the same, a branch pipe leading from one of said cocks up into the tender and provided with a whistle at its upper end and adapted to be blown when the cock is closed, substantially as described.



4. In an air-brake signal, the combination of the main air-pipe running lengthwise of the train beneath the cars, valves situated inside the cars and connected with the main air-pipe, and whistles attached to the valves and adapted to be blown when the valves are opened, substantially as described.

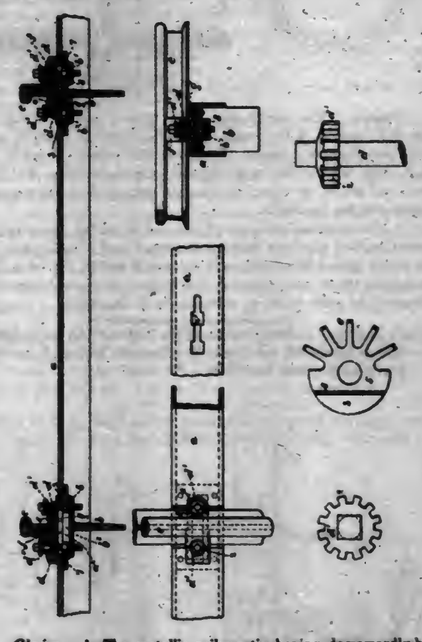
400,640. VEHICLE-SEAT LOCK. JAMES H. COREY, Connautville Pa. Filed Sept. 25, 1888. Serial No. 286,367. (No model.)

Claim.—In vehicle-seat locks, the torsion-spring E, having its bearings in the seat-hangers c^2, and provided with the end loops, e, cranks e' e^2, and bail e^3, in combination with the rods D D, having reversed end hooks to connect with the loops e and rails C, substantially as shown and described.



400,641. COMPOUND STEAM-ENGINE. MILES CORYELL, New York, N. Y. Filed July 23, 1888. Serial No. 281,282. (No model.)

Claim.—1. In a compound engine wherein the steam is worked expansively in all the cylinders, the valve-operating mechanism comprising the rock-shaft k, having an arm, k', coupled to the eccentric which actuates the cut-off valves, and two oppositely-arranged arms, m and m', coupled to the respective stems of the cut-off valves, and a rocking lever mounted on shaft k, and having its arms o and o' coupled, respectively, to the stems of the main valves, the arms o being also coupled to the eccentric which actuates the main valves, as set forth.



2. The combination, with the bed-plate, the pillars, and the cylinders, of the tie-plate E, mounted on and secured to the cylinders, and connected to the pillars at its upper end, said tie-plate having a tubular part, e, to receive a tie-rod, e', the said rod, and the nuts e^3, substantially as and for the purposes set forth.

400,642. MAP. HENRY R. DE BRAHMONT, Geneva, Switzerland. Filed Oct. 15, 1888. Serial No. 288,194. (No specimens.) Patented in Belgium Mar. 27, 1888, No. 81,202.

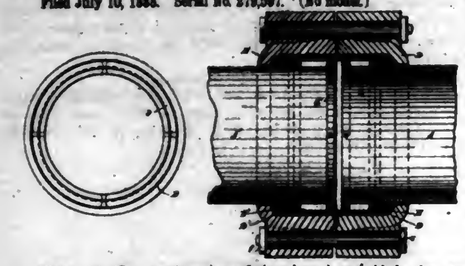
Claim.—The map herein specified, representing the earth having a straight equatorial line and a central straight meridian perpendicular to the equator, and extending from the north to the south pole and dividing the representation of one hemisphere from the other, the boundaries of the maps and the meridians being arcs of circles, the meridian-lines being equidistant, or nearly so, at the equator and at the north and south latitude lines, which also are arcs of circles, substantially as set forth.

400,643. METALLIC RAILWAY-TIE AND FASTENING. HENRY L. DE ZEEW, Geneva, assignor to himself, Albert G. Lucas, Utica, and William D. Burrall, Waterloo, N. Y. Filed Aug. 13, 1888. Serial No. 282,433. (No model.)

Claim.—1. The metallic railway-tie having downwardly-bent edges and slotted at a', in combination with the spuds or anchor-plates b, riveted to the tie and provided with pockets at b' beneath the slots of the ties, substantially as set forth.

2. The combination, with a metallic railway-tie having slots at a', of spuds or anchor-plates b, secured to said tie and having pockets b' in their upper faces, and the screw-bolts d, having conical disks or heads d' and a square end to the same, the nuts of the bolts being received and held within the pockets b', substantially as set forth.

3. The combination, with the metallic railway-tie a and the rail c, of the screw-bolts d, the conical disks or heads d' to said bolts, peripheral teeth 2, formed upon the conical disks d', and the washer e, through which the screw-bolt passes, said washer being provided with peripheral teeth 6, which teeth are adapted to be bent over into the teeth 2 to secure and lock the screw-bolt and prevent its turning, substantially as set forth.



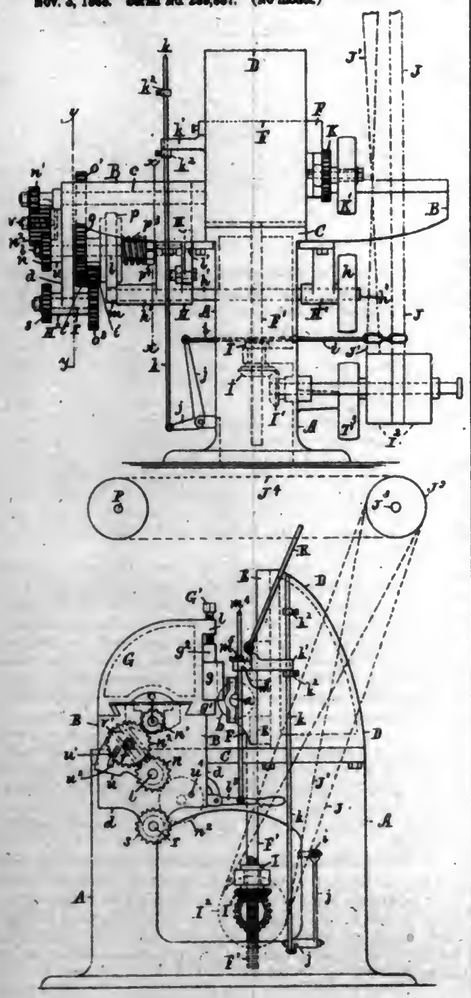
4. The combination, with a metallic railway-tie having slots at a', of spuds or anchor-plates b, secured to said tie and having pockets b' in their upper faces, the screw-bolts d, having conical disks or heads d' and a square end to the same, the nuts of the bolts being received and held within the pockets b', the braces f upon the outer surface of the rail and fitting the contour thereof, the leg 7 upon the brace adapted to pass into the slot a' of the tie, and the screw-bolt d, passing through the brace and adapted to secure the same and the rail to place, substantially as set forth.

5. The combination, with the rail c and the metallic tie a, of the screw-bolts d, conical disks or heads d' to said bolts, the peripheral teeth 2, and the washer e, having a flat portion, 3, to rest upon the tie, and an inclined portion, 5, fitting the inclined web of the rail, and having peripheral teeth 6, which teeth are adapted to be bent into the teeth 2 to lock the bolt-head and prevent it turning, substantially as set forth.

6. The combination, with the metallic rail c and the metallic railway-tie a, of the spuds b, connected to the metallic tie, and the bolts d, for holding the rail to the tie, a corrugated plate of steel, g, between the base of the rail and the top of the metallic tie to form an elastic bearing for the rail, said corrugated plate being notched for the bolts d, which act to hold the plate in position, substantially as set forth.

400,644. PIPE-COUPLING. SOLOMON R. DRESSER, Bradford, Pa.

Filed July 10, 1888. Serial No. 279,597. (No model.)



Claim.—1. The combination of the pipes A and A', having detachable retainers on their ends, the coupling-sections B and B', made male and female for gasket H between said sections B and B', the loose rings, the packing-rings between coupling-sections and loose rings, and means for clamping the pipe-sections B and B' together substantially as described.

2. The combination of the pipes A and A', having detachable retainers on their ends, the coupling-sections B and B', made male and female for gasket H between said sections B and B', the loose rings having shoulders and recesses *d'*, the packing-rings, and means for clamping the parts together, substantially as described.

400,645. AUTOMATIC MACHINE FOR CUTTING RACK-TEETH.

ULRICH EBERHARDT and HENRY R. EBERHARDT, Newark, N. J. Filed Nov. 3, 1888. Serial No. 290,857. (No model.)

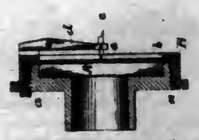
Claim.—1. In a rack-cutter, the combination, with a cutter-head movable vertically and having the cutters mounted upon a horizontal spindle, of a rack-carriage adjustable to and from the cutter-spindle and movable parallel therewith and adapted to hold the blank with its face vertically before the cutters, as and for the purpose set forth.

2. A rack-cutter comprising a bed having horizontal ways C, a cross-head movable horizontally thereon, vertical guides formed upon the bed, a cutter-head fitted to slide vertically in such guides and provided with a horizontal cutter-spindle, and a rack-carriage movable upon the cross-head parallel with the cutter-spindle and adjustable to and from the same, as and for the purpose set forth.

3. In a rack-cutter, the combination, with a cutter-spindle, of a rack-carriage, a feed-screw having a thread corresponding with the diametral pitch of a spur-wheel, as .5236 of an inch, a shaft, *r*, and a train of gears connected with the said screw and adapted to rotate the shaft $\frac{1}{101}$ of a revolution for each rotation of the screw, and a locking device to hold the said shaft when turned, as and for the purpose set forth.

4. In a rack-cutter, the combination, with a cutter-spindle, a rack-carriage, and a screw for feeding the same carriage parallel with the spindle, of the notched disk N, a catch for locking the same, a shaft rotating with such disk and provided with a gear-wheel, *n*, and two interchangeable trains of gearing connecting the screw with such gear-wheels, the wheels in one train being proportioned to turn the screw for cutting teeth of diametral pitch, and the wheels in the other train being proportioned to turn the screw for cutting teeth of circumferential pitch, substantially as herein set forth.

5. In a rack-cutter, the combination, with a cutter-spindle, of a rack-carriage, a feed-screw for shifting the same, a shaft provided with a locking device to hold the said shaft when turned a complete revolution, and two interchangeable trains of gears adapted for connecting the said shaft and screw, the wheels in one train being proportioned to turn the screw for cutting teeth of diametral pitch, and the wheels in the other train being proportioned to turn the screw for cutting teeth of circumferential pitch, substantially as herein set forth.



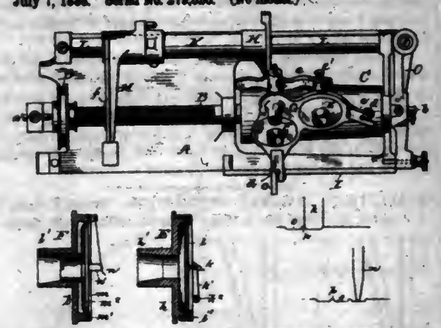
6. In a rack-cutter, the combination, with a rack-carriage and a feed-screw for operating the same, of a rotary spindle provided with a gang of three or more cutters shaped and spaced upon the spindle to form in the rack-blank simultaneously a series of two or more teeth of uniform size and pitch, and feeding mechanism adapted to shift the rack-carriage intermittently in correspondence with the total pitch of the teeth cut by the gang of cutters, substantially as herein set forth.

7. In a rack-cutter having the feed-screw actuated by a friction-driver, the combination, with the feed-screw, of a shaft connected thereto by a suitable gearing, a friction-plate clamped between fast and loose flanges rotated with such shaft, and a spring pressed upon the movable flange, as and for the purpose set forth.

8. In a rack-cutter, the combination, with a cutter-head moving vertically upon a suitable bed and a rack-carriage moving horizontally upon the same, of a counter-shaft arranged over the rack-cutter, a belt-compensating lever pivoted upon the counter-shaft and carrying two guide-pulleys, two guide-pulleys upon the rack-cutter, an endless belt applied to the pulley upon the counter-shaft and to a pulley upon the cutter-head and carried over the several guide-pulleys, as set forth, and a connection from the cutter-head to the lever to move the lever with the cutter-head, as and for the purpose set forth.

9. The combination, with a rack-cutter having a horizontally-moving rack-carriage and a cutter-spindle mounted in a cutter-head, of a counter-shaft arranged over the rack-cutter, a belt connecting a pulley upon the counter-shaft with a pulley upon the cutter-head, a driving-belt applied to fast and loose pulleys upon the counter-shaft to stop and start the same, a shipper applied to such driving-belt, a spring to throw the shipper to its inoperative position, a latch to hold the shipper in its operative position, and a trip-lever connected with the latch and actuated by the rack-carriage to withdraw the latch at the end of the carriage travel, and to thereby stop the machine automatically, as and for the purpose set forth.

400,646. PHONOGRAPH RECORDER AND REPRODUCER. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to the Edison Phonograph Company, of New Jersey. Filed June 7, 1888. Serial No. 276,284. (No model.)



Claim.—1. In a phonograph, the recorder or reproducer having in combination with the recording or reproducing point a diaphragm of glass, substantially as set forth.

2. In a phonograph, the recorder or reproducer having in combination with the recording or reproducing point a diaphragm of microscope-glass, substantially as set forth.

3. In a phonograph, the recorder or reproducer having in combination with the recording or reproducing point a diaphragm of glass clamped between metallic rings with rings of yielding material around the edges of the glass diaphragm, substantially as set forth.

4. In a phonograph, the recorder having in combination a glass diaphragm and a recording-point secured directly thereto by a suitable cement, substantially as set forth.

400,647. PHONOGRAPH. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to the Edison Phonograph Company, of New Jersey. Filed July 7, 1888. Serial No. 279,290. (No model.)

Claim.—1. A phonograph having a reproducing-point narrower than the indentations forming the sound-record, substantially as set forth.

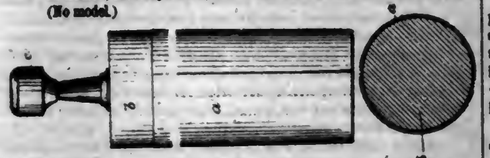
2. The combination, in phonographs, of separate recording and reproducing instruments, the reproducing-point being narrower than the recording-point, substantially as set forth.

3. In a phonograph, the reproducer having its point narrower than the indentations forming the sound-record, in combination with means for adjusting such reproducer laterally across the track of the record, substantially as set forth.

4. In a phonograph, the reproducer having its point narrower than the indentations forming the sound-record, in combination with a phonogram-blank carrier adapted to receive a removable phonogram-blank, substantially as set forth.

5. In a phonograph, the reproducer having its point narrower than the indentations forming the sound-record, and means for adjusting such reproducer laterally across the track of the record, in combination with a phonogram-blank carrier adapted to receive a removable phonogram-blank, substantially as set forth.

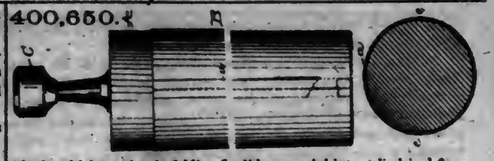
400,648. PHONOGRAM-BLANK. THOMAS A. EDISON, Llewellyn Park, N. J. Filed July 30, 1888. Serial No. 281,457. (No model.)



Claim.—1. Phonogram-blanks made of a mixture of a wax with stearic acid, substantially as set forth.

2. Phonogram-blanks made of a mixture of ceresin and stearic acid, substantially as set forth.

3. Phonogram-blanks made of a mixture of ceresin, beeswax, and stearic acid, substantially as set forth.



4. Phonogram-blanks made of a mixture of ceresin, beeswax, and stearic acid, in about the proportion, by weight, of one hundred parts of ceresin, twenty-five parts of beeswax, and twenty-five parts of stearic acid, substantially as set forth.

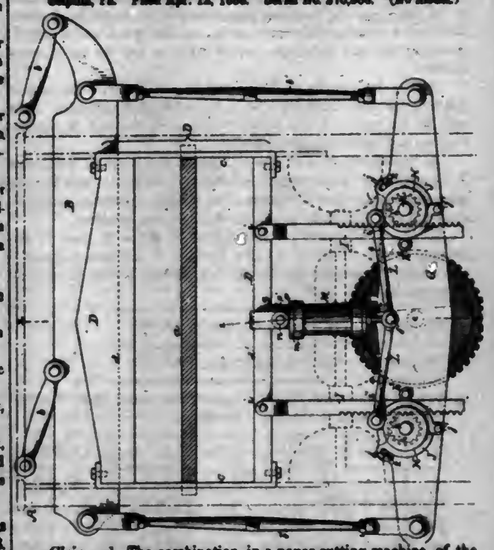
400,649. METHOD OF MAKING PHONOGRAM-BLANKS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Oct. 11, 1888. Serial No. 287,943. (No model.)

Claim.—The method of making a phonogram-blank, which consists in wrapping a sheet of flexible material upon a tapering cylindrical core, dipping the same into the sound-recording material, which is caused to adhere to its surface, and then turning off the surface of such material into a true cylindrical form, substantially as set forth.

400,650. METHOD OF MAKING PHONOGRAM-BLANKS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Oct. 17, 1888. Serial No. 288,361. (No model.)

Claim.—1. The method of making a collapsible phonogram-blank, which consists in folding flexible material into cylindrical form, covering the same with sound-recording material, and removing such material on two opposite lines, substantially as set forth.

2. The method of making a phonogram-blank, which consists in folding flexible material into cylindrical shape, with its edges meeting, securing such edges by a thin strip pasted on the outside of the cylinder, and covering said cylinder with sound-recording material, substantially as set forth.



3. The method of making a collapsible phonogram-blank, which consists in wrapping flexible material upon a core, securing it together at its edges, dipping it in sound-recording material, so that the same adheres to its surface, and removing such material on two lines opposite each other, substantially as set forth.

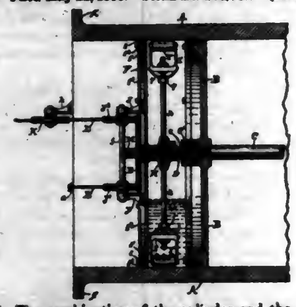
4. The method of making a collapsible phonogram-blank, which consists in wrapping flexible material upon a tapering core, securing it together at its edges, dipping it into sound-recording material which adheres to its surface, turning off such material into cylindrical form, and removing such material on two lines opposite each other, substantially as set forth.

400,651. ILLUMINATING COMPOSITION. TIMOTHY J. FEALY, Boston, Mass. Filed Oct. 23, 1888. Serial No. 288,893. (No specimens.)

Claim.—A composition for illuminating purposes, composed of olive-oil, wax, and salt, in or about the proportions stated.

400,652. PAPER-CUTTING MACHINE. HENRY P. FRISTER, Philadelphia, Pa. Filed Apr. 12, 1888. Serial No. 270,286. (No model.)

Claim.—1. The combination, in a paper-cutting machine, of the paper-clamp D, the cutter-beam, and mechanism, substantially as described, for operating said beam, with depending rack or racks hung to the clamp, devices, substantially as specified, for frictionally holding the rack or racks to the beam, and a cylinder and piston, one of which is connected to the clamp and the other to the said frictional holding devices, substantially as set forth.



2. The combination, in a paper-cutting machine, of the paper-clamp D, the beam, and mechanism, substantially as described, for operating the same, with pinions and friction-wheels on said beam, racks attached to the clamp and engaging with the said pinions, friction-bands adapted to act upon the band-wheels, a cylinder carried by the clamp D, a piston in said cylinder, and means, substantially as described, for connecting said piston to the friction-bands, all substantially as set forth.

3. The combination, in a paper-cutting machine, of the paper-clamp D, the beam, and mechanism, substantially as described, for operating the same, pinions and friction-wheels on said beam, racks attached to the clamp and engaging with said pinions, friction-bands adapted to act upon the band-wheels, and a cylinder carried by the

clamp D, with links L L, connected together to the piston and to the friction-bands, all substantially as set forth.

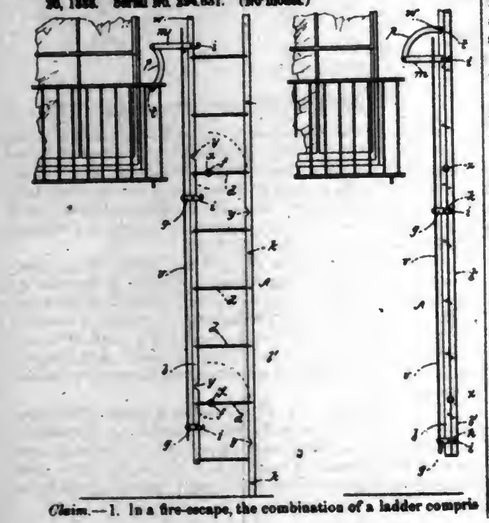
4. The combination, in a paper-cutting machine, of the paper-clamping frame, an operating beam therefor, a cylinder, M, pivoted to the frame, a piston therein, mechanism, substantially as described, connected to said piston for frictionally retaining the clamping-frame to the beam, and a relief-valve so seated in the cylinder that it will be operated at a certain point in the stroke of the driving mechanism, substantially as described.

400,653. CYLINDER-LUBRICATOR. ADAM L. FILLMORE, Cincinnati, Ohio. Filed May 22, 1888. Serial No. 274,747. (No model.)

Claim.—1. The combination of the cylinder and the piston B, a diaphragm, F, traveling backward and forward in said cylinder, and a rotating lubricant-distributer located in the space between the said piston and said diaphragm, substantially as and for the purposes specified.

2. The combination of a cylinder, a piston-head, a diaphragm fixed to the piston-rod and traveling therewith and forming a space therewith, and a rotating distributer within the said space, and means for operating the said distributer, substantially as and for the purposes specified.

3. The combination of the cylinder A, the piston B, the stem D, diaphragm F, hub H, sleeve *e*, spokes *h*, lubricators attached to the ends of the spokes *h*, and means for rotating the hub H, substantially as and for the purposes specified.



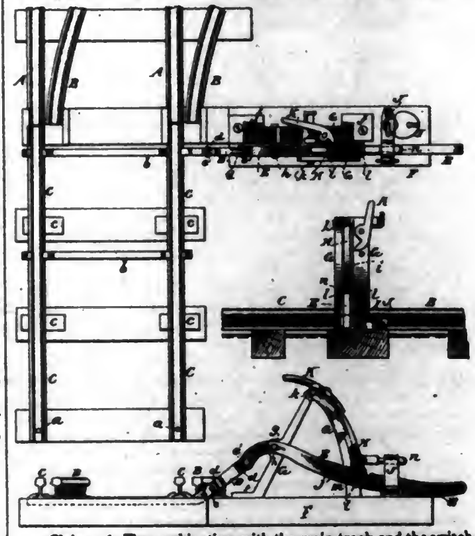
4. The combination of the cylinder A, the piston B, diaphragm F, the stem D, grooved pulley E, provided with sleeve *e*, hub H, lubricators attached to hub H, pulleys J' J², suitably supported, pulley K, and cord L, substantially as and for the purposes specified.

5. The combination of the cylinder A, piston B, stem D, diaphragm F, hub H, spokes *h*, yokes I, rollers I', springs *i* and nuts *i'*, and means for rotating the hub H, substantially as and for the purposes specified.

400,654. WITHDRAWN.

400,655. WITHDRAWN.

400,656. FIRE-ESCAPE. JAMES FLYNN, Boston, Mass. Filed Dec. 26, 1888. Serial No. 294,631. (No model.)



Claim.—1. In a fire-escape, the combination of a ladder compris ing channeled side bars and rungs pivoted therein, levers pivoted to one side bar and provided with hooks for receiving pins on the opposite side bar when the ladder is closed, a vertical rod pivoted to said levers for releasing them from said pins, and a slotted bar pivoted to one of said levers and adapted to receive a pin on a side bar, whereby said rod may be locked, substantially as described.

2. In a fire-escape, a ladder provided with channeled side bars having rungs pivoted therein, sleeves secured to certain rungs at one side of the center thereof for receiving studs in the wall of the building, hooked levers pivoted to a side bar for receiving pins on the opposite bar, a vertical rod pivoted to said levers, and a curved bar pivoted to one of said levers, said bar being provided with a slot for receiving a pin on a side bar, all being arranged to operate substantially as set forth.

3. In a fire-escape, the combination of the ladder A, comprising channeled side irons, *b b'*, and rungs *d*, pivoted therein, the sleeves *f* on said rungs for pivoting the ladder to a building, the levers *g m*, pivoted to the side iron, *b*, and provided with hooks *i*, the pins *k* on the side iron, *b'*, the rod *v*, pivoted to said levers, and the curved bar *p*, pivoted to the lever *m* and provided with the slot *l*, for engaging a pin, *w*, and locking said bar, substantially as described.

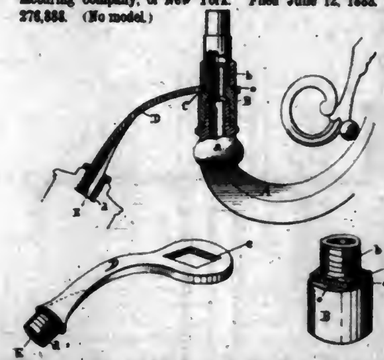
400,657. RAILWAY-SWITCH STAND. GEORGE F. GAGE, Huntingdon, Pa. Filed Nov. 9, 1888. Serial No. 290,362. (No model.)

Claim.—1. The combination, with the main track and the switch-rails, of the operating mechanism for said switch-rails, and a safety gravity-lock for the operating-lever of said mechanism, pivoted in a higher plane than said lever, and moving over the lever and engaging and locking the same when it is in the substantially horizontal position, substantially as described.

2. The combination, with the main track and the switch-rails, of the operating mechanism for said switch-rails, the operating-lever of which works through a slotted bracket, and the gravity safety-lock, also working through said slot and pivoted at its upper end, with its lower end embracing the lever, substantially as shown and described.

3. The combination, with the main track and the switch-rails, of the operating mechanism for said switch-rails, and a gravity safety-lock pivoted at its upper end above the lever of the operating mechanism, with its free end riding on said lever, and adapted to engage said lever below the pivot thereof when the lever is in a substantially horizontal position and lock the same, substantially as shown and described, and for the purpose specified.

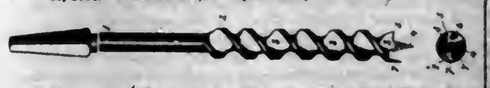
4. The combination, with the main track and switch-rails and the operating mechanism for said switch-rails, of a safety-lock for the operating-lever and a pivoted catch working at right angles to said safety-lock, substantially as and for the purpose specified.



5. The combination, with the main track and the switch-rails, of the operating mechanism for said switch-rails, the gravity safety-lock riding over the lever of said operating mechanism and provided with a handle, n, the lock and hasp I J, for locking said handle, and a pivoted catch working at right angles to the safety-lock, substantially as and for the purpose specified.

6. The combination, with the main and switch rails and the operating mechanism for the switch-rails, the operating-lever of which is formed with a notch, of a gravity safety-lock pivoted to the rear of the pivot of said operating-lever and on a higher plane and moving over and with the same, and formed with a detent to engage said notch and with jaws to embrace the lever, substantially as shown and described.

7. The combination, with the support F and the brackets G, secured thereto and provided with a slot, as described, of the operating-lever pivoted on said bracket and working in the slot thereof, and connected at its end to the mechanism for operating the rails, and the safety-lock pivoted at one end to said bracket and working in the slot thereof over said lever, substantially as described.



8. The combination, with the switch-rails, the support F, and the bracket G, secured to said support and formed with curved slotted portion, as described, of the operating-lever pivoted to said bracket and the curved safety-lock pivoted at one end to the apex of said bracket and working in said slot over and with the operating-lever, substantially as shown and described.

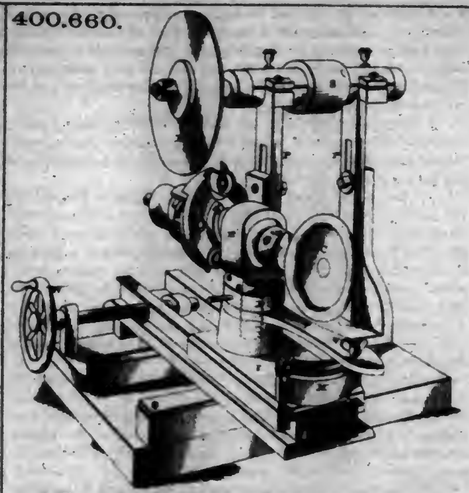
400,658. ELECTRIC-LAMP ATTACHMENT FOR GAS-FIXTURES. EMIL P. GEHNERT, Brooklyn, N. Y., assignor to the E. P. Gleason Manufacturing Company, of New York. Filed June 12, 1888. Serial No. 276,888. (No model.)

Claim.—A device for attaching electric lamps to gas-fixtures, consisting of the two pieces, a socket, as B, adapted to screw on the nipple of a gas-fixture, said socket having the angular neck C and nipple *b*, and the arm, as D, one end of which is provided with a nipple adapting it to attach a lamp and the other end with an angular opening or eye adapted to fit the neck of said socket, combined and arranged in the manner and for the purpose specified.

400,659. AUGER. FRANK C. GERARD, Seymour, Conn. Filed June 18, 1888. Serial No. 277,414. (No model.)

Claim.—1. An auger or bit having upon one side of the leading-screw a cutting-edge concaved upon its lower side, and upon the other side a cutting-spur sharpened to its base and supported by a floor, 8, cut away at the front, said spur projecting below the plane of the cutting-edge, and the plane of the latter being below the plane of floor 8, substantially as and for the purpose set forth.

2. An auger or bit having upon one side of the leading-screw a cutting-edge, and upon the other side thereof a cutting-spur supported by a floor, 8, cut away at the front, the entire front of said spur being sharpened so that it will cut to the base, as and for the purpose set forth.



3. An auger or bit having a leading-screw the threads of which are straight upon the upper side and inclined upon the lower side, a cutting-edge forming a continuation of the thread of the screw, and a cutting-spur upon the opposite side, the horizontal plane at the base of the spur being higher than the cutting-edge, as and for the purpose set forth.

4. A double-groove auger or bit having a pod twisted to form a delivery-groove wider than the other groove, a single cutting-edge at the base of the delivery-groove, and a single cutting-spur opposite to the cutting-edge, the plane at the base of the spur being higher than the plane of the cutting-edge, as and for the purpose set forth.

400,660. MACHINE FOR GRINDING SHIMER MOLDING-BITS, &c. HIRAM C. GILBERT, Burlington, Vt. Filed July 5, 1888. Serial No. 279,014. (No model.)

Claim.—1. The combination of a reciprocating carriage, a handle mounted thereon, and an adjusting-block placed upon the handle, the mandrel-frame having its shank to pass through the block, and the mandrel which passes through the frame and upon which the head is placed, substantially as described.

400,660.

2. The combination of a vertically-adjustable emery-wheel, an adjustable mandrel upon which the head is placed, a frame through which the mandrel passes, an adjusting-block by which the frame is adjusted vertically, a handle for turning the frame horizontally around, a locking-screw for holding the handle in any desired position, and a reciprocating carriage, substantially as set forth.

400,661. APPARATUS FOR DETERMINING ELECTRIC OR MAGNETIC FORCES. ADOLPHUS GIFFORD, Richmond, Va. Filed Jan. 24, 1888. Serial No. 261,731. (No model.)

Claim.—1. An instrument for determining the value of magnetic or electric or electro-magnetic forces, comprising a polarized body, a balance, a fulcrum common to both, an adjustable weight on said balance, a register, shifting mechanism for shifting the weight on the balance, and transmitting mechanism for transmitting the movements of the weight to the register, as described, for the purpose specified.

2. An instrument for determining the value of magnetic or electric or electro-magnetic forces, comprising a polarized body, a balance, and a revoluble staff upon which said body and balance are poised, said body being adapted to be rotated independently of the staff and balance, to adjust the same in any position relatively to the balance, substantially as and for the purpose specified.

3. An instrument for determining the value of magnetic or electric or electro-magnetic forces, comprising a polarized body, a balance, a revoluble staff or arbor upon which said body and balance are poised, said body being adapted to be rotated independently of the staff and balance, and a stop to lock the balance and staff against rotation, substantially as and for the purpose specified.

4. An instrument for determining the value of magnetic or electric or electro-magnetic forces, comprising a polarized body, a balance, a revoluble staff or arbor upon which said body and balance are poised, said body being adapted to be rotated independently of the staff and balance, a shifting device for shifting the staff from its bearings, and a stop for locking the balance and staff against rotation when so shifted from its bearings, substantially as and for the purpose specified.

5. An instrument for determining the value of magnetic or electric or electro-magnetic forces, comprising a dial divided into four sections of ninety degrees each, a magnetic needle, a balance, a staff or arbor upon which said balance and needle are poised and which is revoluble in the center of the dial, and a weight or weights adjustable on the balance, substantially as and for the purpose specified.

6. An instrument for determining the value of magnetic or electric or electro-magnetic forces, comprising a dial divided into four parts of ninety degrees each, a magnetic needle, a balance, a staff or arbor upon which said balance and needle are poised and which is revoluble

in the center of the dial, and a weight or weights adjustable on the balance, in combination with a supporting-plate and means, substantially such as described, for supporting the instrument either in a horizontal or vertical north and south and east and west plane, or in a plane at an angle to the north and south line, substantially as and for the purpose specified.

7. The combination, with the staff K, of the bearings *g* and *h*, consisting each of a jewel having a bearing enlarged from a center toward the outside to form a knife-edge bearing, g^3, substantially as and for the purpose specified.

8. The combination of the staff K, having collars or flanges k^4 k^5, the cock G, constituting one of the bearings of said staff, the bridge E^2, through which the other end of the staff projects and upon which the collar k^5 is adapted to bear, and the spring-actuated angle-lever H, constituting the other bearing for said staff, the bearing end of which projects under said bridge of shifting devices for shifting the staff from its bearings, consisting of the spring-actuated angle-lever I, operating on flange k^4 of staff K, and the push-bar L, provided with inclined faces L' L^2, for tilting the levers I H, substantially as and for the purpose specified.

9. The combination, with the revoluble shaft K, the needle D, and balance M, carrying toothed weights N and N', of the pinion *o*, for rotating said weights on the balance, and a shifting device for shifting said pinion into and out of gear with one of the weights, whereby either one or both weights may be rotated on the balance, substantially as and for the purpose specified.

10. The combination, with the staff K, the balance M, rigidly secured thereto, and the needle D, revoluble on said staff, of the crown-wheel C, provided with pins projecting from its upper face, shifting devices for shifting the staff K vertically to bring the needle into the path of said pins, and a stop to lock the staff and balance against rotation, whereby said needle may be rotated on the staff through the medium of the pins on the crown-wheel independently of the staff and balance, substantially as and for the purpose specified.

11. The combination, with the staff K, the balance M, rigidly secured thereto and carrying toothed disk-weights N and N', the needle D, revoluble on staff K, a shifting device for shifting the staff vertically, and a locking device for locking said staff against rotation when shifted, of the arbor O, carrying a pinion, *o*, adapted to mesh with one or both weights, and a train of registering-gearing operated from the worm-thread of the arbor, substantially as and for the purpose specified.

12. The combination, in an instrument of the class described, of a revoluble staff, a balance rigidly connected thereto and carrying a weight or weights adjustable thereon, a shifting device for shifting the weights on the balance, and a train of registering-gearing operating hands indicating units, tens, and hundreds, operated from said shifting device and constructed to rotate the hands in the same direction, forward or backward, substantially as and for the purpose specified.

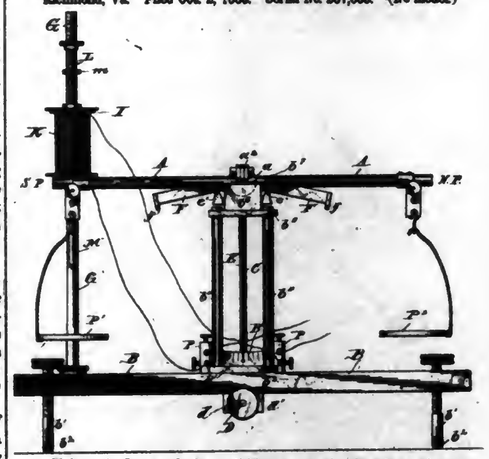
13. The combination, with the herein-described instrument provided at its southeast and southwest corners with journal-bearings, a supporting-plate for said instrument, and journals pivoted to said plate and fitting into said journal-bearings, of a quadrant adapted to be secured on the line north and south of the instrument, a slide-rest for supporting the north end of said instrument, a pointer adapted to travel along the graduations of the quadrant, with the slide-rest, and a locking device for locking the slide-rest in position on the quadrant, substantially as and for the purpose specified.

14. The combination, with the described instrument provided on its back plate with an axial pin, of a frame adapted to revolve on the axial pin, a spool of insulated wire supported from said frame, and binding-posts for connecting the wire ends with a source of electricity, substantially as and for the purpose specified.

400,662. ART OF DETERMINING THE VALUE OF ELECTRIC, MAGNETIC, OR ELECTRO-MAGNETIC FORCES BY WEIGHT.

ADOLPHUS GUPPERICH, Richmond, Va. Filed Sept. 25, 1888. Serial No. 286,372. (No model.)

Claim.—1. The herein-described mode of determining the value of magnetic, electric, or electro-magnetic forces by weight, which consists in first determining by weight the value of terrestrial magnetism by counterbalancing an equilibrated polarized body as against the influence of such magnetism and utilizing the value obtained as a standard of comparison in weighing other like forces, substantially as and for the purposes specified.



2. The mode of determining the value of magnetic, electric, or electro-magnetic forces, which consists in neutralizing a polarized and equilibrated body against the influence of terrestrial magnetism, subjecting such body to the influence of the force whose value is to be determined, and counterbalancing the power exerted thereby upon said body by a gravital force, as described.

3. The described mode of obtaining standard polarized bodies, which consists in magnetizing equilibrated bodies to a definite power and neutralizing the same as against a definite force of terrestrial magnetism by means of a correspondingly-definite gravital force, substantially as and for the purposes specified.

4. The described mode of obtaining standard polarized bodies, which consists in magnetizing equilibrated bodies to a definite power, placing such bodies in a line due east and west, and neutralizing the same as against a definite power of terrestrial magnetism by means of a correspondingly-definite gravital force, substantially as and for the purposes specified.

400,663. APPARATUS FOR DETERMINING THE VALUE OF ELECTRO-MAGNETIC FORCES BY WEIGHT.

ADOLPHUS GUPPERICH, Richmond, Va. Filed Oct. 2, 1888. Serial No. 287,033. (No model.)

Claim.—1. In a scale for weighing magnetic, electric, or electro-magnetic forces, a magnetized or polarized scale-beam, substantially as and for the purposes specified.

2. In a scale for weighing magnetic, electric, or electro-magnetic forces, a magnetized or polarized beam neutralized as against terrestrial magnetism, substantially as and for the purposes specified.

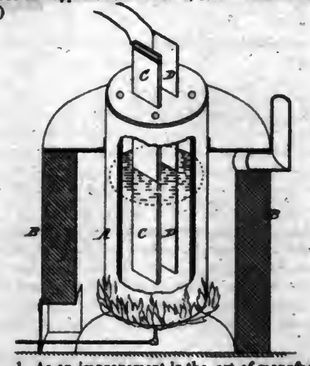
3. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with a magnetized or polarized scale-beam, of a coil of insulated wire included in an electric circuit and supported in proximity to one of the poles of the beam, substantially as and for the purposes specified.

4. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with a magnetized or polarized scale-beam, of a coil of insulated wire included in an electric circuit and supported in proximity to one of the poles of the beam in the plane of the center of attraction or point of leverage of the forces, substantially as and for the purposes specified.

5. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with a magetized or polarized scale-beam, of a coil of insulated wire included in an electric circuit and supported in proximity to one of the poles of the beam and adjustable relatively to said beam.

6. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with a magnetized or polarized scale-beam, of a coil of insulated wire included in an electric circuit and supported in proximity to one of the poles of the beam in the plane of the center of attraction or point of leverage of the forces and adjustable relatively to said center or point, substantially as and for the purposes specified.

7. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with a magnetized or polarized scale-beam neutralized as against terrestrial magnetism, of a coil of insulated wire included in an electric circuit and supported in proximity to one of the poles of the beam, substantially as and for the purposes specified.



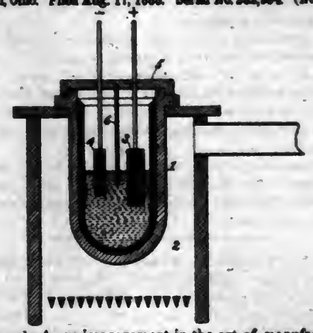
8. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with a magnetized or polarized scale-beam neutralized as against terrestrial magnetism, of a coil of insulated wire included in an electric circuit and supported in close proximity to one of the poles of the beam in the plane of the center of attraction or point of leverage of the forces and adjustable relatively thereto, substantially as and for the purposes specified.

9. In a scale for weighing magnetic, electric, or electro-magnetic forces, a magnetized or polarized scale-beam and a scale-pan suspended from said scale-beam at the center of attraction or point of leverage of the forces, substantially as and for the purposes specified.

10. In a scale for weighing magnetic, electric, or electro-magnetic forces, the combination, with the scale-beam A and the screw-threaded standard G, carrying the adjusting-nut I, of the spool-holder comprising the rod L, bracket-arm L', and guide-rod and bracket M *m*, substantially as and for the purposes specified.

400,664. PROCESS OF REDUCING ALUMINIUM FROM ITS FLUORIDE SALTS BY ELECTROLYSIS.

CHARLES M. HALL, Oberlin, Ohio. Original application filed July 9, 1886, Serial No. 207,601. Divided and this application filed Feb. 2, 1887. Serial No. 226,206. (No model.)



Claim.—1. As an improvement in the art of manufacturing aluminium, the herein-described process, which consists in dissolving alumina in a fused bath composed of the fluorides of aluminium and potassium, and then passing an electric current, by means of an anode formed of non-carbonaceous material, through the fused mass, substantially as set forth.

2. As an improvement in the art of manufacturing aluminium, the herein-described process, which consists in dissolving alumina in a fused bath composed of the fluorides of aluminium, potassium, and lithium, and then passing an electric current through the fused mass, substantially as set forth.

400,665. MANUFACTURE OF ALUMINIUM.

CHARLES M. HALL, Oberlin, Ohio. Filed Aug. 17, 1888. Serial No. 282,954. (No specimens.)

Claim.—1. As an improvement in the art of manufacturing aluminium, the herein-described method, which consists in fusing a combination of the fluoride of aluminium and the fluoride of an alkaline-earth metal, adding alumina to the bath so formed and passing a current of electricity through the fused mass, substantially as described.

2. As an improvement in the art of manufacturing aluminium, the herein-described method, which consists in fusing a combination of the fluoride of aluminium and the fluoride of calcium, adding alumina to the bath so formed, and then passing a current of electricity through the fused mass, substantially as set forth.

400,666. PROCESS OF ELECTROLYZING CRUDE SALTS OF ALUMINIUM.

CHARLES M. HALL, Oberlin, Ohio. Filed Aug. 17, 1888. Serial No. 282,955. (No specimens.)

Claim.—1. As an improvement in the art of manufacturing aluminium, the method herein described, which consists in fusing a combination of the fluoride of aluminium, the fluoride of calcium, and the fluoride of sodium, adding alumina to the bath so formed, and then passing a current of electricity through the fused mass, substantially as set forth.

2. As an improvement in the art of manufacturing aluminium, the method herein described, which consists in fusing a combination of the fluoride of aluminium, the fluoride of calcium, the fluoride of sodium, and the chloride of calcium, adding alumina to the bath so formed, and then passing a current of electricity through the fused mass, substantially as set forth.

400,667. PROCESS OF ELECTROLYZING FUSED SALTS OF ALUMINIUM.

CHARLES M. HALL, Oberlin, Ohio. Filed Sept. 21, 1888. Serial No. 286,084. (No specimens.)

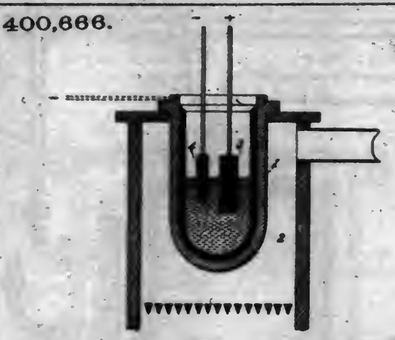
Claim.—1. As an improvement in the art of manufacturing aluminium or alloys thereof, the herein-described continuous method, consisting in dissolving alumina in a fused bath composed of the fluoride of aluminium and the fluoride of a metal more electro-positive than aluminium, passing an electric current through the fused solution by means of suitable electrodes arranged therein, thereby separating the alumina into its constituent elements, adding from time to time or continuously a fresh supply of alumina to the bath, and removing the aluminium, substantially as set forth.

2. As an improvement in the art of manufacturing aluminium, the herein-described continuous method, consisting in dissolving alumina in a fused bath composed of the fluorides of aluminium, sodium, and calcium, and the chloride of calcium, passing an electric current through the fused solution by means of suitable electrodes arranged therein, thereby separating the alumina into its constituent elements, adding from time to time or continuously a fresh supply of alumina to the bath, and removing the aluminium, substantially as set forth.

400,668. VACUUM-PUMP.

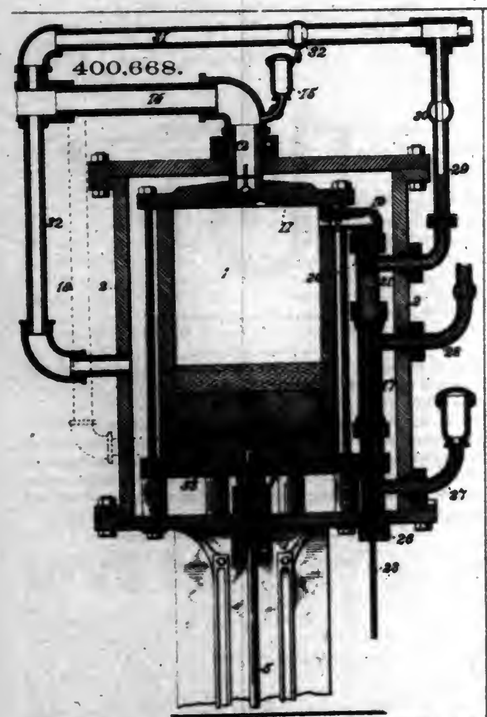
JAMES T. HANDAY, Pittsburg, Pa. Filed Aug. 3, 1887. Serial No. 246,034. (No model.)

Claim.—1. In an apparatus for the production of high vacuums, the combination of a cylinder having a valvular connection with a continuously-operating exhaust-pump and with the vessel to be exhausted, a shell surrounding said cylinder and protecting the same as against the admission of air, except through connection with the vessel to be exhausted, and a suitably-packed piston operating in said cylinder, substantially as set forth.



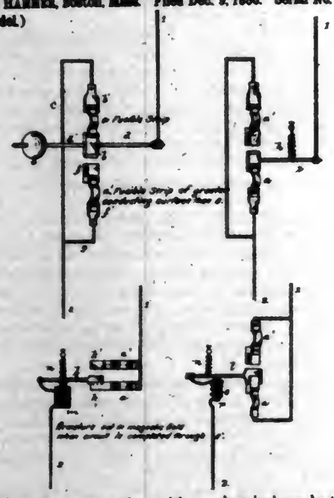
2. In an apparatus for the production of high vacuums, the combination of a cylinder having a valvular connection with a continuously-operating exhaust-pump and with the vessel to be exhausted, a shell surrounding said cylinder and having pipe-connections with a continuously-operating exhaust-pump, and a suitably-packed piston operating in said cylinder, substantially as set forth.

3. In an apparatus for the production of high vacuums, the combination of a cylinder having a valved outlet, a mechanically-operated fluid-piston, a valve-chamber connected thereto and to the vessel to be exhausted, a valve for closing the connection to the cylinder, and a mechanically-operated fluid-piston for operating said valve, substantially as set forth.



4. In an apparatus for the production of high vacuums, the combination of a cylinder, a piston operating therein, a valve-chamber having a valved connection to said cylinder, and a piston for operating said valve, the several joints, connections, and valves, when in a closed position, having a fluid seal, substantially as set forth.

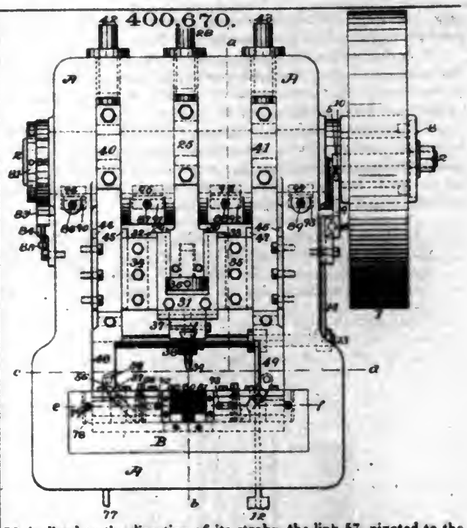
5. In an apparatus for the production of high vacuums, the combination of a cylinder, the head thereof having a concave inner surface, a valved outlet located at the apex of the concave surface, a valved inlet connecting the cylinder and the vessel to be exhausted, and a mechanically-operated fluid-piston in said cylinder, substantially as set forth.



400,666.

400,668.

400,669. SAFETY DEVICE FOR ELECTRIC CIRCUITS. WILLIAM J. HAMMER, Boston, Mass. Filed Dec. 9, 1886. Serial No. 221,067. (No model.)



Claim.—1. The combination, with an electrical conductor, of a safety-catch normally in the circuit thereof, a substitute safety-catch of greater conducting capacity, and means for automatically placing the latter in circuit upon the breaking of the former, substantially as set forth.

2. The combination, with an electrical conductor, of a safety-catch normally in the circuit, a switching device suspended by said safety-catch, and a substitute safety-catch of greater conducting capacity provided with suitable terminals situated beneath said switching device, whereby upon the breaking of the normal safety-catch the substitute is switched automatically into circuit, substantially as set forth.

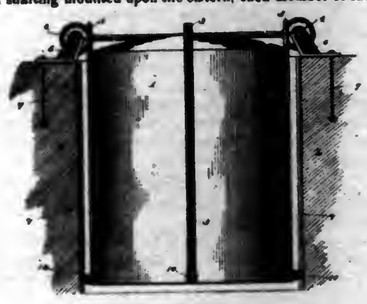
400,670. FORGING-MACHINE. HENRY HAMMOND, New Haven, Conn. Filed Dec. 4, 1888. Serial No. 292,637. (No model.)

Claim.—1. The combination of the pitman 48, provided with a surface, 55, parallel to the direction of its stroke, and with a surface,

400,670.

56, inclined to the direction of its stroke, the link 57, pivoted to the pitman opposite to that parallel surface, and the block 63, adapted to slide substantially at right angles to the stroke of the pitman and during one such stroke to be first caused by that inclined surface thus to slide, and then to be held stationary by that parallel surface, and then to be forced by that link to slide still farther, all substantially as described.

2. The combination of the shaft 2, the pitman 25, provided with the head 36, and the gate 31, and the pitman 40, provided with the link 57 and the die-block 63, all constructed and combined substantially as described.



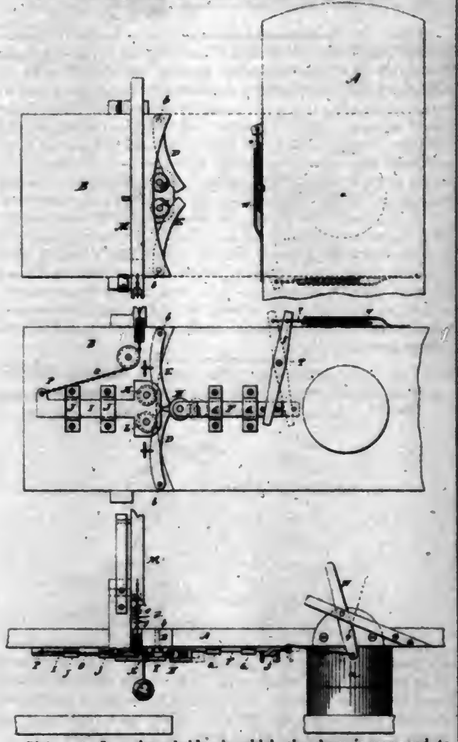
3. The combination of a pulley mounted on a shaft with a bushing between them, and with an elastic cushion between the pulley and the bushing, and a rotating eccentric key between the bushing and the shaft, a shaft carrying the pulley and intermittently revolved thereby, and three pitmen harmoniously worked by cranks on the shaft, all constructed and combined so that the pulley turns freely on the shaft when the key is in one position, and that turning the key into another position locks the shaft to the bushing and transmits the motion of the pulley to the shaft and thence to the pitmen, and that the cushion eases the otherwise sudden shock of the beginning of that transmission, all substantially as described.

4. The combination of the shaft 2, provided with cranks, substantially as described, the pitmen 25, 40, and 41, worked by those cranks, the disk 81, keyed to that shaft and provided with the eccentric surface 82, and the shoe 83, fixed adjacent to that surface, all constructed and combined so that the shoe will tend to stop each revolution of the disk and shaft and each reciprocation of the pitmen, all substantially as described.

5. The combination of the shaft 76, worked by the arm 77 and having the arms 74 and 75, with the cam-rods 70 and 71, reciprocating two opposite die-blocks simultaneously in opposite directions, all substantially as described.

400,671. GASOMETER. WILBERFORCE B. HAMMOND, Boston, Mass. Filed Jan. 18, 1889. Serial No. 296,700. (No model.)

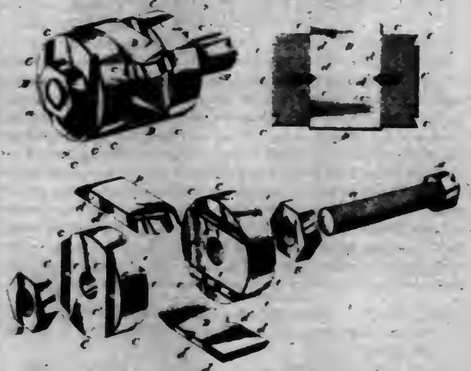
Claim.—1. In a gasometer, the combination, with a cistern, of an inverted holder adapted to rise and fall therein, guides spaced at governing-points about said holder and attached thereto, and connected shafting mounted upon the cistern, each member of said shaft-



400,671.

ing being operated by or geared to one of said guides, whereby a motion of parallel translation of the holder is assured at all periods of its rise and fall, substantially as described.

2. In a gasometer, the combination, with a cistern, of an inverted holder adapted to rise and fall therein, rack-bars spaced at governing-points about said holder and attached thereto, and connected shafting mounted upon the cistern, each member of said shafting being provided with a sprocket-wheel intermeshing with one of the rack-bars, substantially as described.



400,672. DRAW-BRIDGE GATE. WILLIAM HANEY, New Haven, Conn. Filed May 21, 1888. Serial No. 274,470. (No model.)

Claim.—1. In a draw-bridge in which the draw is arranged to swing in a horizontal plane, the combination of the levers D E, hung upon pivots beneath the approach to the draw, so as to swing in a horizontal plane, but inclined toward the draw, a longitudinal slide, I, arranged in rear of said levers, and upon which both the said levers are adapted to bear, a gate over the approach with a connection therefrom to said slide I, a longitudinal central slide, F, beneath the draw, so as to form a projection in the plane of the said levers D E, and so as to work upon the inclined surface of one of said levers as the draw opens or closes, a hand-lever hung at a stationary point on the draw, and a connection therefrom to said slide F, substantially as described, and whereby the projection of the said slide F may be forced into or taken from engagement with said levers.

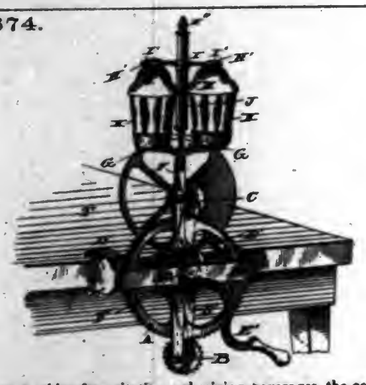
2. In a draw-bridge in which the draw is arranged to rotate in a horizontal plane, the combination therewith of the two levers D E, arranged upon the approach to the draw, hung upon pivots at their outer end and inclined toward the center of the bridge, where the free ends of the lever substantially meet, a projection on the draw arranged to work in a path in the plane of said levers D E as the draw opens or closes, a vertically-moving gate located on the approach to the draw, and a connection from said gate to said levers, substantially as described, and whereby as the bridge swings in either direction it will operate upon one of said levers, according to the direction in which the said bridge swings, and impart a corresponding opening or closing movement to said gate, with a yielding spring in the connection between the gate and said levers, substantially as described.

400,673. CUTTER-HEAD FOR MOLDING-MACHINES. PETER J. HARDY, Tom's River, N. J. Filed Apr. 30, 1887. Renewed Jan. 19, 1889. Serial No. 296,902. (No model.)

Claim.—1. As an improvement in molding-machines, the combination of a journaled spindle, two disks which are placed upon and adapted to be rotated with and to be relatively moved lengthwise of the same, and are provided within their contiguous faces with transverse grooves that have each a projecting stud, and cutters which have notched side edges that are adapted to enter said grooves and to engage with said studs, substantially as and for the purpose specified.

2. As a means for securing a cutter in position within a cutter-head, two disks that are adapted to rotate with a journaled spindle in the same plane and around a common axis, and are provided within their contiguous faces with coinciding grooves that are adapted to engage with the side edges of a cutter, and with pins which are arranged in said grooves and adapted to engage with corresponding notches in said cutter-edges, in combination with said spindle, and with means whereby said disks may be moved toward each other, substantially as and for the purpose set forth.

3. As an improvement in cutter-heads, the combination of two reversible clamping-disks that are provided within each of their faces with grooves for engagement with the side edges of a cutter, each of which grooves may be caused to coincide with one of the grooves of the opposite disk, and is provided with a pin for engagement with a notch in the edge of a cutter that has a position with relation to the longitudinal center of said groove which is different from the like position of either of the other pins of the same disk, substantially as and for the purpose shown and described.



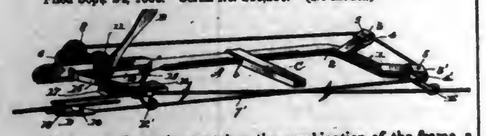
4. In combination with the threaded spindle provided with the nuts, the disks having within each face two or more grooves, and each groove provided with an engaging-pin, and the cutters which have each side edge adapted to fit into either of said grooves and provided with a notch for engagement with said pin, substantially as and for the purpose specified.

400,674. BEVERAGE SHAKING AND MIXING MACHINE. PETER P. HARING, Brenham, Tex. Filed Apr. 26, 1888. Serial No. 271,961. (No model.)

Claim.—1. The combination of the frame provided with arms at right angles thereto and the main drive-wheel journaled therein, gear-wheels journaled at the ends of the arms, provided with wrist-pins and meshing with the drive-wheel, a shaker-bar connected to the wrist-pins of the gear-wheels and having a loop or opening for the insertion of the shaft of the drive-wheel, and the cups or tumbler-holders attached rigidly to the shaker-bar, substantially as and for the purpose set forth.

2. The combination, with the frame, of the shaker-bar, tumbler-holders, covers for the tumblers, and a spring-actuated movable cross-bar provided at its outer ends with rings adapted to engage with the covers, substantially as and for the purpose set forth.

400,674.

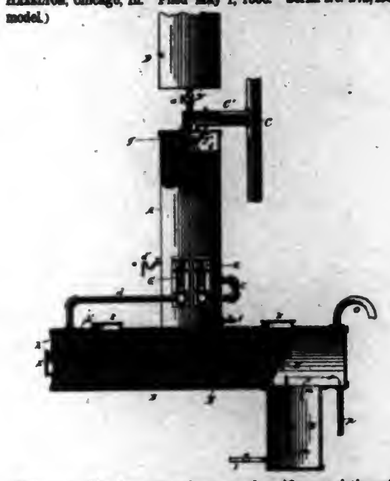


3. In a machine for agitating and mixing beverages, the combination consisting substantially of the following elements: a suitable frame adapted to be fastened upon a table or other support, a main drive-wheel journaled in said frame and provided with a crank or handle for operating it, a pair of gear-wheels or pinions journaled on the ends of the arms of the frame, provided with wrist-pins and meshing with the main wheel, a shaker-bar connected to the wrist-pins of said wheels, a series of tumbler-holders attached to and projecting laterally from the shaker-bar, the tumblers and covers, and a movable spring-actuated top bar connected to and moving with the shaker-bar and adapted to exert downward pressure upon the covers when the same are placed in position upon the tumblers, substantially as set forth.

400,675. WAGON-BRAKE. JOHN W. HARTMAN, Mapleton, and HENRY P. CLAY, Prescott, Kans. Filed Jan. 14, 1889. Serial No. 296,305. (No model.)

Claim.—The stirrup A, having hole a^3 and carrying the spring-pin D in ears a^4 a^5, in combination with brake-bars B B, having the holes b' b^2 b^3, whereby said brake-bars may be adjusted, as and for the purposes set forth.

400,676. COMBINED WIRE STRETCHER, TIGHTENER, AND SPLICER. JAMES P. HAYS and HENRY R. CLEMENS, Wellsville, Kans. Filed Sept. 24, 1888. Serial No. 286,238. (No model.)

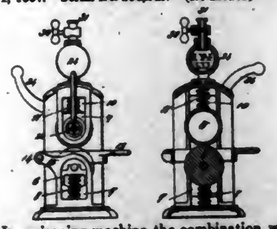


Claim.—1. In a wire-stretcher, the combination of the frame, a shaft, a reel mounted on the shaft, a ratchet-wheel and a lever for operating the reel, arms secured to the frame and forming a bearing for the said shaft, a yoke secured to the arms, and a clamp working in the yoke, substantially as described.

2. In a wire-stretcher, the combination of the frame curved at one end, pulleys secured to the said curved portion, a reel mounted on a shaft at the other end of the frame, a ratchet-wheel and lever for operating the reel, and a clamp or block supported on the frame, substantially as described.

3. In a wire-stretcher, the combination of the frame curved at one end, pulleys secured to the said curved portion, a shaft at the other end of the frame, a reel mounted on the shaft, a rope or chain passing from the reel around the said pulleys, a clamp secured to the rope, a ratchet-wheel and a lever for operating the reel, and a clamp or block supported on the frame, substantially as described.

4. In a wire-stretcher, the combination of the frame curved at one end, pulleys secured to the said curved portion, a reel mounted on a shaft at the other end of the frame, a ratchet-wheel and lever for operating the reel, a clamp or block supported on the frame opposite the reel, and guides secured to the clamp and to the curved portion of the frame, substantially as described.



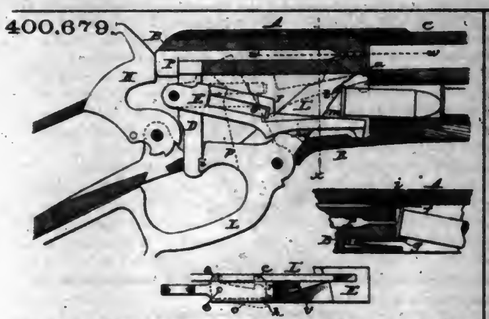
400,677. FEED-WATER HEATER AND PURIFIER. MILTON W. HAMILTON, Chicago, Ill. Filed May 1, 1888. Serial No. 272,435. (No model.)

Claim.—1. The feed-water heater and purifier consisting of heater A, containing wooden blocks *b*, and having branch of engine exhaust-pipe C connected with its top and overflow and blow-off pipes *d f*, respectively, and distributing-cone *g*, feed-water tank D, set above the heater, and having a pipe, D', leading down into the elbow of the pipe C', pump or pumps G', purifying-cylinder B, containing filtering substance H, and provided with distributing-cone *h*, man-holes *k*, and perforated diaphragm F, catch-basin E, provided with partition *l*, and having blow-off pipe *s*, and pipes *o* and *p*, all constructed, arranged, and operated substantially in the manner and for the purpose specified.

2. In a heater and purifier, the combination, with heating-cylinder A, engine exhaust-pipe C, and water-tank D, of branch exhaust-pipe C', connecting the pipe C with cylinder A, and pipe D', leading down from tank D into elbow of pipe C', substantially as herein shown and described, whereby the cold feed-water from the tank D may be operative to condense the steam entering the pipe C', and thereby create and maintain sufficient vacuum to contiuually draw steam from pipe C, as set forth.

400,678. IRONING-MACHINE. GUSTAVUS HEIDEL, St. Louis, Mo., assignor to the National Self-Heating Sad Iron Company, same place. Filed Oct. 1, 1887. Serial No. 251,943. (No model.)

Claim.—In an ironing-machine, the combination, with the frame, of a lower roller supported on springs 8 in each end of the frame, arms 15 on each end of the frame, frame 13, pivoted at 14 to said arms between the rollers, hollow upper roller held by springs in contact with the lower roller, burner for heating the upper roller, supply-pipe, and reservoir, all substantially as and for the purpose set forth.



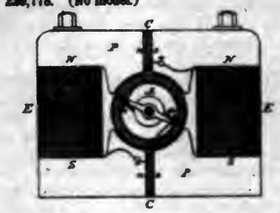
400,679. MAGAZINE-GUN. LEWIS L. HEPBURN, New Haven, Conn. Filed Jan. 12, 1889. Serial No. 296,129. (No model.)

Claim.—1. The combination, in a gun, of the receiver A, having a solid or unbroken wall at its top, with the longitudinal opening I in its side, and the reciprocating breech-block B, of the proper form transversely to fill the cavity between the walls of the receiver and the opening I in its side, substantially as shown and described.

2. The carrier E, having the rocker or dog *c* pivoted therein, said rocker or dog being provided with the shoulders *b* and *c*, constructed as described, and adapted to engage and operate with the lever L', as set forth.

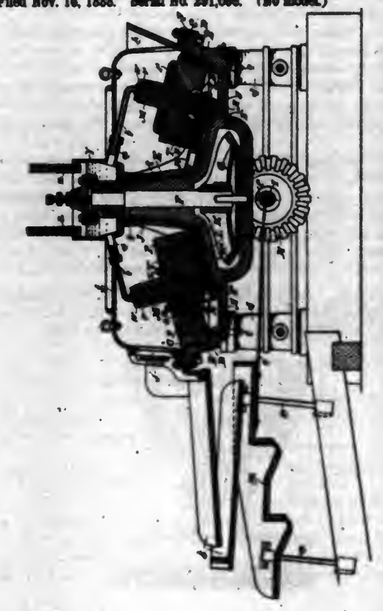
3. In combination with the receiver A, having an opening, I, in its side, and its top wall closed or unbroken, the barrel C, having its

400,679.



rear end projected backward into the cavity of the receiver, and having a notch or recess, *a*, cut in its under wall only, substantially as and for the purpose set forth.

4. In combination with the pivoted carrier E, the pivoted lever, L, provided with an eccentric, *w*, adapted to come in contact with the under side of the carrier as the lever is moved to open the breech, and elevate the front end of the carrier to a point just above the lower wall of the magazine-tube, and thereby prevent the cartridge from prematurely passing out of the magazine, as set forth.

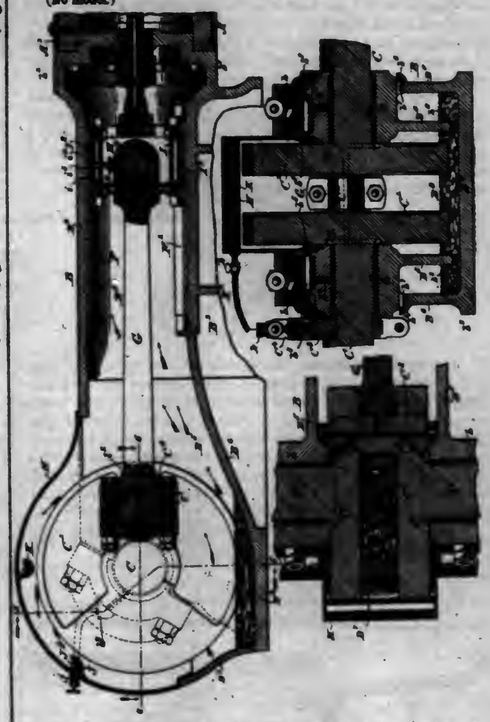


5. The flat-spring ejector *f*, provided with the projection *i*, said projection being provided with a right-angled face at its front and an inclined or beveled face at its rear side, the same being secured in a recess formed in the inner wall of the receiver, substantially as shown and described.

400,680. PREVENTION OF SPARKING IN ELECTRIC MOTORS AND GENERATORS. DANIEL HIGHAM, Philadelphia, Pa., assignor to the Higham Electric Motor Company, same place. Filed Mar. 5, 1887. Serial No. 229,773. (No model.)

Claim.—An electric motor or generator having field-magnet coils on its cores and counter distorting-coils on its pole-pieces, as and for the purpose set forth.

400,681. GRINDING-PAN. PHILIP HINKLE, San Francisco, Cal. Filed Nov. 16, 1888. Serial No. 291,066. (No model.)



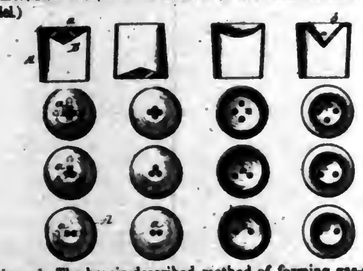
Claim.—1. In a grinding-pan, the inclined bottom, the outwardly-inclined sides, with the correspondingly-shaped ring-die fixed therein by calking, the carrier or driver, the bottom of which is inclined to correspond with the bottom of the pan, and having the radial guide-slots, in combination with guides fitted in said slots, the top plates, the upwardly extending shafts fixed in said guides so as to extend at an inclination outwardly, and the rollers turning upon said shafts, with their peripheries traveling in contact with the ring-die, substantially as herein described.

2. A grinding-pan having the inclined bottom and sides, the correspondingly-inclined die, the rotary carrier having radial slots in its outer periphery, with top plates and guides movable in said slots, said guides having upwardly-projecting cones or hubs, and the inclined shafts M, fixed in said cones or hubs, in combination with rollers fitting said shafts, having upwardly-extending sleeves from the top, and concavities in the bottom fitting the conical hubs of the guides, and the anti-frictional rings T and U, the holding nut and washer at the top of the shaft, substantially as herein described.

3. In a grinding-pan, the inclined bottom and sides, the correspondingly-inclined rollers, the inclined shafts, and the radially-moving guides, in combination with a central rotating reservoir, and pipes connecting said reservoir with the upper ends of the shafts, so as to discharge water through them and beneath the rollers and guides, substantially as herein described.

4. In a grinding-pan, the inclined bottom and sides, the radially-moving guides, the inclined shafts, the grinding-rollers journaled at the corresponding inclination upon said shafts, the conduits, and pipes, whereby water is discharged through the roller-shafts and between the carrier and the pan-bottom, substantially as herein described.

400,682. LUBRICATING DEVICE FOR STEAM-ENGINES. ALBERT L. IDE, Springfield, Ill. Filed Feb. 20, 1888. Serial No. 264,606. (No model.)



Claim.—1. The combination, with a steam-engine crank-shaft and disk and an engine-frame affording bearings for the shaft and formed to provide an oil tank or basin beneath the disk, the side walls of which rise to a point above the lower edge of the disk, of a detachable cover fitted to the frame and forming with the latter a closed housing surrounding the crank-disk and adjacent parts, a trough or receptacle located upon the inner surface of the cover in position to receive from the same lubricant thrown thereon by the disk, and a pipe attached to the housing communicating with said trough and leading to a bearing-surface to be lubricated, substantially as described.

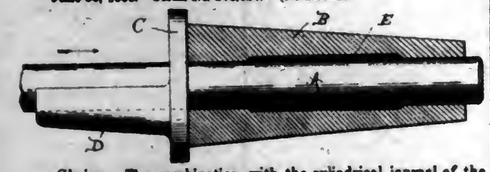
2. The combination, with a crank-shaft and a crank-disk, of an

oil tank or basin beneath the disk, the side walls of which rise to a point above the lower edge of the disk, a housing or casing provided with an oil-receiving surface arranged in the same plane with the disk, a trough located within the housing in position to receive from the said oil-receiving surface fluid lubricant cast thereupon by the crank-disk, a pipe leading from said trough to a bearing to be lubricated, and a valve in said passage, substantially as described.

3. The combination, with an engine crank-shaft, a crank-disk thereon, and a bearing for the shaft provided with an oil cup or receptacle located in position to receive from the surface of the bearing-lubricant cast upon the same by the disk, of a pipe communicating with said trough or receptacle and discharging into the oil-cup upon the bearing, said oil-cup being provided with an overflow pipe or passage leading into the housing, substantially as described.

400,683. METHOD OF FORMING GAS-OUTLETS. WALTER M. JACKSON, New York, N. Y. Filed Nov. 6, 1888. Serial No. 290,103. (No model.)

Claim.—1. The herein-described method of forming gas-outlets, consisting in forcing the head of a closed sheet-metal pillar or tip into shape and at the same time or subsequently giving the under or inner surface of the head a convex shape, and then making apertures through the latter in such directions that none of the escaping gas shall pass vertically while in the apertures, substantially as set forth.



2. The herein-described method of forming gas-outlets, consisting in forcing the head of a closed sheet-metal pillar or tip into shape, then thickening the head or apex of the same by the insertion of a separate piece of material, and finally making apertures through the latter in such directions that none of the escaping gas shall pass vertically while in the apertures, substantially as set forth.

400,684. HORSESHOE. DAVID S. JAFFRAY, Chicago, Ill. Filed May 14, 1888. Serial No. 273,782. (No model.)

Claim.—In combination with the horseshoe A, having the longitudinal recesses A' A' formed therein, the transverse slot a^2 in said horseshoe, forming a key-socket and a U-shaped calk, B, the prongs thereof fitting the recesses A' A' in the shoe, said calk having an opening, b^2, passing through it in line with the opening a^2 of the horseshoe, the top of said opening being contracted by the shoulders b^2, and a key, as C, passing through said opening a^2 b^2, and bearing upon the shoulders b^2 of the slot in the calk, whereby it is prevented from slipping out, substantially as described.

400,685. AXLE-SKEIN. JOHN A. JOHNSON, Madison, Wis. Filed June 30, 1888. Serial No. 278,697. (No model.)

Claim.—The combination, with the cylindrical journal of the metallic axle A, of the skein B, shrunk upon said journal, having the annular chamber E, and provided with the collar C and the inwardly-projecting bolster D, which collar and bolster are integral with the skein, substantially as specified.

400,686. RECEPTACLE FOR PULVERIZED SUBSTANCES. FERDINAND KAMPF, Chemnitz, Germany. Filed Aug. 17, 1888. Serial No. 283,016. (No model.)

Claim.—A receptacle for dry pulverized condiments, having an interior tube extending from the top opening of the receptacle nearly to the bottom of said receptacle, for the purpose of allowing a definite quantity of the condiments to be ejected at one movement, substantially as herein shown and described.

400,686.

400,687. FUSE OR IGNITING DEVICE FOR PROJECTILES. WILLIAM KENNEDY, Brooklyn, N. Y. Filed Jan. 7, 1889. Serial No. 295,617. (No model.)

Claim.—1. An igniting device or fuse for an elongated rifle shell or projectile, consisting of a wheel rotatively mounted in a chamber in the projectile, with its axis of rotation coincident with the axis of rotation of the projectile, and an igniter and arrester, one of which is borne by the projectile and the other by said wheel, said igniter and arrester being arranged in the same circular path, whereby they are brought into contact by the rotation of the wheel relatively to the projectile.

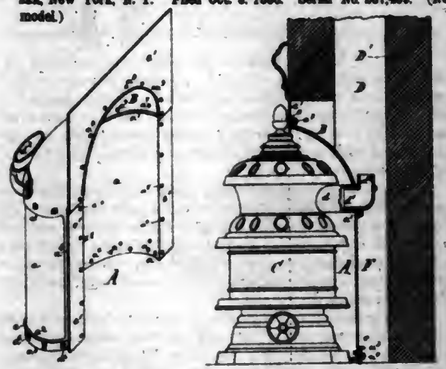
2. The combination, with the body of the projectile, provided with a chambered tip or cap capable of removal, of the wheel rotatively mounted within said cap, its axis of rotation coinciding with that of the projectile, said projectile and wheel being provided, the one with a holder for the igniter and the other with an arrester arranged in the same path with the igniter, whereby the exploding charge is ignited by the rotation of said wheel relatively to the projectile.

3. The combination, with the body of the projectile, provided with a chambered tip or cap capable of removal, of a wheel rotatively mounted within said cap and having on its rim a holder for the igniter, and an arrester carried by the projectile and arranged in the path of the igniter carried by said wheel, whereby the igniter is fired by the rotation of the wheel relatively to the projectile.

4. The combination, with the body of the projectile, provided with a chambered tip or cap capable of removal, of the wheel rotatively mounted within said cap and provided with a holder for the igniter, the arrester carried by the projectile and arranged in the path of the igniter carried by the wheel, and the detent whereby the wheel is held against accidental rotation while the projectile is being manipulated.

5. The combination, with the body of the projectile, provided with a chambered tip or cap, of the wheel rotatively mounted in said cap on a screw-bearing, the axis of rotation of said wheel coinciding with the axis of the projectile, said projectile and wheel being provided, the one with a holder for the igniter and the other with an arrester in the same path with the igniter.

400,688. AUTOMATIC FIRE-EXTINGUISHER. CHARLES W. KRESTNER, Chicago, Ill., assignor of one-half to William E. Smith, same place. Filed Jan. 26, 1889. Serial No. 297,671. (No model.)



Claim.—1. In an automatic fire-extinguisher, the combination of a nozzle, a yoke projecting beyond the orifice of the nozzle and having retaining-lugs on each of its upright portions, a cap-valve adapted to close the nozzle-orifice, levers adapted to engage the lugs of the yoke-uprights and having short arms bearing on the valve, and a fusible strip connected at its respective ends by arms and links to the upper ends of the levers, substantially as described.

2. In an automatic fire-extinguisher, the combination of a nozzle, a yoke projecting beyond the orifice of the nozzle and having lugs toward each end of its upright portions, a valve adapted to close the nozzle-orifice, levers having projections to engage the lower lugs of the yoke-uprights and having their upper ends extended to bear upon the outer side of the upper lugs and provided with short arms adapted to bear on the valve, and a fusible strip connected at its respective ends by arms and links to the upper ends of the levers, substantially as described.

3. In an automatic sprinkler, a deflector secured over the nozzle-orifice, said deflector comprising a disk slitted radially and having the metal thereof turned down at the edges of the slits at a screw-pitch, whereby to break the water into spray, substantially as described.

400,689. RECESS SUMMER-PIECE FOR STOVES. JOHN H. KEYSER, New York, N. Y. Filed Oct. 3, 1888. Serial No. 287,409. (No model.)

Claim.—1. The summer piece, hood, or cell A for a stove, comprising the cast-iron cap portion B, of arched and concave form, skeleton frame a^3 a^4, bolting-flange c, inner stove-pipe collar, d', and curved sheet-iron body portion a, bolted to the skeleton frame of the cap portion, substantially as described.

2. The summer-piece A for a stove, comprising cap portion B, skeleton frame a^3 a^4, curved body portion a, flange c, inner collar d', and sheet-metal reducible flange or rim c', bolted to the flange c, substantially as and for the purpose described.

3. The summer-piece A, comprising the cast-iron cap portion B, of arched and concave form, skeleton frame a^3 a^4, the curved body portion a, the inner stove-pipe collar, d', cast on the cap portion, the outer upturned collar, d^3, connected to the cast-iron cap portion, the bolting-flange c, and the sheet-metal reducible flange c', substantially as and for the purpose described.

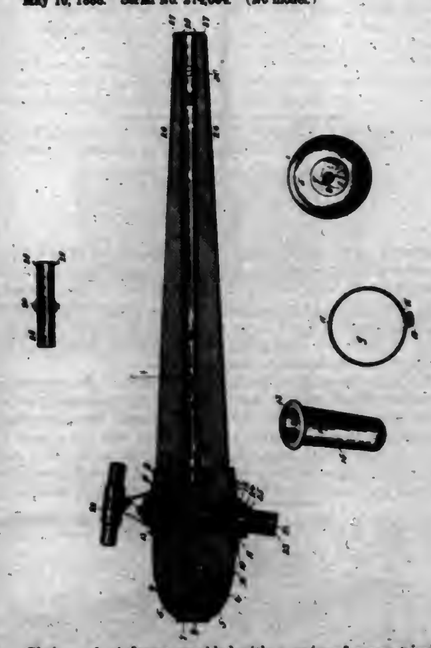
4. The summer-piece A for a stove, comprising the skeleton frame a^3 a^4, cast-iron cap portion B, and body portion a, both made of less horizontal extension than the recess of the fire-place and provided with collars d' d^3, flange c, and reducible sheet-metal flange or rim c', substantially as and for the purpose described.

5. The summer-piece A for a stove, comprising the cast-iron cap portion B and body portion a, and skeleton frame a^3 a^4, said portions B and a being both made of less horizontal extension than the recess of the fire-place and provided with collars d' d^3 and flange c, substantially as and for the purpose described.

6. A summer-piece for a stove, having its curved sheet-metal body portion a provided with reducible flanges which are of metal homogeneous therewith and made in one piece, and applied in combination with an arched cap portion forming an extension of the body portion, substantially as described.

7. A summer-piece for a stove, having its arched cap portion B, its inner collar, and its skeleton frame of homogeneous metal and made in one piece, substantially as described.

400,690. COMBINATION-TOOL. ARDEN D. KENDALL, Miles, Iowa. Filed Dec. 3, 1888. Serial No. 292,463. (No model.)



Claim.—The hereinbefore-described combination-tool, composed of the three levers A, B, and C, pivotally connected together, the levers A and B, having the curved jaws D' and D, respectively, the lever A, having the cutting-edge d, and the lever B, having the saw-edge d', and the tack-extractor d^3, and the lever C, having the screw-driver

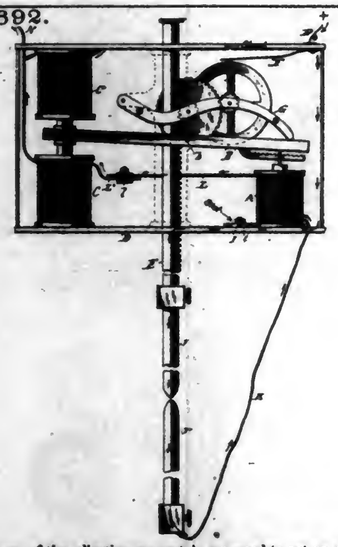
400,690.

E at one end and the cork-screw F at its other end, substantially as shown.

400,691. FAUCET. WILLIAM W. KENDALL, Leetonia, Ohio. Filed May 16, 1888. Serial No. 274,064. (No model.)

Claim.—1. A faucet provided with a series of concentrically-shouldered annular recesses at its front end, a shouldered metal ring seated in the recesses, and an elastic buffer seated in the shoulders of the ring, and a screw for retaining the buffer in position, substantially as specified.

2. A faucet bored for the reception of a key-seat and provided with a metal clasp having perforations registering with said bore, in combination with a removable seat mounted in the bore and formed with flanges at its upper end adapted to take over said band, and screw-threaded at its lower end and bound in position by suitable nut and washer, substantially as specified.



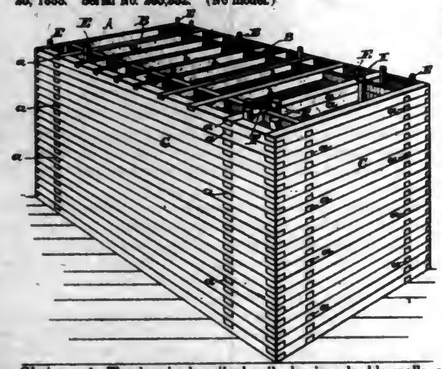
3. The combination, with a wooden faucet having a transverse bore, of a metal seat mounted in the bore and formed with flange at its upper end and screw-threads at its lower end and with nuts for binding the same to position, and of a metal key mounted in the seat and screw-threaded at its lower end and provided with nuts for binding it in position, whereby the key and its seat are adapted for removal and application to a new wooden faucet-body, substantially as specified.

400,692. ARC LAMP. GEORGE M. LANE, Asbury Park, N. J. Filed Dec. 26, 1888. Serial No. 294,575. (No model.)

Claim.—1. In an electric-arc lamp, the combination, with the feed-controlling lever, the magnet C in the main circuit, and the magnet C' in a shunt, the two magnets C and C' acting in opposition to each other for controlling the movements of the said lever, of the adjusting or compensating magnet A, of less force than the feed-controlling magnets, placed in the main circuit with the magnet C, and acting on the said feed-controlling lever in opposition to the said magnet C proportionate to the strength of the current, substantially as and for the purpose described.

2. In an electric-arc lamp, the combination, with the feed-controlling lever and the magnets C and C', for controlling the movements

400,692.



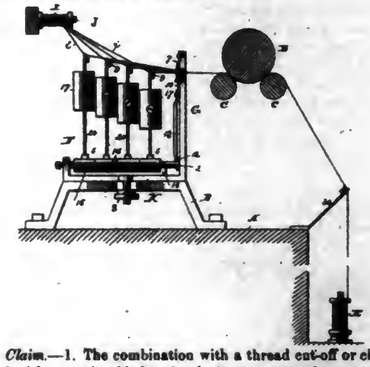
of said lever, of the adjusting-magnet A, arranged to act on said lever in opposition to the magnet C and adjustable to and from the pivotal support of the said lever, substantially as and for the purpose described.

3. In an electric-arc lamp, the combination, of the feed-controlling lever B, the magnets C and C', the arm H, and the magnet A, adjustable on the frame and having its core suspended from the said arm H, substantially as and for the purpose described.

4. The combination of the feed-controlling lever, the magnet C in the main circuit, and the shunt-magnet C', arranged to act in opposition to one another on the same end of the said feed-controlling lever, the compensating magnet A, of less force than the magnet C and in the main circuit therewith, arranged to act on the other end of the said lever in opposition to the magnet C, and having its armature connected and movable with the said lever, substantially as described.

400,698. CRIB. CYRENIUS LAWRENCE, Clyde, Mich. Filed Feb. 25, 1888. Serial No. 265,332. (No model.)

Claim.—1. The herein-described crib, having double walls, a space between said walls open at the top and bottom, and a compartment within the inner walls, having a solid bottom, substantially as shown and described.



2. A crib having outer and inner walls, B and C, secured to each other by the projecting timbers *a*, a space between said walls open at the top and bottom, and a compartment within the inner walls, B, having a solid bottom, D, substantially as shown and described.

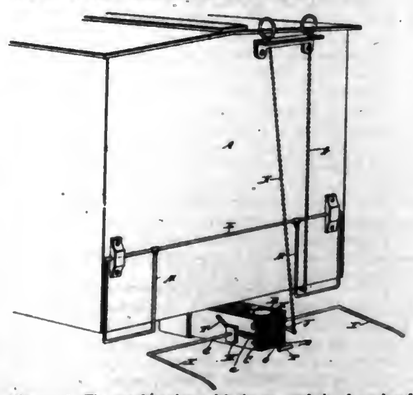
3. The combination, with the cribs having double walls, a space between said walls open at the top and bottom, and a compartment within the inner walls, having a solid bottom, of suitable piles driven between the inner and outer walls of the crib, substantially as shown and described.

4. The combination, with the crib having inner and outer walls, B C, a space between said walls open at the top and bottom, and a compartment within the inner walls, having a solid bottom, of suitable piles, E, driven between said inner and outer walls, the piles at the corners of the compartment being connected by chains F, extending over the timbers *a*, substantially as shown and described.

400,694. STOP-MOTION FOR DOUBLING-MACHINES, &c. ANTHONY A. LEHMANN, Baltimore, Md. Filed Oct. 8, 1887. Serial No. 251,835. (No model.)

Brief.—The object of the invention is to provide improved means for insuring the stoppage of the thread in doubling upon the accidental breakage of one or more of its strands.

Claim.—1. The combination with a thread cut-off or clamp provided with a moving blade, of a shaft, connections between the shaft and blade to move said blade, a weighted arm pivotally mounted on said shaft and having a loop for the thread, and a contact-piece on the shaft adapted to be struck by the weighted arm as it falls, whereby the shaft and blade are moved simultaneously with the fall of the said arm, substantially as described.

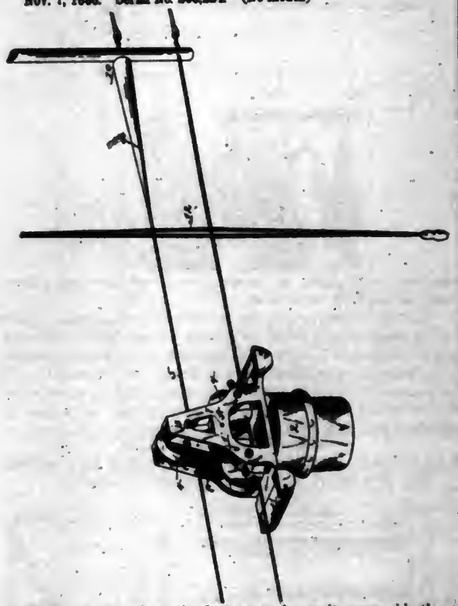


2. The combination, with a thread cut-off or clamp provided with a moving blade, of a shaft, connections between the shaft and blade to move said blade, a plurality of weighted arms pivotally mounted on said shaft, each having a loop for the thread, and a contact-piece on the shaft common to all of the weighted arms, whereby the fall of either or all of the arms will simultaneously move the shaft and blade, substantially as described.

3. The combination, with a thread cut-off or clamp, of a shaft, connections between the shaft and said cut-off or clamp, a weighted arm provided at one end with a loop for the thread and at the opposite end with a sleeve loosely mounted on said shaft, and having a shoulder, 5, and a contact-piece on the shaft in position to be struck by the shoulder on the movement of the weighted arm, whereby the shaft is rocked, substantially as described.

4. The combination, with a thread cut-off or clamp, of a shaft, connections between the shaft and said cut-off or clamp, two or more weighted arms pivotally mounted on said shaft, and a contact-piece on the shaft in position to be struck by the movement of either of said arms, whereby the shaft may be rocked by one of the arms, substantially as described.

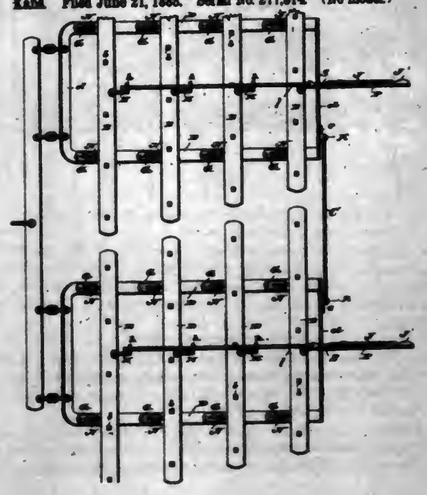
5. The combination of a thread cut-off or clamp provided with a reciprocating blade, a shaft having an arm connected to move said blade when it is rocked, a plurality of weighted arms loosely mounted on said shaft and each having a loop for the thread, and a contact-piece common to all of the arms in position to be struck by either of them upon the breakage of the thread, substantially as described.



400,695. CAR-COUPLING. GEORGE W. LEWTON, Eldora, Iowa. Filed Jan. 9, 1889. Serial No. 295,830. (No model.)

Claim.—1. The combination, with the car and the draw-head, of the rock-shaft L, mounted on the car and having the loops M at its ends, and the shaft G, mounted in the draw-head and carrying the coupling-link, and provided at its ends with the arms I I, adapted to be engaged by the loops M, as set forth.

2. The combination, with a draw-head having the slot C and recess D in its front end and the inclined slot F in its upper rear portion, of the shaft G, mounted in said slot F, and the coupling-link secured to said shaft and extending forward therefrom through the slot C, and provided at its front end with the cross-head adapted to fall within the recess E, as set forth.



400,696. CASH-CARRIER. DAVID LIPPT, Mansfield, Ohio. Filed Nov. 7, 1888. Serial No. 290,234. (No model.)

Claim.—1. A cash-carrier frame carrying on its upper side three grooved wheels and on its lower side a cash-receptacle, and an idle grooved wheel placed intermediate of the three grooved wheels and adapted to bear against a stop at the end of the track, substantially as specified.

2. A cash-carrier frame carrying on its upper side three grooved wheels for running upon the track, a cash-receptacle secured to its under side, a grooved idle-wheel placed intermediate of the three grooved wheels and adapted to bear against a tapered stop at the end of the track, and two rollers mounted in the base of the frame and adapted to be acted against by a starting-cord, substantially as described.

400,697. HARROW. HENRY L. MACK, Summit, Cloud County, Kans. Filed June 21, 1888. Serial No. 277,814. (No model.)

400,697.

Claim.—In a harrow of the character described, the combination, substantially as set forth, of the continuous rectangular frame, the side bars of which are provided on the upper side with bent plates, the tooth-beams connected therewith by means of eyebolts, the coupling-bar provided at intervals with transverse circular openings and at its rear end having notches in its upper edge, the brackets rigidly secured at their lower forked ends to the tooth-beams and provided at their upper ends with laterally-projecting studs to engage the circular openings in the coupling-bar, the rearmost of said brackets having an extended shank constituting an operating-lever, a spring-pressed pawl pivoted to the lever above the coupling-bar and forked at its free end to straddle said bar, and a connecting-rod composed of two sections adapted to slide one upon the other.

400,698. BUTTER-PACKAGE. CHARLES H. MACOMBER, Atwater, Minn. Filed June 18, 1888. Serial No. 277,402. (No model.)

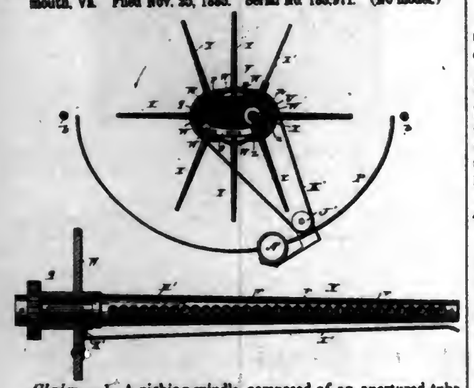
Claim.—The package herein described, comprising the open-ended sections telescoping together, and the followers fitting in the ends of the package, substantially as described.

400,699. QUILTING ATTACHMENT FOR SEWING-MACHINES. CHARLES MANSEVILLE, Farmer, Tex. Filed Oct. 2, 1888. Serial No. 287,073. (No model.)

Claim.—1. A quilting attachment for sewing-machines, consisting of two side bars, a take-up roll at one end, a stay-rod at or near the central part thereof, a vertically-adjustable guide and tension-roll revoluble between the stay-rod and take-up roll, an independently revoluble pay-off roll for the lining at the opposite end of the side bars, a vertically-adjustable pay-off roll for the top removably mounted in bearings between the side bars adjacent to the stay-rod and between the latter and the lining pay-off roll, and revoluble in its bearings independent of rotation of the lining pay-off roll for adjusting the tension of the top independent of the lining, and a transverse rail on which the side bar travels, substantially as described.

2. A quilting-machine consisting of two side bars, a take-up roll at one end, a stay-rod at or near the central part thereof provided with supporting-wheels, a vertically-adjustable guide and tension-roll revoluble in bearings between the take-up roll and the stay-rod, a vertically-adjustable independently-revoluble pay-off roll for the lining at the opposite end of the side bars, a vertically-adjustable pay-off roll for the top removably mounted in bearings between the side bars adjacent to the stay-rod and between the latter and the lining pay-off roll, and revoluble in its bearings independent of rotation of the lining pay-off roll for adjusting the tension of the top independent of the lining, and a transverse rail on which the supporting-wheels rest and travel, substantially as described.

3. In a quilting-frame attachment for sewing-machines, the combination, with two parallel side bars, having their greatest width and weight at one end, of a vertically-adjustable take-up roll journaled in said side bars, a vertically-adjustable tension and guide roll journaled in brackets depending below the side bars, a stay-rod connecting the said bars at or near their central part and rising to or nearly to their upper edges, a pay-off roll for the top vertically adjustable in brackets rising above the side bars, a pay-off roll for the lining in the other end of the frame, and a rail supporting the frame, the pay-off for the lining and the take-up roll having ratchets and thumb-buttons and the frame being provided with wheels moving on the rail, substantially as described.



4. In a quilting-frame attachment for sewing-machines, a frame

composed of side bars strengthened by a flange, said bars tapering from a point past their centers to one end, a stay-bar having elbow-braces connecting said bars, a rail clamped upon the work-table of the machine and having a groove and bead, and wheels upon the frame moving upon said bead, all constructed and arranged substantially as described.

5. In a quilting-frame attachment for sewing-machines, the combination, with two parallel bars having one end of greater width and weight, of a guide-roll and a pay-off roll for the top of the quilt journaled upon opposite sides of a substantially central stay-rod rising nearly flush with the upper edges of the said bars, a take-up roll at the wider ends having a ratchet engaging with a spring-pressed pawl on the frame, and a pay-off roll for the lining having a similar ratchet and pawl, the guide-roll and pay-off for the top being adjustable below and above the bars, respectively, substantially as described.

6. In a quilting-frame attachment for sewing-machines, the combination, with a supporting-rail for the frame having suitable attaching-clamps and provided with metallic plates having openings in their projecting ends, and having slots cut from their edges into said openings in a plane inclined to the perpendicular, of legs having headed bolts set in their ends, said bolts being adapted to enter the slots by inclining the legs, substantially as described.

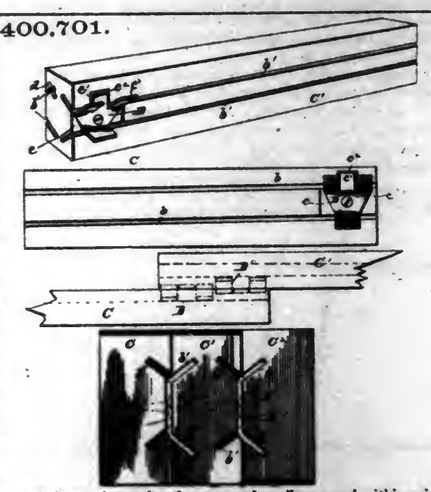
400,700. COTTON-HARVESTER. SAMUEL D. T. MANNING, Portsmouth, Va. Filed Nov. 26, 1885. Serial No. 183,971. (No model.)

Claim.—1. A picking-spindle composed of an apertured tube, and an interior core provided with picking-pins corresponding with said apertures, said picking-pins being of such length that they do not project beyond the exterior surface of the spindle, substantially as set forth.

2. A rotating cage and rotating picking-spindles journaled therein and carried thereby, in combination with fixed toothed rods carried by said cage, each of said rods being located immediately beneath one of said spindles, substantially as set forth.

3. A gathering-box open on one side, a rotating cage located therein, and rotating picking-spindles mounted thereon, in combination with stripping-bars located on said cage beneath said spindles, and stripping-bands arranged between said spindles and bars, substantially as set forth.

4. A rotating spindle which has a double rotary motion on its axis, first in one direction and then the other, and also a bodily movement in an approximately-circular path, in combination with a stripping-bar parallel with said spindle, which is carried around with said spindle, said bar being toothed on one edge and flat on the other, substantially as set forth.

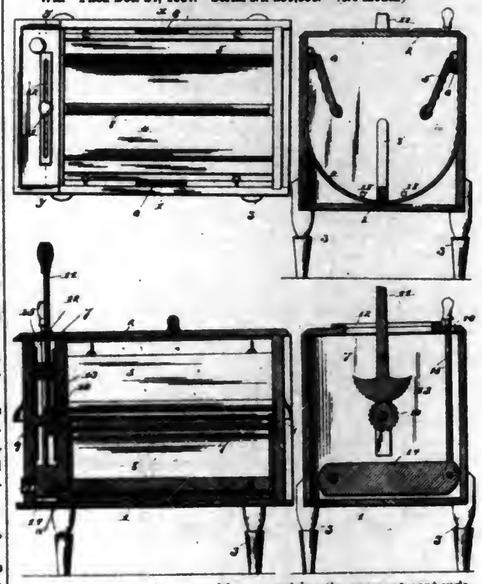


400,701. EXTENSION-TABLE. ELIAS I. MATTESON, Randolph, N. Y. Filed July 7, 1888. Serial No. 279,235. (No model.)

Claim.—1. In an extension-table, the combination, with a series of extension-sections have grooves arranged on an incline relatively to the side edges thereof, and central extension-sections having grooves parallel with their side edges, of runners pivotally secured to the several sections and entering the grooves in the next adjacent sections, substantially as set forth.

2. In an extension-table, the combination, with a series of extension-sections having diverging grooves, the grooves in the end sections being arranged on an incline relatively to the side edges of the sections, and the grooves in the central section being parallel with its side edges, of runners pivoted to the sections and adapted to run in said grooves, substantially as set forth.

3. In an extension-table, the combination, with a series of extension-sections having grooves arranged on an incline relatively to the side edges thereof, and central extension-sections having grooves parallel with their side edges, the said sections being recessed at points

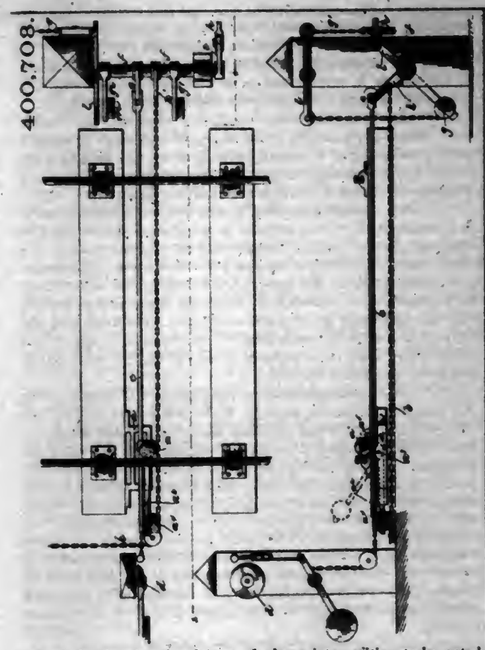


400,701.

near their meeting ends, of runners pivotally secured within said recesses, substantially as set forth.

4. In an extension-table, the combination, with extension-pieces having longitudinal grooves, of runners pivoted to said extension-pieces and adapted to work in said grooves, said runners consisting of a plate having portions at each end thereof bent obliquely to enter the grooves in the sections, and a tongue projecting from one end of the runners and bearing upon the face of the sections to broaden the bearing of said runners on the section, substantially as set forth.

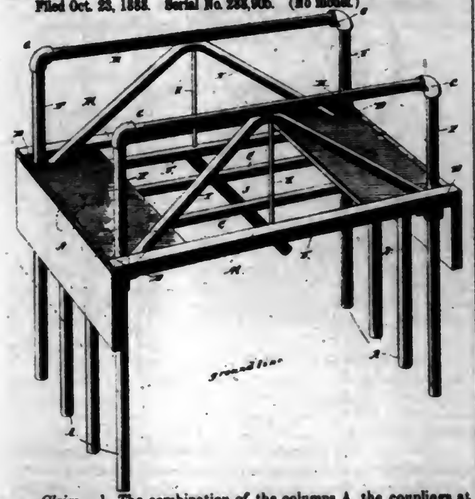
400,702. WASHING-MACHINE. RICHARD HASE, North La Crosse, Wis. Filed Dec. 27, 1887. Serial No. 259,038. (No model.)



Claim.—The washing-machine comprising the compartment suds-box, the dasher hung therein and geared to an operating handle or lever arranged in its lesser compartment, and the pivoted longitudinally-arranged wings, the under sides of which, as also the opposite surfaces of the suds-box, are corrugated, which wings also stand off from the sides of the suds-box as well as being yielding, substantially as specified.

400,708. AUTOMATIC SIGNAL FOR RAILWAYS. JOSHUA OXLEY, 3 Harleston Cottages, Harleston Green, County of Middlesex, England. Filed Sept. 23, 1887. Serial No. 250,509. (No model.) Patented in England Feb. 26, 1886, No. 2,815.

Claim.—1. In a device for actuating railway alarm-signals, the combination, with the track, of a pivoted rocking lever carrying a globe forming a friction-wheel, and mechanism, substantially as described, for drawing the globe or the lever into position to be acted upon by the wheels of the car.

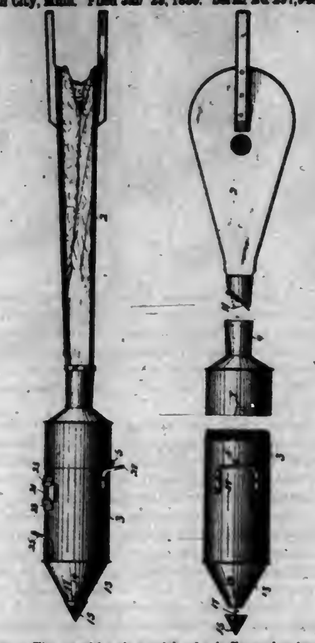


400,703.

2. In a device for actuating railway alarm-signals, the combination of a pivoted rocking lever carrying a globe, the alarm mechanism, substantially as described, actuated thereby, and the arm and lever connected to the operating-lever and adapted to operate a suitable recording-instrument, as set forth.

3. The mechanism for actuating railway alarm-signals and recording-instruments, consisting of a pivoted rocking lever on which is mounted on a horizontal axis a globe, arranged and operating substantially as and for the purpose set forth.

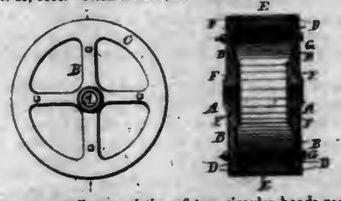
400,704. TRUSS-BRIDGE. JOHN W. PAMLEY, East Randolph, N. Y. Filed Oct. 23, 1888. Serial No. 288,905. (No model.)



Claim.—1. The combination of the columns A, the couplings at the upper ends of some of the said columns, the elbows at the upper ends of the remaining columns, the tubular beams secured to and between said couplings and elbows, the standards secured to the couplings, the said standards being tubular, the elbows at the upper ends of the standards, and the tubular rails secured to and between said elbows, as set forth.

2. The combination of the tubular columns, the tubular beams secured to and between the upper ends of the columns, the tubular standards projecting upward from the outer columns, the tubular rails secured to and between said standards, the tubular cross-bar arranged beneath the beams at the centers of the same, the tubular braces, and the securing-rods inserted through the rails, the braces, the outer beams, and the ends of the cross-bar, as set forth.

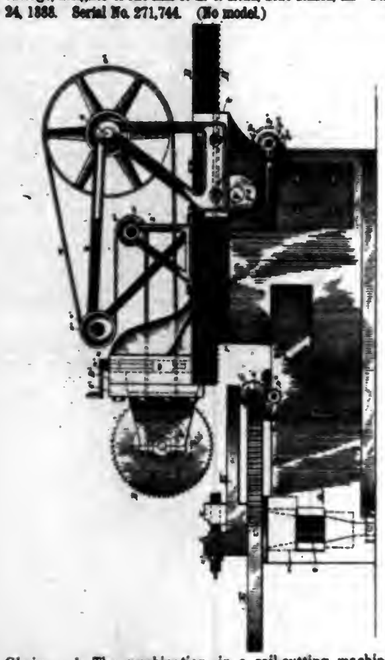
3. In a bridge, the metallic columns A, of any desired number, the standards secured to and above the end columns, the longitudinal metallic beams C, secured to the intermediate columns A, the side longitudinal beams, E, secured to the end columns A, the metallic rails H, secured to the upper ends of the standards secured on the end columns A, and the cross-bar J, suspended from the rails H and arranged transversely across beneath the longitudinal beams, as set forth.



4. In a bridge, the metallic columns A, of any desired number, the standards secured to and above the end columns, the longitudinal metallic beams C, secured to the intermediate columns A, the metallic rails H, secured to the standards secured to the upper ends of the end columns A, and the cross-bar J, suspended from the rails H and arranged transversely across beneath the longitudinal beams C, the side longitudinal beams, E, secured to the end columns A below the rails H, and the braces I, connected to the end columns and bearing under the cross-rails H, as set forth.

400,705. GOPHER-EXTERMINATOR. MARTIN B. PARKER, Sibley Earth City, Minn. Filed Jan 29, 1889. Serial No. 297,943. (No model.)

Claim.—The combination, with the bellows having the inclined end and the valve 11, hinged upon said end, of the combustion-chamber 3, provided with a tube, 9, fitting upon the end of the bellows, and with a conical end, the conical spark-arrester fitting over the end of said combustion-chamber and provided with the fastening-hook 17, the ledges 23 upon the sides of the combustion-chamber, and the door 21, sliding under said ledges, all substantially as described, and for the purpose set forth.



400,706. PULLEY. ROBERT C. PAUL, Cumberland, Md. Filed Nov. 15, 1888. Serial No. 290,963. (No model.)

Claim.—A pulley consisting of two circular heads provided with inwardly-projecting flanges and with hub portions, a series of tenoned staves inserted in said flanges between the heads and forming with the annular portions of the heads the face or periphery of the pulley, and screw rods and nuts for securing the heads and staves in position, substantially as described.

400,707. MACHINE FOR CUTTING RAILS.

THOMAS G. PERKINS, Chicago, assignor of one-half to R. C. Read, Blue Island, Ill. Filed Apr. 24, 1888. Serial No. 271,744. (No model.)

Claim.—1. The combination, in a rail-cutting machine, of a rotary cutter, a horizontally-reciprocating table carrying at one end the rotary cutter, and a stationary turn-table at one end of the machine provided with means for supporting a rail thereon, and serving to permit setting of the supported rail to any angle in the horizontal plane with reference to the vertical plane of the rotary cutter, substantially as described.

2. The combination, in a rail-cutting machine, of a rotary cutter, a horizontally-reciprocating table carrying at one end the rotary cutter, an adjustable stationary support for the rail toward the end of the forward stroke of the reciprocating table, and an angle-indicating attachment, substantially as and for the purpose set forth.

3. The combination, in a rail-cutting machine, of a rotary cutter, a horizontally-reciprocating table carrying at one end the rotary cutter, a stationary turn-table at one end of the machine, and provided with means for supporting a rail thereon, and serving to permit setting of the supported rail to any angle in the horizontal plane with reference to the vertical plane of the rotary cutter, and an angle-indicating attachment geared to the turn-table and operated by the rotation thereof, substantially as described.

4. In a rail-cutting machine, in combination with the bed A, a reciprocating table, B, carrying a saw, D, a rack, B', on the table B, a shaft, q, provided with a cog-wheel, q', in mesh with the rack and with a worm-wheel, q^2, a worm-shaft, p, having its worm in mesh with the wheel q^2, and a driving-shaft, p^2, geared to the shaft p, substantially as described.

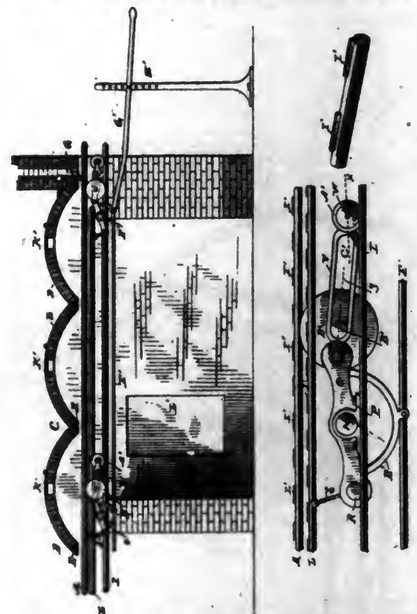
5. In a rail-cutting machine, in combination with the bed A, a reciprocating table, B, carrying a saw, D, vertically adjustable on its support, substantially as described.

6. In a rail-cutting machine, in combination with the bed A, a reciprocating table, B, carrying a saw, D, a driving-shaft, o, supported on the bed and connected with the saw-shaft by an endless belt, and a compensator for the endless belt on the table B, substantially as described.

7. In a rail-cutting machine, in combination with the bed A, a reciprocating table, B, carrying a saw, D, on a rotary shaft, o', brackets y on the bed supporting rotary shafts o and o^3, a rotary shaft, o^4, supported on the table B, and an endless belt, m, connecting the shaft o and saw-shaft, and passing over the intermediate shafts, o^3 and o^4, to form a compensator, substantially as described.

8. In a rail-cutting machine, in combination with the bed, a reciprocating table, B, carrying a saw, D, and a turn-table, E, adjacent to the saw, and provided with means for holding the rail to be cut, substantially as described.

9. In a rail-cutting machine, in combination with the bed, a reciprocating table, B, carrying a saw, D, a turn-table, E, adjacent to the saw, and a guard, E', upon the turn-table, provided with a clamp for holding a rail to be cut, substantially as described.



10. In a rail-cutting machine, in combination with the bed, a saw, D, a turn-table, E, having teeth on its periphery, a worm-shaft, i, in mesh with the teeth of the turn-table and carrying a cog-wheel, i', a rotary shaft, i^2, carrying a cog-wheel, i^3, in mesh with the wheel i', and a protractor, G, having a dial-finger, k^3, connected by suitable gearing with the shaft i^2, whereby rotation of the said shaft turns the table E and the dial-finger to indicate upon the protractor the angle to which the table E is turned, substantially as described.

11. In a rail-cutting machine, in combination with the bed, a saw, D, a turn-table, E, having teeth on its periphery, a worm-shaft, i, in mesh with the teeth of the turn-table and carrying a cog-wheel, i', a rotary shaft, i^2, carrying a cog-wheel, i^3, in mesh with the wheel i', a miter-gear, g', and a dial-finger, g^3, a stationary dial, H, surrounding the shaft i^2, a worm-shaft, k, carrying a miter-gear, g, in mesh with the miter-gear g^2, a rotary worm-wheel, k', in mesh with the worm on the shaft k and on an arbor, k^2, carrying a dial-finger, k^3, and a protractor, G, supported adjacent to the dial-finger k^3, substantially as and for the purpose set forth.

12. In a rail-cutting machine, in combination with the bed, a saw, D, a turn-table, E, having teeth on its periphery, a worm-shaft, i, in mesh with the teeth of the turn-table and carrying a cog-wheel, i', a rotary shaft, i^2, carrying a cog-wheel, i^3, in mesh with the wheel i', a miter-gear, g', a cog-wheel, g^6, and a dial-finger, g^3, a stationary minute-dial, H, surrounding the shaft i^2 and having a seconds-dial, H', marked upon it, a shaft, e', carrying a pinion, e^2, in mesh with the wheel g^6 and a cog-wheel, e, an arbor, f, carrying a dial-finger, g^4, for the dial H', and a pinion, f', in mesh with the cog-wheel e, a worm-shaft, k, carrying a miter-gear, g, in mesh with the miter-gear g^2, a rotary worm-wheel, k', in mesh with the worm on the shaft k and on an arbor, k^2, carrying a dial-finger, k^3, and a protractor, G, supported adjacent to the dial-finger k^3, substantially as and for the purpose set forth.

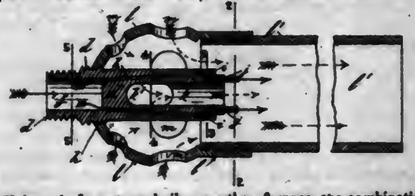
400,708. DEVICE FOR CONVEYING SHEETS OF GLASS THROUGH THE ANNEALING-TUNNEL.

PETER PFEIFER, Durhamville, N. Y. Filed Sept. 29, 1887. Serial No. 251,027. (No model.)

Claim.—1. In a device for conveying sheets of glass through the annealing-tunnel, the combination, with the tunnel, of horizontal bars extending longitudinally therethrough, connected levers pivoted centrally upon said bars, a series of longitudinal conveying-rods supported at their ends by one end of said levers, links, each link being pivoted at one of its ends to the other end of one of the aforesaid levers, a second set of bars, disks carried by the links to support the last-named bars, and devices for rocking the levers, as set forth.

2. In a device for conveying sheets of glass through the annealing-tunnel, the combination, with the tunnel, horizontal bars extending longitudinally through the tunnel, rocking levers pivoted centrally upon the bars, links, each link pivoted to one end of the levers, and the free end of the link resting upon the aforesaid bars, said links having carrying-disks loosely mounted therein, and a series of longitudinal conveying-rods supported by the disks, and devices adapted to operate the levers in unison, as set forth.

3. In a device for conveying sheets of glass through the annealing-arch, the combination of horizontal bars extending longitudinally in the tunnel, rocking levers pivoted on said bars, links connected at one end to the rocking levers and loosely supported on the horizontal bars at the other, horizontal axles supported loosely by said links, disks or wheels mounted upon said axles, a series of longitudinal conveying-rods supported by said disks or wheels, and devices for operating the levers, as set forth.



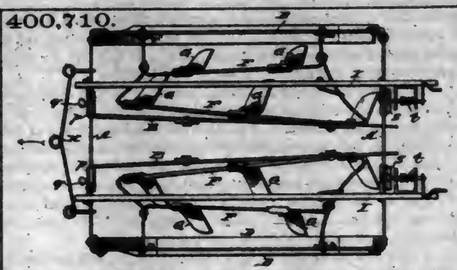
4. In devices for conveying sheets of glass through the annealing tunnel, the combination of the tunnel, horizontal bars extending through the tunnel, cross-shafts pivoted on said longitudinal bars, levers pivoted on each end of said shafts, slotted links pivoted at one end to one end of the levers and resting loosely at the other end on the horizontal bars, a series of horizontal axles supported loosely by said links and adapted to roll therein in the direction of the length of the tunnel, a series of wheels centered upon said axles and a series of longitudinal conveying-rods supported upon said wheels, and devices for operating the levers in unison, as set forth.

5. In a device for conveying sheets of glass through the annealing-tunnel, the combination, with the tunnel, of horizontal bars extending longitudinally therethrough, connected levers centrally pivoted upon said bars, a series of longitudinal conveying-rods support one end of said levers, a series of links, each link being pivoted at one of its ends to the other end of one of the aforesaid levers, the free end of the links resting on the aforesaid bars, a series of horizontal axles supported loosely by said links and adapted to roll thereon in the direction of the length of the tunnel, a series of wheels centered upon said axles, a second series of longitudinal conveying-rods supported upon said wheels, and devices to operate the aforesaid levers in unison, as set forth.

6. In devices for conveying sheets of glass through the annealing-tunnel, the combination, with the tunnel, of horizontal bars extending longitudinally therethrough, connected levers centrally pivoted upon said bars, a series of longitudinal conveying-rods supported by one end of said levers, a series of links, each link being pivoted at one of its ends to the other end of one of the levers, wheels connected to the free end of the links and resting upon the bars, a series of horizontal axles supported loosely by said links and adapted to roll therein in the direction of the length of the tunnel, a series of wheels or disks centered upon said axles, a second series of longitudinal conveying-rods supported upon said wheels, and devices for operating the levers in unison, as set forth.

400,709. SMOKE-PREVENTER FOR FURNACES.

HENRY R. PRESCOTT, St. Louis, Mo., assignor, by direct and mesne assignments, of part interest to Edward B. Roth and William H. Barnett, both of same place. Filed Jan. 21, 1889. Serial No. 296,980. (No model.)



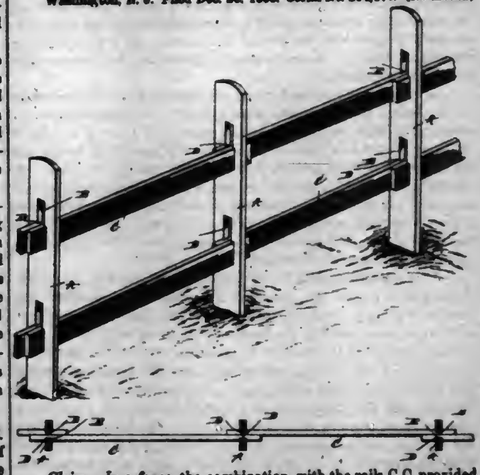
Claim.—1. In a steam-boiler or other furnace, the combination of a nozzle, d, having inlet steam-chamber f, communicating by passages h with annular space i, and outlet annular passage j, and having a central passage, k, receiving air through inlet-openings k', with means for admitting steam to chamber f, substantially as shown, and for the purpose described.

2. In a steam-boiler or other furnace, the combination of a nozzle, d, having inlet steam-chamber f, passages h, annular space i, outlet annular passage j, and central passage, k, having inlet-openings k', hood or casing l, surrounding the nozzle d, and having openings m for receiving air, with means for admitting steam to chamber f, substantially as shown, and for the purpose described.

3. In a steam-boiler or other furnace, the combination of a nozzle, d, having inlet steam-chamber f, passages h, annular space i, outlet annular passage j, and central passage, k, having inlet-passages k', hood or casing l, surrounding the nozzle d, and having extension-pipe e and openings m, with means for admitting steam to chamber f, substantially as shown, and for the purpose described.

400,710. CORN-PLOW.

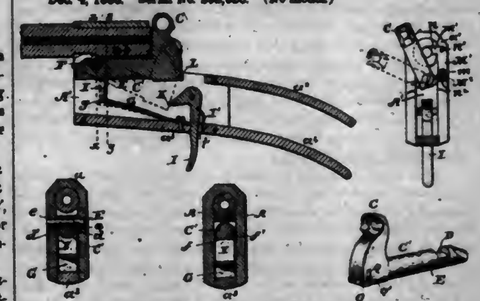
WILLIAM GUILLEN and FRANCIS A. DAKE, Almena, Kans. Filed Dec. 28, 1888. Serial No. 294,897. (No model.)



Claim.—1. A plow or cultivator consisting of upwardly-arched end frames, A A', longitudinal side bars, B B, standards C C, runners D, arranged at the lower ends of the standards, the longitudinal guard-blades E E', the blades or shovels G, and the frames F F, placed between and connected to the standards and guard-blades, substantially as shown and described.

2. The combination, with the arched end frames, A A', of the two handles I I, connected thereto, the link-rods r, and the shovels, substantially as shown and described.

400,711. FENCE.



ROBERT J. REIMER, Belvidere, N. J., assignor of one-fourth to Jacob V. Carter, same place, and Joseph B. Cornish, Washington, N. J. Filed Dec. 20, 1888. Serial No. 294,177. (No model.)

Claim.—In a fence, the combination, with the rails C C, provided with transverse grooves D D, equal in depth to half the thickness of a rail, of the posts provided with the vertical openings or slots B B, equal in length to twice the width of a rail and equal in width to the thickness of a rail, all constructed and combined substantially as and for the purpose specified.

400,712. BREECH-LOADING FIRE-ARM.

CHARLES M. RIDER, Newark, Ohio, assignor of one-half to William Baker, same place. Filed Dec. 4, 1888. Serial No. 292,630. (No model.)

Claim.—1. In a breech-loading fire-arm, the combination, with the breech of the barrel, of a combined breech-block and hammer pivoted to permit of a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech, substantially as shown and described.

2. In a breech-loading fire-arm, the combination, with the breech of the barrel, of a combined breech-block and hammer pivoted to permit of a swinging motion in a plane at an angle to the face of the

breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech, and a spring holding said combined breech-block and hammer normally against said face, substantially as shown and described.

3. In a breech-loading fire-arm, the combination, with the breech of the barrel, of a combined breech-block and hammer pivoted to permit of a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech, a spring holding said combined breech-block and hammer normally against said face, and a trigger adapted to engage the breech-block and hammer and hold the same in a cocked position against the tension of the spring, substantially as shown and described.

4. In a breech-loading fire-arm, the combination, with the breech of the barrel, of a combined breech-block and hammer having a shank pivoted to permit said breech-block and hammer to have a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech, substantially as shown and described.

5. In a breech-loading fire-arm, the combination, with the breech of the barrel, of a combined breech-block and hammer having a shank pivoted to permit said breech-block and hammer to have a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech, and a spring holding the breech-block and hammer normally against said face, substantially as shown and described.

6. In a breech-loading fire-arm, the combination, with the breech of the barrel, of a combined breech-block and hammer having a shank pivoted to permit said breech-block and hammer to have a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech, a spring holding said combined breech-block and hammer normally against said face, and a trigger adapted to engage the breech-block and hammer and hold the same in a cocked position against the tension of the spring, substantially as shown and described.

7. In a breech-loading fire-arm, the combination, with the breech-frame and breech of the barrel, of the combined breech-block and hammer having a shank provided with a notch near its forward end, a fulcrum-pin mounted in the frame and engaging with said notch, a mainspring holding the shank in engagement with its fulcrum-pin and the combined breech-block and hammer normally against the face of the breech, and a trigger adapted to engage the breech-block and hammer and hold the same in a cocked position, all constructed, arranged, and operating substantially as shown and described, whereby the breech-block and hammer may have a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech.

8. In a breech-loading fire-arm, the combination, with the breech-frame and the breech of the barrel, of a combined breech-block and hammer having a shank provided with a notch in the upper side of its forward end, having its bottom in two different planes at an angle to each other, a fulcrum-pin mounted in the frame and engaging with said notch, a notch on the under side of the shank having its bottom formed in two different planes at an angle to each other, a mainspring secured in the frame, a link engaging at one end with the mainspring and at its other end with the notch in the under side of the shank, and a trigger adapted to engage the breech-block and hammer and hold it in a cocked position against the tension of the spring, all constructed, arranged, and operating substantially as shown and described, whereby the breech-block and hammer may have a swinging motion in a plane at an angle to the face of the breech and an axial motion which permits it to be turned laterally in a plane substantially parallel with the face of said breech.

9. In a breech-loading fire-arm, the combination, with the breech-frame and breech of the barrel, of the combined breech-block and hammer C, having the shank C', provided on its upper side near its forward end with the notch D, having its bottom formed in two different planes, *d* and *d'*, at an angle to each other, and on its under side with the notch F, having its bottom formed in two different planes, *f f'*, at an angle to each other, the fulcrum-pin E, mounted in the frame and engaging with the notch D, the mainspring G, the link H, engaging at one end with the end of the spring H and at its other end with the notch F, and the trigger I, adapted to engage the combined breech-block and hammer and hold it in a cocked position against the tension of the spring, all constructed, arranged, and operating substantially as shown and described.

10. In a breech-loading fire-arm, the combination, with the breech-frame and the breech of the barrel, of the combined breech-block and hammer C, having the shank C', provided on its upper side near its forward end with the notch D, having its bottom formed in two different planes, *d d'*, at an angle to each other, the fulcrum-pin E, engaging with the notch D and normally resting against the plane *d*, and a spring holding said shank in engagement with its fulcrum-pin and permitting said shank to have an axial movement, whereby, as said combined breech-block and hammer is turned laterally, when the fulcrum-pin engages the plane *d'* the piece will be held in a safety or half-cocked position, substantially as shown and described.

11. In a breech-loading fire-arm, the combination, with the breech-frame and breech of the barrel, of a combined breech-block and hammer, C, having the shank C', provided with a fulcrum-pin mounted in the frame and having a notch, F, on its under side, having its bottom formed in two different planes, *f f'*, at an angle to each other, the spring G, and the link or block H, secured on the end of said spring and having its upper end in engagement with the notch F and normally resting against the plane *f*, said spring permitting the shank to have an axial movement, all constructed, arranged, and operating substantially as shown and described.

12. In a breech-loading fire-arm, the combination, with the breech-frame and breech of the barrel, of a spring extractor-lever pivoted to the frame at one side of the breech and having one end adapted to engage the rim of a shell when inserted in the barrel, and a breech-block pivoted to permit of a lateral movement with relation to the breech and adapted when moved laterally to engage the spring-extractor and operate the same, substantially as shown and described.

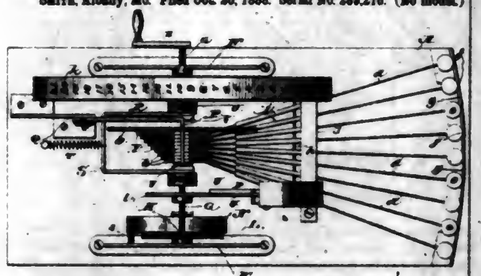
13. In a breech-loading fire-arm, the combination, with the extractor-lever M, pivoted to the breech-frame and having one end adapted to engage the rim of a shell and provided with the spring-arm M^2, of the breech-block C, pivoted to permit of a lateral movement with relation to the breech and adapted when turned laterally to engage said spring-arm and lift it against its tension to cause it to operate the extractor when released from the breech-block, substantially as shown and described.

14. In a breech-loading fire-arm, the combination, with the breech of the barrel, the extractor-lever M, pivoted to the breech-frame and having a projecting end, *m'*, normally resting in the recess *n* in the breech of the barrel, and having the spring-arm M^2, of the breech-block C, pivoted to permit of a lateral movement with relation to the breech and provided with the spring-actuated dog *o*, adapted to engage said spring-arm M^2 as the breech-block is turned laterally and operate the extractor, all constructed, arranged, and operated substantially as shown and described.

400,718. DENTAL ARTICULATOR. WILLIE P. SLACK and GEORGE A. SMITH, Lawrence, Mass. Filed Jan. 11, 1889. Serial No. 296,066. (No model.)

Claim.—1. In a dental articulator, the supporting-frame having the holes or sockets 6 6 for the reception of pins or dowels affixed to the lower mold, combined with the pivoted or hinged frame having the holes or sockets 6 6 for the reception of pins or dowels affixed to the upper mold, as set forth.

2. The combination of the lower frame having rods 8 8, the upper frame having sleeves jointed or swiveled to its ends, whereby the upper mold is enabled to rise and fall, said sleeves having orifices fitting loosely on the rods 8 8, whereby the upper mold is enabled to swing laterally, as set forth.



3. The combination of the lower frame having the rods 8 8, the upper frame having sleeves jointed to its ends, (said sleeves embracing the rods 8 8,) and a spring whereby said sleeves are normally held with a yielding pressure against the lower frame, as set forth.

4. The combination of the lower frame having the rods 8 8, the upper frame having a pivotal connection with the lower frame and provided with an ear, *m*, having a tapped socket, and an adjusting-screw engaged with said socket and bearing on a portion of the lower frame, whereby the downward movement of the upper mold may be adjusted, as set forth.

5. The improved dental articulator composed of the supporting-frame *a*, having the rods 8 8 and the detachable pins or dowels 7 7, the upper frame, *b*, having the sleeves *u u*, jointed or pivoted to its ends, said sleeves being adapted to slide and move laterally on the rods 8 8, the detachable pins or dowels on the upper frame, the controlling-spring *i*, and the adjusting screw or stop *s*, all arranged and operating substantially as set forth.

6. The combination of the lower frame, *a*, the lower cast supporting-arm, 4, made in a separate piece from said arm, and a screw, *s*, connecting said arm and frame, as set forth.

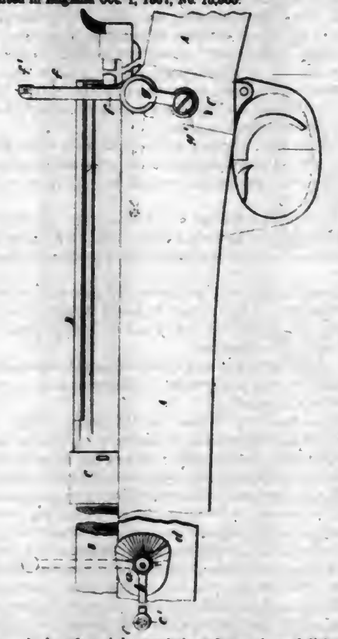
400,714. ADDING-MACHINE. JOHN G. SMITH and GEORGE W. SMITH, Albany, Mo. Filed Oct. 26, 1888. Serial No. 289,216. (No model.)

Claim.—1. In an adding-machine, the combination of the spring actuated main shaft, the indicator-wheel carried thereby, the ratchet-wheel rigidly secured thereto, the pawl engaging said wheel to prevent movement of the shaft, a series of trip-levers adapted to disengage the pawl from the ratchet-wheel and to hold it disengaged therefrom for periods of different lengths, and a series of operating-levers adapted to actuate the trip-levers, as set forth.

2. The combination of the main shaft, the indicator-wheel carried thereby, the spring adapted to actuate said shaft, the ratchet-wheel mounted on the main shaft, the pawl engaging the ratchet-wheel, a series of trip-levers loosely mounted on the main shaft and provided at their upper ends with arcs of varying lengths bearing against the pawl and adapted to disengage it from the ratchet-wheel, and a series of operating-levers adapted to actuate said trip-levers, as set forth.

3. The combination of the main shaft, the spring to actuate the same, the indicator-wheel carried thereby, the ratchet-wheel rigidly secured to said shaft, the pawl engaging the ratchet-wheel, the trip-levers loosely mounted on the shaft and adapted to disengage the pawl from the ratchet-wheel, the yoke loosely mounted on the main shaft, the transverse rod connecting said yoke to the lower ends of the trip-levers and engaging the ratchet-wheel, a spring to hold said yoke in its normal position, and a series of operating-levers adapted to actuate the trip-levers, as set forth.

4. The combination of the main shaft having a crank at one end, a volute spring connected by gearing to the other end of the shaft and adapted to actuate the same, the ratchet-wheel rigidly mounted on the shaft, the pawl engaging said ratchet-wheel, a series of trip-levers adapted to disengage the pawl from the ratchet-wheel and thereby control the rotation of the shaft, and a series of operating-levers adapted to actuate the trip-levers, as set forth.



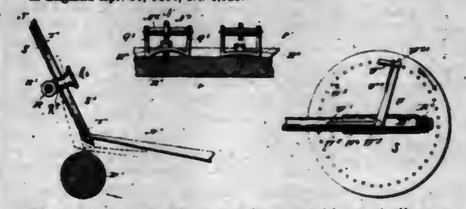
5. The combination of the spring-actuated main shaft, the indicator-wheel carried thereby, the ratchet-wheel rigidly secured thereon, the pawl engaging the ratchet-wheel, the trip-levers loosely mounted on the main shaft and having longitudinal slots in their lower ends, the yoke loosely mounted on the main shaft and having depending arms, the rod secured in said arms, passing through the slots in the trip-levers, and engaging the ratchet-wheel, and the operating-levers connected with the trip-levers to actuate the same, as set forth.

6. The combination of the spring-actuated main shaft, the indicator-wheel carried thereby, the ratchet-wheel secured rigidly thereon, the pawl engaging the ratchet-wheel, the series of trip-levers loosely mounted on the main shaft and having arcs at their upper ends of varying lengths, the said arcs having the stops *x* and bearing against the pawl, the yoke loosely mounted on the main shaft, the rod carried by the yoke, passing through the trip-levers, and engaging the ratchet-wheel, and the operating-levers connected with the trip-levers, as set forth.

7. The combination of the spring-actuated main shaft, the indicator-wheel carried thereby, the ratchet-wheel secured on the shaft, the standard Q, the pawl pivoted thereon and engaging the ratchet-wheel, the trip-levers mounted on the main shaft and bearing against the pawl, the yoke loosely mounted on the shaft and connected with the trip-levers, the spring secured to the yoke to hold it normally lowered, the operating-levers, and the connecting-rods having their lower ends pivoted to the operating-levers and their upper ends pivoted to the trip-levers at about the centers of the same, as set forth.

8. The combination of the main shaft, mechanism for rotating the same, the disk secured on said shaft, having a single notch in its edge and a single tooth projecting from its edge, the standard in front of the main shaft, the disk journaled on said standard and having a series of notches in its edge and a single tooth projecting from its edge, and having a series of recesses in its side, the indicator-plate secured to the edge of the last-mentioned disk, and the spring secured to the standard and provided with a pin engaging one of the recesses in the side of the disk, as set forth.

400,715. SIGHT FOR FIRE-ARMS. JOSEPH J. SPEED, Waltham Cross, England. Filed Jan. 7, 1889. Serial No. 295,640. (No model.) Patented in England Oct. 1, 1887, No. 13,335.



Claim.—1. In a fore sight consisting of a graduated disk mounted at the side of the gun, and a sight-supporting bar pivoted in said disk and having an indicator registering with the graduations on said disk, substantially as described.

2. The combination, with a fire-arm, of a fore sight consisting of an arm carrying a suitable sight adjustably pivoted with respect to a graduated scale or dial, substantially as described, and a rear sight consisting of a pivoted arm having a peep-hole, and a spring to sustain said arm in a fixed position, substantially as described.

3. The combination, with a fire-arm, of a fore sight consisting of a dial, *a*, and a pivoted arm, *b*, registering therewith and carrying a suitable sight, a rear sight carried by an arm, *f*, and a spring, *g*, for supporting said arm in elevated position, substantially as described.

400,716. TYPE-WRITING MACHINE. CHARLES SPIRO, New York, N. Y. Filed Apr. 15, 1887. Serial No. 234,905. (No model.) Patented in England Apr. 30, 1887, No. 6,325.

Claim.—1. A bracket for a type-bar, comprising a yielding convex base provided with upwardly-projecting sides, substantially as specified.

2. The combination, with the type-bar having lateral pivots or bearings, of a support consisting of a yielding convex base provided with projecting sides, perforated for the reception of the pivots, and an attaching device passing through the base into a suitable table or foundation, substantially as specified.

3. The combination of a suitable foundation having a groove the front and rear walls of which are parallel and curved on circles having a common center, with a type-bar having lateral pivots, and with a type-bar-supporting bracket having a convex base of a width agreeing with that of the groove in the foundation, and having projecting

sides adapted to receive the type-bar pivots, and a fastening device passing through the convex base of the bracket and into the foundation, substantially as specified.

4. In combination with the platen and type-bars of a type-writing machine, an inclined tilting rotatable ink-disk, with its edge arranged in the path of the free end of the type-bars, and a disk-tilting spring, substantially as specified.

5. The combination, with the platen and type-bars of a type-writing machine, of a flanged rotatable and tilting inking-disk arranged to project into the path of the type, substantially as specified.

6. The combination, with the pawl and rack of the feed mechanism of the carriage, of a pawl-carrying lever, a double bail, a series of key-levers suitably notched and arranged above the bail, and suitable devices for directly connecting the double bail with the pawl-carrying lever, substantially as specified.

7. An inking-plate provided with an outwardly-flared flange, in combination with printing-characters constructed and arranged, substantially as specified, to come into contact with said flange with their faces parallel to it.

8. An inking-disk provided with a flange and centrally pivoted at a point to present the flange in a plane substantially agreeing with that of the face of the type when inked thereby, substantially as specified.

9. The combination, with the key-levers K and with the type-bars connected therewith, of the carriage D, having the rack I, the double bail L, having the arm L^3, the pawl J and its pivoted lever, and the rod L^4, substantially as specified.

10. The plate P, provided with a series of parallel circular grooves, and perforated between the grooves for the passage of connecting-rods, substantially as specified.

11. The combination, with the plate P, having circular annular grooves and intermediately-arranged apertures, of type-bar brackets arranged within the grooves, type-bars mounted therein, and connecting-rods passing through the apertures, substantially as specified.

12. The combination of the bracket R, a sleeve mounted thereon, an inking-disk mounted on the sleeve and projecting into the path of the type, and an inking-disk-returning device, substantially as described, for bringing the disk to its normal position after having been depressed by a type, substantially as and for the purpose specified.

13. The combination, with the bracket, the sleeve pivotally mounted thereon, and the disk pivotally mounted on the sleeve, of disk-rotating mechanism, substantially as described, mounted on the sleeve, substantially as specified.

14. The combination of the bracket, the sleeve mounted thereon, the inking-disk mounted on the sleeve, and a pawl-carrying lever mounted on the sleeve, and having a projecting arm and stops arranged on the bracket in the path of the arm, substantially as and for the purpose specified.

400,717. THERMOMETER-CASE. CHARLES J. TAGLIABUE, Brooklyn, N. Y. Filed Dec. 13, 1888. Serial No. 293,436. (No model.)

Claim.—1. A case for thermometers, provided at each of its ends with an elastic pad having a portion extending into the case, a portion extending beyond the case, and a flange engaging the edge of the case, substantially as described.

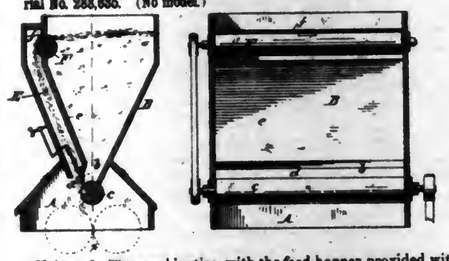
2. A case for thermometers, provided at each of its ends with an elastic pad having a portion extending into the case, a portion extending beyond the case, and a flange engaging the edge of the case, said flanges being of such width as to form an elastic rest for the case when the case falls lengthwise, substantially as described.

3. A case for thermometers, provided at each of its ends with an elastic pad having a portion extending beyond the case, a hollow portion provided with a slide and spring extending into the case, and a flange engaging the edge of the case, substantially as described.

400,718. STEAM-TRAP. WALTER A. TAYLOR, New Orleans, La., assignor to Taylor Brothers, same place. Filed Oct. 23, 1888. Serial No. 288,969. (No model.)

Claim.—1. In a steam-trap, the combination, with a condensed-water vessel having a discharge located outside thereof below the water-level, a weighted float in the vessel having a stem rising through the top thereof, a lever pivoted above and outside the casing and connected with the float-stem, and an external rigid rod connecting the lever to the stem, of the external valve for moving the valve in unison with any movement of the lever, and a lever-stop, bracket, and guide rising from a support on the top of the vessel and adjustable lengthwise in a vertical plane on said support to enable the water to be carried at different levels above the discharge-valve, substantially as described.

2. In a steam-trap, the combination, with a condensed-water vessel having an external discharge-valve, a lever pivoted above the vessel and connected with the float, and an external rigid connection between the lever and the valve-stem which moves the valve in unison with any movement of the lever, of a supporting-bracket rising from the top of the vessel, a stop-bracket and guide for the lever, having a stem movable lengthwise in a vertical plane in the supporting-bracket, and means for rigidly locking the stem and supporting-bracket together, substantially as described.



400,719. MEDICINE-SPOON REGISTER. HOWARD W. WELLS, Poughkeepsie, N. Y., assignor of one-half to John G. Collingwood, same place. Filed May 9, 1888. Serial No. 273,350. (No model.)

Claim.—1. A medicine-spoon in combination with a time and dose register, consisting of a revolving time-dial and a pointer or index-hand to indicate the dose, all constructed upon a clamp-shaped base-plate, so as to be independently movable, as and for the purpose described.

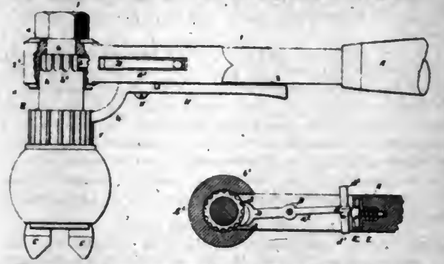
2. A clamp-plate adapted to engage with a spoon-handle, a revolving dial marked with hours or portions thereof and pivoted on the clamp-plate, so that any hour-mark may be brought opposite a mark on the clamp-plate, together with an index-hand or dose-indicator moving independently upon the revolving dial, in combination with a spoon, for the purpose of indicating the time for giving medicine and the character of the dose, substantially as described.

400,720. FEED-REGULATOR. JOHN B. WHEATLEY, Detroit, Mich., assignor to August Heine, Silver Creek, N. Y. Filed Oct. 20, 1888. Serial No. 288,635. (No model.)

Claim.—1. The combination, with the feed-hopper provided with a discharge-opening, of a partition forming an overflow-passage communicating with the upper end of the feed-hopper and a distributing-roller whereby the material is uniformly discharged from the upper end of the feed-hopper into the overflow-passage, substantially as set forth.

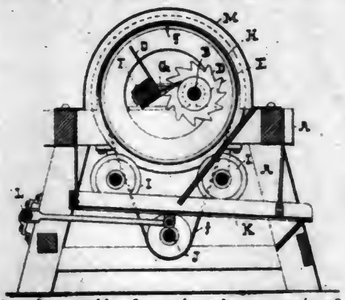
2. The combination, with a feed-hopper provided with a discharge-opening, of a partition arranged within the hopper and forming an overflow-passage on one side of the hopper, an opening arranged near the upper end of said partition between the hopper and overflow-passage, and a distributing device arranged in said opening, substantially as set forth.

400,721. SHIRT-WAIST. EDWARD W. WHEELER, Chicago, Ill., assignor to A. L. Singer & Co., same place. Filed Oct. 27, 1887. Serial No. 253,501. (No model.)



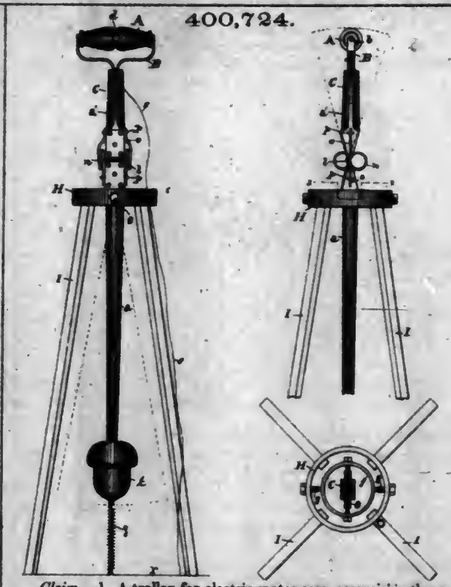
Claim.—The combination, in a waist, of a cloth body, A, extending below the waist-line, a waistband sewed to the outer surface of the cloth body, said waist being provided with eyelets extending through said band and cloth body, buttons for said waist provided

400,721.



with shanks extending through said eyelets, a fastening device for securing the button-shanks upon the interior of the garment, and a strip, G, secured at its upper edge to the garment inside the latter and forming a flap to cover the fastenings for the button-shanks, whereby the body of the person is protected from contact with the button-shanks, substantially as described.

400,722. RATCHET-WRENCH. WILLIAM H. WHITMORE, Cleveland, Ohio. Filed June 23, 1888. Serial No. 277,939. (No model.)



Claim.—In a ratchet-wrench, the combination, with a lever, a spindle journaled therein, and pawl mounted on the lever and engaging the spindle for operating the latter, of a sleeve mounted on the spindle for compressing the jaws of the latter, and a dog mounted on the lever and adapted to engage the sleeve for moving the latter up or down, substantially as set forth.

400,723. TOBACCO-CUTTER. JOHN B. ADT, Baltimore, Md. Filed Oct. 4, 1888. Serial No. 287,210. (No model.)

Claim.—In a machine for cutting tobacco, a series of revoluble saws, combined with a fixed comb placed at an angle with reference to a line drawn from the center of the said saws through the base or support for the said comb, a deflecting device which consists of a plate which extends from the upper surface of the said comb and falls back at an angle from the vertical, and an inclosing revoluble cylindrical sieve, substantially as and for the purpose specified.

400,724. TROLLEY FOR ELECTRICAL RAILWAYS. DAVID A. ASHLEE, Richmond, Va. Filed Apr. 12, 1888. Serial No. 270,420. (No model.)

Claim.—1. A trolley for electric-motor cars, comprising the combination of a standard, I, provided at its top with a gimbal-ring, a staff mounted on a pivot in said gimbal-ring with its lower end free, so as to have a swinging movement in all directions, and a cylinder on the upper end of the staff.

2. A trolley for electric-motor cars, comprising the combination of a staff made in two sections which are united by a spring-joint, a supporting-pivot attached to the lower section, and a cylinder on the upper end of the top section.

3. A trolley for electric-motor cars, comprising the combination of a staff made in two sections, which are united by a joint or hinge, a supporting-pivot attached to the lower section, a spring at the said joint or hinge to retain the top section upright, and a cylinder on the upper end of the top section.

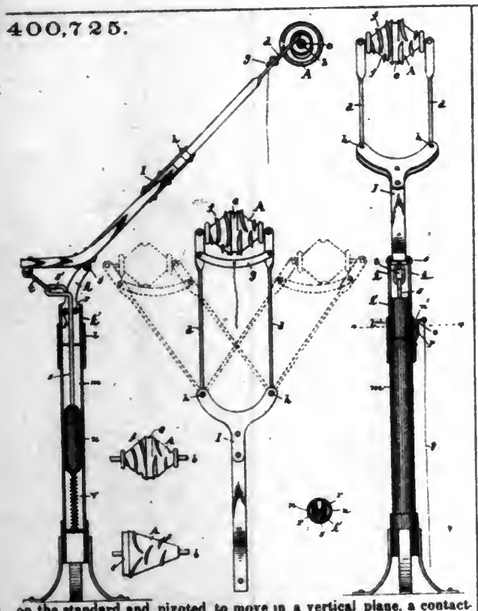
4. A trolley for electric-motor cars, comprising the combination of a staff made in two sections which are united by a spring-joint, a gimbal-ring supporting the said staff, and a cylinder on the upper end of the top section.

5. A trolley for electric-motor cars, comprising the combination of a gimbal-ring, a staff mounted on a pivot in said gimbal, so as to have a swinging movement in all directions, a cylinder on the upper end of the staff, and a weight attached to the bottom of the staff.

6. A trolley for electric-motor cars, comprising the combination of a gimbal-ring, a staff mounted on a pivot in said gimbal, so as to have a swinging movement in all directions, a cylinder on the upper end of the staff, a weight attached to the bottom of the staff, and a spring connecting the lower end of the weighted staff with the car-top.

400,725. TROLLEY FOR ELECTRIC RAILWAYS. DAVID A. ASHLEE, Richmond, Va. Filed July 27, 1888. Serial No. 281,902. (No model.)

Claim.—1. A trolley-cylinder, A, for electric-motor cars having a circumferential groove, *c*, around its greatest diameter, and provided with a tapered side which has disconnected spirals leading up to the said circumferential groove, for the purpose set forth.



2. A trolley-cylinder, A, for electric-motor cars, having a greater diameter at the center than at the end and tapered from said center toward the end, and provided at the center with a groove, *c*, which extends all around, and on the tapered side with segment grooves or ridges *f*, which are disconnected from each other, but which lead up to the said center groove, for the purpose set forth.

3. The combination of a trolley-staff, I, pivoted to move in a vertical plane, arms *d*, connected by pivots *h* to the trolley-staff, so as to swing laterally, and a contact-cylinder mounted to revolve in bearings at the ends of said pivoted arms, as set forth.

4. The combination of a standard, a trolley-staff, I, mounted on the standard and pivoted so as to move in a vertical plane, arms *d*, connected by pivots *h* to the trolley-staff, so as to swing laterally, a contact-cylinder mounted to revolve in bearings at the ends of said pivoted arms, and a weight pulling down on the trolley-staff, as set forth.

5. The combination of a tubular standard, a trolley-staff mounted

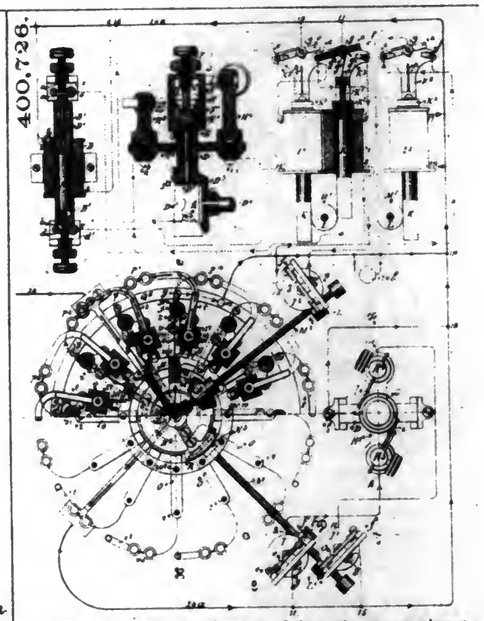
400,725.

on the standard and pivoted to move in a vertical plane, a contact-cylinder, a weight in the tubular standard, and means for suspending the said weight to the trolley-staff.

6. The combination of a tubular standard, a trolley staff mounted on the standard and pivoted to move in a vertical plane, a contact-cylinder, a rod passing from the top down into the tubular standard, and provided at its upper end with a laterally-projecting loop, a link, *t*, connecting the trolley-staff and said loop, and a weight suspended from the rod in the tubular standard.

7. The combination of a tube-socket provided with a spring having a pin or lug, *p*, a pivot-arm attached to a section, *l'*, which occupies said socket and may be turned therein, a trolley-staff, I, on the pivot-arm and capable of turning in a vertical plane, and a contact-cylinder.

8. The combination of a tubular standard, a tube-socket on top of the standard, pivot-arm having a tube-section which may turn in the tube-socket, a trolley-staff mounted on said pivot-arm, a contact-cylinder, a rod passing from the top down into the tubular standard and provided at its upper end with a laterally-projecting loop, a link, *t*, connecting the trolley-staff and said loop, and a weight suspended from the rod in the tubular standard.

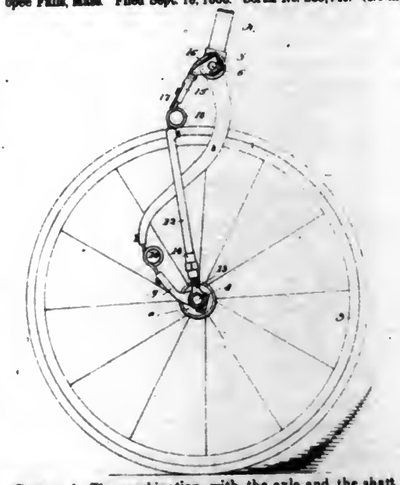


400,726. **METHOD OF REGULATING ELECTRIC CURRENTS.** JOSEPH W. BALET, New York, N. Y., assignor of one-half to Robert Dunlap and Luke F. Comma, same place. Filed Jan. 21, 1888. Renewed Mar. 9, 1889. Serial No. 302,743. (No model.)

Claim.—1. The method of regulating electric currents automatically, which consists in conveying the main current or a portion of the main current into one or more storage-batteries, so as to absorb the surplus energy of the main current when the main current is too strong to do the work, and adding the current of as many storage-batteries to the main current as may be necessary to supply the deficiency of electrical energy in the main circuit when the main current is too weak to do the work, substantially as specified.

2. The method of regulating electric currents automatically, which consists in conveying the main current or a portion of the main current into storage-batteries, so as to absorb the surplus energy of the main current when the main current is too strong to do the work, and cutting out the fully-charged storage-batteries from the charging-current by causing the circuit of the charged batteries to open and disconnecting the storage-batteries from the main circuit when the main current corresponds to the work to be done, substantially as specified.

3. The method of regulating electric currents automatically, which consists in conveying the main current or a portion of the main current into storage-batteries, so as to absorb the surplus energy of the main current when the main current is too strong to do the work, and cutting out the fully-charged storage-batteries only from the charging-current by causing the circuit of the charged batteries only to open when a charging-current will flow through them, and disconnecting the storage-batteries from the main circuit when the main current corresponds to the work to be done, and adding the current of the storage-batteries to the main current as may be necessary to



400,726.

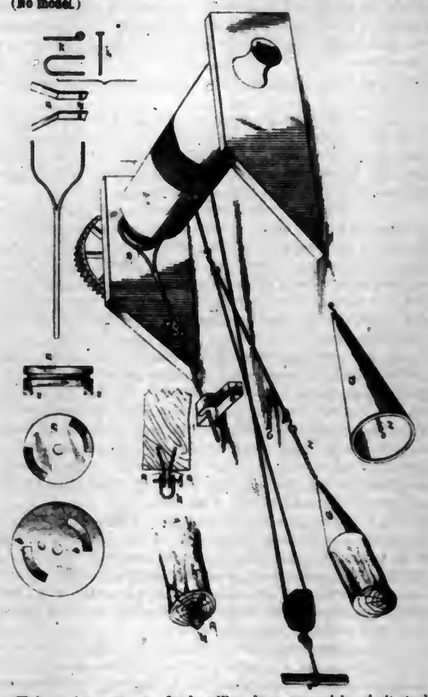
supplement the deficiency of energy of the main current when the main current is insufficient for the work to be done, substantially as specified.

4. The method of regulating electric currents automatically, which consists in conveying the main current or a portion of the main current into storage-batteries, so as to absorb the surplus energy of the main current when the main current is too strong to do the work, and disconnecting the storage-batteries from the main circuit when the current in the main circuit corresponds with the work, and adding the current of as many storage-batteries as may be necessary to the main current to supply the deficiency of energy of the main current when the main current is too weak to do the work, substantially as described.

400,727. **SPRING-FORK FOR BICYCLES.** LEON BAUDREAU, Chicopee Falls, Mass. Filed Sept. 18, 1888. Serial No. 285,746. (No model.)

Claim.—1. The combination, with the axle and the shaft above and parallel thereto, of two sets of curved or angular arms, each intermediately jointed and connected by their ends to the said shaft and axle, arranged in relation to each other to form in substance a figure 8, and a spring applied to exert a pressure between said angular arms to maintain them in their relations described and to yield under pressure applied substantially in the direction of their lengths, substantially as described.

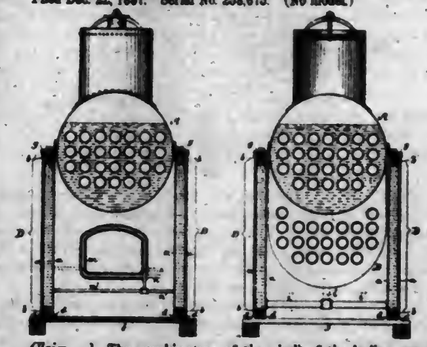
2. The combination, with the axle and the shaft above and parallel thereto, of two sets of curved or angular arms, each consisting of two members united by a coil-spring, and the said so-formed angular arms connected by their ends to the shaft and axle, and arranged in relation to each other to form in substance a figure 8, and a coil surrounding said shaft loosely and connected by its ends to the upper members of each of said arms, substantially as set forth.



3. Spring-fork devices for bicycles and similar vehicles, consisting of the axle 4, the shaft 6, parallel with said axle, a support for said shaft, substantially as described, the fork-legs 8, hung on said shaft, the arms 9, secured on said axle, the springs 10, uniting said legs and arms, the posts 12, connected to the axle, the arms 15, secured on said shaft, the springs 18, uniting said posts and arms 15, and the springs 16, having an engagement with said legs and the arms 15, combined and operating substantially as set forth.

4. Spring-fork devices for bicycles and similar vehicles, consisting of the axle 4, the shaft 6, parallel with said axle, a support for said shaft, substantially as described, the fork-legs 8, hung on said shaft, the arms 9, secured on said axle, the springs 10, uniting said legs and arms, the posts 12, the arms 13 on said axle, the nuts 14, uniting arms 13 and said posts, the arms 15, secured on said shaft, the springs 18, uniting said posts and arms 15, and the springs 16, having an engagement with said legs and said arms 15, combined and operating substantially as set forth.

5. Spring-fork devices for bicycles and similar vehicles, consisting of the axle 4, the shaft 6, parallel with said axle, a support for said shaft, substantially as described, the legs 8, hung on said shaft and curving first toward one side of said axle and then in the opposite direction and terminating above and to one side of said axle, the arms 9, secured on said axle, the springs 10, uniting said legs and arms, the posts 12, connected to the axle, the arms 15, secured on said shaft, the springs 18, uniting said posts and arms 15, and the springs 16, having an engagement with said legs and the arms 15, combined and operating substantially as set forth.

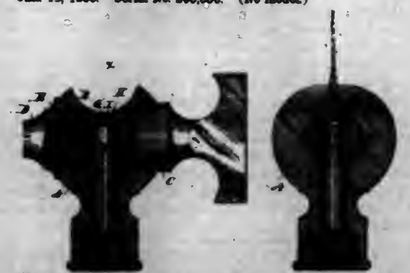


6. Spring-fork devices for bicycles and similar vehicles, consisting of the axle 4, the shaft 6, parallel with said axle, a support for said shaft, substantially as described, the fork-legs 8, hung on said shaft, the arms 9, secured on said axle, the springs 10, uniting said legs and arms, the posts 12, connected to the axle and crossing said legs 8, the arms 15, secured on said shaft, the springs 18, uniting said posts and arms 15, and the springs 16, having an engagement with said legs and the arms 15, combined and operating substantially as set forth.

400,728. **DEVICE FOR HANDLING LOGS AND TIMBER.** WILLIAM RAFFERT, New Orleans, La. Filed Nov. 26, 1887. Serial No. 256,169. (No model.)

Claim.—An apparatus for handling logs, comprising bolts to be driven into the end of a log, a clevis attached to the said bolts, a cone for the end of the log, and a chain, all adapted to be used in connection with a winding-drum, substantially as specified.

400,729. **STEAM-BOILER.** WILLIAM T. BATE, Conshohocken, Pa. Filed Dec. 22, 1887. Serial No. 258,675. (No model.)

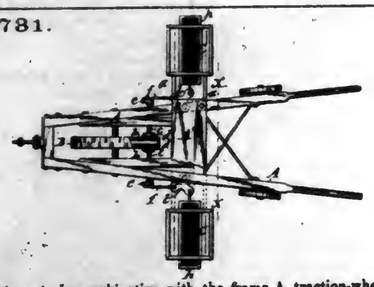


Claim.—1. The combination of the shell of the boiler, comprising the tubed cylindrical barrel and tubed depending leg at the rear, with opposite water-chambered cheek-pieces extending forward from the depending leg of the boiler and forming the sides of the fire-box, each cheek-piece being a self-contained independent structure outside of and forming a joint with the barrel and leg of the boiler, all substantially as specified.

2. The combination of the shell of the boiler, comprising the tubed cylindrical barrel and tubed depending leg, with the fire-box casing having a front plate conforming to the shape of the cylindrical barrel, a back plate conforming to the shape of the depending leg, and opposite water-chambered cheek-pieces extending forward from said depending leg and forming the sides of the fire-box, each cheek-piece being a self-contained independent structure outside of and forming a joint with the barrel and leg of the boiler, all substantially as specified.

3. The within-described water-chambered cheek-piece for the fire-box of a steam-boiler, the same consisting of a jointless rectangular frame forming the top, bottom, and ends of said cheek-piece, and opposite side plates secured to said frame, so as to form therewith a hollow rectangular slab, all substantially as specified.

400,730. **SPRAY-NOZZLE.** JOHN BEAN, Los Gatos, Cal. Filed Jan. 19, 1888. Serial No. 260,358. (No model.)

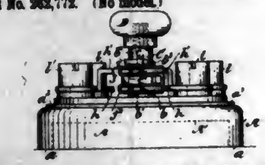


Claim.—1. In a spray-nozzle, the combination, with the body thereof having a passage through it, of a plug rotatably fitted thereto across the said passage, a transverse passage extending partly through the said plug, and a concavo-convex partition extending across the passage in the plug, and having a slot therein.

2. In a spray-nozzle, the combination, with the body thereof having a longitudinal passage, a transverse passage intersecting it, and a concave mouth, of a plug rotatably fitted to the transverse passage, and having a passage partly through it, and a concavo-convex partition across the said passage and near one end thereof, with the convex side toward the farthest termination of the passage in the plug, substantially as described.

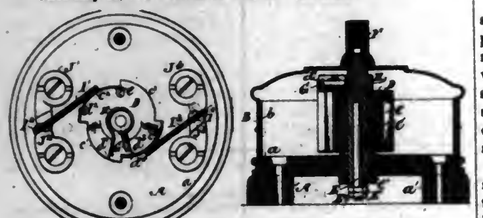
400,731. **FERTILIZER-DISTRIBUTER.** JULIUS BENDER, Manlius, N. Y., assignor to Ann Jennett Bender, same place. Filed July 14, 1888. Serial No. 279,977. (No model.)

400,781.



Claim.—1. In combination with the frame A, traction-wheel B, and hopper C, the reciprocating sieve *a* under the hopper, the gear *b*, rotating with the traction-wheel, the counter-shafts *c*, pinion *d* on one end of said shaft, meshing with the aforesaid gear, the crank *e* on the opposite end of said shaft, and the pitman *f*, transmitting motion from the said crank to the sieve, as set forth.

2. In combination with the frame A and traction-wheel B, the hoppers C C, carried on opposite sides of said frame, the reciprocating sieves *a a* under said hoppers, the gears *b b* on opposite sides of the traction-wheel, the counter-shafts *c c*, pinions *d d* on one end of said shafts, meshing, respectively, with the two gears aforesaid, cranks *e e* on the opposite end of the shafts, and two two-armed levers, *l l*, each connected with one of the cranks and one of the sieves, substantially as described and shown.



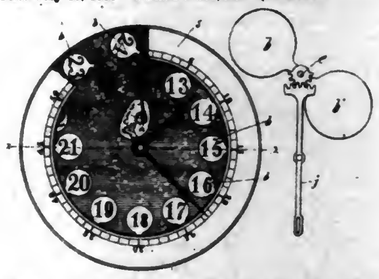
3. In combination with the frame A and traction-wheel B, the arms *a a*, extending laterally from opposite sides of the frame, the hoppers C C, connected to said arms adjustably longitudinally thereon, the sieves *a a*, arranged movably horizontally under the hoppers, gears *b b* on opposite sides of the traction-wheel, counter-shafts *c c*, parallel with the axle of said traction-wheel, pinions *d d* on one end of the counter-shafts, meshing with the gears, cranks *e e* on the opposite end of the counter-shafts, two two-armed levers, *l l*, pivoted to the frame and each having one of its arms connected with one of the sieves, and pitmen *f f*, connecting the said levers with the cranks, substantially as described and shown.

400,732. ELECTRIC SWITCH. SIGMUND BERGMANN, New York, N. Y., assignor to Bergmann & Company, of New York. Filed Feb. 2, 1888. Serial No. 262,772. (No model.)

Claim.—In an electric switch, the combination, with a base, of a shaft, a cross-bar of insulating material mounted on the shaft, two fixed electrical conductors mounted on the base, two other fixed electrical conductors mounted on the base approximately opposite the conductors first named, and contact-pieces on each end of said cross-bar comprising each three U-shaped portions and each adapted to contact with both sides of its two adjacent conductors, substantially as specified.

400,738. SWITCH FOR ELECTRIC CIRCUITS. SIGMUND BERGMANN, New York, N. Y., assignor to Bergmann & Company, of New York. Filed May 18, 1888. Serial No. 274,262. (No model.)

Claim.—1. In a switch, the combination of a rotary part or wheel, a shaft around which the rotary part or wheel turns, a radial projection on the shaft, and a spring connected to the shaft, establishing a connection between the shaft and the rotary part or wheel, substantially as specified.



2. In a switch, the combination of a rotary part or wheel, an axle or support upon which the rotary part or wheel may turn, a shaft capable of turning relatively to the axle or support of the rotary part or wheel, a radial projection on the shaft, and a spring secured to the rotary shaft, establishing a connection between the said rotary shaft and the rotary part or wheel, substantially as specified.

3. In a switch, the combination, with a rotary part or wheel provided with tangential segment-surfaces, certain of which are of insulating material and the others of which are faced with conducting material, of a rotary shaft around which the rotary part or wheel turns, a pin radial from said shaft, and a spring fastened to the rotary shaft and extending outwardly therefrom between projections extending from the rotary part or wheel, substantially as specified.

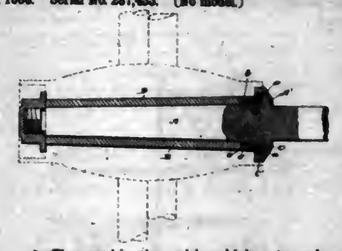
4. In a switch, the combination of a rotary part or wheel, a rotary shaft around which the rotary part or wheel can turn, and provided with upwardly-extending projections, a pin extending radially from this shaft between the said projections of the rotary part or wheel, and a spring, also connected with the shaft and extending between the said projections, substantially as specified.

5. In a switch, the combination, with a rotary part or wheel, of a rotary shaft around which the rotary part or wheel can turn, and having a pin extending radially therefrom, a spring connected to said shaft, a hand-piece for imparting motion to the shaft and the rotary part, and having a screw-threaded connection with said shaft, and brushes contacting with the rotary part or wheel, substantially as specified.

400,734. TIME-PIECE DIAL. CHARLES BICKFORD, Boston, Mass. Filed July 19, 1888. Serial No. 280,425. (No model.)

Claim.—1. In a time-piece, the combination of a plate or dial, *a*, a series of twelve figure or ordinal plates, each independent of the others, pivoted to swing in a plane parallel with the dial on pivots which are arranged concentrically with relation to the center of the dial, and a motor operated by the time-movement of the time-piece and operating said plates successively, whereby each plate is moved independently into its operative position once in every twelve hours and out of its operative position during the succeeding twelve hours, as set forth.

2. In a time-piece, the combination of the plate or dial *a*, a series of figure or ordinal plates pivoted to swing in a plane parallel with the dial, a rack-segment, *c*, revolved with the hour-hand of the time-piece, and intermediate devices, whereby edgewise motion is imparted successively to said plates from said segment, as set forth.



3. In a time-piece, the combination of a plate or dial, *a*, a series of figure or ordinal plates pivoted to swing in a plane parallel with the dial, a rack-segment revolved with the hour-hand of the time-piece, intermediate devices which impart edgewise motion from said segment to said plates, whereby said plates are moved successively to and from their operative positions, and a ring or cover outside of the dial, whereby said plates are concealed when in their inoperative positions, as set forth.

4. In a time-piece, the combination of a plate or dial having a series of fixed ordinals, a series of ordinal plates or movable ordinals pivoted to swing in a plane parallel with the dial, a rack-segment revolved by the hour-hand of the time-piece, intermediate devices which impart edgewise motion successively to said plates from said segment, whereby said plates are alternately swung over the corresponding fixed ordinals and away from the same, and a ring or cover outside of the dial, whereby said plates are concealed when moved away from the fixed ordinals, as set forth.

5. In a time-piece, the combination of a series of arbors, *e*, ordinal-plates or ordinals secured to said arbors, a rack-segment affixed to the hour-hand thimble of the time-piece, a series of pinions mounted in fixed bearings and arranged to be engaged successively by said segment, eccentric-pins on said pinions and on the hubs of the ordinal-plates, and radial levers pivoted between their ends and engaged at their ends with said pins, as set forth.

6. In a time-piece, the combination of a transparent or translucent plate or dial, *a*, a series of movable ordinals mounted to swing in a plane parallel with the dial, and an opaque ring or shield arranged to conceal the said ordinals when they are moved away from their operative positions, as set forth.

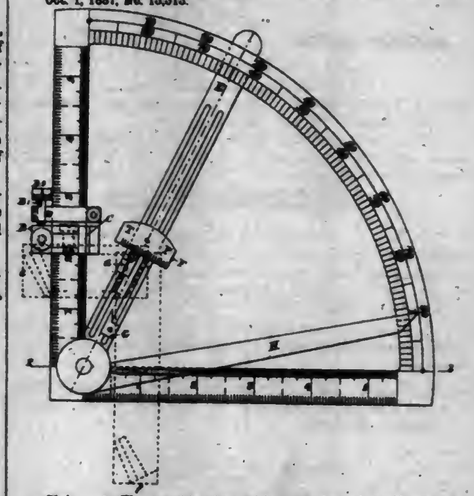
400,735. AXLE-BOX. WILLIAM P. BLAKE, Cleveland, Ohio. Filed Oct. 6, 1888. Serial No. 287,433. (No model.)

Claim.—1. The combination, with vehicle-axle and axle-box, the latter having a detachable thimble, substantially as indicated, of axle-collar having an annular chamber in the outer face thereof for receiving the end of such detachable collar, substantially as set forth.

2. The combination, with vehicle axle and collar, the latter having an annular chamber in the outer face thereof, of axle-box having a detachable thimble screwed into the inner end of the box, such thimble having an enlarged head adapted to fit into the chamber of the axle-collar, substantially as set forth.

3. The combination, with vehicle axle and collar, the latter having an annular chamber in the outer face thereof concentric with the axis of the axle, of axle-box having an enlarged end or head adapted to fit into such annular chamber, substantially as set forth.

400,736. WATER-FILTER. JAMES V. BLAKE and F. CORTES WILSON, Chicago, Ill.; said Blake assignor to said Wilson. Filed Jan. 14, 1889. Serial No. 296,309. (No model.)



Claim.—1. In combination with the casing, the inner annular partition provided with apertures at or near its lower edge, the outer lower annular partition, the pan resting upon the inner partition and having the neck or extension with perforated bottom extending down within the inner partition, the perforated nozzle in an opening from the pan into the pan-extension, and suitable outlets from the lower portion of the space around the outer partition, substantially as and for the purpose shown.

2. In combination with the pan having the central opening in its bottom, and the extension on the pan having a perforated bottom, the filter-casing having its bottom provided with apertures near its outer edge, the central annular partition supported on such bottom extending up around the pan-extension to the pan-bottom, and provided around its lower edge with apertures, the outer partition extending up around the inner partition to a point below the pan-bottom, a perforated nozzle in the central opening in the pan-bottom, and suitable filter-packing in the pan-extension, and the chambers formed between the two partitions and the outer partition and casing-wall, substantially as and for the purpose set forth.

3. In a filter, in combination with the casing having its bottom provided with exit-apertures near its outer edge, the inner annular partition extending upward from the casing-bottom, and near such bottom provided with apertures, the outer partition extending up from the casing-bottom, but lower than the inner partition, the pan having its bottom resting upon the top of the inner partition and provided with the extension with perforated bottom surrounded by the inner partition, the straining-nozzle through which the water flows from the pan into the pan-extension, the sponge within the nozzle, a body of sand within the pan-extension, and the charcoal packing within the annular chambers between the two partitions and the casing, substantially as and for the purpose described.

4. In combination with the casing having its bottom perforated near its outer edge, the outer partition, and the inner partition made higher than the other and provided with apertures near its lower edge, the pan having its bottom supported upon the top of the inner partition and provided with the central extension with perforated bottom, the straining-nozzle in the passage from the pan into the pan-extension, a sponge within such nozzle, a layer of gravel on the bottom of the pan-extension, and a body of sand within such extension above the gravel, a layer of gravel on the casing-bottom, the charcoal packing or filling within the two chambers between the outer and inner partitions and between the outer partition and the casing, and a layer of gravel on top of such filling, extending down to a point below the level of the top of the outer partition, substantially as and for the purpose specified.

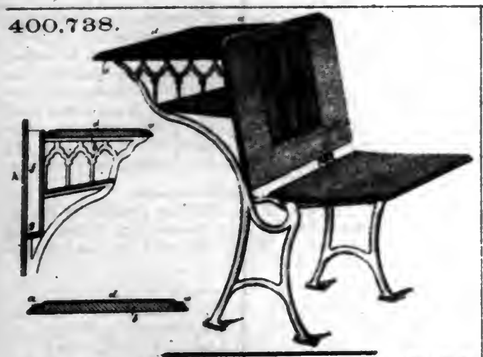
400,787. APPARATUS FOR PLOTTING ANGLES FOR BEVEL-GEAR. JOSEPH A. BOORMAN, Leeds, County of York, England. Filed Aug. 25, 1888. Serial No. 283,303. (No model.) Patented in England Oct. 1, 1887, No. 13,313.

Claim.—1. The combination, with a graduated quadrant, of a slide movable upon one arm of the same, a graduated arm hinged to the slide and extending at right angles to the side upon which the slide is located, and an adjustable slide upon said arm, for the purpose set forth.

2. An instrument for ascertaining the correct angles of bevel and miter wheels and the angle of a line passing through a point at given distances from vertical and horizontal planes, comprising a graduated quadrant, a radial arm pivoted to the quadrant capable of adjustment around the axis of the same and adapted to be clamped in the desired adjustment, and a transverse adjustable slide upon the radial arm, for the purpose set forth.

3. The combination of a graduated quadrant, an adjustable slide upon one arm of the same, a graduated arm hinged to the slide and provided with an adjustable slide, a radial arm pivoted to the axis of the quadrant and capable of adjustment around the same, a transverse reversible and adjustable slide upon the radial arm, and indices for the same, for the purpose set forth.

4. An instrument for ascertaining the correct angles of bevel and miter wheels and the angle of a line passing through a point at given distances from vertical and horizontal planes, comprising a graduated quadrant and an adjustable arm pivoted to the same at its axis and adapted to be clamped at the desired angle, an adjustable transverse slide upon this arm, and a radial index or arm loosely pivoted to the axis of the quadrant, all arranged for the purpose set forth.



5. An anglegraph comprising a graduated quadrant, a slide upon an arm of the same provided with a graduated arm, an adjustable radial arm pivoted to the axis of the quadrant and adapted to be clamped at the desired ascertained angle, a transverse reversible and adjustable slide upon the radial arm, a pair of indices upon the radial arm, and an index mounted upon the axis to freely turn upon the same, for the purpose set forth.

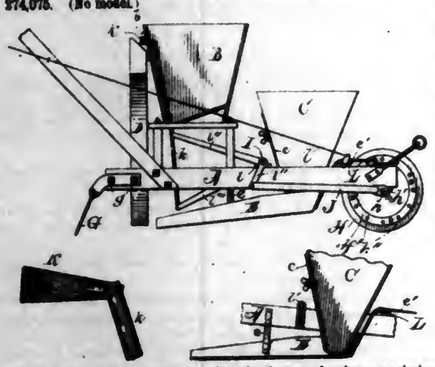
400,788. SCHOOL-DESK. ANNA M. BENADUM, Philadelphia, Pa. Filed Dec. 14, 1888. Serial No. 293,553. (No model.)

Claim.—1. The combination, in a school-desk top, of the outer border or frame, the panel within the same, and the rubber covering having a surface higher than the surface of the frame and having its edges confined between the panel and said frame, all substantially as specified.

2. A school-desk having a slate-well with closed internal casing, and an open front with cross-slats forming the front of the well, substantially as specified.

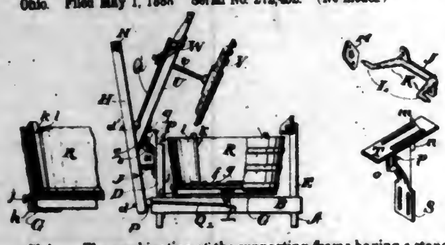
400,738.

400,739. THREAD. LUCIUS BRIGGS, Glasgo, Conn. Filed Oct. 22, 1888. Serial No. 288,843. (Specimens.)



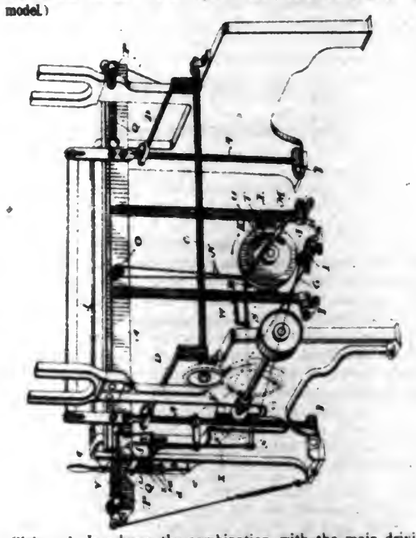
Brief.—The object of the invention is to produce a thread for use in crochet-work, &c., which will give to the fabric a peculiar beaded or twilled appearance.

Claim.—1. A new article of manufacture consisting of a cabled thread made of two threads of like number doubled and twisted together and two threads of a finer number doubled and twisted together, the two kinds of doubled and twisted thread being twisted together or cabled, as described.



2. A cabled thread consisting of three or more doubled and twisted threads one of which is of finer number than the others, as described.

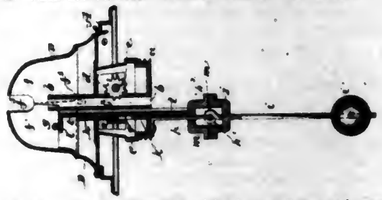
400,740. CORN-PLANTER AND FERTILIZER-DISTRIBUTER. JOHN B. BROADWELL, Alpharetta, Ga. Filed May 16, 1888. Serial No. 274,075. (No model.)



Claim.—In a planter, the seed-distributing mechanism, consisting of the wheel H, its shaft A, provided with cranks A' at each end, the connecting-rods J, rock-shafts I, having cranks i'' and arms i''', rods k, and the pivoted seed-cups K, the hopper B, provided with the holes b, having adjustable covers b', and the curved chutes D, for depositing the seed in the furrow, all arranged and operating substantially as shown and described.

400,741. WASHING-MACHINE. BENJAMIN BROBST, Columbus, Ohio. Filed May 1, 1888. Serial No. 272,452. (No model.)

Claim.—The combination of the supporting-frame having a standard, as D, the hinge-piece S, secured to said standard, hinge-piece T, pivotally secured to piece S, said piece T having a downwardly-projected wing, n, having therein a circular slot, O, and the cross-bar U, substantially as described, and for the purpose set forth.



400,742. SHUTTLE-MOTION FOR LOOMS. JOSEPH L. BROOK, Simcoe, Ontario, Canada. Filed May 21, 1888. Serial No. 274,575. (No model.)

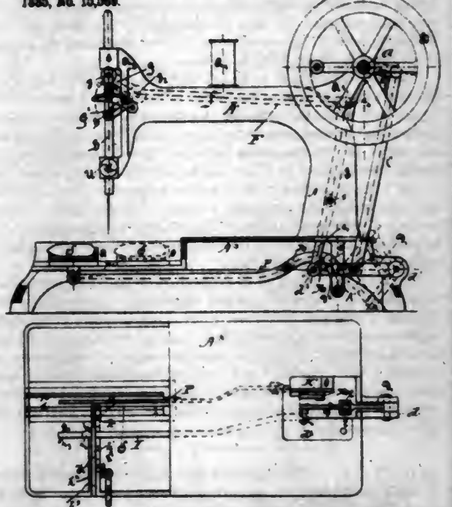
Claim.—1. In a loom, the combination, with the main driving-shaft, a pulley having a flattened portion, as shown, and provided with a fixed projecting stud on its face, a pivoted lever extended across the face of said pulley, and the pickers connected by cords to said lever, of a friction-pinion revolving in contact with said pulley and connected with the main driving-shaft, substantially as and for the purpose specified.

2. The lay A, the weighted and flattened friction-pulley K, journaled on a stud fixed to the lay, the friction-pulley J, the main driving-shaft, connections between said pulley J and said shaft, the longitudinally-movable rod S, the stud U, extending from the face of the pulley K, and a pin, R, extending from the opposite side of the pulley K and passing the rod S, combined with the lever X, connected to the rod S, the bail *f*, fixed to the lay, the wedge-shaped plate Y, pivoted in the frame of the machine and extended through said bail, the pickers, the pivoted lever L, extending across the face of the pulley K, and the cords N, connecting said lever L to the pickers, substantially as and for the purpose specified.

400,743. LAMP-EXTINGUISHER. CHARLES M. BROWN, Chicago, Ill. Filed Oct. 11, 1888. Serial No. 287,903. (No model.)

Claim.—1. The combination, with a burner-frame and a cone made in two sections, one section thereof being pivoted to the other section, of a sliding plate for operating the pivoted section of the cone, substantially as set forth.

2. The combination, with a burner-frame, of a cone made in two sections, one section pivoted on the other, a sliding plate to operate the pivoted section, a block on the sliding plate, and a rod attached to a fixed arm by a universal joint, said rod carrying a block at one end and a weight at the other, substantially as set forth.



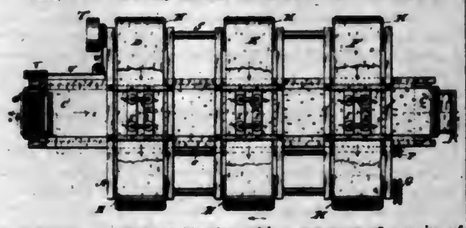
3. The combination, with a burner-frame, of a cone made in two sections, one section pivoted on the other, a sliding plate to operate the pivoted section, a guide-plate for the sliding plate, a lip at one end of the sliding plate and a block at the other end, a fixed arm, a rod pivoted to the fixed arm by a universal joint, and a block at one end of said rod and a weight at the other end, substantially as set forth.

4. The combination, with a burner-frame, of a cone made in two sections, one section pivoted to the other, a rod fixed to the pivoted section, a sliding plate having a lip to engage said fixed rod, and a block at the lower end of said rod, fixed arm, a rod connected to the fixed arm by a universal joint, a weight at the lower end of said pivoted rod, and a block at the upper end thereof, the blocks on the

sliding plate and pivoted rod being made cup-shaped to receive the universal joint, and having annular flanges at their meeting faces, substantially as set forth.

5. The combination, with a burner-frame, of a cone made in two sections, one section pivoted to the other, a rod fixed to the pivoted section, a sliding plate to engage said fixed rod, and a pivoted lever attached at one end to the sliding plate, whereby the pivoted section may be made to turn and close the opening in the burner, substantially as set forth.

400,744. SEWING-MACHINE. EWALD BRÜCKER, Siegler, near Troisdorf, Germany. Filed Mar. 2, 1886. Serial No. 194,613. (Model.) Patented in Germany Sept. 30, 1885, No. 47,993, and in England Dec. 18, 1885, No. 15,569.

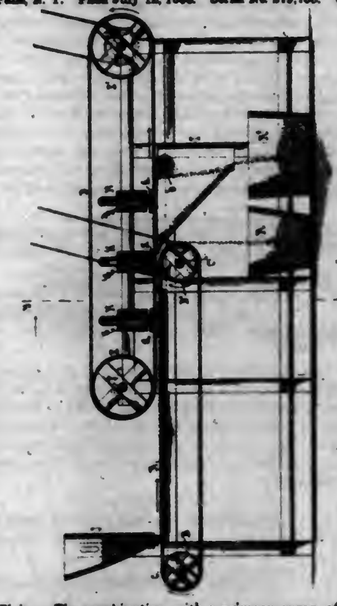


Claim.—1. The combination, in a sewing-machine, of the main or power shaft, a crank thereon, a pitman connected to said crank, a pair of toggle-arms connected at their middle joint to said pitman, a feed reciprocating bar connected to the free end of one of said toggle-arms, a shuttle-bar, a swinging arm, to which said shuttle-bar is pivotally attached, and a crank or lever connected to said swinging arm and to the free end of said toggle-arm, whereby, when said crank is rotated, said shuttle and feed reciprocating bar will be moved alternately in the same direction, substantially as set forth.

2. The combination, in a sewing-machine, of the main or power shaft, a crank thereon, a pitman connected to said crank, toggle-arms connected to said pitman at their middle joint, a lever fulcrumed on the machine-frame and connected to one of said toggles, a needle-bar-actuating arm pivotally connected to said lever, a vertically-moving needle-bar, and a pair of toggles coupling said needle-bar and arm, substantially as described.

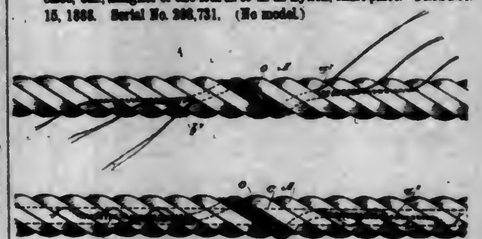
3. In a sewing-machine, the combination, with the horizontally-reciprocating needle-bar-actuating arm, of a pair of toggles, one of which is pivotally connected to the machine-head and the other to the needle-bar, and a pivot passing through the lower member of said toggles and having a forked end which embraces and slides upon the presser-bar, substantially as described.

400,745. WITHDRAWN.



400,746. MAGNETIC SEPARATOR. GORDON COWLING, Glens Falls, N. Y. Filed July 12, 1888. Serial No. 279,754. (No model.)

Claim.—1. The combination, with a conveyer, of a series of aprons to operate transversely to the conveyer and at different distances from the same, a magnetized plate secured in proximity to each of the aprons, and suitable driving mechanism for actuating the aprons, substantially as set forth.



2. The combination, with a conveyer, of a series of aprons to operate transversely to the conveyer and at different distances from the same, a magnetized plate secured in proximity to each of the aprons, a scraper or brush made to act on each of the aprons, a separate receptacle under each of the aprons, and suitable mechanism for actuating the aprons, substantially as set forth.

400,747. MAGNETIC SEPARATOR. GORDON COWLING, Glens Falls, N. Y. Filed July 12, 1888. Serial No. 279,755. (No model.)

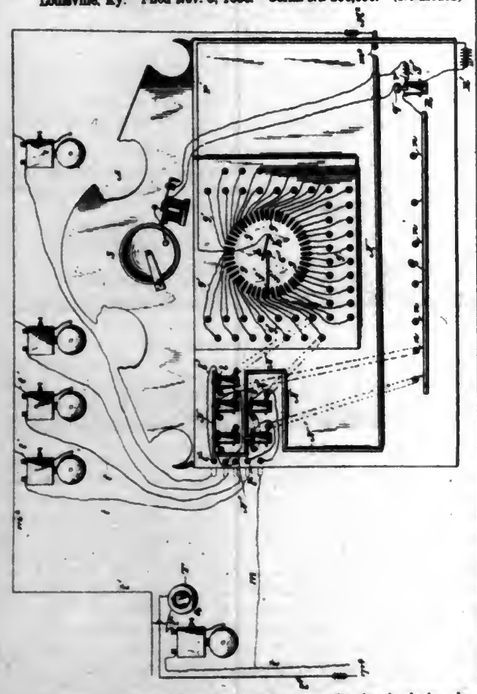
Claim.—The combination, with a primary apron, of a secondary apron situated over and made to extend in the same direction as the primary apron, a magnetized plate secured in proximity to the secondary apron, and suitable driving mechanism for actuating the aprons, substantially as described.

400,748. ART OF SPLICING CABLES. JOHN COLLINS, San Francisco, Cal., assignor of one-fourth to H. H. Lynch, same place. Filed Dec. 15, 1888. Serial No. 293,731. (No model.)

Claim.—1. In the art of splicing cables, the method of treating and disposing of the strand ends or tucks, which consists in dividing them back to their union with the cable, cutting off even with the surface of the cable one of the divisions of each tuck, laying up the remaining divisions so as to form a splice-strand occupying the vacant score of the cable, unlaying the projecting ends of said last-named divisions into individual wires, and finally laying said unlaid ends in a flattened condition into the cable under the strands and against the soft core of the cable, substantially as described.

2. In the art of splicing cables, the method of treating and disposing of the strand ends or tucks, which consists in dividing them back to their union with the cable, cutting off even with the surface of the cable one of the divisions of each tuck, laying up the remaining divisions so as to form a splice-strand occupying the vacant score of the cable, tucking said divisions under adjacent strands, unlaying their projecting ends back to said strands into individual wires, and finally laying said unlaid ends in a flattened condition into the cable under the strands and against the soft core of the cable, substantially as described.

3. In the art of splicing cables, the method of treating and disposing of the strand ends or tucks, which consists in dividing them back to their union with the cable, cutting off even with the surface of the cable one of the divisions of each tuck, laying up the remaining divisions so as to form a splice-strand occupying the vacant score of the cable, unlaying the ends of said last-named divisions into individual wires, and finally tucking and laying under different strands of the cable the different wires of the said divisions and carrying them around and against the soft core of the cable, whereby said wires are nipped by all the strands of the cable, substantially as described.



4. In the art of splicing cables, the method of treating and disposing of the strand ends or tucks, which consists in dividing them back to their union with the cable, cutting off even with the surface of the cable one of the divisions of each tuck, laying up the remaining divisions so as to form a splice-strand occupying the vacant score of the cable, tucking said divisions under adjacent strands of the cable, unlaying the projecting ends of said last-named divisions into individual wires, tucking different ones of said wires under succeeding strands, and finally laying in all of said wires under different strands of the cable against and around the soft core thereof, whereby said wires are nipped by all the strands of the cable, substantially as described.

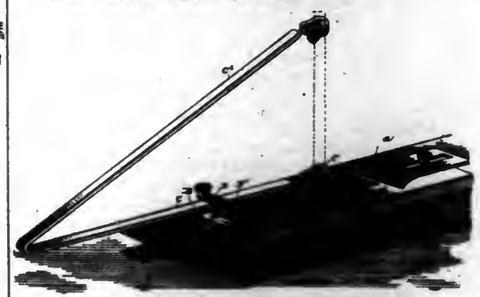
400,749. DOUBLE-ACTING SWIVEL. MATTHIAS COLLIER, Freeport, Pa. Filed June 1, 1888. Serial No. 275,789. (No model.)

Claim.—In a double swivel, the combination of a hollow body provided with orifices at each end of less diameter than the hollow itself, with two end pieces whose shanks play loosely in said orifices, and whose interior ends are enlarged, so as to nearly fill the hollow in the central body, the said exterior ends being provided with rings or other suitable means for connecting them with ropes, chains, &c., substantially as described.

400,750. ALARM SYSTEM. CHARLES A. COX and JOSEPH F. COX, Louisville, Ky. Filed Nov. 5, 1888. Serial No. 290,059. (No model.)

Claim.—1. The combination, in an automatic circuit-closing device, of a hinged door or frame conjointly provided with the following elements: a time-piece having a contact-arm located at the rear of said door and adapted for circuit-connection and rotating correspondent with an hour-hand, rear contact-plates, *g*, portion *c*, having contacts connected with plates *g*, portion *d*, having alarm circuit-contacts, and coupling devices to connect the contacts of portions *c d*, substantially as set forth.

2. The combination, in an automatic circuit-closing device, of a time-piece, two series of contacts respectively corresponding with divisions of time and alarms, an electro-magnet having a circuit-closing armature, alarm-circuit controlled by said armature, and a bell directly included therein, couplers to close the primary circuit through any desired magnet or magnets, an arm actuated by the time-piece and adapted for primary circuit-connections, and a series of plates connected to said time-contacts, substantially as set forth.



3. The combination, in an automatic circuit-closing device, of a hinged door or frame, a time-piece carried thereby, contact-arm *f*, and plates *g*, portion *c*, having contacts connected with said plates, portion *d*, having contacts *e*, an electro-magnet for each pair of contacts *e*, an armature for each electro-magnet controlling the room circuit-connections, and coupling devices for connecting the contacts of portion *c d*, substantially as set forth.

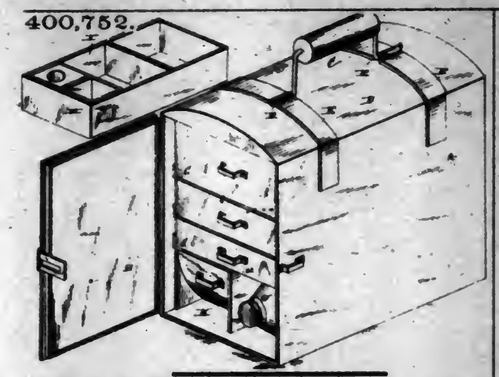
4. The combination, in an automatic circuit-closing device, of a time-piece carried thereby, contact-arm *f*, and plates *g*, portion *c*, having contacts connected with said plates, portion *d*, having contacts *e*, electro-magnets connected to the latter and each having an armature, and alarm circuit-connections controlled by said armatures and including metallic strips N N', arranged as and for the purpose specified.

5. The combination, with an electro-magnet, of a clamp or collar secured thereto and having ears, a vertical armature pivoted in said ears, a malleable-metal extension depending from said armature below its pivotal connection, and a weight permanently secured to said extension, substantially as set forth.

6. The combination, in an automatic circuit-closing device, of a time-piece, two series of contacts respectively corresponding with divisions of time and alarms, an electro-magnet having a circuit-closing armature and adapted to control an alarm-circuit, couplers to close the primary circuit through any desired magnet or magnets, an arm actuated by the time-piece and adapted for primary circuit-connections, a series of plates connected to said time-contacts, and a shunt-circuit and circuit-closing device included therein to complete an alarm-circuit independent of the time-piece, substantially as set forth.

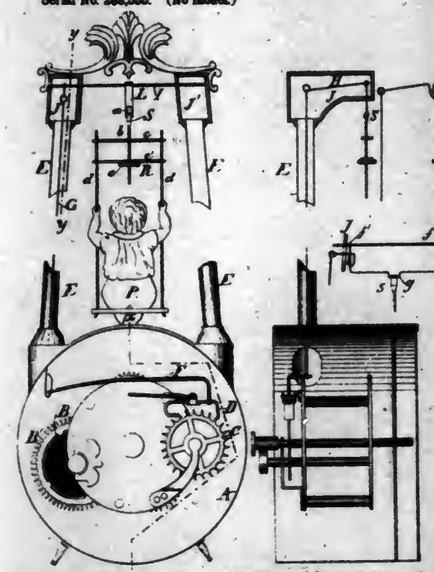
400,751. TUCK CREASING AND MARKING ATTACHMENT FOR SEWING-MACHINES. ALICE A. CRAWFORD, Austin, Tex. Filed May 2, 1888. Serial No. 272,601. (No model.)

Claim.—1. In a tuck creaser and marker, the combination, with a creasing-blade arranged on the bed-plate of a sewing-machine, and the needle-bar and supporting-arm attached thereto, of a block adjustably secured upon said arm and provided with a groove to receive the creasing-blade and with a chalk or crayon holder, substantially as set forth.



2. The combination, with an arm attached to the needle-bar of a sewing-machine, of a block provided with a holder for a marker and with spring-jaws clasping said arm, the said jaws being provided with a pinching-screw, whereby the block may be adjustably secured upon said arm, substantially as set forth.

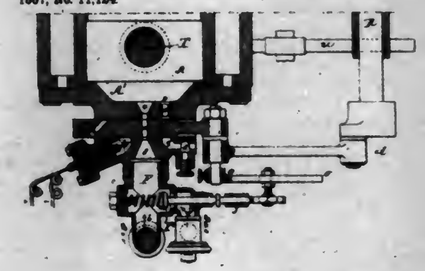
3. The combination, with a tuck-line-indicating device, of a support therefor, consisting of the V-shaped rod having means at its free ends for connecting it to the needle-bar of a sewing-machine, substantially as set forth.



400,752. DINNER-PAIL. PERRY L. CROSSMAN, Granby, Mo. Filed Aug. 6, 1888. Serial No. 282,043. (No model.)

Claim.—The dinner-pail consisting of the case having a series of compartment-ledges, a series of boxes or drawers supported upon said ledges, and the bottom compartments for holding a butter-dish and a bottle, said case having integral with itself an arched top or cover having applied to and depending from its under side the knife and fork holding brackets having the curved approximately horizontal portion, substantially as set forth.

400,752.



400,753. CLOCK. WALTER D. DAVIES, Brooklyn, N. Y., assignor to the Ansonia Clock Company, Ansonia, Conn. Filed Oct. 19, 1888. Serial No. 288,536. (No model.)

Claim.—In a clock, the combination, with an escapement, of an arm receiving motion from the verge thereof, a case for the clock-movement, a post or pillar extending upwardly above the said case, a bell-crank lever, a rod extending upwardly through said pillar or post and connected to said arm and to one of the arms of said bell-crank lever for transmitting motion to the latter, and a pendulum suspended from the other arm of said bell-crank lever above the clock-case, substantially as specified.

400,754. MOTIVE-POWER ENGINE. EDOUARD D. DESOUTTEVILLE and LEON F. C. MALANDIN, Fontaine-le-Bourg, France. Filed Oct. 12, 1886. Serial No. 216,012. (No model.) Patented in Germany May 4, 1884, No. 33,915, and May 2, 1886, No. 37,420; in France Feb. 4, 1885, No. 160,367; in England Jan. 1, 1886, No. 11; in Belgium May 4, 1886, No. 72,974; in Italy June 10, 1887, No. 21,342, and in Spain July 13, 1887, No. 11,124.

Claim.—1. A gas-engine provided with a slide-valve having a small outlet from the igniting-chamber to the atmosphere when the said chamber is opened to the cylinder, in combination with an inclosing-cover for the slide, and containing said igniting-chamber, substantially as set forth.

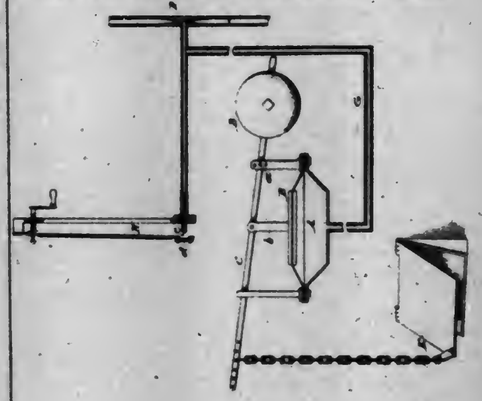
2. The combination of the gas-valve of a gas-engine and a compressing-cylinder and piston operated by a moving part of the engine, with a tappet operated with the slide to act on the gas-valve under the control of the compressing-cylinder and piston, substantially as described.

3. The combination of the cylinder of a gas-engine and its slide having a passage, *a*, with passages *p q* in the cylinder-head and cover, and a regulating-plug for the escape of the air in starting the engine.

400,755. ASBESTUS PACKING. JOHN B. DEEDS, Terre Haute, Ind., assignor to Robert H. Catlin, same place. Filed Mar. 23, 1888. Serial No. 268,294. (No specimens.)

Claim.—In an article for packing, strips or lengths of asbestus or mineral wool when twisted, spun, or plaited into shape, and having incorporated therewith a paste composed of plumbago or described equivalent, oil, and rosin, substantially as described.

400,756. METHOD OF TREATING ASBESTUS. JOHN B. DEEDS, Terre Haute, Ind., assignor to Robert H. Catlin, same place. Filed Dec. 13, 1888. Serial No. 293,495. (No specimens.)

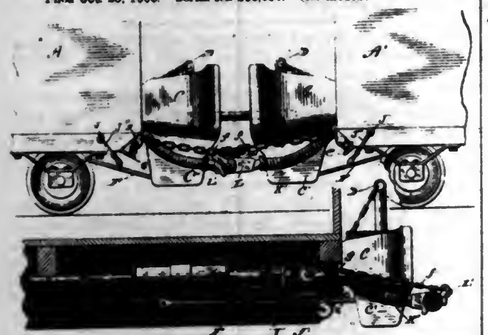


Claim.—The method herein described of treating asbestus or mineral wool, the same consisting in combining therewith, in proper quantity, a thin paste composed of plumbago, oil, and rosin, subjecting the mass to the action of heat, and then allowing the same to cool, as set forth.

400,757. BURDEN-CARRIER. ROBERT H. DIXEY, New Orleans, La. Filed Nov. 22, 1888. Serial No. 291,613. (No model.)

Claim.—As an improved article of manufacture, the burden-carrier described, consisting, essentially, of the two longitudinal bars A, the hinge-bar *b*, secured near the lower ends thereof, the braces arranged at opposite ends of the hinge-bar, the hinged shelf adapted to rest upon the braces and fold upon the longitudinal bars, the curvilinear rods or bars connecting the longitudinal bars, the arm-loops secured to said longitudinal bars, and the adjusting-rope connecting the hinged shelf with one of the curved transverse rods, substantially as specified.

400,758. TEMPERATURE-REGULATOR. LUCIEN F. EASTON, La Crosse, Wis. Filed Dec. 26, 1888. Serial No. 294,610. (No model.)



Claim.—1. The combination of a valve, damper, or analogous device, an expansible and contractible chamber having a movable part arranged to actuate said valve, damper, or device, a pumping apparatus communicating with the chamber, and a thermally-controlled valve serving to open and close communication between the pump and the external atmosphere at a point between the pump and the chamber, substantially as and for the purpose specified.

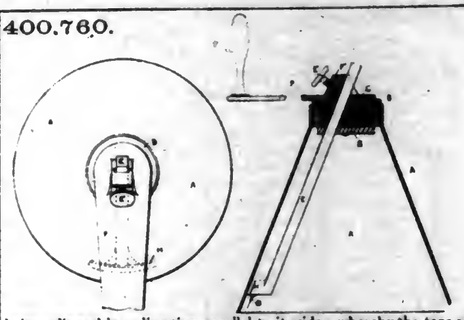
2. The combination of a valve, damper, or analogous device, an expansible and contractible chamber having a movable part arranged to actuate said valve, damper, or other device, an exhausting apparatus serving to exhaust air from the chamber, and a thermally-controlled air-inlet serving to admit air to the chamber or to the exhaust system at any point.

3. The combination of chamber A, movable wall B, lever C, weight D, valve or damper E, aspirator F, pipe G, provided with inlet *e*, and thermostat H, provided with valve *d*, said parts being constructed and arranged to operate substantially as set forth.

400,759. PIPE-COUPLING. RICHARD J. EDWARDS, Galena, Ill. Filed Oct. 23, 1888. Serial No. 288,957. (No model.)

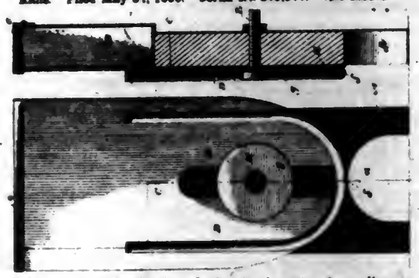
Claim.—1. The combination of the cars, transverse crank-shafts journaled upon the cars, conducting-pipes upon the cars provided with flexible hose-sections, pipe-couplings on the ends of these flexible sections, these couplings being provided with interlocking lugs and upwardly-extending arms, and chains connecting the upwardly-extending arms with the respective crank-shafts on the cars, whereby the couplings may be uncoupled, whether the cars be in motion or at rest, substantially as described.

2. The combination, with the cars provided with draw-bars and draw-heads, of the coupling devices, multiple crank-shafts journaled on the cars and adapted to operate the uncoupling devices, the air-pipes provided with the flexible sections, the pipe-couplings provided with interlocking lugs and arms, chains connecting these arms with the cranks on the respective crank-shafts, valves in the air-pipes, arms on the stems of these valves, these arms being adapted to be operated by cranks on the crank-shafts, whereby by a single movement of one of the crank-shafts the coupling devices may be uncoupled, the pipe-couplings uncoupled, and the valves in the air-pipes closed, substantially as described.



3. The combination, with the cars, of the multiple crank-shafts journaled in the cars and provided with operating-handles, the air-pipes provided with stop-cocks, arms on the stems of these cocks, these arms being adapted to be operated by the cranks of the crank-shafts, flexible hose-sections on the ends of the air-pipes, coupling-sections on the ends of these flexible sections, these coupling-sections being provided with interlocking lugs and rigid arms, and the chain for connecting these rigid arms with the respective crank-shafts, whereby the said stop-cocks may be closed and the hose-sections detached at one operation, substantially as described.

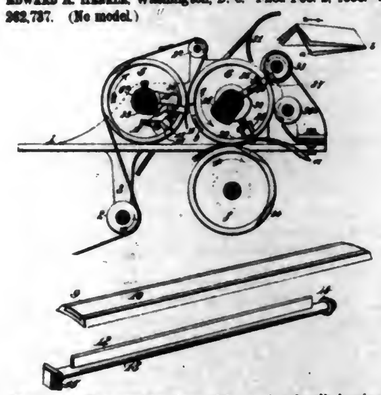
400,760. CAN-OPENING DEVICE. THOMAS ELCOATE, Norton, Stockton-on-Tees, County of Durham, England. Filed Feb. 6, 1889. Serial No. 298,863. (No model.)



Claim.—1. The combination, with a loose cover for protecting the contents of a can after it has been opened, of the rotatable radial arm E, mounted centrally on the interior of said cover and provided with a downwardly-projecting cutter, D, adapted to pierce the top of the can when the loose cover is laid or pressed thereon, and a suitable crank-handle, F, on the exterior of the cover, adapted to rotate the arm E, whereby the top of the can may be removed or cut off by the rotation of said handle, substantially as set forth.

2. A can-opener having a loose shell or cover, A, with sloping or tapering sides adapted to receive the top of the can it is desired to open, and having a knife-carrying arm, E, mounted obliquely in a rotatable head or boss, C, on the interior of said cover A, and capable of being adjusted in a direction parallel to its sides, whereby the tops of sealed cans of different sizes may be removed or cut off, substantially as set forth.

400,760.



400,761. LUBRICATOR. LAWRENCE M. FLEISCHMANN, Wichita, Kans. Filed May 31, 1888. Serial No. 275,577. (No model.)

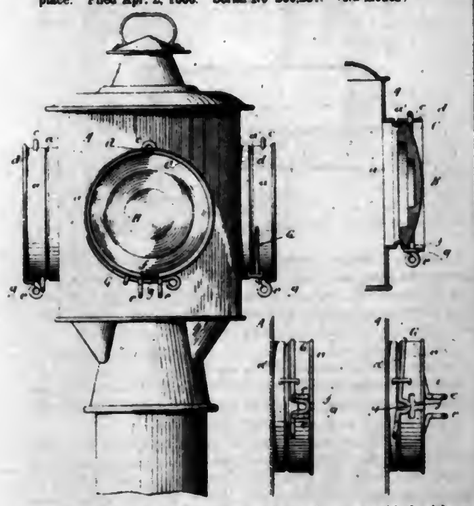
Claim.—1. A lubricating device having the depending vertical flange slotted longitudinally, and the tube leading from the lubricant-holder and looped downwardly and across a slot of the flange and provided with an aperture at its lowest point, substantially as specified.

2. A lubricating device having the depending vertical flange slotted longitudinally, and the tube leading from the lubricant-holder and provided with an aperture at its lowest point, substantially as specified.

400,762. PAPER-FOLDING MACHINE. JOSEPH C. FOWLER and EDWARD A. HENKLE, Washington, D. C. Filed Feb. 2, 1888. Serial No. 262,737. (No model.)

Claim.—1. The combination, with a pair of rolls having surface contact and provided with cutting mechanism operating upon the tangent line, of grippers pivotally mounted at the ends of one of said rolls, cams rigid on supports which underlie the ends of said grippers, whereby their other extremities are brought down upon the margins of the sheet just after the cut is made, and a similar pair of grippers upon the other roll which seize the end of the web, both pairs of grippers acting after the cut is made, whereby the two parts are positively separated, substantially as described.

2. The combination, with a pair of rolls having surface contact and provided with cutting mechanism acting upon the tangent line, of a pair of pivotally-mounted grippers mounted on and rotating with each of said rolls, cams rigidly mounted upon suitable supports and timed to act upon one pair of said grippers to cause them to seize the margins of the web, one pair of grippers seizing the sheet at its center and the other pair just beyond the line of cut, whereby the cut portion



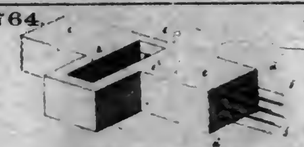
is carried in one direction and the end of the web in the other, substantially as described.

3. The combination, with two rolls having surface contact and with a third roll having contact with the second of said rolls, of web-severing mechanism acting upon the line of contact of the two first-named rolls, a pair of grippers pivotally mounted near the ends of the first roll and actuated by cams to engage the margins of the web immediately after it is cut, grippers pivotally mounted near the ends of the second roll and operated by cams to seize the center of the cut sheet, and a third pair of grippers separated from the second pair by a suitable arc and actuated by cams to seize the center of the centrally-folded sheet, substantially as described.

4. The combination, with a pair of rolls geared to revolve in unison and having their peripheries cut away to leave marginal contacting portions, of severing mechanism acting on the tangent line of said rolls, grippers pivoted on brackets at the ends of the first roll, cams throwing said grippers down upon the margins of said roll, two independent grippers pivoted at each end of the second roll and having independent cams which actuate the same, a third roll having contact with the second roll, and a roll running upon the same above said third roll, substantially as described.

5. The combination, with a pair of rolls geared to revolve in unison, of severing mechanism acting upon the line of contact, grippers pivotally mounted near the ends of the first roll and having cams which engage their ends with the edges of the web an instant after the cut, a second pair of grippers mounted upon the second roll and having cams which engage them with the center of the cut sheet, a third roll beneath the second roll, between which the folded edge is drawn by said grippers, a third pair of grippers pivoted near the ends of the second roll and actuated by separate cams to seize the center of the folded sheet, a fourth folding-roll running in contact with the second roll, and a creasing-roll having one or more creasing-collars running in grooves in the said second roll, substantially as described.

400,763. LENS-FASTENING FOR LAMPS. JOHN S. GALL, Rochester, N. Y., assignor to the Steam Gauge and Lantern Company, same place. Filed Apr. 2, 1888. Serial No. 269,231. (No model.)



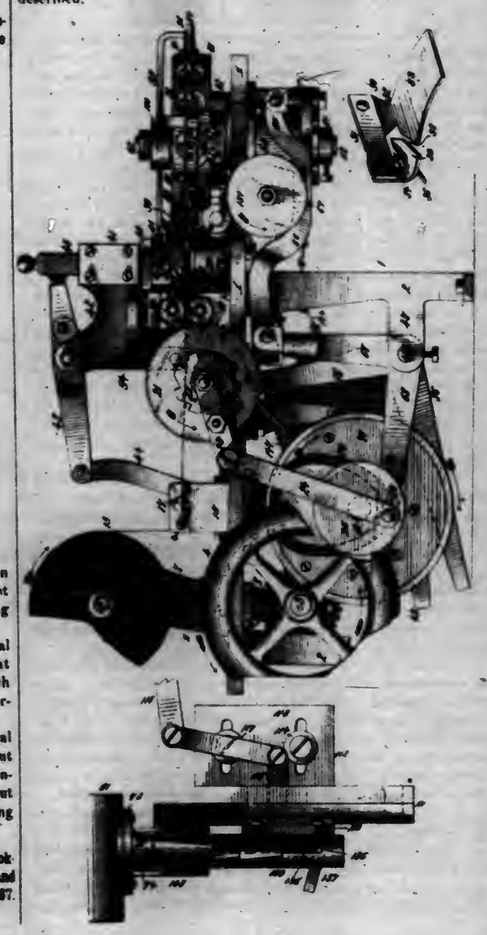
Claim.—1. The combination, with the frame provided with an internal shoulder and with an undercut notch, of a lens resting against said shoulder, and an elastic bow bearing against the lens and engaging with its ends in said undercut notch, substantially as set forth.

2. The combination, with the frame provided with an internal shoulder and having on opposite sides an opening, *d*, and an undercut notch, *f*, of a lens, and an elastic bow provided with an ear, *c*, which engages in the opening *d*, and having its ends engaging in said undercut notch *f*, substantially as set forth.

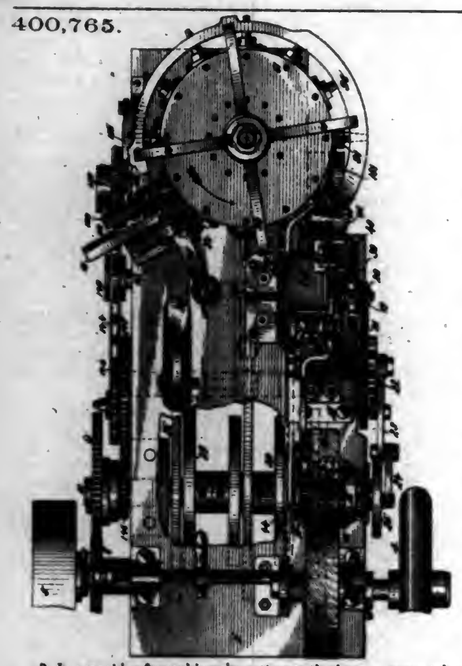
3. The combination, with the frame provided with an internal shoulder and having on opposite sides an opening, *d*, and an undercut notch, *f*, of a lens, an elastic bow provided with an ear, *c*, which engages in the opening *d*, and having its ends engaging in said undercut notch, *f*, and a spring-catch, G, secured to the frame and engaging between the ends of the bow, substantially as set forth.

400,764. UNDERGROUND CONDUIT. PATRICK R. GREENE, Brooklyn, N. Y., assignor two-thirds to Peter Byrne, Jersey City, N. J., and John Claffy, Brooklyn, N. Y. Filed Sept. 15, 1888. Serial No. 285,467. (No model.)

400,764.



Claim.—As an improved article of manufacture, a conduit-section composed of cement and having a laterally-arranged well or manhole formed integral therewith to form a T in cross-section, and a series of longitudinal tubular perforations extending from the well the entire length of the section, and also having the inner wall of the well provided with an opening, *e*, the whole being adapted when placed in a street to have the well extending outwardly from the curb, substantially as specified.



400,765. MACHINE FOR MAKING CIGARETTE MOUTH-PIECES OR PAPER TUBES. GEORGE M. GRENWOLD, New Haven, Conn., and ROBERT W. THURMAN and RICHARD H. WRIGHT, Lynchburg, Va., assignors to the Lone Jack Cigarette Company, Lynchburg, Va. Filed Aug. 4, 1887. Serial No. 246,138. (No model.)

Claim.—1. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a cutting mechanism, substantially as described, rollers for feeding the paper strip, a paste-roller for applying an adhesive substance to one edge of a blank cut from said strip, and a presser-foot for pressing the edge of the blank into contact with the paste-roller, substantially as described.

2. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a die-block, a vertically-reciprocating cutter-head, rollers for feeding a paper strip to the cutting mechanism, a paste-roller for applying an adhesive substance to one edge of a blank cut from the paper strip, and a presser-foot carried by the cutter-head to force the blank into contact with said paste-roller, substantially as described.

400,765.

3. In a machine for making cigarette mouth-pieces or paper tubes, the combination of mechanism, substantially as described, for feeding a paper strip, a die-block, a vertically-reciprocating cutter-head having knives for cutting a blank from the paper strip, a rotary mandrel provided with means, substantially as described, for grasping one corner of the blank at its forward end, a roller for applying an adhesive substance to the rear edge of the blank, and a presser-foot for forcing the blank into contact with said roller, substantially as described.

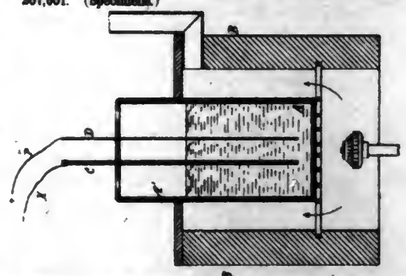
4. In a machine for making cigarette mouth-pieces or paper tubes the combination, with a rotary mandrel-carrier, of a series of rotary mandrels mounted in said carrier, a receptacle for melted wax or paraffine, an absorbent material so placed in said receptacle as to come in contact successively with the cigarette mouth-pieces or tubes carried by said mandrels as the carrier rotates, and means for keeping the wax or paraffine in a melted condition, substantially as described.

5. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a rotary mandrel-carrier, a pawl-and-ratchet mechanism provided with lever-connections for actuating said carrier from a cam-shaft, a series of mandrels mounted in said carrier and provided with pinions, a gear loosely surrounding the carrier-shaft and meshing with said pinions, a pawl-and-ratchet mechanism for driving said gear, and lever-connections for actuating said pawl-and-ratchet mechanism from the cam-shaft with which the mandrel-carrier is connected, all substantially as described.

6. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a rotary mandrel-carrier, a series of rotary mandrels mounted in said carrier and each provided with a longitudinal slot, a gripping dog or latch pivoted in said slot and a spring located beneath the rear end of said latch, a vertically-reciprocating cutter-head provided with knives for forming blanks to be fed to said mandrels, and a lever connected by a link with the cutter-head lever and adapted to bear on the rear end of the mandrel latch or dog and thereby raise its forward end to engage a blank, substantially as described.

7. In a machine for making cigarette mouth-pieces or paper tubes, the combination, with a rotary mandrel-carrier and a series of rotary mandrels mounted therein and each provided with a longitudinal slot, a pivoted dog, and spring, of a reciprocating tubular pull-off or receiver formed in two telescopic parts having a yielding connection, substantially as described, and provided with a spring for raising the mandrel latch or dog, and spring-hooks for withdrawing a finished tube or mouth-piece from the mandrel, substantially as described.

8. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a rotary mandrel-carrier, a series of rotary mandrels mounted in said carrier, a reciprocating pull-off or receiver for taking the finished mouth-pieces from said mandrels, a slotted guideway for the pull-off, an arm passed through the slot in said guideway and attached to the pull-off, and lever-connections for actuating said arm from a cam-shaft with which the mandrels and mandrel-carrier are connected, all substantially as described.



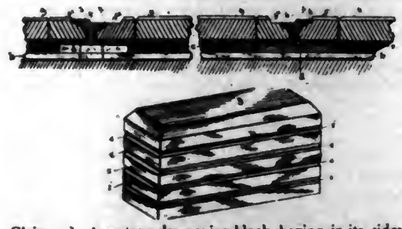
9. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a rotary mandrel-carrier, a series of rotary mandrels mounted therein, a reciprocating pull-off or receiver having a longitudinal slot, and an ejector-rod for entering said slot at intervals and removing the mouth-pieces or tubes collected in the pull-off or receiver, substantially as described.

10. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a rotary mandrel-carrier, a series of rotary mandrels, a slotted pull-off or receiver for taking finished mouth-pieces from said mandrels, an ejector-rod carried by a spring-depressed lever a cam for raising said lever, and means for actuating said cam from the shaft that actuates the mandrels, mandrel-carrier, and pull-off, substantially as described.

11. In a machine for making cigarette mouth-pieces or paper tubes, the combination, with a mandrel and mandrel-carrier, of a reciprocating tubular pull-off formed in two telescopic parts provided with means for releasing a mouth-piece or tube engaged on the mandrel and for withdrawing the same, substantially as described.

12. In a machine for making cigarette mouth-pieces or paper tubes, the combination of a rotary mandrel-carrier, a series of rotary mandrels mounted in said carrier and provided with means, substantially as described, for gripping a paper blank, rollers for feeding a paper strip, mechanism, as set forth, for cutting a blank from said strip, a lever actuated from the cutting mechanism to cause the mandrel-gripping device to seize a blank, pressure devices for winding the blanks on the rotary mandrels, means for coating the tips of the mouth-pieces with paraffine or like material, a pull-off for withdrawing the finished mouth-pieces from the mandrels, and an ejector for removing said mouth-pieces from the pull-off, all substantially as described.

400,766. PROCESS OF REDUCING ALUMINIUM BY ELECTROLYSIS. CHARLES M. HALL, Oberlin, Ohio. Filed July 9, 1886. Serial No. 207,601. (Specimens.)

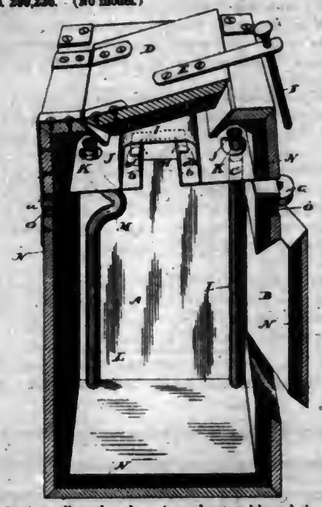


Claim.—1. As an improvement in the art of manufacturing aluminium, the herein-described process, which consists in dissolving alumina in a fused bath composed of the fluorides of aluminium and a metal more electro-positive than aluminium, and then passing an electric current through the fused mass, substantially as set forth.

2. As an improvement in the art of manufacturing aluminium, the herein-described process, which consists in dissolving alumina in a fused bath composed of the fluorides of aluminium and sodium, and then passing an electric current, by means of a carbonaceous anode, through the fused mass, substantially as set forth.

3. As an improvement in the art of manufacturing aluminium, the herein-described process, which consists in dissolving alumina in a fused bath composed of the fluorides of aluminium, sodium, and lithium, and then passing an electric current, by means of a carbonaceous anode, through the fused mass, substantially as set forth.

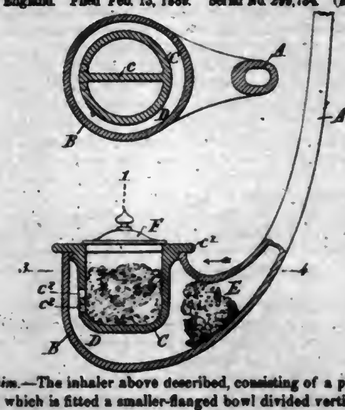
400,767. STREET-PAVEMENT. HENRY S. HALLWOOD, Columbus, Ohio. Filed Nov. 16, 1888. Serial No. 291,083. (No model.)



Claim.—1. A rectangular paving-block having in its sides continuous horizontal grooves or corrugations encircling said blocks and the upper edges beveled, substantially as and for the purpose described.

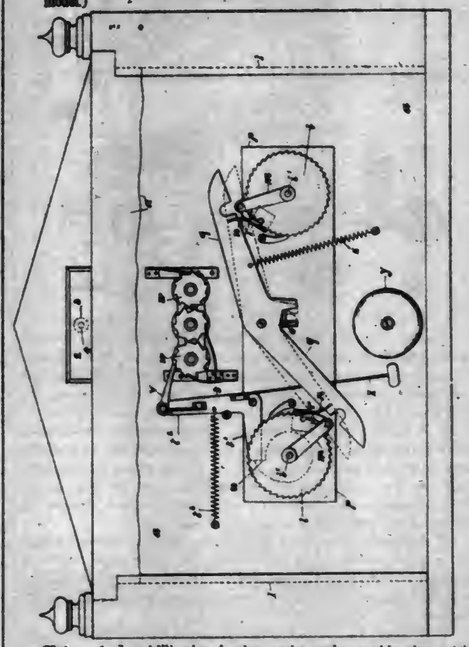
2. The combination, in a street-pavement, of the street-railway rails *f*, the adjoining paving-blocks *f'*, so set as to have their beveled top upon a higher level than the top of the rail, the blocks *f*[3] having one half of their surface depressed in line with the surface of the bearing-flange of the track and the other half having their tops upon a higher level than the top of the rail and the inner ends or sides adjoining said rails conforming to the shape of the web and flanges of the rail, but with an opening between them alongside the flange and the web of the rail wherein pitch is poured, substantially as described.

3. In a street-pavement and railway-track, the combination of the layer of boards *b*, planks *d* laid thereon, railway-track rails *f*, secured to said planks and boards, as described, and the layer of gravel, sand, or broken stone, *c*, upon said planks and boards, with the paving blocks or bricks resting upon said layer *c*, substantially as described.



400,768. REFRIGERATOR PACKING-BOX. PHILIP HOMMEIER and JACOB BALL, Waterloo, Ontario, Canada, assignors of one-third to John Nichol, same place. Filed Dec. 15, 1887. Renewed Feb. 8, 1889. Serial No. 299,236. (No model.)

Claim.—1. A cooling-chamber, A, and a top hinged thereto and formed with ice-chamber C, having an opening, H, protected by the walls *b*, having flanges *d*, in combination with the perforated shield I over said opening outside the walls *b*, substantially as and for the purpose specified.



2. The combination, with the chamber A and the hinged top formed with an ice-chamber, C, provided with openings J and an opening, H, protected by the walls *b* and flanges *d*, of the perforated shield I over the opening H outside the walls *b*; the pipes K, communicating with the openings J, the pipe L, and the flexible pipe M, connecting one of the pipes K with the pipe L, substantially as shown and described.

400,769. INHALER. JOSEPH S. HOOKER, Hastings, County of Sussex, England. Filed Feb. 13, 1889. Serial No. 299,734. (No model.)

Claim.—The inhaler above described, consisting of a pipe in the bowl of which is fitted a smaller-flanged bowl divided vertically into two compartments for the reception of the chemical substances to be inhaled, such compartments being pierced with holes for the discharge of the vaporous chemical substances into a mixing-chamber contained within the outer bowl, and closed against the stem of the pipe by a plug of moistened sponge, as and for the purpose above set forth.

400,770. GAME-COUNTER. JOHN HOPE, Liverpool, County of Lancaster, England. Filed Oct. 16, 1888. Serial No. 288,201. (No model.)

Claim.—1. In a billiard and other register, the combination, with a dial provided with numerals, a main working-pointer for registering the state of the game, a single ratchet-wheel mounted on said pointer, and a pawl-lever and pawl by which said wheel is actuated, of a hand-actuated pointer mounted on the same arbor as the main working-pointer and connected with said pawl-lever, whereby the increments of score are added and the said main working-pointer operated, substantially as described.

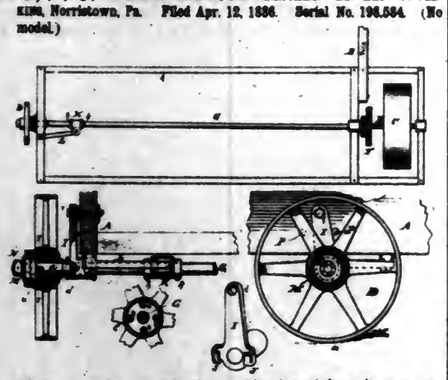
2. The combination, with the pointer-spindle *i'* of an apparatus for marking the scores made in playing the game of billiards and other like games, of a cam, *u*, lever *t*, secondary counter *w*, gong *y*, and gong-striker *x*, said lever being adapted to be operated by the said cam and to actuate the said counter and gong, as set forth.

3. In a billiard or other game marker, the combination of the spindle *i'*, the actuating-head *k*, pointer *i*, pawl-lever *m*, pawl *n*, ratchet-wheel *l*, hollow shaft *h'*, pointer *h*, a numeral-dial, *c*, and the cam *u*, lever *t*, gong *y*, striker *x*, pawl *v*, and counter *w*, as set forth.

4. The combination, with the actuating pawl-levers *m*, of a lever, *g*, and key *o*, said lever being adapted to engage and interlock with the said pawl-levers *m* and operated by the key *o*, substantially as and for the purposes set forth.

5. In a billiard or other game marker, the combination of the spindles *i' i'*, actuating-heads *k k*, pointers *i i*, pawl-levers *m m*, pawls *n n*, ratchet-wheels *l l*, hollow shafts *h' h'*, pointers *h h*, cam *u*, lever *t*, gong *y*, striker *x*, pawl *v*, counter *w*, and a locking-lever, *g*, and key *o*, substantially as and for the purposes set forth.

400,771. DENTAL RUBBER-DAM CLAMP. JAMES W. IVORY, Philadelphia, Pa. Filed Sept. 13, 1888. Serial No. 285,305. (Model.)



Claim.—1. A dental clamp consisting of two jaws having spring-connections on opposite sides thereof and provided with recesses adjacent to and upon both sides of said jaws, substantially as and for the purpose set forth.

2. A dental clamp consisting of jaws having spring-connections,

the latter being elliptical in front and having lower portions swelled forwardly, as at *a*, substantially as and for the purpose set forth.

400,772. RUNNING-GEAR FOR VEHICLES. EDWARD W. JENKINS, Norristown, Pa. Filed Apr. 12, 1886. Serial No. 198,584. (No model.)

Claim.—1. In a vehicle, the combination of the pole, two supporting-wheels for the vehicle geared together, a clutch for connecting and disconnecting the two wheels with respect to each other, and a mechanical connection between the pole and clutch, whereby the shifting of the latter is caused by lateral pressure upon the pole.

2. A vehicle-frame and two supporting-wheels, in combination with separate shafts for said wheels, gearing connecting said shafts, and a clutch to connect or disconnect one of said wheels with its shaft, a pole for the vehicle, and a connection between the pole and the clutch, whereby upon turning the vehicle the clutch is actuated to disconnect the outer wheel.

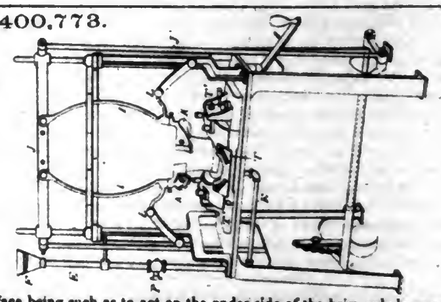
3. A vehicle-frame and two supporting-wheels of different diameters, in combination with a pole close to the larger wheel, shafts for said wheels, and gearing connecting the shafts and a grain-platform between said supporting-wheels, substantially as and for the purpose specified.

4. A vehicle-frame and two supporting-wheels of different diameters, in combination with two parallel shafts for said wheels, and gearing connecting the shafts, the larger wheel being fixed to its shaft, and a clutch between the smaller of said wheels and its shaft for connecting or disconnecting that wheel with its shaft.

5. A vehicle-frame, a pole attached thereto near one wheel, and two supporting-wheels, in combination with supporting-shafts and a ratchet-clutch connecting one of said wheels with its shaft, whereby the wheel farthest from the pole is free to rotate faster than the wheel next to the pole, but not slower, substantially as and for the purpose specified.

6. In a vehicle, the combination of two supporting-wheels of different diameters, a pole attached to the frame near one wheel, separate shafts upon which the wheels are mounted, the wheel near the pole being fixed to its shaft, gearing connecting the shafts, and a ratchet-clutch connecting the other wheel to its shaft, whereby the wheel farthest from the pole is free to rotate faster than the wheel next to the pole, but not slower.

7. The combination of frame A, master-wheel C and its gear E, intermediate spur-wheel, *f*, shaft G, having pinion H and clutch-head M, fixed bearing *g* and loose bearing I for said shaft, grain-wheel D, having spring-clutch N and loosely supported on shaft G, and link L, connected to the frame and shaft G, substantially as and for the purpose specified.



8. In a harvester, the combination of the frame, the main and grain wheels, of different diameters, mounted on separate axles, a pole attached to the frame near the main wheel, gearing connecting the main wheel with the grain-wheel, and a clutch connecting the grain-wheel with its immediate driver, whereby the grain-wheel is driven from the main wheel and is at the same time free to rotate faster but not slower than the main wheel.

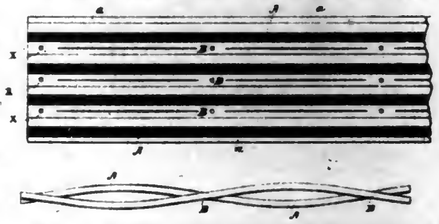
400,773. BOTTOM BOARD FOR HATS. CHARLES E. KRATOR, Brooklyn, N. Y., assignor to the Palmud Hat Machine Company, same place. Filed Feb. 2, 1887. Serial No. 226,253. (No model.)

Claim.—1. A hollow bottom board of elastic material having as a unitary part a solid central portion, substantially as described.

2. A hollow bottom board having as a unitary part a solid central portion and an outlet or inlet for a fluid, substantially as described

3. The within-described bottom board for a hat-brim-curling machine, said bottom board having as a unitary part a solid central portion, and around it a surface flexible throughout and conforming to the general shape of the brim with its dip and roll, said flexible surface being such as to act on the under side of the brim only in pressing, all substantially as specified.

4. The within-described bottom board for a hat-brim-curling machine, said bottom board constituting a self-contained structure independent of and detachable from the machine, and having as a unitary part a solid central portion and around this a flexible upper surface conforming to the general shape of the brim of the hat, all substantially as specified.



5. The combination of the flexible bottom board of a hat-brim-curling machine with wedge-pieces to support and give shape to the side edges of the bottom board, substantially as described.

6. The combination of the flexible bottom board of a hat-brim-curling machine with movable wedge-pieces to support and give shape to the side edges of the bottom board, all substantially as described.

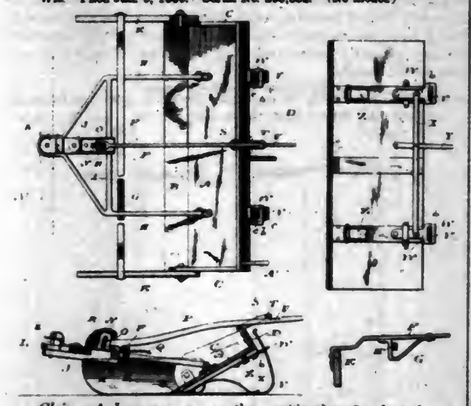
7. The combination of the bottom board having a solid center, and a hollow rim with movable wedge-pieces to support and give shape to the flexible side edges of the bottom board, substantially as described.

8. The combination of the flexible bottom board of a hat-brim-curling machine with pressers and side-edge curlers and movable wedge-pieces to support and give shape to the flexible side edges of the bottom board, substantially as described.

400,774. METALLIC LATHING. ISRAEL KINNEY, Windsor, Ontario, Canada. Filed Dec. 3, 1887. Serial No. 256,906. (No model.)

Claim.—1. Metallic lathing formed of sheet metal having longitudinal corrugations A and slitted longitudinally throughout between said corrugations, excepting at points in transverse zones, whereby bands B are left for holding the strips thus formed together, portions of said strips being alternately raised and depressed, as herein shown.

2. Metallic lathing constructed of longitudinally-corrugated strips secured together, as shown, by transverse bands, portions of each longitudinally-corrugated strip being raised or depressed, the raised portion of one strip being opposite the depressed portion of the adjacent strips, whereby the mortar is deflected by the sides of the corrugations in the depressed portions behind the raised portions, as set forth.



3. Metallic lathing constructed, substantially as described, of longitudinally-corrugated flanged strips secured parallel to each other, portions of each strip throughout being alternately raised and depressed, the raised portions of one strip being opposite the depressed portions of the adjacent strips, whereby the corrugations and flanges of the depressed portions of each strip deflect the mortar behind the raised portions of the adjacent strips to effectually key the same.

4. Metallic lathing constructed of longitudinally-corrugated strips secured together, as described, and having their portions between securing-points alternately raised and depressed, as hereinbefore explained.

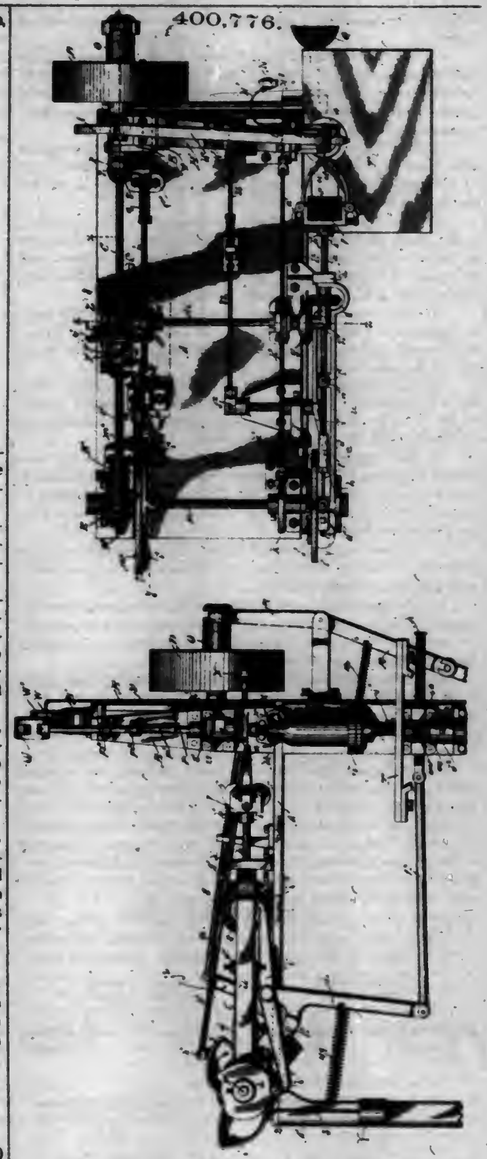
5. Metallic lathing constructed of longitudinally-corrugated strips secured in the proper relative positions to each other, substantially as shown, said longitudinal strips being bowed alternately in the plane of their length, as shown and described.

6. Metallic lathing consisting of long parallel longitudinally-corrugated strips, each of said strips having alternate longitudinally-corrugated portions raised and depressed, the adjacent portions of the strips being bent oppositely, as described.

400,775. SNOW-SCRAPER. GERHARD J. KOPMEIER, Milwaukee, Wis. Filed Jan. 9, 1889. Serial No. 295,852. (No model.)

Claim.—1. In a snow-scraper, the combination of a pivoted scraping-board, a tongueless draft-frame shackled thereto, and a doubletree or analogous device detachably connected to said draft-frame, substantially as set forth.

2. In a snow-scraper, the combination of a pivoted spring-supported scraping-board, a draft-frame shackled thereto, and a doubletree or analogous device detachably connected to the draft-frame, substantially as set forth.



3. In a snow-scraper, the combination of the main runners, a cross-brace uniting the same and provided with depending loops, a scraping-board pivoted to the runners, a draft-frame shackled to the scraping-board and supported by said loops, a standard on the draft-frame, a rearwardly-extended lever fulcrumed on said cross-brace and loosely connected to the standard, and a latch pivoted to said scraping-board to engage the lever, substantially as set forth.

4. In a snow-scraper, the combination of a pivoted scraping-board, runners hinged to the under side of the same and having upwardly-extended free ends provided with notches, slotted plates pivoted to said scraping-board to engage said free ends of the runners, a strap connecting the pivoted plates, and a lever for actuating the strap, substantially as set forth.

5. In a snow-scraper, the combination of a pivoted scraping-board, runners hinged to the under side of the same and having upwardly-extended free ends provided with notches, pivotally-adjustable slotted plates secured to the scraping-board to engage said free ends of the hinged runners, and springs secured to said scraping-board to exert their force against the same and rest upon said runners, substantially as set forth.

6. A snow-scraper comprising a pair of main runners, a cross-brace uniting the same and provided with depending loops, a scraping-board pivoted to the main runners and provided with hinged runners having upwardly-extended and notched free ends, pivotally-adjustable slotted plates secured to the scraping-board to engage said free ends of the hinged runners, a draft-frame shackled to said scraping-board and supported by said loops on the cross-brace, a standard on the draft-frame, a rearwardly-extended lever fulcrumed on said cross-brace and loosely connected to the standard, and a latch pivoted to the scraping-board to engage the lever, substantially as set forth.

400,776. MACHINE FOR CORKING AND WIRING CORKS TO BOTTLES. HENRY LA CASSE, Syracuse, assignor to Sol Wile, Rochester, N. Y. Filed July 30, 1888. Serial No. 281,361. (No model.)

Claim.—1. The combination of a compressor for compressing the cork, a wire-carrier having jaws for applying the wire to the cork and bottle, a plunger for forcing the cork into the bottle, and connected mechanism for actuating the several devices in their due order, substantially as and for the purpose set forth.

2. The combination of the compressor, plunger, wire-carrier having jaws, and hammer N, and connected mechanism for actuating the several devices in their due order, substantially as and for the purpose set forth.

3. The combination of the compressor, plunger, wire-carrier having jaws, bottle-support, and jaws M M, for grasping the neck of the bottle, and connected mechanism for actuating the several devices in their due order, substantially as and for the purpose set forth.

4. The combination of the plunger, wire-carrier and its jaws, jaws M M, for holding the two strands of wire together while the bottle is revolved to twist them onto the cork, the rotating bottle-support J, and connected mechanism for actuating the several devices in their due order, substantially as and for the purpose set forth.

5. The combination of the bottle-support, wire-carrier having jaws, jaws M M, and hammer N, for cutting off the wire after it has been twisted onto the cork, and connected mechanism for actuating the several devices in their due order, substantially as and for the purpose set forth.

6. The rotating wire-carrier I, having jaws *a a*, and shaft *b*, sliding endwise in the pivoted hanger U and oscillating on the hub U', journaled on the shaft F, substantially as and for the purpose set forth.

7. The wire-carrier I, provided with jaws *a a*, and shaft *b*, adapted to move endwise in a hanger, U, and to oscillate on the hub U', in combination with the elbow-bearing Z', the gears *g g'*, and the pivoted actuating-shaft H, all substantially as and for the purpose set forth.

8. The wire-carrier I, having jaws *a a*, and shaft *b*, mounted in the hanger U to oscillate therewith, in combination with the cam *h* on the shaft F and the pivoted lever V, substantially as and for the purpose set forth.

9. The hanger U, provided with the hub U', journaled on the shaft F, and the projecting bearing *d'*, in combination with the rods *f f'*, sliding bearing *d*, carrying the shaft *b* of the wire-carrier, the cam *i*, for impelling the bearing *d* and shaft forward, and the cord 3 and

weight Y, for retracting it, substantially as and for the purpose set forth.

10. The combination of the wire-carrier I and its jaws with the shaft *b*, elbow-bearing Z', gears *g g'*, shaft H, sleeve *o*, slotted post X', swiveled bearing Z, gears G G', and collar H^3, setting in a cut-out in the bearing Z, for rotating the wire-carrier and permitting it to oscillate, substantially as and for the purpose set forth.

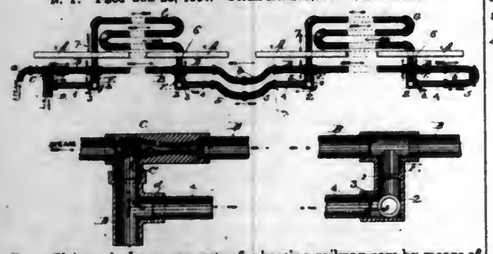
11. The bottle-support J, having screw-shaft J', in combination with the collar J^3, pinion 44, clutch 45, and rack K, operated by rod L^2, connected to lever L, actuated by cam *j*, substantially as and for the purpose set forth.

12. The combination, with the bottle-support J and its shaft J', of the loosely-mounted pinion 44, actuated by the forward movement of the rack K to engage the clutch 45 and revolve the support J, and disengaged from the clutch by the rearward movement of the rack, substantially as and for the purpose set forth.

13. The compressor S', mounted movably in the bracket-support S, composed of a semi-tubular section and a pivoted section, in combination with the rod *s* and its actuating-cam *u*, substantially as and for the purpose set forth.

14. The bracket-support S, provided with the curved slot or recess 29, in combination with the vertically-moving compressor S', hinged on pin 21 to the compressor-rod *s* and its actuating mechanism, substantially as and for the purpose set forth.

15. The combination, with the bracket-support S, of the compressor S', having a hinged section or segment, the pivoted locking-lever K', having the projecting end 27 in the path of the finger P', carried by the plunger P, and the finger P', substantially as and for the purpose set forth.

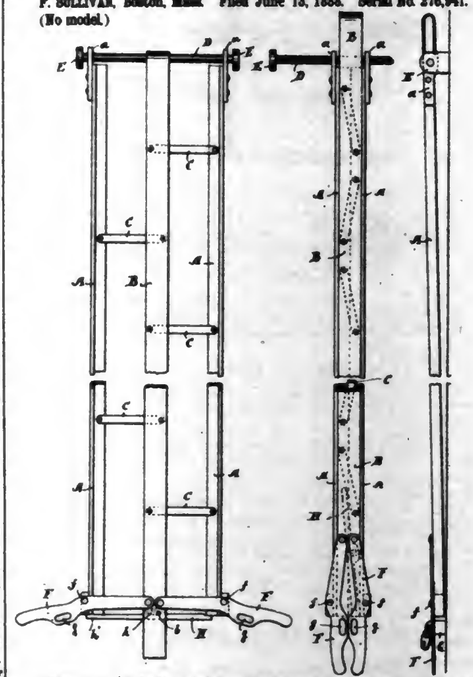


16. The combination, with the plunger P, of the vertically-movable compressor S', having the bulb or swell 52 near its exit, substantially as and for the purpose set forth.

17. The combination, with the hammer N, having spring-shank N', secured to pinion N^3, of the rack N^2, rod k^2, lever *k'*, having stud 38, the cam *k*, having notches 39 and 40, and the spring 41, substantially as and for the purpose set forth.

18. The combination of the jaws M M, mounted on the shafts M' M', gears 32, crank M^2, rod 33, eccentric-lever j^3, the cam *j*, for actuating the lever j^3, and a spring on the rod 33 for restoring the jaws M M to their normal position, substantially as and for the purpose set forth.

19. The combination of the wire-carrier I, having jaws, the main shaft C, and intermediate mechanism for operating the jaws, with the gear G, having notches 14, the lever H', having pawl-hook 15, a clutch, *p'*, and the pivoted lever F', carried by the sliding section of the clutch *p'* to force the pawl of lever H' from engaging the notches in gear G, and the spring 51, for forcing the lever H' toward the gear for stopping the wire-carrier in its normal position after twisting the wire, substantially as and for the purpose set forth.

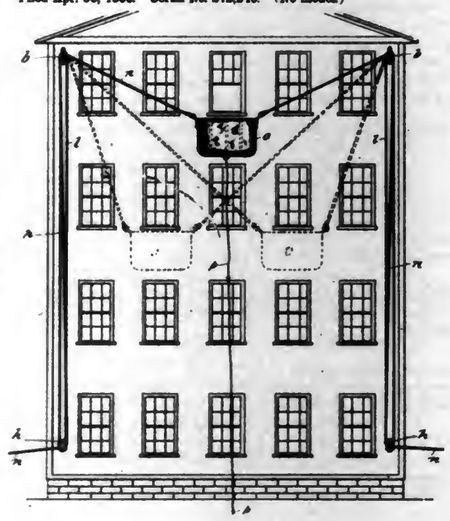


400,777. APPARATUS FOR HEATING RAILWAY-CARS. JOHN LOFTUS, Albany, assignor of one-half to John Greenalch, East Albany N. Y. Filed Oct. 25, 1887. Serial No. 253,308. (No model.)

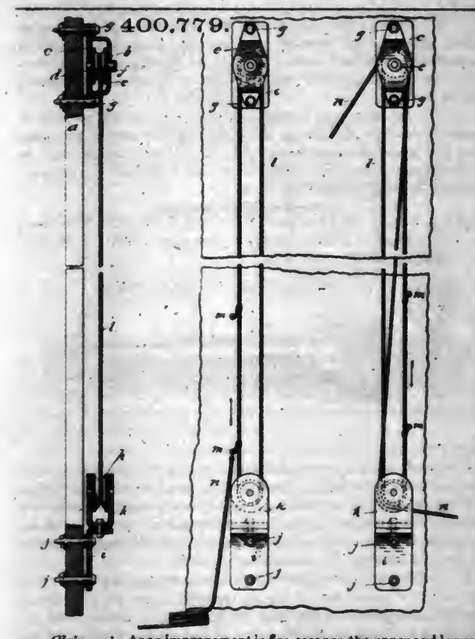
Claim.—1. In an apparatus for heating railway-cars by means of mixed steam and air, the combination of a steam-injector that is connected with a steam-supply, and is provided with an air-inlet, a conducting-pipe for conveying the commingled steam and air from said injector directly to the rearmost end of the train without passing the same through the radiators, said conducting-pipe being provided on each car with branch fittings which do not break the continuity of the opening through said pipe nor divert the direct current of steam and air into the radiators, said branch fittings having just below their T-heads a perforated diaphragm, and at their lower end a triple elbow, a lower system of pipes which is connected at the rearmost end of the train to said conducting-pipe, and by which the steam and air is returned toward the foremost end of the train and into the injector, the direct continuity of said lower system of pipes being broken between the branch fittings under each car, and lateral pipes leading from the lower end of each branch fitting and connecting with the radiators within the cars, as and for the purpose herein specified.

2. The valveless branch fitting E, consisting of a body-piece having at its upper end a T-head and at its lower end a triple elbow, the single branch of the latter ranging in line with the T-head, and the oppositely-located lateral branches thereof ranging at right angles to said T-head, said body-piece having within it and just below the opening through said T-head a perforated diaphragm, as and for the purpose herein specified.

400,778. FOLDING LADDER. FRANK W. LOWE and CORNELIUS F. SULLIVAN, Boston, Mass. Filed June 13, 1888. Serial No. 276,941. (No model.)



Claim.—1. A folding ladder consisting of two side angle-irons and a central flat bar with rounds on each side of same, said rounds being pivoted at their inner ends to the central flat bar and at their outer ends to the side angle-irons, substantially as shown and described.



2. The side angle-irons, A, central flat bar, B, and rounds C, in combination with operating-levers F, substantially as set forth.

3. The side angle-irons, A, central flat bar, B, and rounds C, in combination with operating-levers F and spacer-bar H, substantially as shown and described.

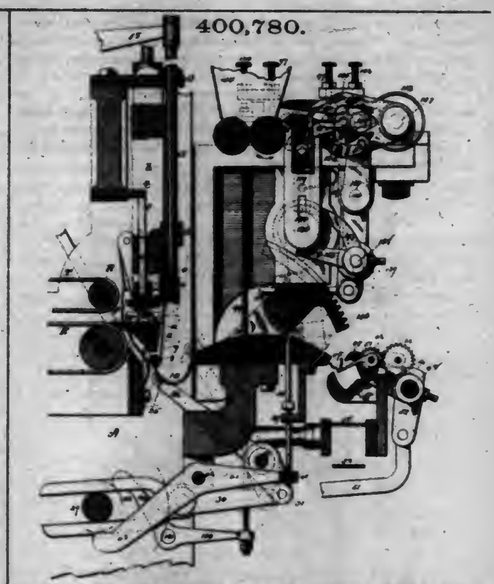
400,779. FIRE-ESCAPE. CHARLES A. LOCK, Manchester, N. H. Filed Apr. 30, 1888. Serial No. 272,246. (No model.)

400,779.

Claim.—1. As an improvement in fire-escapes, the upper and lower sheaves and pulleys attached to the front wall of a building, the two endless ropes or chains passed each around an upper and lower pulley, and the car or vehicle having chains or cables designed to be connected to said endless ropes or chains at their outer ends, substantially as described, whereby said car or vehicle can be raised or moved to the desired point between said endless ropes or chains, as stated.

2. A building having its outer wall provided with a sheave or pulley at or near the roof or top and a similar sheave or pulley at or near the ground, and an endless rope or chain passing over said pulleys the bearing for the lower pulley being swiveled in its support, as set forth.

3. The herein-described improvement in fire-escapes, consisting of the upper and lower sheaves and pulleys attached to the outer wall of a building near the ends thereof, the endless ropes or chains passed over the respective upper and lower pulleys and having hooks or attaching devices, the car or vehicle, and the chains or cables secured thereto and designed to be connected at their outer ends to said hooks or attaching devices, substantially as described.



400,780. CIGARETTE-MACHINE. FRANK J. LUDINGTON, Waterbury, Conn. Filed Aug. 27, 1888. Serial No. 283,535. (No model.)

Claim.—1. In a machine for making cigarettes, the combination of a feeding device to deliver a predetermined quantity of tobacco, a stationary cutter below and a vertically-reciprocating slide above carrying a corresponding cutter, and between which cutters the tobacco is so delivered, the presser *f*, yieldingly supported in said slide, springs between said slide and presser, and a spring-latch also between said slide and presser, with a shoulder, *r*, adapted to engage said latch as the slide commences its ascent, and a stationary shoulder, *t*, in the path of said latch as it ascends with the slide, substantially as described, and whereby said latch is tripped as the slide approaches its upward position.

2. In a machine for making cigarettes, the combination of a feeding device to deliver a predetermined quantity of tobacco, a stationary cutter, *a*, over which the tobacco so delivered passes, and a corresponding reciprocating cutter, *c*, above, with the sliding cleaner 2, arranged in rear of said cutter *a*, so as to move forward over the edge of the cutter at predetermined times, and mechanism for imparting such sliding movement to said cleaner, substantially as and for the purposes described.

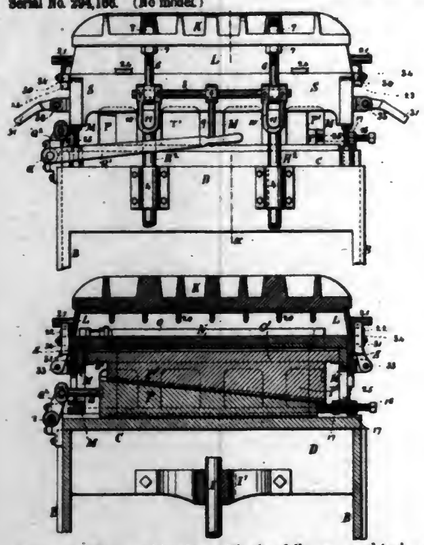
3. In a cigarette-machine, the combination of the rolling-table 6, the flexible apron 7, attached by its forward end to the outer edge of the said table, a bar, 8, at the rear of the table, to which the other end of the apron is attached, swinging levers 9, carrying said bar 8, guard 25, arranged to double the apron over the tobacco as the apron is drawn forward over the table, levers 26, carrying said guard 25, mechanism for imparting swinging movement to said bar and guard, nippers 37, working through openings in the table and apron and adapted to grasp the inner edge of the wrapper and hold it upon the apron, so that as the tobacco is rolled by said apron and guard over the table

400,780.

the said wrapper will be wound around the tobacco, with two pairs of cutters, 47 49, arranged forward of the bed, to which the rolled cigarette is delivered, substantially as described, said cutters being adapted to clip the ends of the cigarette.

4. In a machine for making cigarettes, the combination of the rolling-table 6, the apron attached by its forward end to the forward edge of the table, the said apron adapted to receive the requisite quantity of tobacco for a cigarette at the rear edge of the table, mechanism, substantially such as described, to double said apron over the tobacco and roll it over the table to its forward edge, nippers 37, working through openings in the table and apron to grasp the inner edge of the wrapper, fingers 45, forward of the table and arranged to receive the rolled cigarette as it is delivered from the apron, with two pairs of cutters, 47 49, arranged distant from each other corresponding to the length required for the cigarette, with mechanism, substantially such as described, to turn said fingers 45 downward to deliver the cigarette to the said cutters, substantially as described.

5. In a machine for making cigarettes, the combination of the rolling-table and feeding and rolling mechanism, a carrier at the forward edge of the table moving in a path parallel with the table and adapted to receive the cigarettes as they fall from the apron, and a hopper, 66, to which the cigarettes are delivered from said carrier, the bottom of the said hopper being inclined to a mouth, 67, the said mouth corresponding in width substantially to the diameter of a cigarette and forming a conductor for the discharge of the cigarettes, substantially as described.



6. In a machine for making cigarettes, the combination of the rolling-table, a feeding and rolling mechanism, a carrier at the forward edge of the table moving in a path parallel with the table and adapted to receive the cigarettes as they fall from the apron, a hopper, 66, the bottom of the said hopper inclined to a mouth, 67, a carriage below said hopper and movable in a path at right angles thereto, the said carriage constructed with a series of vertical partitions, 68, forming a corresponding series of parallel pockets, 71, with mechanism, substantially such as described, to impart step-by-step movement to said carriage, and whereby the said pockets are successively brought beneath the mouth of the hopper, substantially as described.

7. A receiver for cigarettes, consisting of a series of vertical partitions, 68, forming a corresponding series of pockets, 71, the said pockets open at the top and one end, combined with a removable front, 84, constructed with fingers 85, projecting from its lower edge, the said fingers corresponding to and adapted to form false bottoms for the said pockets, substantially as described.

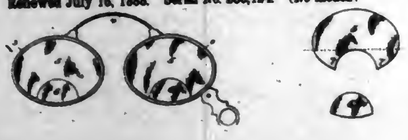
8. In a machine for making cigarettes, the combination, with mechanism adapted to deliver the requisite quantity of tobacco and roll the same into its wrapper, of a spool carrying the paper from which the wrapper is to be taken, the axis of said spool being parallel with the path in which the cigarette is rolled, two pairs of nippers, 92 93, arranged above and at one side of said rolling devices, a pair of fingers, 117 118, hung upon a shaft parallel with the run of the paper and with the path of the rolling cigarette, the said shaft being midway between the nippers holding the paper and the table over which the cigarette is rolled, mechanism, substantially such as

described, to impart to said shaft a longitudinal reciprocating movement, a pair of blades, 105 106, arranged to cut the paper, with mechanism, substantially such as described, to impart rotative movement to said shaft, substantially as described.

400,781. SAND-MOLDING MACHINE. JOHN N. MATLOCK, Brooklyn, N. Y., assignor to himself, and Thomas Hilton Williams and Samuel Ducenbury Tompkins, both of Jersey City, N. J. Filed Dec. 20, 1888. Serial No. 294,166. (No model.)

Claim.—1. The combination, with the follower, sand-bed, patterns, and flask, of the flask-rest S and screws for adjusting the flask-rest to vary the sand-joint between two parts of the mold, substantially as set forth.

2. The combination, with the patterns, of a sand-bed having openings corresponding to the outline of the patterns, a pattern-bed to which the patterns are connected, wedges P beneath the pattern-bed and connected with the same, a grooved top plate, C, the wedges P, having ribs that fit the grooves in the top plate, a frame, M, around the pattern-bed and supporting the sand-bed, mechanism, substantially as specified, for giving an end motion to the wedges P, and a stop for limiting the movement of said wedges, substantially as set forth.



3. The combination, with the flask, of the flask-rest and means for adjusting the same vertically, a sand-bed within the flask-rest, patterns occupying openings in the sand-bed, a pattern-bed with which the patterns are connected, the plate C and the wedges acting between the same and the pattern-bed, the rock-shaft Q, lever Q', and connection to the wedges P, for raising or lowering the patterns, the stripping-plates T, and connections from the same to the bed C, substantially as set forth.

4. The combination, with the press, the frame for the same, the sand-bed, and the flask, of a follower, side rods, H', to which the follower is hinged at one side, rods H^2, having hook-shaped ends, the rods 6, rock-shaft 8, passing through eyes on the rods, the lever-handle 9, and the loops 10, connected to said rock-shaft, whereby the follower is connected to or disconnected from the rods H^2 by the movement of the lever 9, substantially as set forth.

400,782. METHOD OF TREATING SISAL, &c. ALPHEUS W. MOUTCORREY, New York, N. Y. Filed Apr. 13, 1888. Serial No. 270,605. (No specimens.)

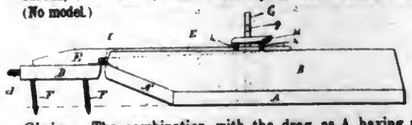
Claim.—The method, substantially as herein described, of cleaning sisal and analogous fibers and preparing the same for spinning after the ultimate fibers have been separated from each other and the preliminary cleaning effected, which consists in combing or hatcheling said fibers to remove the remaining foreign adhering matter before oil has been applied thereto and of subsequently oiling said fiber.

400,783. SPECTACLE-LENS. AUGUST MORCK, Jr., Warren, Pa., assignor of one-half to Fred. Morck, same place. Filed Sept. 10, 1887. Renewed July 16, 1888. Serial No. 280,124. (No model.)

Claim.—1. The combination, with a far-vision lens having its lower edge cut out centrally in semicircular form, of a near-vision lens shaped to fit said central semicircular opening in the far-vision lens, and secured therein by suitable adhesive substance, substantially as set forth.

2. A far-vision lens having its lower edge cut out centrally in semicircular form, and having the surface on both sides of the opening thus made extended to the lower rim of the inclosing-frame, in combination with a near-vision lens shaped to fit said central semicircular opening, substantially as set forth.

400,784. AXLE-LUBRICATOR. OTTO F. MULHAUPT, Shreveport, La., assignor to J. Henry Shepherd, same place. Filed Jan. 24, 1889. Serial No. 297,371. (No model.)



Claim.—1. In an axle-lubricator, a spindle provided with a longitudinal groove the upper and lower walls of which meet the surface of the spindle with a gradual curve, the lower portion of said groove being undercut to provide an oil-containing channel, said groove being connected by one or more perforations with an oil-chamber, substantially as shown, and for the purpose set forth.

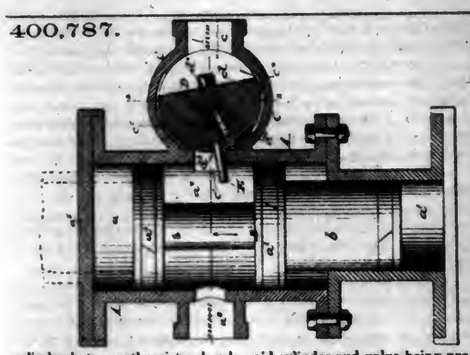
2. In an axle-lubricator for carriages or wagons, the combination of a hollow spindle, an oil cup or chamber connected therewith, a longitudinal groove in the front or leading side of the spindle, the lower edge of said groove being undercut to provide an oil-containing channel, and openings connecting the groove with the bore of the spindle, whereby the lubricant is distributed over the major portion of the surface of the spindle and axle-box, substantially as shown.

3. In an axle-lubricator for carriages and wagons, a spindle bored longitudinally to provide an oil-chamber, C, a longitudinal groove, D, in the front side of the spindle, and perforations e, connecting said groove with the oil-chamber, the longitudinal groove being undercut at its lower portion to provide an oil-channel, the exterior edges of said groove being curved, substantially as shown.

400,785. COMBINED HARROW AND DRAG. GEORGE W. MULLENNIX, Yates Centre, Kans. Filed Sept. 5, 1888. Serial No. 284,650. (No model.)

Claim.—The combination, with the drag, as A, having an inclined forward end, and sides, as B, of a harrow, as D, hinged to the forward upper end of the drag, teeth F, a long lever, as E, rigidly secured to the upper side of the harrow and extending back over the drag, and a vertically-arranged rack-bar, as G, having rectangular teeth, as *g*, on its side, between which the end of the lever is adapted to be placed, substantially as described.

400,786. PROCESS OF PREPARING COTTON-SEED FOR PLANTING. GEORGE W. NEWELL, Mapleville, assignor of one-half to Arthur Arrington, Louisburg, N. C. Filed July 16, 1887. Serial No. 244,531. (No specimens.)



Claim.—1. The hereinabefore-described process of preparing cotton-seed for planting, destroying the adherent fibrous matter, which consists in placing the cotton-seed in the condition in which it comes from the gin into a suitable vessel, or into suitable vessels, then pouring upon it a quantity of the sulphuric acid of commerce to cover it about two-thirds, adding a quantity of water equal to about one-half the quantity of acid, thus covering the seed, then stirring and allowing to remain for a few minutes, and then removing and soaking, substantially as set forth.

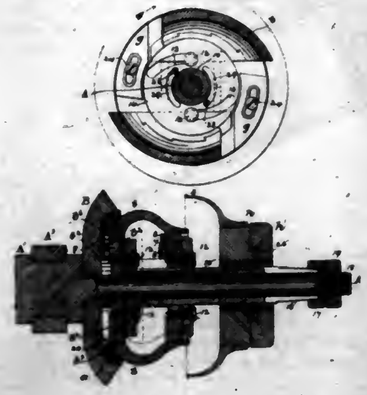
2. The process of preparing cotton-seed for planting, which consists in treating the seed with a solution composed of about two parts of sulphuric acid of commerce and about one part of water.

400,787. STEAM-PUMP. SAMUEL J. PARKER, Rochester, N. Y., assignor to Elisa J. Parker, same place. Filed June 8, 1888. Serial No. 276,435. (No model.)

Claim.—1. The cylinder and the transverse cylindrical valve-chest at its side, in combination with the double-headed piston in the cylinder, and the oscillating and longitudinally-reciprocating valve mounted in the valve-chamber and having the arm extended into the

400,787.

cylinder between the piston-heads, said cylinder and valve being provided with ports, substantially as shown, for admitting steam to and from the ends of the valve-chamber and the ends of the cylinder, whereby the operative parts are all brought within and protected by the cylinder and valve-chamber.



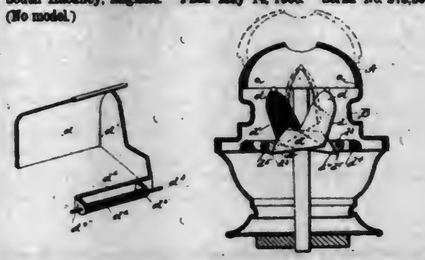
2. In a steam-pump, a cylinder having the central exhaust-ports, a double-headed piston therein, a valve-chamber lying transversely against the side of the cylinder, a rocking and reciprocating valve mounted in said chamber and provided with an arm extending into the cylinder between the piston-heads, and also provided with steam-ports leading to its ends, a single exhaust-port in its face, and two independent live-steam ports around its ends, all operating in connection with corresponding ports in the cylinder and valve-chamber, as shown.

3. In a steam-pump, the steam-cylinder and the pump-cylinder a', forming a continuation thereof at one end, in combination with the piston having one end fitted to the steam-cylinder and the other end projected in the form of a piston into the pump-cylinder, the transverse valve-chamber opening into the steam-cylinder, and the rocking and reciprocating valve provided with the arm or tappet, said moving parts being wholly inclosed within the cylinder and valve-chamber.

4. The cylinder provided with the ports a^6 and a^7 and the central exhaust-port, and the transverse cylindrical valve-chamber located at the side of the cylinder and communicating centrally therewith, in combination with the double-headed piston in the cylinder, and the oscillating and longitudinally-reciprocating valve mounted in the valve-chamber and provided with the arm extending directly into the cylinder between the piston-heads, said valve provided with the ports leading from the steam-inlet to its ends, with the live-steam ports d^7 d^8 and the exhaust-port d^6.

5. The steam-cylinder provided with the central exhaust-port, a^5, and the cylindrical valve-chamber located transversely at the side of the cylinder and communicating therewith by an opening, c', in combination with the double-headed piston mounted in the cylinder, and the oscillating and reciprocating valve mounted in the valve-chamber and provided with the operating-arm extended through the opening c' into the cylinder, said valve and cylinder provided with ports, substantially as described, and said opening c' adapted to permit the movement of the valve-operating arm therein, both longitudinally and transversely of the cylinder.

400,788. ROTARY CUTTER FOR TRIMMING-MACHINES. MERTON D. PHELAN, Wollaston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed June 13, 1888. Serial No. 276,969. (No model.)



Claim.—1. In a heel-trimming tool, a chambered tread-guard and expansible cutter, combined with a rand or counter guard, the said parts being adjustable relatively toward and from each other in the direction of the length of the cutter-shaft to expose different portions of the blades of the cutter, according to the style of the heel, substantially as described.

2. The combination, with a cup-shaped counter-guard and a chambered tread-guard, of a cutter-shaft and an expansible cutter connected thereto between the said counter-guard and tread-guard and made adjustable with relation to the said counter and tread guards in the direction of the length of the cutter-shaft, to operate substantially as described.

3. The chambered or dished tread-guard, cutter-shaft, and cutter thereon made adjustable longitudinally in the direction of the length of the said shaft within the chambered end of the tread-guard, combined with means, substantially as described, to expand the cutter and to enable its blades to substantially fill the chambered portion of the tread-guard inclosing the said blades, substantially as described.

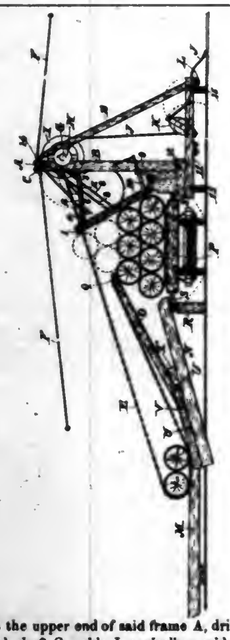
400,789. LAMP-EXTINGUISHER. CHARLES E. POPPLEWAITE, South Hackney, England. Filed May 14, 1888. Serial No. 273,896. (No model.)

Claim.—1. The automatic extinguisher consisting of the pivoted shutters provided with pins, and the detachable weighted dome to rest upon said pins, and the springs, substantially as described, whereby, when the dome is in place, it serves by its weight upon the pins to hold the shutters open against the action of the springs, as set forth.

2. The extinguishing mechanism for single-burner flat-wick oil-lamps, consisting of the combination of the shutters d with pins d^7, arms d', and bars d^2, the springs d^3, and the pins d^5, and the movable weight supported on the pins d^7, substantially as described.

3. The extinguishing mechanism for single-burner flat-wick oil-lamps, consisting of the combination of the shutters d with arms d' and bars d^2, the springs d^3, the pins d^5, the levers e, with bars e', pins d^7, projection e, and the lever F, and movable weight supported on the pins d^7, substantially as described.

4. The extinguishing mechanism of duplex flat-wick oil-lamps, consisting of the shutters d, with arms d' and bars d^2, the springs d^3, the pins d^5, the levers e, with bars e', pins d^7, and projections e^3, the frame g', and movable weight supported on the pins d^7, substantially as described.

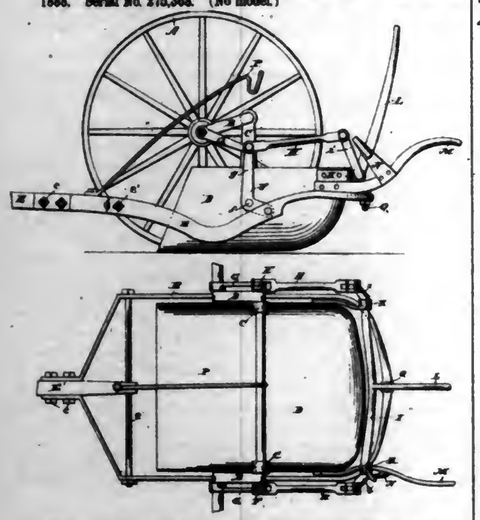


400,790. LOG-LOADING MACHINE. GEORGE W. PRATT and JAMES P. HARSON, Oshkosh, Wis. Filed Apr. 23, 1888. Serial No. 271,560. (No model.)

Claim.—1. In a log-loading machine, the combination, with the vertical frame, the thereto-attached log-loading chains, and the mechanism for winding and operating the said chains, of one or more log-stops adjustably connected to said frame and adjustable bars for moving and retaining said stops at any desired angle for stopping the logs parallel to each other when being elevated and loaded by the action of said chains, substantially as and for the purpose specified.

2. In a log-loading machine, the combination of a frame mounted upon a supporting-base and provided with retaining-braces, horizontal rotating shaft G, secured in journal-bearings at the upper end of said frame, a driving-pulley rigidly affixed centrally upon said shaft G and provided with an encircling cable communicating with the moving power, chain-retaining spools H H, affixed to the respective ends of said shaft G, two chains, E, secured, respectively, at one end to the respective spools H H and at their other ends to the ends of the movable log-supporting skids O, stationary skids N, provided with retaining-ways for the reception of the lower ends of said movable skids O, and two log stops or bars, I, adjustably connected at their respective ends to the vertical frame A and adapted to stop the logs in their proper places as they are being loaded or piled together, substantially as and for the purpose specified.

3. A log-loading machine comprising a vertically-arranged frame, A, pivoted at its lower end upon a movable base, 11, base 11, base-supporting runners 15 15, frame-supporting braces 13, pivoted at their lower ends to said base 11 and connected at their upper ends to the upper end of said frame, horizontally-arranged shaft G, secured



400,790.

in journal-bearings at the upper end of said frame A, driving-pulley I, rigidly affixed to said shaft G, cable J, encircling said pulley I and communicating therefrom with the moving power, chain-retaining spools H H, affixed to the respective ends of said shaft G, and two chains, E, secured, respectively, at one end to said spools H and at the other end to the log-supporting skids O, all substantially as and for the purpose specified.

4. In a log-loading machine, the combination, with the vertical frame provided with mechanism for operating the log-loading chains E, of the log stops or bars 1, adjustably connected at their lower ends with said frame, ratchet-bars 3, pivoted at one end to the upper ends of said stops 1, and ratchet-engaging pins or stops 5, upon which the teeth of said ratchet-levers are adapted to engage as said log-stops are adjusted, substantially as and for the purpose specified.

400,791. WHEEL-SCRAPER. TIMOTHY REBHOLS, Troy, Ohio, assignor of one-half to Wm. G. Rebhols, same place. Filed May 23, 1888. Serial No. 275,368. (No model.)

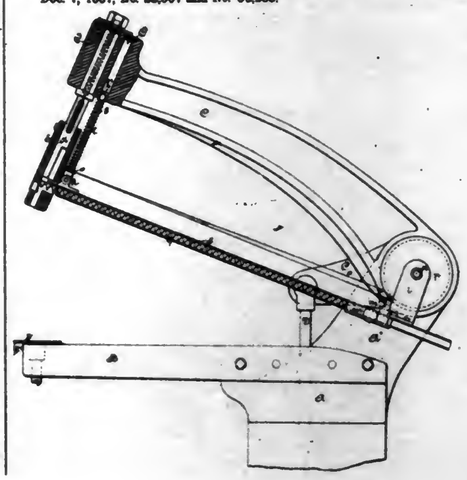
Claim.—1. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon, and the frame or hounds connected to the scraper-bowl, of a rod or shaft journaled on the rear of the scraper-bowl, and having the cranked ends connected to the cranked ends of the axle, and the handle for rotating said shaft, whereby the scraper-bowl may be raised or lowered, substantially as described.

2. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon, and the frame or hounds connected to the scraper-bowl, of a rod or shaft journaled on the rear of the scraper-bowl, having its cranked ends connected to the cranked ends of the axle, and the catch engaging the cranked ends of the shaft for holding the bowl in elevated position, substantially as described.

3. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon, the frame or hounds, and the bell-crank levers connecting said scraper-bowl and frame, of a lever connected to the cranked axle and bell-crank levers, respectively, for moving the same and raising or lowering the scraper-bowl, substantially as described.

4. In a wheel-scraper, the combination, with the cranked axle the scraper-bowl hung thereon, the frame or hounds, and the bell-crank levers connecting said frame and scraper-bowl, of a lever pivoting on the rear of the scraper-bowl, and a connection between the cranked end of the axle and bell-crank levers, and levers pivoted to the rear of the bowl, as set forth.

5. In a wheel-scraper, the combination, with the cranked axle the scraper-bowl hung thereon, and the lever for raising and lowering said scraper-bowl, of the frame or hounds extending entirely around the bowl, and serving as a stop for limiting the tilting of the same, substantially as described.



6. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon by the standards having the downward extensions, and the frame or hounds, of levers carried by the lower ends of the standards and connected to the frame or hounds, and a lever connected to said first-mentioned levers and to the cranked axle for raising and lowering the scraper-bowl, substantially as described.

7. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon, the frame or hounds, the bell-crank levers connecting the bowl and frame or hounds, the lever pivoted to the rear of the scraper-bowl, and the connection between said lever and the cranked end of the axle and bell-crank levers, of a handle, also connected to the rear of the scraper-bowl, and serving to tilt or dump the same independently of the raising and lowering mechanism.

8. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon, the frame or hounds passing around the same, and the bell-crank levers uniting the frame and scraper-bowl, of the lever pivoting on the rear of the scraper-bowl, and connected to the cranked end of the axle and bell-crank levers for raising and lowering, the dumping-handle rigidly connected to said scraper-bowl, and the lock for holding the same in elevated position while being dumped, substantially as described.

9. In a wheel-scraper, the combination, with the cranked axle, the scraper-bowl hung thereon, the frame or hounds passing around the same, and the raising and lowering lever, of an adjusting-block on said frame or hounds for varying the angle at which the scraper-bowl shall operate, substantially as described.

400,792. MACHINE FOR MAKING JOINT-FASTENINGS. CARL T. RENUS, Dresden, Saxony, Germany, assignor to Jean Scherbel, same place. Filed Oct. 30, 1888. Serial No. 289,531. (No model.) Patented in Germany Apr. 30, 1887, No. 41,313, and May 10, 1887, No. 42,444; in England May 28, 1887, No. 7,807; in Belgium July 14, 1887, No. 78,308; in France July 15, 1887, No. 184,818, and in Austria-Hungary Dec. 7, 1887, No. 22,307 and No. 58,233.

Claim.—1. In a machine for cutting off and hammering on sheet-metal cramps to effect connections between sheets of material, the combination of a die, movable upward and downward and having its face plain or recessed, with a sleeve, E, sliding on the die against the reaction of a spiral spring, and consisting of a trough-shaped piece, *b*, and the covering-plates *b'* and *b²*, the latter having a recess, *c*, for the entrance of the sheet-metal strip into the sleeve E, and with a flat anvil, B, supplied with a matrix, *q*, or with a beam-like anvil, B', having the shape of an inverted V, all substantially as set forth.

2. In such a machine, the combination of the covering-plate *b²* with a guiding-bolt, *c'*, passed through it and adjusting the position of the sheet-metal strip, substantially as and for the purpose specified.

3. In such a machine, the combination of a bolt, *c*, passed through the piece *b* of the sleeve E and sliding in the slot *f''* of the die *a*, with a rod, *f*, on the head of which acts the spring *g*, situated in the hollow fixing-pin *a'* of the die *a*, and pushing forward the sleeve E, substantially as set forth.

4. In such a machine, the matrix *q*, with a concentric groove, *q'*, in its face, substantially as shown, and for the purpose specified.

5. In such a machine, the combination of the sleeve E with a feed-channel, *k*, guiding the sheet-metal strip, and attached to the lever-head C', carrying the die *a*, by means of a rod, *l*, with a head, *l'* held in a hole of the lever-head and surrounded by a spiral spring, *o*, and hinged by a hinge, *k*, to the groove *k*, substantially as set forth, and for the purpose described.

6. In such a machine, the combination of the feed-channel *k*, with a feeder, *m m'*, communicating, by means of the cord *n*, led around the disk *o* on the rod *l*, with a drum, *p*, containing a watch-spring, and situated on the axis *x* of the lever C, carrying the die, substantially as and for the purpose set forth.

400,793. MEDICAL COMPOUND. ANDRE ROSSETS, Pattonville, Tex. Filed Nov. 17, 1888. Serial No. 291,135. (No specimens.)

Claim.—The herein-described medical compound, consisting of the extracts of eucalyptus, lady's-slipper, gentian, balmony, and the oil of sassafras, in substantially the proportions specified.

400,794. BLANK-HEADING DIE. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed July 5, 1888. Serial No. 279,052. (No model.)

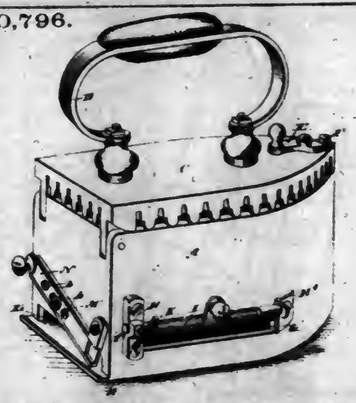
Claim.—1. The improved die hereinbefore described, having guide-ribs in its head-forming cavity, substantially as and for the purpose set forth.

2. A die in which the heads of blanks or nails are formed, having guide-ribs arranged to laterally support the wire or stock *w* and centralize it while being subjected to the action of the heading-hammer, substantially as hereinbefore described

3. A die of the class described having the head-forming cavity provided with a series of ribs for guiding the wire or stock laterally, and adapted to be impressed into the head of the blank during the heading operation.

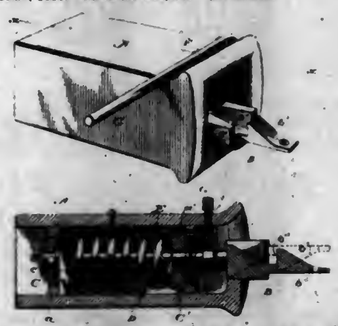
4. The combination, in a machine for making headed blanks or nails, of actuated dies, substantially as hereinbefore described, having a head-forming cavity provided with guide-ribs, for the purpose specified.

400,795. SPARK-COIL. FRANCIS H. ROOT, Chicago, Ill., assignor to the Root Electric Gas Lighting Company, of Illinois. Filed Apr. 19, 1888. Serial No. 271,245. (No model.)



Claim.—1. As an improvement in the manufacture of spark-coils, a core consisting of pliable metal strips laid together flatwise, and a winding which is wound to provide gaps or notches, such as set forth, whereby the core may be readily bent and brought substantially within the radius of a circle.

2. A spark-coil consisting of a core formed of pliable metal strips laid together flatwise, and a winding which is wound to provide gaps or notches, such as set forth, the whole being substantially within the radius of a circle.



400,796. SAD-IRON. ALBERT ROSA, Milwaukee, Wis., assignor to Jennie A. Zinn, same place. Filed Feb. 14, 1887. Serial No. 227,533. (No model.)

400,796.

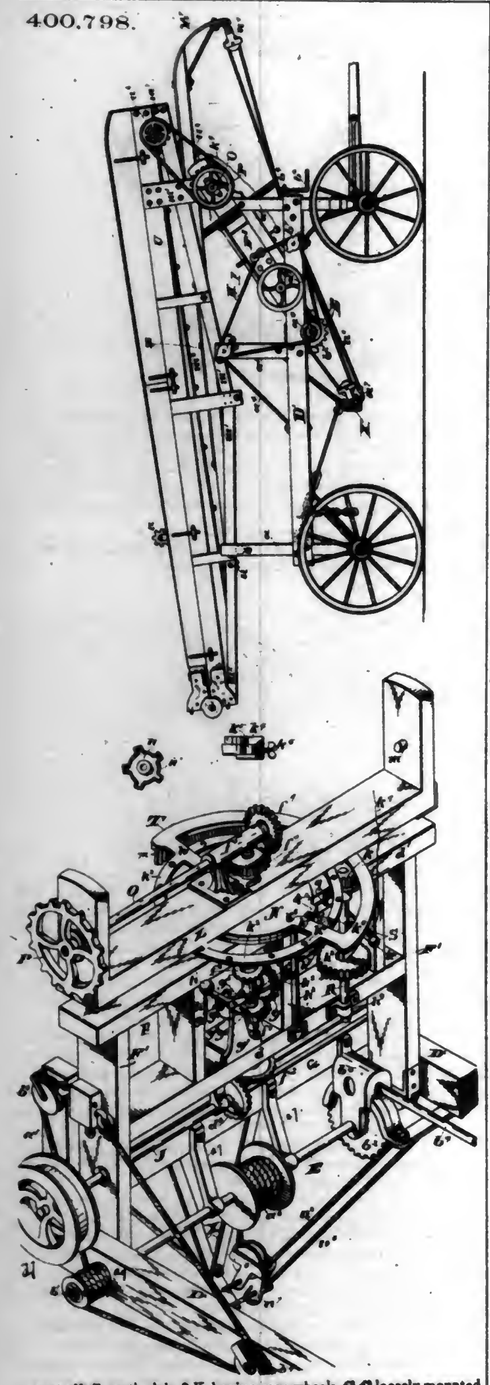
Claim.—A hollow sad-iron having its body portion provided with a cover of such construction that a draft-space and openings are left between said shell and cover when the latter is in its normal position, longitudinal openings in the sides of the shell near its base, plates or dampers journaled in bearings on said shell, and set-screws arranged to impinge against the journals of said plates or dampers, substantially as described.

400,797. CAR-COUPLING. DAVID H. ROYER, Millmont, Pa. Filed June 27, 1888. Serial No. 278,366. (No model.)

Claim.—1. The herein-described draw-bar, having the beveled hook b^3, the converging side walls, b^4, and the flat bearing-faces at the front ends of said walls to serve as buffers and limit the motion of the heads as they are advanced toward each other.

2. In combination with the draw-head, the plate C, the vertically-movable plate C', the draw-head revoluble about its longitudinal axis, and the spring E, acting to urge the draw-bar downward.

3. In a car-coupling, the draw-head, the two plates C C', movable horizontally therein, the plate C' being also adapted for vertical motion, the spring between said plates, and the draw-bar having its forward end provided with a hook and its rear end arranged to rotate in and slide through the two plates provided with pins or fastenings *c c'*.



400,798. STRAW-STACKER. ALLEN A. RUSSELL, Indianapolis, Ind., assignor to Russell & Company, Massillon, Ohio. Filed June 6, 1888. Serial No. 276,268. (No model.)

Claim.—1. A stacker supporting and carrying truck comprising the carrying-wheels B, axles A, a bolster, C, pivotally secured to the front axle, standards *a*, secured to the rear axle, standards *a'*, secured to the bolster, sills D', secured to the standards *a a'* at a point above the said bolster and rear axle, as shown, and vertical posts a^3, rigidly secured to the sills D as a support for the folding frame F, substantially as described, and for the purpose set forth.

2. The combination, with the supporting-frame, of a cross-shaft, E, extending through the said frame, having spools on the ends thereof, a vertical post secured to said frame, a folding frame, F, pivotally secured about said shaft, a pulley secured at the upper portion of said vertical post, a similar pulley secured to the supporting-frame, a cable wound about the spools on the ends of the said cross-shaft and placed about the pulleys on the supporting-frame and the vertical post, and the ends secured to the frame F, a worm-wheel secured on the cross-shaft, and a worm and a shaft by which the shaft E may be rotated to either raise or lower the frame F and the front end of the stacker, substantially as described, and for the purpose set forth.

3. The combination, with the frame F, actuating-shaft J, gear-

400,798.

wheels d^3 f^3, vertical shaft K, having gear-wheels f^3 f^5 loosely mounted thereon, having inwardly-projecting clutch-teeth, as f g^3, a sliding clutch to engage therewith, gear-wheels f^3 f^4, shaft O, sprocket-wheels P and m^7, chain n^3, wheel g, shaft Q, worm k^7, worm-wheel k^8, shaft R, pinion k, segment T, ring k^9, having perforations k^{10}, pins p, and a gear-shipper, these parts operating jointly, as shown and described, to continuously rotate the endless apron and to oscillate the carrier-frame about its pivotal connection with the supporting-frame, substantially as set forth.

4. The combination, with a stacker-supporting frame, of a cross-shaft, E, extending through said frame, having on its outer ends spools having a toothed connection with collars b, rigidly secured to said shaft, and having teeth on their outer face to engage similar teeth on the inner face of said spool, and a nut by which said spool may be held in engagement with the said collar or released therefrom, substantially as described.

5. The combination, with a supporting-frame and a depending frame, X, of a cross-shaft, E, extending through said frame, supported in journal-boxes, as a^2, a folding frame, F, supported on the inner ends of said journal-boxes, collars b, rigidly secured to said shaft, spools a^9, loosely mounted upon the ends of said shaft and adapted to be fixed to and turn in unison with the collars b, cables connecting said spools with the frame F, a spool, a^6, mounted on shaft E, a hoisting-rope, n^6, secured to said spool and to free end of lever W, a worm-wheel, b^2, mounted on shaft E, a worm, b^3, and crank-shaft b^4, whereby the shaft E may be rotated, the frame F raised to a vertical position, the lever W drawn down, and the stacker raised, substantially as set forth.

6. The combination, in a straw-stacker, of a supporting-frame having side sills, as D, a cross-shaft, E, supported on said sills and having collars b rigidly mounted thereon, said collars adapted for fixed engagement with spools a^9, loosely mounted on said shaft, cables adapted to wind on and off said spools, the ends of said cables secured to a folding frame, F, a worm-wheel, b^2, a worm, b^3, and a shaft, b^4, to actuate said worm, substantially as described, and for the purpose set forth.

7. In an oscillating straw-stacker, a supporting-frame, F, circular way M, bolster L, pivotally secured thereto, a table, N, secured to said bolster and resting on said way, a segment, T, a gear-trip, k^9, and an adjustable stop operated by the oscillations of said table N to oscillate said gear-trip to change the direction of oscillation of the stacker-frame, substantially as described.

8. The combination of the shaft Q, hanger k^5, journal-box k^4, pivotally secured in said hanger, a worm-wheel, k^8, worm k^7, a sliding journal-box, k^3, and a gear-shipping lever, S, whereby said shaft may be oscillated to engage and disengage the said worm with the wheel, substantially as described, and for the purpose set forth.

9. The combination of a gear-shaft mounted in movable journals and having mounted thereon a gear to engage a co-operative gear, a gear-shipping lever, and a flexible connection extending from said lever to the operator on the stack, whereby the gears may be engaged or disengaged to start or stop the oscillatory movement of the stacker-frame, substantially as described, and for the purpose set forth.

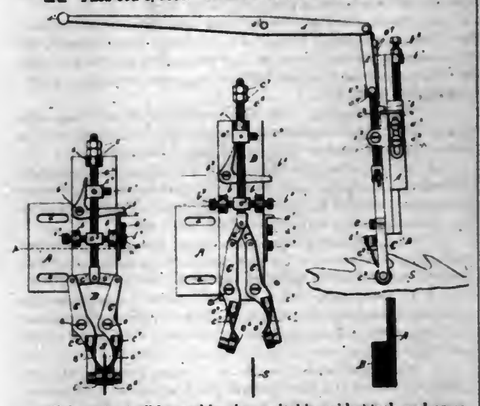
10. The combination of a stacker-frame, as Z, pivotally secured to a supporting-frame, as F, of a lever, W, the rear end of which is secured to the said frame, the front portion resting on a bearing that coincides with the pivotal connection of the frame Z, the front end projected forwardly and downwardly, and a flexible connection with a winding-spool, whereby the rear portion of the stacker-frame Z may be raised or lowered, substantially as described, and for the purpose set forth.

11. The combination of the circular way M, turn-table N, loop k^4, shoe k^5, and thumb-screw k^6, substantially as described, and for the purpose set forth.

400,799. IRONING-BOARD. JOHN M. SEBOLD, Philadelphia, Pa., assignor of one-half to William Schreiner, same place. Filed July 7, 1888. Serial No. 279,283. (No model.)

Claim.—1. The clamp C, with a nose and heel, and the tightening-lever E, having a spirally-curved and serrated edge, e, said parts being combined substantially as described.

2. An ironing-board having ears on the under side thereof, a forked clamp pivoted in said ears and having two noses adapted to engage a supporting-ledge and provided with a heel, and a rotary lever with a head having inclined and serrated contact-face, said parts being combined substantially as described.

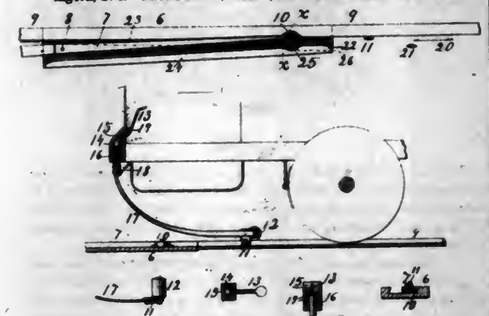


400,800. PRUNING-KNIFE. LOUIS H. SNOLDER, Cleveland, Ohio. Filed Sept. 10, 1888. Serial No. 285,066. (No model.)

Claim.—A cutter-blade having a handle provided with a piece at either side, which is highest at its center and inclines toward each extremity, whereby a swell is formed centrally in the handle, in combination with wire wrapping about the shank and piece to form the covering of the handle, substantially as set forth.

400,800.

400,801. SAW-GUIDE. CHARLES W. SLEEPER, Island Pond, and RUSSELL M. WOODARD, Norton, Vt.; said Sleeper assignor to said Woodard. Filed Oct. 3, 1888. Serial No. 287,597. (No model.)



Claim.—1. A slide working in a suitable guide-block and carrying two movable guide-fingers to grasp the saw, combined with a rod, c^3, connected to the guide-fingers by two links, c' c', which form a toggle-joint between the extremities of the said guide-fingers and act to open and close the same, and with means, substantially as described, to raise and lower the slide and to raise and lower the rod c^3 independently of the slide, substantially as described and for the purpose set forth.

2. The slide B, the guide-fingers, and the rod c^3, combined with the latch b^3, to prevent the rod c^3 from moving while lowering the slide, and with the stop a', to trip the said latch and allow the rod to move when the slide reaches its lower position, substantially as described, and for the purpose set forth.

3. The slide, the guide-fingers, and the rod c^3, combined with the adjusting-screws b^3, to adjust the guide-fingers to line with the saw, and with the stop-screw b^4, to adjust the height of the slide, substantially as described, and for the purpose set forth.

400,802. AUTOMATIC SWITCH. WILLIAM X. STEVENS, Washington, D. C. Filed Nov. 17, 1888. Serial No. 291,100. (No model.)

Claim.—1. The combination of a railway-frog and a switch-tongue pivoted thereon and having a portion of its side edges slanted under, the edge of the rail portion of the frog also being slanted under beside the tongue, the said two slanting sides forming an aperture which in cross-section is wedge-shaped, with the base of the wedge downward, and which in horizontal section is wedge-shaped, with the base of the wedge toward the point of the said tongue, substantially as shown and described.

2. A railway-switch tongue having a portion of its side edges slanted under near its point, substantially as shown and described, whereby the under side of the point of the tongue is made a more obtuse wedge than the body of the tongue is.

3. The combination of the wedge 11, the wheel 12, journaled thereto, and the drag-bar 17, adapted to be hung to a car, substantially as shown and described.

4. The combination of a switch-operating wedge, a wheel journaled thereon to roll on the track, and an elastic connection between the wedge and the car, substantially as shown and described, whereby the rocking of the car is compensated for and the wheel is maintained upon the track.

5. The combination of a switch-operating wedge hung upon a car and adapted to travel beside the rail, a device, substantially as described, upon the car for turning the wedge to the right and left, and a laterally-elastic connection between the said device and wedge, whereby the wedge is elastically pressed to the side of the rail, as set forth.

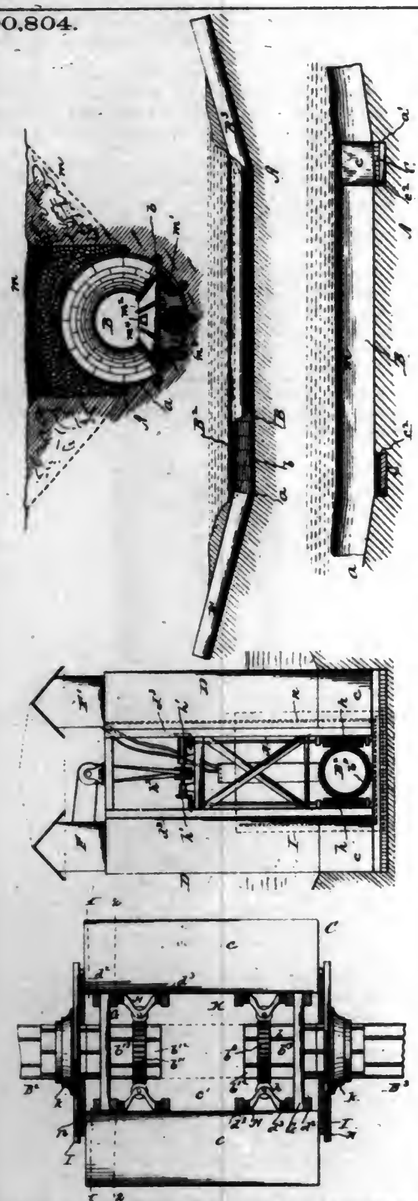
6. The combination of a rail or frog having a notch in its side adapted to admit an operating-wedge, a switch-tongue located beside the said notch and pivoted to swing, a wedge carried upon a car, and a spring-connection between the wedge and the car, whereby the wedge is pressed upon the rail in a direction to engage the said notch, substantially as shown and described.

400,803. PICK. HIRAM C. STOUFFER, Mineral Ridge, Ohio, assignor of one-half to Edward Hunt, same place. Filed Sept. 3, 1888. Serial No. 284,406. (No model.)

Claim.—1. A socket part for pick-handles, having its solid outer end provided with openings g g on each side of a central screw-threaded hole, f, in combination with the handle, and one or more wedges, h, driven into the latter through said openings, substantially as described.

2. A socket part for pick-handles, having its solid outer end provided with openings g g on each side of a central screw-threaded hole, f, and having flat end bearing parts, d d, each having a projecting pin, e, in combination with the handle, one or more wedges, h, driven into the latter through said openings, the pick-head having the holes i i, and the fastening screw-bolt therefor, substantially as described.

3. The combination, in a pick, of a metallic socket part for receiving the handle, having a central screw-threaded opening and openings on each side thereof, in combination with one or more wedges driven into the handle through said openings, the pick-head, and the screw-bolt for securing the head upon the socket part over the said openings and their wedges, substantially as described.



4. The pick-socket part having its outer end recessed at e and provided with a solid part between said recess and the socket, having a central screw-threaded opening, f, and an opening, g, on each side of said central opening, the said openings terminating in the socket and in the recess, combined with the handle secured over the inner ends of said openings, the wedges h, driven through said openings g into the handle, the pick-head secured in the socket-recess over the butt-ends of said wedges, and the fastening-screw, as shown and described.

400,804. SUB-RIVER TUNNEL. ANDREW W. STRAUB, Philadelphia, Pa. Filed Jan. 28, 1888. Serial No. 262,213. (No model.)

Claim.—1. A sub-river tunnel composed of a series of long sections separated from each other by short sections which are secured at each end with one of the long sections, and an anchorage of broken material and cement upon the top and at the sides of the tunnel-sections, and the top surface of the anchorage being approximately flush with the river-bed, substantially as set forth.

2. In combination with a sub-river channel or way, a section of a tunnel having longitudinal peripheral ribs in said way, caissons at

400,804.

columns and gates, and a tunnel resting on said flooring between said boxes and passing through said gates, substantially as set forth.

7. A metal tunnel-section having removable bulk-heads and interior stay-rods to retain the form of the section while building the section and floating and sinking it to position at the bottom of the river, substantially as set forth.

8. In combination with a sub-river channel or way, a section of a tunnel, removable caissons at the ends of said tunnel-section, and power appliances upon said caissons in gear with the tunnel-section, substantially as set forth.

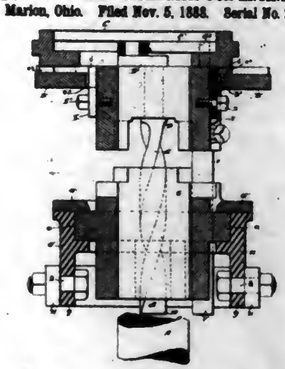
9. A tunnel-section having end and middle removable bulk-heads, stuffing-boxes on the end bulk-heads, and air and water pipes passing through said end heads, substantially as set forth.

10. The combination, with sub-river tunnel-sections, the caisson-foundation C, uprights D D, and gates or ends I, having openings for the passage of the tunnel-sections, and packing between said uprights and the gates or sides and between the latter and the tunnel-sections, substantially as set forth.

11. The combination, with tunnel-sections B^3 B^3, of a removable caisson having removable ends I, through which said tunnel-sections pass, and slides or frames G H, substantially as set forth.

12. A tunnel-section having exterior longitudinal ribs, removable end bulk-heads, stuffing-boxes on the end bulk-heads, air and water pipes passing through said end heads, and outside gear-wheels at or near the ends of the section, substantially as set forth.

13. The combination of a caisson having frames H and power appliances, and a sub-river tunnel-section having outside gear-wheels connected to said power appliances, as and for the purpose set forth.



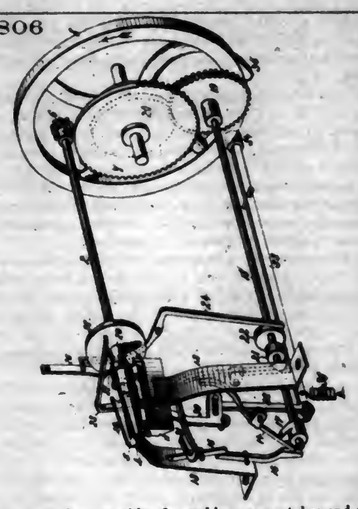
14. In combination with a sub-river channel, a tunnel-section, removable caissons for said section, and power appliances on the caissons in gear with the tunnel-section for lowering the latter to and for rotating it in the subway, substantially as set forth.

15. The combination of foundation C, having open ends, and side columns or towers, D, and the gates or ends I, substantially as set forth.

16. In combination with a sub-river channel, tunnel-sections, and removable caissons located at the opposing ends of successive tunnel-sections, substantially as set forth.

17. In combination with a sub-river channel, tunnel-sections separated from each other, so as to leave a space between their ends, and removable caissons joining said ends, substantially as and for the purpose set forth.

400,805. REVERSING MECHANISM FOR ENGINES. JOHN W. STRINGER, Marion, Ohio. Filed Nov. 5, 1888. Serial No. 289,989. (No model.)



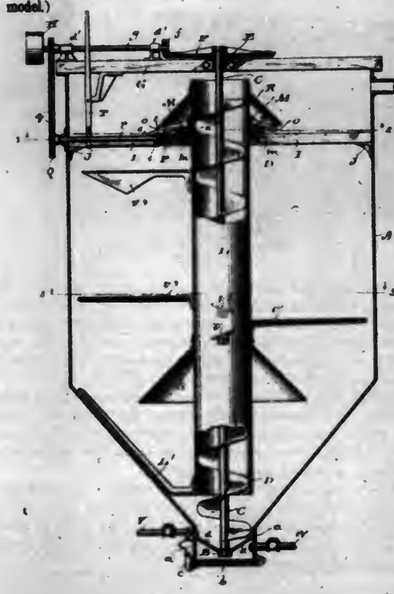
Claim.—1. The combination, with shifting eccentric disk for reversing the engine, of crank and connecting-link for shifting such eccentric disk, the position of link and crank past their dead-centers being utilized in locking the eccentric disk in its working position, substantially as set forth.

2. The combination, with shifting eccentric disk and crank and link for operating the same, the position of the link and crank past their dead-centers being utilized in locking the eccentric disk in its working position, of crank-shaft having spiral flutings or grooves, and a sliding block for engaging and rotating such shaft by reciprocations of the block, the parts being arranged substantially as set forth.

3. The combination, with a hub mounted on the engine-shaft and provided with ways and a sliding eccentric disk mounted on said ways, of crank and connecting-link for shifting such eccentric disk, the position of link and crank past their dead-centers being utilized in locking the eccentric disk in its working position, substantially as set forth.

400,806. MACHINE FOR MAKING MOUTH-PIECES OR HOLDERS FOR CIGARS, CIGARETTES, &c. ROBERT W. THURMAN, Lynchburg, Va., assignor to the Lone Jack Cigarette Company, same place. Filed Mar. 28, 1887. Serial No. 232,634. (No model.)

400,806

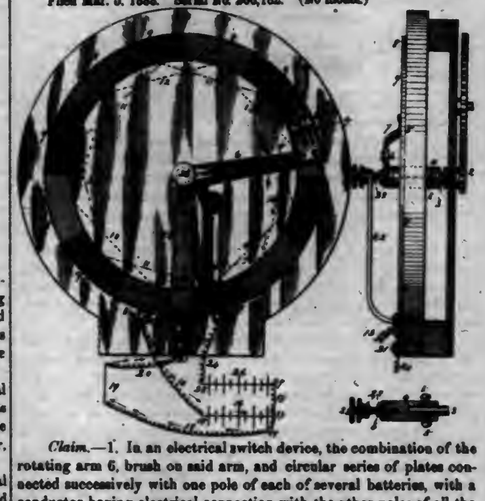


Claim.—1. In a machine for making paper tubes and mouth-pieces for cigarettes, the combination, with a rotary mandrel having a longitudinal groove, of a swinging spring gripping-finger pivoted intermediate its ends in said groove, and a device, substantially as described, for acting on the tail end of the finger to swing it, for the purposes set forth.

2. The combination, with a rotary mandrel having a longitudinal groove, of a swinging spring gripping-finger pivoted intermediate its ends in said groove, a swinging lever for acting on the tail end of the finger to swing the latter, and a rotary cam for actuating the lever, substantially as described.

3. The combination of a rotary mandrel having a longitudinal groove, a swinging spring-actuated gripping-finger pivoted in said groove, a device, substantially as described, for acting on the tail end of the finger to swing it, and an ejector slidable on the mandrel, substantially as described.

4. The combination, with a rotary mandrel provided with a gripping-finger for holding a paper blank, of a roller and a pressure-bar located on opposite sides of said mandrel and each supported in normal contact therewith by a spring-standard, and cam-actuated levers for acting on said spring-standards to remove said roller and pressure-bar from contact with the mandrel, substantially as described.



400,807. APPARATUS FOR MALTING GRAIN. PETER G. TORPER, Milwaukee, Wis. Filed June 5, 1888. Serial No. 276,458. (No model.)

Claim.—1. The combination, with the tank, of a spiral conveyer supported therein, and means for revolving the same, a tube surrounding said conveyer provided with conveyer-arms, and means for revolving said tube, substantially as described.

2. The combination, with the tank, of a spiral conveyer supported therein, and means for revolving the same, a tube surrounding said conveyer and means for revolving it, deflecting-hoods carried by said tube, and a plowing-arm projecting from said tube between the hoods, substantially as described.

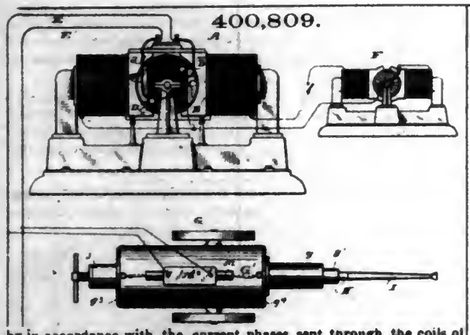
400,808. SWITCH DEVICE FOR ELECTRIC CURRENTS. JOSEPH A. TURNER, St. Louis, Mo., assignor to Charles R. Turner, same place. Filed Mar. 5, 1888. Serial No. 266,182. (No model.)

Claim.—1. In an electrical switch device, the combination of the rotating arm 6, brush on said arm, and circular series of plates connected successively with one pole of each of several batteries, with a conductor having electrical connection with the other poles of all the batteries, and an adjustable pivotal contact, 23, completing the circuit between said conductor and rotating arm, all substantially as and for the purpose described.

2. Two or more plates or series of plates arranged in a circle, each series of plates in electric connection together and with one pole of a galvanic battery and insulated from the plates of the other series, and a revolving arm in connection with the opposite poles of all the batteries to that with which the said plates are in connection, and having a brush carried by the revolution of the arm into and out of contact with the plates, for the purpose set forth.

3. The combination, with a disk having an annular series of closely-related insulated plates, electric batteries, each having one pole connected to one or to alternate ones of said plates, of a hand pivoted centrally in relation to the series of plates rotated by clock-work, adapted to contact with the plates successively, and having electrical connection with the remaining poles of all the batteries.

4. In a switch for electric batteries, the combination, with the frame or support and clock-work 2, mounted thereon, of shaft 3, rotated by clock-work 2, insulating-sleeve 4, carried by said shaft, arm 6, mounted on the sleeve and carrying brush 7, insulated plates 8 9, with which said brush is adapted to contact successively, connections between said plates and one pole of each of several batteries successively, arm 22, carrying screw 23, making pivotal electrical contact with arm 6, and electrical connection between the arm 22 and the other poles of all the batteries, as herein shown.



400,809. ALTERNATING-CURRENT ELECTRIC RECIPROCATING ENGINE. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Sept. 13, 1888. Serial No. 285,294. (No model.)

Claim.—1. In a system of electro-magnetic reciprocating engines, a source of electricity giving defined phases of current in a closed circuit, engines having motor-coils placed in said circuit and energized by the said defined currents, and a magnetic piston or plunger placed under the influence of the said coils, substantially as described.

2. A reciprocating electric-engine system comprising an engine having two or more motor-coils and a magnetic piston adapted for reciprocation within said coils, an electric generator adapted to produce rising and falling defined electric impulses, and circuit-connections between the motor-coils and generator, whereby electric impulses are supplied to the motor-coils in alternation, substantially as described.

3. An electro-magnetic reciprocating engine comprising a solenoid or solenoids composed of one or more coils and in circuit with a source of electricity giving defined phases of current, and a magnetic piston under the influence of the coils and arranged to be reciprocated there-

400,809.

by in accordance with the current phases sent through the coils of the engine, substantially as described.

4. An electro-magnetic reciprocating engine comprising a coil or coils in circuit with a source of alternating or defined electric currents, a piston arranged to move longitudinally within the said coil or coils under the influence of the phases of the supply-current, and a tool holding piston-rod attached to the piston, substantially as described

5. An electro-magnetic reciprocating engine comprising an actuating coil or coils in circuit with a source of alternating or intermittent currents, a non-magnetic lining or tube within the coil or coils, and a piston adapted to be reciprocated within the interior tube under the influence of alternating phases of current circulating in the motor-coils, substantially as described.

6. An electro-magnetic reciprocating engine comprising a motor coil or coils in circuit with a source of alternating or defined electric currents, and an iron plunger adapted to be reciprocated within the coil or coils under the influence of the alternating currents, the mass of said plunger being laminated or subdivided, substantially as described.

7. In an electro-magnetic reciprocating engine, a motor-helix in circuit with a source of alternating or defined electric currents, a plunger attached to the tool-holding devices adapted to be reciprocated within the helix under the influence of and in accordance with the phases of current circulating therein, a series of terminals extending from the coils of the helix, and a movable contact for adjusting the length of the stroke of the plunger by cutting out a greater or less portion of the motor-helix, substantially as described.

8. In an electro-magnetic reciprocating engine, a motor-helix in circuit with a source of alternating or defined electric currents, a piston attached to the tool-holding devices and adapted to be reciprocated within the helix under the influence of and in accordance with defined currents circulating therein, a series of terminals extending from the coils of the helix, and movable contacts for cutting out a greater or less portion of the motor-helix, whereby the length of the stroke may be adjusted and whereby also the operative position of the plunger may be determined, substantially as described.

9. In a reciprocating electric engine, the combination of motor-coils in circuit with a source of defined electric currents, a piston arranged within said coils and actuated alternately thereby, and a circuit-changing device arranged and operating to connect the supply-circuit alternately with the said coils at the zero-point between the current phases, substantially as described.

10. In a reciprocating electro-magnetic engine, the combination of motor-coils, a piston moving within said coils under the influence of current flowing therethrough in alternation, a circuit-closing plunger, a solenoid for imparting reciprocating motion thereto, said solenoid being of less length than the plunger, and two sets of main and auxiliary contacts at opposite ends of the path of the circuit-closing plunger, said sets of main and auxiliary contacts being electrically connected to the outer terminals of the motor-coils, respectively, substantially as described.

11. In a reciprocating electro-magnetic engine, the combination, with motor-coils and a magnetically-actuated piston arranged to be moved back and forth within said coils by the influence of currents circulating in said coils in alternation, of a reciprocating circuit-changing device comprising a solenoid, an iron plunger therefor of a length exceeding that of the solenoid, main contacts located at opposite ends of the path of the plunger and electrically connected to the motor-coils, respectively, and auxiliary contacts located between the inner extremities of the main contacts and the solenoid, but separated therefrom, whereby the extremity of either end of the plunger will be out of contact with one of the main contacts when in its opposite position, substantially as described.

12. In a reciprocating electro-magnetic engine, the combination, with motor-coils and a magnetically-actuated piston moving within said coils, of a circuit-changing device for directing the supply-current through said coils in alternation, comprising a solenoid, a reciprocating plunger, contacts representing the motor-coils and located in the path of the plunger, and an adjustable resistance for regulating the speed of the circuit-changing device, substantially as described.

13. In a reciprocating electro-magnetic engine, the combination of a source of intermittent or defined current, motor-coils, and a piston arranged to be reciprocated within said coils by the passage of said currents therethrough in alternation, and a circuit-changing device comprising a solenoid in circuit with said intermittent currents and having a reciprocating plunger arranged to close the main circuit upon the motor-coils in alternation, said plunger and piston operating simultaneously and completing their respective movements during each phase of current, substantially as described.

14. In a reciprocating electro-magnetic engine, the combination of motor-coils, a piston moving in said coils, and a circuit-changing device comprising a solenoid, a reciprocating plunger therefor, and tubular contacts arranged to receive the ends of the plunger, the diameter of said tubes being adjusted to retard the free escape of air and form an air-cushion to absorb the momentum of the plunger, substantially as described.

15. In a reciprocating electro-magnetic engine, the combination, with a motor coil or coils and a magnetically-actuated piston moving in said coils under the influence of currents flowing therethrough, of an inductional transformer in circuit therewith for producing defined currents of alternating polarity, an electro-dynamic motor mechanically connected to circuit-changing devices in said transformer for controlling the flow of the primary current therethrough, and means for regulating the speed of the motor and thereby controlling the action of the transformer, substantially as described.

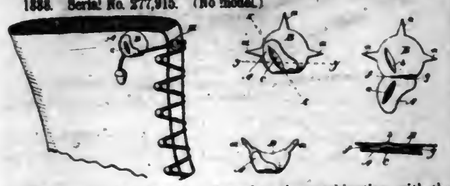
16. In a reciprocating electro-magnetic engine, the combination, with a motor coil or coils and a magnetically-actuated piston moving in said coils under the influence of currents flowing therethrough, of a source of continuous current, an inductional transformer for producing defined currents of alternating polarity, an electro-dynamic motor mechanically connected to circuit-changing devices in said transformer for controlling the flow of the primary current therethrough, and an adjustable resistance for regulating the speed of the motor and thereby controlling the action of the transformer, substantially as described.

17. The combination, with an electro-magnetic reciprocating engine, of a source of continuous current, an inductional transformer comprising primary and secondary coils, a commutator the sections of which are connected to the continuations of the coils of the primary circuit, rotatably-mounted commutator-brushes in circuit with the source of continuous current, and an electro-dynamic motor connected to and acting to rotate the brushes upon the commutator to distribute the primary current and render the secondary coils active, substantially as described.

400,810. UNDERGROUND CONDUIT. WILLIAM WALTER, Philadelphia, Pa. Filed Mar. 22, 1888. Serial No. 268,127. (No model.)

Claim.—1. In an underground conduit, a frame consisting of sections, each section having upsights with side and central connecting-bars, and top segmental bars sustained on said side and central bars by short uprights, said frame being adapted to sustain on said top segmental bars the ground surface, and on its uprights suitable pipes, substantially as described.

2. An underground conduit consisting of sections having uprights and cross-bars, as described, the flooring 13, connecting said sections, a base with side gutters, sewers under said side gutters, and separate pipes leading from the street-surface and side gutters to said sewers, substantially as and for the purpose set forth.



3. In an underground conduit, the combination of sections having top curved or segmental bars, 7, and short uprights 8, supporting said bars, timbers resting on said bars and having the tracks 22 secured thereto, rollers 24, journaled in uprights 8, and the cable 23, substantially as and for the purpose set forth.

400,811. HOLDBACK. GEORGE T. WILSON and JOHN D. HOUSH, Lowville, N. Y. Filed Jan. 4, 1889. Serial No. 295,406. (No model.)

Claim.—The combination, with the chambered body formed with hollow standard and the spring secured at one end within said body, of the hook having a vertical portion in said hollow standard, and a heel pivoted within said body and formed with the flat sides *l* and *m*, bearing on said spring, substantially as shown and described, and for the purpose specified.

400,812. SHOE-FASTENING. STEPHEN WILSON, Jr., Philadelphia, Pa., assignor of one-half to H. C. Conkle, same place. Filed June 23, 1888. Serial No. 277,915. (No model.)

Claim.—1. In a shoe-lace fastening, the combination, with the base rigidly secured to the shoe, of the tongue bent into proximity therewith, forming a V-shaped opening inclined away from the tongue-opening of the shoe and adapted to hold the lacing, whereby a pull on the latter will tend to force it farther down into the V-shaped opening, substantially as set forth.

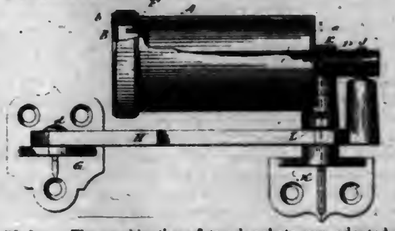
2. In a shoe-lace fastening, the combination, with the base secured to the shoe and the tongue bent over into proximity therewith, forming the V-shaped opening, of the projection on the tongue and the corresponding recess in the base inclined away from the tongue-opening of the shoe, whereby a pull on the lacing held between the tongue and base will tend to force the same farther down between the tongue and base, substantially as described.

3. In a shoe-lace fastening, the combination, with the base secured to the shoe and the tongue lying in proximity therewith, of the inclined longitudinally-corrugated projection on the tongue and the corresponding recess in the base for retaining the lacing in position, substantially as described.

4. The combination, with a shoe having lacing hooks or studs and a fastening for the lacing on the side of the opening opposite and level with the top lacing-stud, whereby the lacing at the top will be supported on each side at substantially the same level, of a hook on the tongue of the shoe engaging said top lacing intermediate its two supports for preventing the displacement of the tongue, substantially as described.

400,813. WEATHER-STRIP. HENRY O. WOY, Green City, Mo. Filed Mar. 1, 1888. Serial No. 265,788. (No model.)

Claim.—The frame A, having the grooved sill B, in combination with the weather-strip C, provided with a projection, *e'*, and an extension, *f*, whose terminal axes *f'* *f²* are pivotally secured in slots in the sides of the frame, which normally lies flush with the frame, and the door D, having the plate I, provided with a projecting lug, *j*, whereby the arc-like oscillation of said lug operates the weather-strip in either direction, respectively, to engage and disengage the strip by reason of the projection *e'*, for the purpose set forth.



400,814. LATCH. BERTON L. WRIGHT, Bridgeport, Conn., assignor to Samuel A. Burnes, same place. Filed Dec. 26, 1888. Serial No. 294,620. (No model.)

Claim.—1. The combination, with a cup-shaped bolt having lugs, of a sheet-metal case having slots engaged by said lugs, and a spring acting to force the bolt outward.

2. A cylindrical bolt-case formed from a blank of sheet metal having an enlargement at the center and projections at its opposite ends, said blank being doubled upon itself, so that the enlargement forms the closed inner end of the case and the inner ends of the slots, the projections forming a flange, 4, at the outer end of the case and the outer ends of the slots.

400,815. DOOR-CHECK. GRANVILLE W. WRIGHT, New Haven, Conn., assignor to Sargent & Company, same place. Filed Jan. 14, 1889. Serial No. 296,234. (No model.)

Claim.—The combination of two brackets, one adapted to be attached to the door and the other to the frame of the door, an arm hung to one of the brackets and so as to swing in a horizontal plane, the said arm constructed with a longitudinal slot vertically through it, the other bracket carrying a pivot which extends through said slot in the arm, a cylinder hung upon said pivot of the said other bracket, a piston in said cylinder, and a rod extending from the piston through the head of the cylinder and hung upon a pivot upon the free end of the said arm, substantially as and for the purpose described.

400,816. RAILWAY-SWITCH STAND. CHARLES ALKINS, Muskegon, Mich., assignor to Henrietta Alkins, same place. Filed Apr. 28 1888. Serial No. 272,200. (No model.)

400,816.

Claim.—1. In a railway-switch stand, a compound lever for the purpose described, comprising, in combination, a pivotally-supported hand-lever and a separately-pivoted lever engaged by said hand-lever and provided with an arm, E, adapted to carry a weight, substantially as set forth.

2. The combination, substantially as hereinbefore set forth, of the hand-lever B and the lever C, carrying a weighted arm, and gear connected with said hand-lever, for the purpose described.

3. The combination, substantially as hereinbefore set forth, with the hand-lever, of the lever C, for the purpose set forth, provided with one or more sockets adapted to receive a bar or arm, for the purpose described.

4. A railway-switch stand comprising a compound lever having as one of its elements the vibratory lever C, carrying a weighted arm, and as an another element the separately-pivoted hand-lever B, pivoted above said weighted lever, and gear connected with the same, a rotary signal-rod arranged alongside the switch-stand, and a connection between the said compound lever and rotary signal-rod, whereby the latter can be operated by operating the hand-lever or controlled and set by the weighted arm of the lower lever, said members combined for operation substantially as described.

400,817. AXLE. EDWARD M. ALLEN, Stafford, Md., assignor to Sallie E. Allen, same place. Filed June 14, 1888. Serial No. 277,135. (No model.)

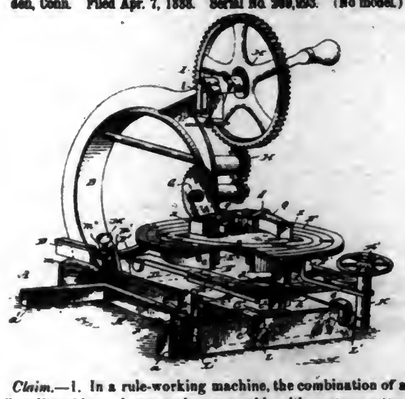
Claim.—1. An axle comprising the connection-blocks, the upper and lower shafts secured rigidly to such connection-blocks and detachable therefrom, and the spindles, substantially as set forth.

2. An improved axle, substantially as described, comprising the connection-blocks, the spindles, the upper and lower shafts connected with the said blocks, and the braces extended between said shafts, substantially as set forth.

3. The combination of the connection-blocks having bores fitted to receive the stems of the spindles, the upper and lower shafts connected with said blocks, the spindles having stems fitted to the bores of the connection-blocks, and the fastening-keys, substantially as set forth.

4. The combination of the connection-block having a bore for the spindle-stem and an extension at the inner end of said bore fitted to receive the fastening-key, the spindle, and the fastening-key, substantially as set forth.

5. The combination, in an axle, of a spindle having a stem and a connection-block having a socket fitted to receive said stem, and provided at the outer end of said socket with a collar or flange, substantially as set forth.



6. An axle comprising the connection-blocks having threaded sockets in their inner faces near their upper and lower ends, and the upper and lower shafts or sections having their ends threaded to enter said sockets, substantially as set forth.

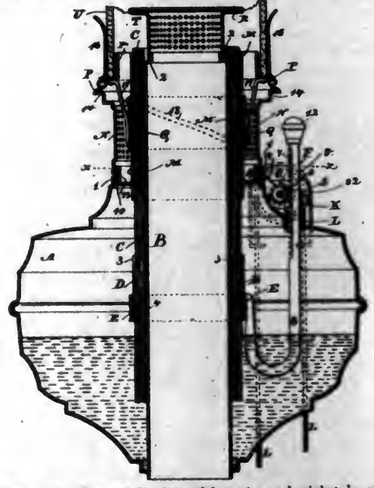
7. An axle having upper and lower shafts or sections and provided thereon with removable wear-sleeves, substantially as set forth.

8. The combination of the connection-blocks having threaded sockets in their inner faces and screws intersecting said sockets, and the shafts or sections having their ends threaded to enter the sockets of the connecting-blocks, substantially as set forth.

9. An axle consisting of the connection-blocks having bores or sockets for the spindle-stems, and provided in their inner faces with sockets for the upper and lower shafts, the spindles having their stems fitted to the bores of the connection-blocks, fastenings whereby to secure the stems in said blocks, the shafts having their ends fitted to the sockets of the blocks, and fastenings for securing said shafts in their sockets, substantially as set forth.

400,818. RULE-WORKING MACHINE. RICHARD ATWATER, Meriden, Conn. Filed Apr. 7, 1888. Serial No. 269,893. (No model.)

Claim.—1. In a rule-working machine, the combination of a vertically-adjustable work-supporting turn-table with a rotary cutter supported above it, substantially as described.



2. The combination of a laterally and vertically adjustable turn-table with a rotary cutter supported above it, substantially as described.

3. The combination, with tracks D, of the carriage E, having turn-table F and the rotary cutter supported above it, substantially as described.

4. The combination, with the base and standard A B of a rule-cutting machine, of the rule-bending rolls I I', the roll I being operated by the main driving-shaft of the cutting mechanism, the lower rolls, I', being adjustable toward and from the upper roll, substantially as described.

5. In a rule-working machine, a turn-table having suitable guide-lines and indexes marked thereon and means for securing the gage-blocks thereto, in combination with a cutter supported above said table and means for feeding the table under the cutter, whereby the work is carried thereto, substantially as described.

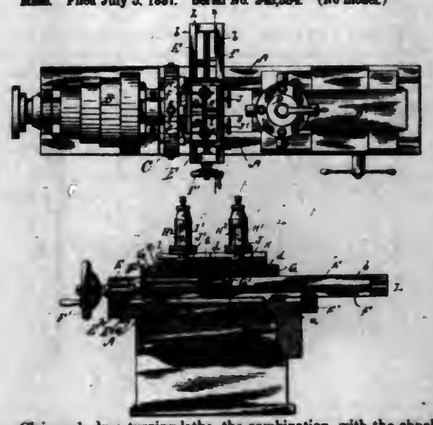
400,819. ARGAND LAMP. LEWIS J. ATWOOD, Waterbury, Conn. assignor to the Plume & Atwood Manufacturing Company, same place. Filed Jan. 6, 1888. Serial No. 259,990. (No model.)

Claim.—1. The combination, with an Argand wick-tube and central air-tube and reservoir, of a wick-holder having a screw-thread upon the same, a screw-ring into which the wick-holder screws, and a rod connected with the screw-ring and passing up through the upper part of the reservoir, substantially as set forth.

2. The combination, with the wick-holder and reservoir, and wick-raiser having rack-teeth upon it, of the shaft and pinion gearing into the wick-raiser, a ring, 1, surrounding the rim 10 of the reservoir, and bearing-arms 9, extending out from the ring to receive the wick-raiser shaft 8, substantially as set forth.

3. The combination, with an Argand wick-tube, of a reservoir and a central sheet-metal air-tube, said air-tube at its upper end be-

ing contracted circumferentially and formed with a two-part right-angle bend of greater width than the thickness of the metal of the air-tube, thereby forming an annular offset or shoulder, 2, and a cavity between the end of the wick and the air-tube, also of greater width than the thickness of the metal of the air-tube to receive overflowing oil and prevent it passing down inside the air-tube, substantially as specified.



4. The combination, with the reservoir, air-tube, and Argand wick, of the wick-tube around the wick, having screw-threads in the upper portion thereof, a chimney-holder, a sleeve around the wick-tube adapted to fit upon the screw-threads thereof, and connections from the sleeve to the chimney-holder, substantially as set forth.

5. The combination, with the Argand wick-tube and chimney-holder, of a base, 13, resting upon the upper end of the reservoir, and an air-distributer above the same, the chimney-holder resting upon the upper end of the air-distributer when the lamp is in use, a sleeve around the wick-tube having inclines for lifting the chimney-holder by a rotary movement, and connections from the sleeve to the chimney-holder, substantially as set forth.

6. The combination, with the air-tube B and an offset, 2, of greater width than the thickness of the metal of the air-tube and forming an annular shoulder at the upper edge of the same, of a foraminous skirt closed at the upper end and forming an air-regulator, and adapted to rest upon the annular shoulder, a space consequent upon the offset and of greater width than the thickness of the walls of the foraminous skirt being formed between the said skirt and the wick, substantially as set forth.

7. The combination, with the wick raiser or holder, the rack and pinion, and pinion-shaft, of a spool upon the pinion-shaft and a cord passing around the same, a guide or strap, 22, surrounding the spool and serving to prevent the cord slipping off, and hanging-eyes connected to said guide or strap and through which the cord passes, the ends of said cord hanging down, so that the wick-raiser can be actuated by pulling upon the cord, substantially as specified.

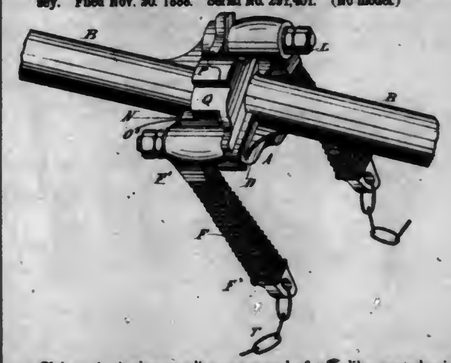
400,820. METAL-TURNING LATHE. JOHN R. BACK, Worcester, Mass. Filed July 5, 1887. Serial No. 243,334. (No model.)

Claim.—1. In a turning-lathe, the combination, with the chucking mechanism, substantially as described, for holding the work to be operated upon, of a carriage capable of a sliding motion transversely to the axis of the chucking mechanism, sliding blocks carrying tool-posts and mounted in ways upon said carriage, said ways being parallel with the axis of the chucking mechanism, and actuating-screws journaled in said carriage and engaging nuts upon said sliding blocks, whereby each of said blocks, with its tool-post, can be moved toward or away from the chucking mechanism independently, substantially as described.

2. In a turning-lathe, the combination, with rotating chucking mechanism for holding the work to be operated upon, of a saddle placed at right angles to the axis of the rotating chuck, a screw journaled in said saddle, a sliding block or carriage actuated by said screw and sliding in ways on said saddle transversely to the axis of the rotating chucking mechanism and carrying the tool-holding blocks, and a pair of tool-holding blocks, each having an independent sliding motion parallel with the axis of the rotating chucking mechanism through actuating-screws, substantially as described.

3. In a turning-lathe, the combination, with a saddle resting on the ways of the lathe, of a screw journaled in said saddle, a sliding block sliding in ways on said saddle and detachably connected with said screw, and a pair of tool-holding blocks having a sliding motion in ways on said sliding block and at right angles thereto, substantially as described.

4. In a turning-lathe, the combination, with a rotating chucking mechanism for holding the work to be turned, of a pair of tool-holding blocks having an independent sliding motion parallel with the axis of the rotating chucking mechanism, a sliding block supporting said tool-holding blocks and having a sliding motion at right angles with the axis of the rotating chucking mechanism, and a saddle supporting said sliding block and resting on the ways of the lathe, said saddle extending over said ways, so as to allow the tool-holding blocks to be moved away from the work, substantially as described.



400,821. MUFFLER FOR SIGNAL-BELLS. EDWARD T. BATES, Brightwood, D. C., assignor of one-half to Melville Lindsay, same place. Filed July 13, 1888. Serial No. 279,805. (No model.)

Claim.—1. As a new article of manufacture, a hollow flexible muffler conforming in its configuration to that of a bell-hammer, adapted to cover said hammer and to be retained in position by adhesion.

2. As a new article of manufacture, a hollow and elastic muffler having the configuration of a bell-hammer, contracted at one end and adapted to be retained in position by its own elasticity, substantially as described.

400,822. PIPE-COUPLING. JAMES C. BAYLES, New York, N. Y., assignor to The Safety Car Heating and Lighting Company, of New Jersey. Filed Nov. 20, 1888. Serial No. 291,401. (No model.)

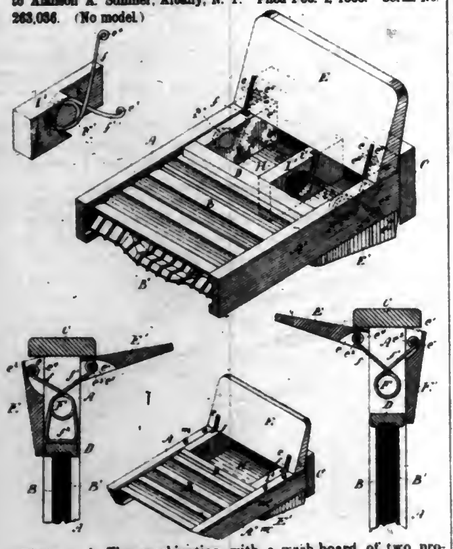
Claim.—1. A pipe-coupling composed of two like parts having vertical meeting faces and provided with a port or passage the axis of which is horizontally angular to the plane of said faces, each part provided with a locking-lever adapted to engage with a flange on the opposite part, said levers adapted to move in planes parallel to the meeting faces of said coupler.

2. A pipe-coupling composed of two like parts, a locking-lever on each part adapted to engage with a flange on the part opposite to that to which it is attached, said levers moving in planes parallel to the meeting faces of the coupler, and an adjustable spring on each part adapted to bear upon the outer side of the head of the lever and to force said lever toward the body of the coupling to which it is attached.

3. A pipe-coupling composed of two like parts, a locking-lever on each of said parts, two springs in the head of each of said locking-levers adapted to exercise their pressure in opposite directions, and means for regulating the tension of one of said springs in each part.

4. A pipe-coupling composed of two like parts, and each part provided with a locking-lever having a plane of movement parallel to the meeting faces of said coupler and adapted to engage a flange on the part opposite to that to which it is attached, a spring so located on each part as to bear upon the outer side of the head of the lever, and a device for adjusting the pressure of said spring, whereby said lever may be adjusted to exert a locking-pressure independent of the force exerted in making the coupling.

5. The combination, with two railway-cars, of a pipe-coupling and its connecting hose or pipes arranged horizontally between said cars, the plane of the meeting faces of said coupling being vertical and in the median line of said cars, and the axis of the port or passage through said coupling and its connecting-hose horizontally angular to the plane of the said meeting faces and substantially straight and diagonally across the space intervening between said cars.



6. The combination, with the heating system of two railway-cars,

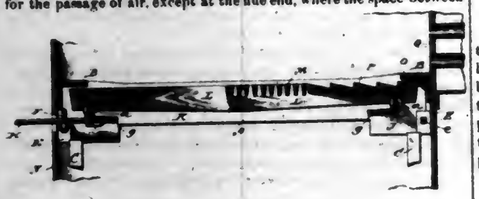
of a pipe-coupling composed of two parts of identical construction, the meeting faces of which are in the median line of said cars, and provided with locking-levers located in planes parallel to said meeting faces.

7. A pipe-coupling composed of two like parts, a locking-lever on each part, a spring bearing upon the outer side of the head of each of said locking-levers, said locking-levers pivoted in a transverse line to the plane of the meeting faces of said cars, and each lever provided with a projecting cam portion adapted to engage a flange on the part opposite to that to which it is attached.

8. A pipe-coupling composed of two like parts, a locking-lever on each part, said locking-lever being pivoted in a transverse line to the plane of the meeting faces of the parts, and each provided with a projecting cam portion adapted to engage a flange on the part opposite to that to which it is attached.

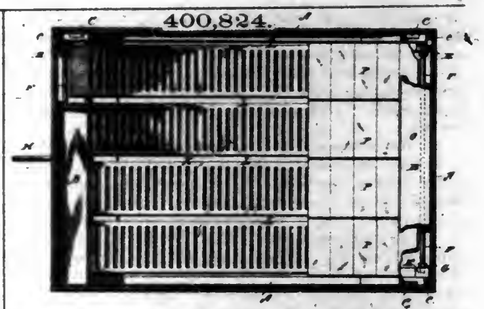
400,823. WASH-BOARD. SOLON BINGHAM, Conklingville, assignor to Alanson A. Sumner, Albany, N. Y. Filed Feb. 4, 1888. Serial No. 263,036. (No model.)

Claim.—1. The combination, with a wash-board, of two protectors, springs pivotally attached to the protectors at or near the outer ends thereof, and said springs held in blocks supported in position contiguous to but independent of the side frames of the board within an opening between the crown-piece and cross bar thereof, substantially as and for the purposes set forth.



2. The combination of a wash-board with studs or cushions in the side frames thereof, protectors pivoted to the extremities of springs, and removable blocks adapted to receive and hold said springs in position within an opening between the crown-piece and supporting cross-bar of the board, substantially as shown and described.

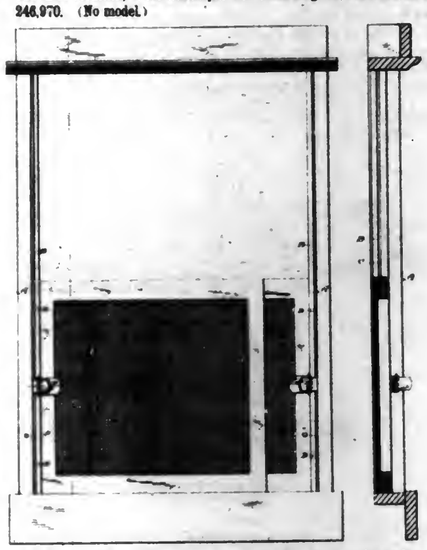
400,824. FURNACE-GRATE FOR PORTABLE ENGINES. STEPHEN E. BURKE, Edon, Ohio. Filed Oct. 15, 1887. Serial No. 252,469. (No model.)



Claim.—1. The grate-bar frame having bars formed with bosses on their inner faces, in which are formed angular cavities, in combination with spreading rods having angular ends fitting in said cavities, substantially as described.

2. The combination, with the fire-box having a flue-sheet at one end thereof, of the grate-bars provided at the end of the box next to the flue-sheet with a rake for drawing the ashes away from the flue-sheet, and thus preventing the banking up of ashes and cinders against the flue-sheet, substantially as described.

3. In an engine furnace-grate, the grate-bar composed of longitudinal bars connected together, and having openings between them for the passage of air, except at the flue end, where the space between



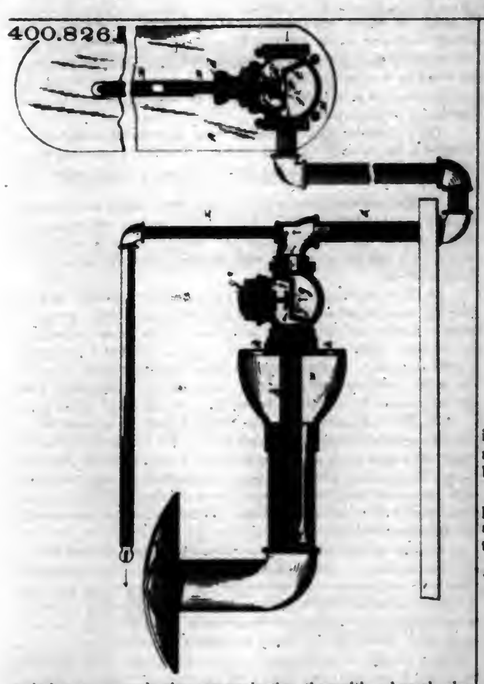
400,824.

the longitudinal bars is closed to break the passage of air, and provided with a rake to draw ashes away from the flue-sheet, substantially as described.

4. A furnace-grate composed of a series of grate-bars constructed of longitudinal bars connected together, and having openings between them for the passage of air, except at the flue end, where the space between said longitudinal bars is closed to break the passage of air, and provided with rake-teeth, substantially as and for the purposes set forth.

400,825. EXTENSION WINDOW-SCREEN. JAMES H. BURT and SELVA E. HOLMAN, West Randolph, Vt. Filed Aug. 15, 1887. Serial No. 246,970. (No model.)

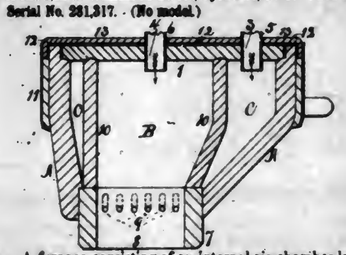
Claim.—1. The combination of the window-frame, the strips applied to the inner sides thereof, each one having a groove, C, in its inner side, and a groove, O, in its edge, the screen-frames provided with pins or projections to catch in the grooves C, and catches to catch in the grooves O, substantially as shown.



2. The combination of the window-frame, the strips B, secured to the inner sides thereof and provided with grooves C O, the expansible window-screen provided with pins or projections D, and the spring-catches P, consisting of stationary plates secured to the screen-frames, and spring-actuated plates pivoted upon the stationary plates, and having their outer ends bent so as to catch in the grooves O, substantially as described.

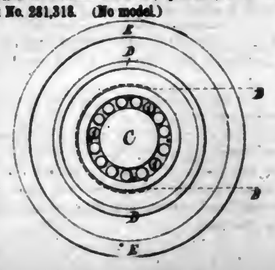
400,826. AUTOMATIC HEAT-REGULATING DEVICE. NATHAN C. BUTLER and FRANK D. ROSENBERGER, Leipsic, Ohio. Filed May 7, 1888. Serial No. 273,069. (No model.)

Claim.—1. In an automatic heat-regulating device, the combination of a main burner, a supply-pipe communicating therewith, a branch pipe communicating with the supply-pipe, a supplemental burner located adjacent to the main burner and communicating with the branch pipe, a gravity-valve in the main pipe between the branch pipe and main burner opening toward the burner, and a globe-valve in the supply-pipe having a permanently-open perforation in the diaphragm, substantially as described.



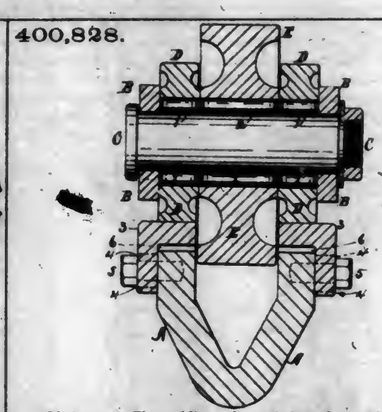
2. In an automatic heat-regulating device, the combination of a

400,826.



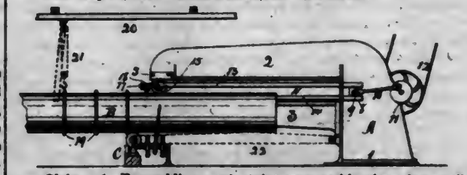
main burner, a supply-pipe communicating therewith, a branch pipe communicating with the supply-pipe, a supplemental burner located adjacent to the main burner and communicating with the branch pipe, a gravity-valve in the main pipe between the branch pipe and main burner opening toward the burner, a globe-valve in the supply-pipe having a permanently-open perforation in the diaphragm, and a thermostat connected to said valve, substantially as described.

400,827. GAS-FURNACE. ROBERT CARTWRIGHT, Rochester, assignor of one-half to William A. Sweet, Syracuse, N. Y. Filed July 28, 1888. Serial No. 281,317. (No model.)



Claim.—A furnace consisting of an internal air-chamber inclosed within a frusto-conical shell, an outer shell separated therefrom creating a gas-chamber between them, and a mixing-chamber having a direct connection to the air-chamber, and ducts connecting the gas-chamber to the mixing-chamber, a top inclosing the upper ends of the gas and air chambers, an air-inlet pipe opening into the air-chamber, a gas-inlet pipe opening into the gas-chamber, and means for clamping the upper end of the gas-chamber and the top together and for supporting the same, substantially as described.

400,828. WELDING-ROLL. ROBERT CARTWRIGHT, Rochester, assignor of one-half to William A. Sweet, Syracuse, N. Y. Filed July 28, 1888. Serial No. 281,318. (No model.)



400,828.

Claim.—1. The welding-roll consisting of a welding-roller and independent supporting-rolls, all mounted upon independent friction-roll bearings, which are themselves mounted upon one arbor, in combination with a trackway for the supporting-rolls.

2. A welding-roll consisting of a welding-roller, independent supporting-rollers, all mounted upon friction-bearings bearing upon an arbor loose in its bearings, and a trackway mounted adjustably upon the main frame of the machine and carrying the supporting-rollers.

400,829. MACHINE FOR WELDING PIPES. ROBERT CARTWRIGHT, Rochester, assignor of one-half to William A. Sweet, Syracuse, N. Y. Filed July 28, 1888. Serial No. 281,319. (No model.)

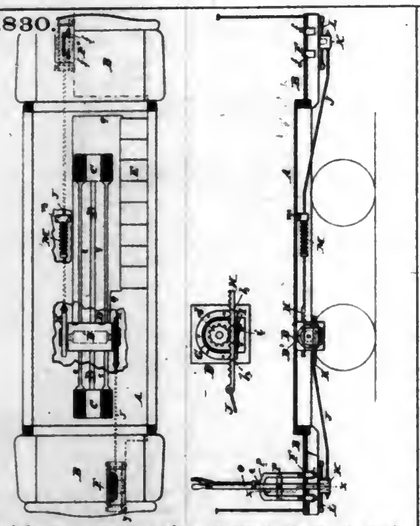
Claim.—1. For welding a tube-joint, the combination of two rollers, one internal and the other external, mounted upon a reciprocating frame, with an internal heating-furnace and an external heating-furnace mounted upon the same frame, substantially as described.

2. For the continuous and simultaneous heating and welding of a pipe joint, the combination of the heating-furnaces mounted upon a reciprocating frame and located within and outside of the pipe of the welding-rolls, mounted upon the same frame, substantially as described.

3. A reciprocating frame upon which heating-furnaces and welding-rolls are mounted contiguous to each other, in combination with a crank having a pitman-rod connected to the frame, substantially as described.

4. A reciprocating frame carrying welding-rolls and heating-furnaces contiguous to each other, in combination with the rolls and furnaces, substantially as described.

5. A reciprocating frame carrying welding-rolls, in combination with heating-furnaces mounted upon the frame, substantially as described.



400,830. ELECTRIC CAR. GEORGE H. CONDICT and VICTOR ANDREE, Philadelphia, Pa., assignors to The Electric Car Company of America, same place. Filed June 20, 1888. Serial No. 277,670. (No model.)

Claim.—1. The combination of a car having a platform, an electric motor to propel the car, a current-regulator to control the current passing to the motor arranged under the body of the car, a positive mechanical device for operating said regulator and extending to the platform, and an operating-lever and fulcrum detachably supported by said platform and having a positive detachable connection with the regulator-operating device, whereby the operating-lever may be readily removed without disturbing the other parts.

2. The combination of a car having a platform, an electric motor to propel the car, a current-regulator to control the current passing to the motor arranged under the body of the car, a positive mechanical device for operating said regulator and extending to the platform, an operating-lever detachably supported by said platform having a positive detachable connection with the regulator-operating device, whereby the operating-lever may be readily removed without disturbing the other parts, and a spring independent of the lever to normally move the regulator to reduce or cut off the current.

3. The combination of a car having a platform, an electric motor

400,830.

to propel the car, a current-regulator to control the current passing to the motor arranged under the body of the car, a positive mechanical device for operating said regulator and extending to the platform, an operating-lever rack and detent detachably supported by said platform having a positive detachable connection with the regulator-operating device, whereby the operating-lever may be readily removed without disturbing the other parts, and a spring independent of the lever to normally move the regulator to reduce or cut off the current.

4. The combination of a car, an electric motor to propel said car, a rotary current-regulator under the car having a transverse axis, and a sliding mechanical mechanism extending to the front of the car and connecting with said regulator by a rack and pinion to rotate it.

5. The combination of a car, an electric motor to propel said car, a rotary-barrel current-regulator under the car, a mechanical mechanism extending to the front of the car to rotate said regulator, and a spring to oppose the rotation of the barrel in one direction and rotate the barrel in the opposite direction to reduce or shut off the current.

6. The combination of a car, an electric motor to propel said car, a rotary-barrel current-regulator under the car, a mechanical mechanism extending to the front of the car to rotate said regulator, a spring to oppose the rotation of the barrel in one direction and rotate the barrel in the opposite direction to reduce or shut off the current, and a locking device to lock the barrel in two or more positions of rotation.

7. The combination, in an electrically-propelled car, of a regulator for the current flowing to the motor, a detachable hand-lever mechanism detachably supported upon the car-platform to move it in one direction, and a spring to move it in the opposite direction to reduce or cut off the current.

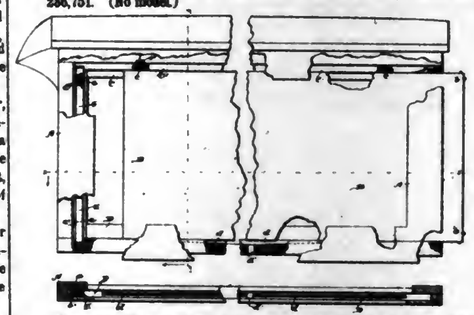
8. The combination of a regulator for the current flowing over an electric circuit, a detachable hand-lever mechanism to move it in one direction, a connection between the hand-lever and regulator, a spring acting on the connection and independent of the lever to move it in the opposite direction to operate the regulator to reduce or cut off the current, and a locking device to lock the lever of the regulator in two or more positions to vary the current passing to the circuit.

9. The combination of a car having a platform, an electric motor to propel the car, a current-regulator to control the current passing to the motor arranged under the body of the car, a positive mechanical device for operating said regulator and extending to the platform, an operating-lever detachably supported by said platform having a positive detachable connection with the regulator-operating device, whereby the operating-lever may be readily removed without disturbing the other parts, and a snap-lock between the movable part of the regulator and the frame supporting it to insure the movable part stopping positively at fixed places.

10. The combination of a car, an electric motor to propel said car, a rotary-barrel current-regulator under the car, a mechanical mechanism extending to the front of the car to rotate said regulator, a series of depressions in the regulator-barrel-operating mechanism, and a spring-lock to snap into said depressions to hold the barrel in given positions.

11. The combination of a car, an electric motor to propel said car, a rotary-barrel current-regulator under the car, a mechanical mechanism extending to the front of the car to rotate said regulator, a spring to oppose the rotation of the barrel in one direction and rotate the barrel in the opposite direction to reduce or shut off the current, a locking device to lock the barrel in two or more positions of rotation, a series of depressions in the regulator-barrel-operating mechanism, and a spring-lock to snap into said depressions to hold the barrel in given positions.

12. The combination of a barrel regulator or switch, a spur-wheel secured to the rotating barrel, a sliding rack meshing with said spur-wheel and moving transversely to the barrel, and a lever to move said rack.



13. The combination of a barrel regulator or switch, a spur-wheel secured to the rotating barrel, a sliding rack meshing with said spur-wheel and moving transversely to the barrel, a lever to move said rack, and a locking device to hold said rack and barrel in two or more positions.

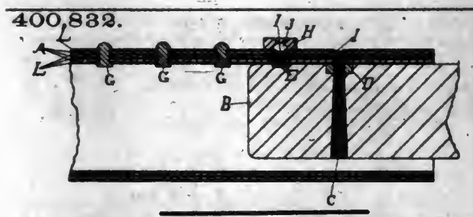
14. The combination of a car having a platform at each end, an electric motor to propel the car, a regulator located under the car, a positive mechanical mechanism to operate the regulator extending to and below each platform of the car, and a detachable operating-handle movable to or from each platform extending from above to below the platform and detachably but positively connectible with the mechanism for operating the regulator at either end of the car.

15. The combination of a car having a platform at each end, a current-regulator for the motor arranged on the car, a rod extending from said regulator to each end of the car to a point below the platforms, an operating-lever-frame support arranged upon each platform, a lever-support detachably connectible to either platform, and an operating-lever carried by the frame and detachably connected with the rod over which it is placed.

16. The combination of a car having a platform at each end, a current-regulator for the motor arranged on the car, a rod extending from said regulator to each end of the car to a point below the platforms, an operating-lever-frame support arranged upon each platform, a lever-support for detachable connection to either platform, an operating-lever carried by the frame and detachably connected with the rod over which it is placed, and a spring acting upon said regulator to cause it to move in opposition to one movement of the lever to move the regulator to reduce or cut off the current to the motor.

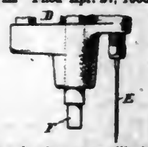
400,831. ADVERTISING-PANEL FOR DELIVERY-WAGONS. EDGER A. CULVER, Cleveland, Ohio. Filed Sept. 29, 1888. Serial No. 286,751. (No model.)

Claim.—1. The combination, in a delivery-wagon the side frame of which is provided with upper and lower grooves open at one end, a strip located within the upper groove, and springs for imparting a downward pressure on said strip, of a panel constructed to be removably secured within said grooves, the spring-actuated strip being arranged to press against the upper edge of the panel, substantially as set forth.



2. The combination, in a delivery-wagon the side frames of which are provided with upper, lower, and an end groove, and strips located in the upper groove and the end groove, and springs tending to force said strips outwardly from the grooves, of a panel constructed to be removably secured within said grooves, said strips being arranged to press against the end and upper edge of the panel, and latches for locking the panel in place, substantially as set forth.

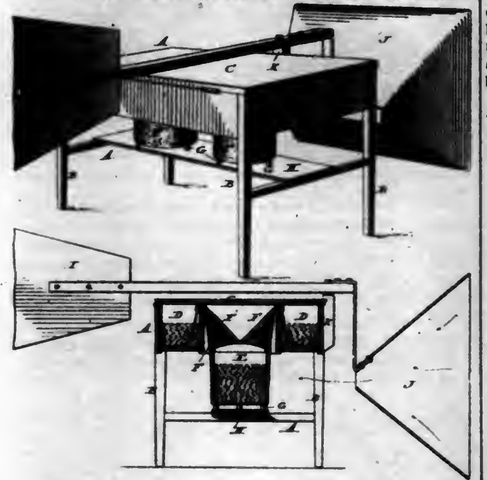
400,832. ASPHALT-COATED SHEET-METAL PIPE. JOHN P. CULVER, Los Angeles, Cal. Filed Dec. 14, 1888. Serial No. 293,584. (No model.)



Claim.—1. A pipe comprising a convolute sheet of metal coated with a cementing substance and having its free edge secured by rivets passing through the several layers of metal and cementing substance.

2. A pipe comprising a convolute sheet of metal coated throughout its entire length with a protective cement, and provided with rivet-holes therein, passing through the free edge and the several layers of the metal and cement, and rivets of metal cast within the rivet-holes, as described.

400,832.



400,833. FEED MECHANISM FOR SEWING-MACHINES. JOHN W. DEWEES, Philadelphia, Pa., assignor to The Union Special Sewing Machine Company, Chicago, Ill. Filed Apr. 27, 1888. Serial No. 272,040 (No model.)

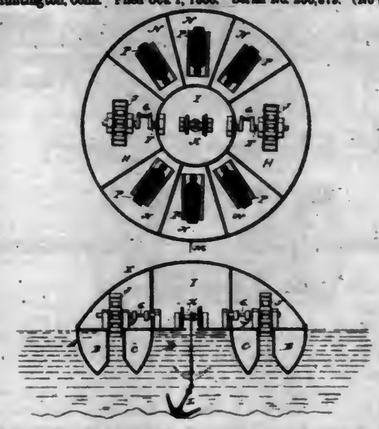
Claim.—In a feed device having an oscillating feed-frame composed of vertical and horizontal arms pivoted together, the combination, with said arms, of a pair of eccentrics mounted upon a driving-shaft, the first of said eccentrics engaging directly with said horizontal arm, a bifurcated frame pivoted upon an axis parallel to the driving-shaft and having in one of its bifurcations a curved slot, a link adjustably secured in said slot and connected with said vertical arm, and a second link and strap connecting the other bifurcation with the second eccentric, substantially as set forth.

400,834. MILK-COOLER. FRANCIS A. DODGE and ISRAEL A. DODGE, Brady, Tex. Filed Oct. 18, 1888. Serial No. 288,496. (No model.)

Claim.—1. In a milk-cooler, the combination, with a body having two water-troughs side by side, but separated from each other, substantially as shown, of cans or vessels and jackets surrounding the cans and extending into the water-troughs.

2. In a milk-cooler, the combination, with the frame or body having two water-troughs arranged side by side, but separated from one another, of the jacketed cans located between the troughs, and having their jackets extending into the latter.

3. In a milk-cooler, the combination, with the frame or body having the two troughs arranged substantially as shown, of the jacketed cans located between and below the troughs, and having their jackets extending into the latter.



4. In a milk-cooler, the combination, with the body or frame A, having troughs D D, of jacketed cans E, board H, and pins G, secured to the board and supporting the cans.

5. In a milk-cooling apparatus, the combination, with the body or frame provided with water-troughs, of the jacketed cans having the upper ends of their jackets extending into the troughs, and an air-collecting device arranged, substantially as shown and described, to collect and direct the air against the exposed jackets.

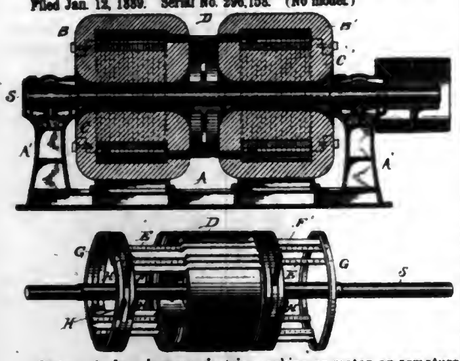
400,835. PROCESS OF TREATING RICE. ENOCH V. DOWLSON, Baltimore, Md. Filed July 27, 1888. Serial No. 281,234. (No specimens.)

Claim.—The herein-described process for treating rice, consisting of first removing from rice in its usual marketable condition the covering of cellular tissue, then subjecting the grain to the action of moisture and heat to thoroughly develop the soluble starch, dextrine, and sugar without destroying the identity of the grains, then hardening or toughening the outside of the grain by cold applications, passing them through rolls or mill, and then drying, as set forth.

400,836. REVOLVING MARINE BATTERY. LOCKWOOD DURAND, Huntington, Conn. Filed Oct. 1, 1888. Serial No. 286,879. (No model.)

Claim.—The herein-described circular battery, consisting of two concentric ring-shaped hulls, B C, connected, but so as to leave a space between the said two rings, combined with a central anchor, and mechanism, substantially such as described, at the center for raising and lowering said anchor, with propelling-wheels arranged in the space between the said rings, substantially as described.

400,837. CULTIVATOR. HORACE G. EMERSON, Rockford, Ill., assignor to Henry H. Palmer and Samuel D. Palmer, same place. Filed May 26, 1888. Serial No. 275,132. (No model.)



Claim.—1. In a garden-cultivator, the combination, with a carrying-wheel, a handle, side bars connecting the wheel and the handle, and a support bolted between said side bars, of a shovel-standard journaled in said support near one end, a segment-ratchet secured to the support near its opposite end, and a handle connecting the standard and segment-ratchet so as to adjust the shovel, substantially as set forth.

2. In a garden-cultivator, the combination, with a handle and supporting-wheel, side bars connecting the handle and supporting-wheel, and provided with curved inner ends, of bars rigidly secured to the said handle and pivoted with their outer ends to the intermediate portions of said side bars, and provided at their opposite ends with overlapping portions which frictionally engage the curved ends of the side bars, substantially as set forth.

3. In a garden-cultivator, the combination, with a handle, and side

bars connecting the handle and supporting-wheel, of bars pivotally connecting the handle with the side bars, and having their ends formed to embrace and adjust the handle upon the upturned ends of the side bars, substantially as set forth.

400,838. DYNAMO-ELECTRIC MACHINE. JUSTUS B. ENTZ, New York, N. Y., assignor to Thomas Alva Edison, Llewellyn Park, N. J. Filed Jan. 12, 1889. Serial No. 296,158. (No model.)

Claim.—1. In a dynamo-electric machine or motor, an armature carrying independent insulated conductors, and alternate supporting-strips to which are attached collecting-rings, forming terminals for the said conductors, substantially as and for the purpose set forth.

2. In a dynamo-electric machine or motor, an armature consisting of a core in the form of a pulley, conducting and supporting strips attached thereto, and collecting-rings secured to the supporting-strips and forming terminals for the conducting-strips, the said supporting-strips extending beyond the pulley's edge, and being bent to receive the rings, substantially as and for the purpose set forth.

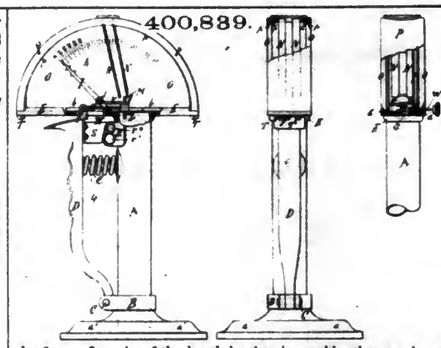
3. In a dynamo-electric machine or motor, the combination, with an annular field-magnet composed of an inner core and a surrounding shell joined to the core at one end and approaching the core at the other end, such approaching ends forming the annular pole-pieces of the magnet, the field-winding placed upon the core and leaving a surrounding space between it and the shell, and an annular armature entering the field of force between the poles and extending over the field-magnet winding, substantially as set forth.

4. In a dynamo-electric machine or motor, the combination, with an annular field-magnet composed of an inner core and a surrounding shell joined to the core at one end and approaching the core at the other end, such approaching ends forming the annular pole-pieces of the magnet, of the field-winding placed upon the core and leaving a surrounding space between it and the shell, an annular armature composed of an iron core, and conductors supported by the core entering the field of force between the poles, the conductors extending beyond such field over the magnet-winding, and collecting-rings connected with such conductors and surrounding the said winding, substantially as set forth.

5. In a dynamo-electric machine or motor, a pair of field-magnets presenting a pair of annular fields of force opposite each other, a pair of helices beyond the fields of force, and an armature made up of magnetic and non-magnetic portions, the arrangement being such that the magnetic portions of the armatures enter the fields and the non-magnetic portions continue beyond and surround the helices, substantially as and for the purpose set forth.

6. An armature consisting of an iron pulley supporting conducting-strips, in combination with a pair of field-magnets presenting annular fields around opposite edges of the pulley, the central portion of the pulley being exposed, substantially as set forth.

7. The combination, with a pair of annular field-magnets supported on a suitable base, of an armature and its shaft, the latter passing through the annular magnets and being supported in independent bearings, substantially as and for the purpose set forth.

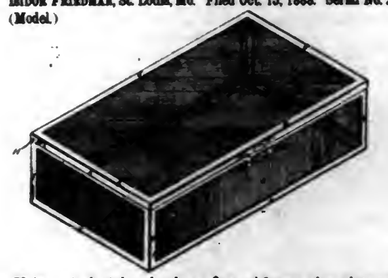


8. A field-magnet constructed in two annular parts, secured together at one end, the inner annulus being circumferentially grooved about its center to admit a helix without obstruction to outside parts, substantially as and for the purpose set forth.

9. A field-magnet constructed in two annular parts secured together at one end and forming an annular yoke at the other, the inner annulus being circumferentially grooved to admit a helix without obstruction to outside parts, substantially as and for the purpose set forth.

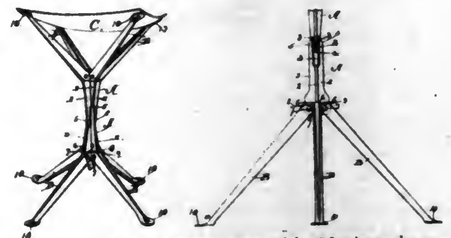
400,839. COIN-OPERATED GRIP-TESTING MACHINE. PERCIVAL EVERITT, London, England. Filed Sept. 14, 1888. Serial No. 285,392. (No model.)

Claim.—1. A coin-operated machine for testing and indicating



400,889.

the force of a grip of the hand, having, in combination, a coin-receiving and releasing mechanism, a hollow post serving as a hand-support, and also as a coin-receptacle, an inclined grip-lever pivoted to the base of such post, and an indicating finger and dial, the pivoted grip-lever causing the release of the coin, and also actuating said finger.

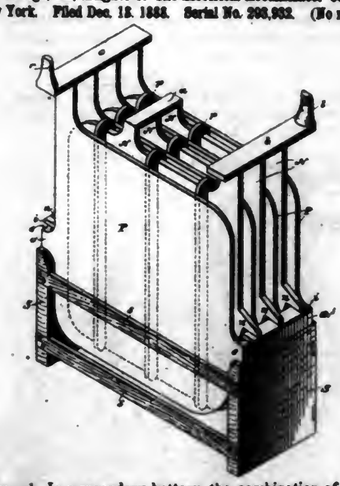


2. In a coin-operated machine for testing and indicating the force of the grip of the hand, the combination, with the grip-lever, of a stationary post to support the hand, a bent arm, K, coin rest or support, arm G, and an indicating-hand, substantially as shown and described.

400,840. GLASS CIGAR-BOX WITH METAL OR OTHER FRAME. ISIDOR FRIEDMAN, St. Louis, Mo. Filed Oct. 15, 1888. Serial No. 288,069. (Model.)

Claim.—A cigar-box having a flanged frame, glass plate set in the frame, and a ventilator consisting of an apertured extension of said frame, a registering aperture in the glass plate, a sliding plate having apertures to correspond with the apertures of said extension and provided with a knob, and bolts or rivets on said plate projecting through elongated slots in said extension, substantially as and for the purpose set forth.

400,841. SECTIONAL CAMP-STOOL. CARL F. GLOCKER, Albany, N. Y., assignor to Henry Lang, same place. Filed June 27, 1888. Serial No. 278,370. (No model.)



Claim.—1. In a camp-stool or other article of furniture, the combination of two separable sections which have substantially the same form and are adapted to be interlocked, one on top of the other, by means of a V-shaped notch and a corresponding edge formed in the central post of each section, said central post for each section having a cruciform cross-sectional area and each rib of said central post being provided with a shoulder, 6, and a series of channel-form arms, which are separately pivoted to the ribs of said central post, each of said arms being provided at its upper end with a shoulder, 9, that is adapted to engage with the shoulder of the rib to which said arm is pivoted, as and for the purpose herein specified.

2. In a camp-stool, the combination of two separable sections of substantially the same form, each section being provided with a central post having in one end a V-shaped notch, whereby the two sections can be interlocked together by fixing one on the top of the other,

each of said sections having a series of swinging arms pivoted to its central post, and a flexible seat-piece for the uppermost section, as and for the purpose herein specified.

400,842. SECONDARY BATTERY. WILLIAM W. GIBBON, Haverford College, Pa., assignor to The Electrical Accumulator Company, of New York. Filed Dec. 13, 1888. Serial No. 293,932. (No model.)

Claim.—1. In a secondary battery, the combination of two elements or electrodes, one being independently removable with respect to the other, and each composed of a series of plates electrically united, an inclosing-cell therefor, an electrolytic liquid, and means for supporting both elements above the bottom of the cell, consisting of fixed points located on opposite sides of both elements between the upper and lower edges, and points of support located at opposite sides of the interior of the inclosing-cell, substantially as described.

2. In a secondary battery, the combination of two elements or electrodes, an inclosing-cell therefor, an electrolytic liquid, and means for supporting both said electrodes above the bottom of the cell, consisting of projections located on opposite sides at or near the central vertical distance thereof and taking against fixed supports within the cell, substantially as described.

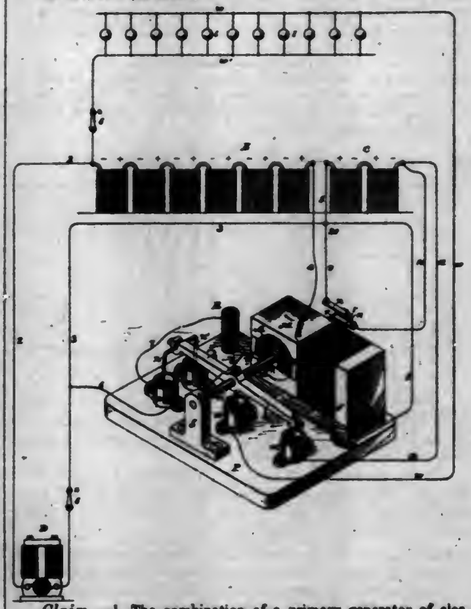
3. In a secondary battery, the combination of two elements or electrodes, each consisting of a series of plates, an inclosing-cell therefor, an electrolytic liquid, a series of projections on one element located on opposite edges between the upper and lower edges united by a mechanical connection to maintain a fixed distance between the plates, a series of projections on the other element similarly located and resting upon said mechanical connection, and means for supporting said elements upon said projections free from contact with the bottom of the cell, substantially as described.

4. In a secondary battery, the combination of two elements or electrodes, each composed of a series of plates, an inclosing-cell therefor, a suitable battery-fluid, a series of projections on opposite sides of both elements near the central vertical distance thereof, strips of conducting material uniting the plates of one element at or near said projections and at a point on the upper edge thereof, strips of conducting material uniting the plates of the second element at points on the upper edge thereof, insulated supports on opposite sides of the inclosing-cell, near its central vertical distance, upon which the projections of the first element rest in position to form a rest for the projections of the second element, and strips of insulated material separating one element from the other, substantially as described.

5. In a secondary-battery, the combination of two elements or electrodes, each composed of a series of plates, an inclosing-cell therefor, a suitable battery-fluid, strips of conducting material uniting the plates of one element at one or more points between the upper and lower edges, also at or near the upper edge, strips uniting the plates of the second element at or near the upper edge, a series of projections on the edges of the second element, insulating-supports upon which the central strips of the first element rest, the projections of the second element resting thereon, and strips of insulating material separating one element from the other, substantially as described.

6. The combination, in a secondary battery, of two elements, each consisting of a series of plates having fixed points of supports between their upper and lower edges, and a support, rest, or frame consisting of two slabs of insulating material located on opposite sides of the cell and held in position with respect to each other by one or more strips, substantially as described.

7. The combination, in an electrical connection, of two sections of conducting material, one section being the complementary part of the other, a series of parallel grooves in the surface of each section, the grooves of one registering with the grooves of the other, and a nut for uniting the two sections mechanically and electrically, substantially as described.



8. The combination of two complementary sections of conducting material having a series of parallel grooves united to form a male screw, and a nut having a female screw for mechanically and electrically uniting the two sections, substantially as and for the purpose described.

9. In an electrical connection, the combination of a battery-terminal carrying a screw-thread, a second terminal carrying a similar screw-thread, and a nut having a corresponding thread for mechanically and electrically uniting both terminals, substantially as described.

10. An electrical connector for batteries, consisting of two sections of conducting material having the form of a cone divided on the plane of its major axis with a helical groove in its curved surface forming a male screw, and a nut having a female screw for uniting the two sections mechanically and electrically combined with a battery-terminal connected to each section, substantially as described.

11. The combination of two sections of conducting material, each forming the terminal of a battery, and each provided with a threaded surface combined with a nut having a threaded contact-surface for mechanically and electrically uniting the two said sections.

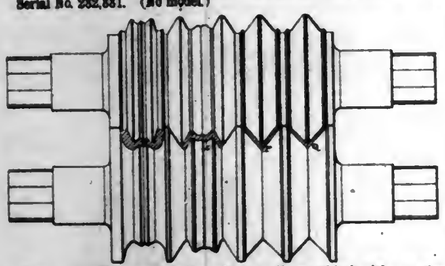
400,843. DISTRIBUTION OF ELECTRICITY BY SECONDARY BATTERIES. WILLIAM W. GIBBON, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed Jan. 12, 1889. Serial No. 296,163. (No model.)

Claim.—1. The combination of a primary generator of electricity, a charging-circuit, a secondary battery, a working-circuit containing a series of translating devices, a compensating resistance to be inserted and withdrawn with respect to the working-circuit between the battery and translating devices, a switch or circuit-changer for inserting and withdrawing said resistance, and an electro-magnet located in a branch circuit between the dynamo and battery and between the battery and translating devices to control said switch.

2. The combination of a dynamo-electric machine, a charging-circuit, a secondary battery, a working-circuit containing a series of translating devices, a compensating resistance consisting of one or more electrolytic cells to be inserted and withdrawn with respect to the working-circuit between the battery and translating devices, a switch or circuit-changer for inserting and withdrawing said resistance, and an electro-magnet located in a branch circuit between the dynamo and battery and between the battery and translating devices operating to control said switch, substantially as described.

3. The combination of a dynamo-electric machine, a charging-circuit, a secondary battery, a working-circuit containing lamps in parallel circuit, a compensating resistance consisting of one or more electrolytic cells yielding a counter electro-motive force with respect to the battery, a switch or circuit-changer for inserting and withdraw-

ing said resistance, and an electro-magnet located in a branch circuit between the dynamo and battery and between the battery and lamps operating to control said switch, substantially as described.

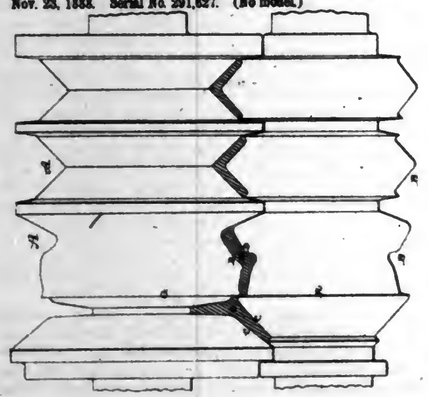


4. The combination of a primary generator of electricity, a charging-circuit, a secondary battery, a working-circuit containing a series of lamps in multiple arc with the battery, a compensating resistance, a switch or circuit-changer for inserting and withdrawing said resistance with respect to the working-circuit, and a polarized electro-magnet located in a branch circuit between the dynamo and battery and between the battery and lamps operating to control said switch or circuit-changer, substantially as described.

5. The combination of a primary generator of electricity, a secondary battery connected therewith, a working-circuit connected with the secondary battery and containing translating devices, one or more electrolytic cells located between the battery and translating devices, and a switch for varying the position of such cells with respect to the working-circuit, substantially as described.

6. The combination of a primary generator of electricity, a secondary battery connected therewith, a working-circuit connected with the secondary battery and containing translating devices—such as lamps—and one or more cells of secondary battery located in circuit between the battery and translating devices yielding a counter electro-motive force with respect to said battery, substantially as described.

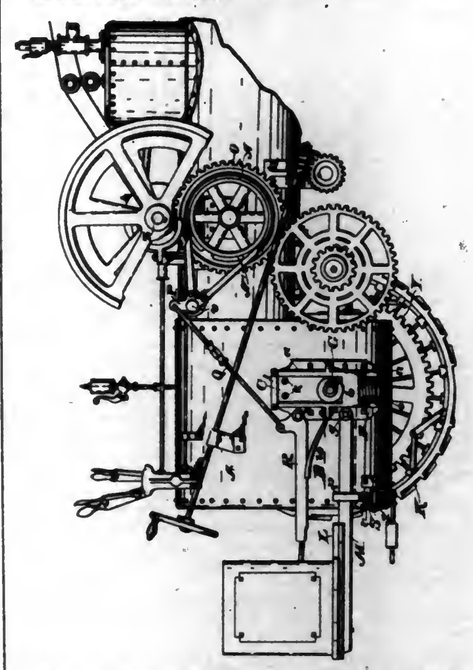
7. The combination of a primary generator of electricity, a secondary battery connected therewith, a working-circuit connected with the secondary battery containing translating devices, a suitable device yielding a counter electro-motive force to be inserted and withdrawn with respect to the working-circuit at a point between said battery and translating devices, and a switch for varying the position of such counter electro-motive-force device with respect to the working-circuit, substantially as described.



400,844. ROLLING-MILL. JOSEPH GUEST, Pittsburg, Pa., assignor of one-half to Ferdinand Protzman, Sr., Sidney M. Youngs, Fred R. Youngs, and Ralph W. Carroll, all of same place. Filed Aug. 16, 1888. Serial No. 282,881. (No model.)

Claim.—1. The combination of two rolls provided with a series of W or M shaped grooves, through which the metal is successively passed, so as to first break down the metal, and then form it into angle-iron, substantially as shown.

2. The combination of two rolls provided with a series of W or M shaped grooves for breaking down the metal and forming it into angle-iron, and cutters for separating the two halves of the double angle-iron, substantially as set forth.



400,845. ROLLS FOR ROLLING METAL. JOSEPH GUEST, Pittsburg, Pa., assignor of one-half to Ferdinand Protzman, Sr., Sidney M. Youngs, Fred. R. Youngs, and Ralph W. Carroll, all of same place. Filed Nov. 23, 1888. Serial No. 291,627. (No model.)

Claim.—1. The combination of the two rolls provided with the two grooves C D, which are separated from each other by the cutter G, for separating the rails at the top of the flange, the grooves being so shaped that both the flanged and the head and web portions are changed in shape at the same time that the rail is being divided, substantially as shown.

2. The combination of two rolls provided with the two grooves C D, which are separated from each other by the cutter G, and separate grooves for finishing each one of the two parts of the rail, substantially as described.

400,846. TRACTION-ENGINE. CHARLES O. HEGGEM, Massillon, Ohio, assignor to Russell & Company, same place. Filed June 6, 1888. Serial No. 276,373. (No model.)

Claim.—1. The combination, in a portable engine, of a spindle-supporting frame, C, having projecting side portions, *a*, a bottom portion, *b*, having a perforation, *d*, spindle G, a spindle-frame having a downwardly-projected portion, H, a spiral spring, F, secured about said portion, and an upwardly-projected portion adapted for lateral adjustment, and means for securing said portion in desired adjustment, substantially as described, and for the purpose set forth.

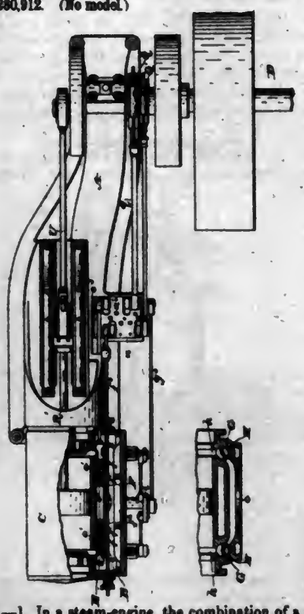
2. The combination, in a portable engine, of a spindle-supporting frame, C, and a spindle-frame, E, loosely secured to said frame C and adapted for vertical vibration and lateral adjustment, substantially as described, and for the purpose set forth.

3. In a portable engine, the combination of the spindle G, and a spindle-supporting frame having an upwardly-projected portion, E, and a downwardly-projecting portion, H, substantially as described, and for the purpose set forth.

4. The combination, in a portable engine, of the U-shaped foot-board support, the ends thereof pivotally secured to the sides of the fire-box, and supporting-springs, substantially as described, and for the purpose set forth.

5. In a portable engine, in combination with a U-shaped foot-board support pivotally secured to the fire-box portion of the boiler, a spring supporting-bracket, *f*, spring *e*, and loop *h*, substantially as described, and for the purpose set forth.

6. In a portable engine, a brake composed, essentially, of a brake-wheel, N', secured to the gear-wheel O, a flexible shoe, N, pivotally secured at both ends to a lever, P, stud *v*, adjustable link Q, foot-lever R, and a spring, *w*, fixed at one end to the engine and bearing with its free end against the under side of the lever R, substantially as set forth.



7. A steam-engine having an axle and an adjusting device in connection therewith to regulate the inclination of the axle, substantially as set forth.

8. A steam-engine having a vertically-yielding axle and an adjusting device in connection with the axle to regulate the inclination of the same, substantially as set forth.

9. In a portable steam-engine, the combination, with the spindle-supporting frame C, of a spindle-frame, E, vertically movable in said frame C and provided with a recess, *g*, a block, *h*, fitting in said recess, and a set-screw, *k*, for separating the upper ends of said frames, substantially as set forth.

10. In a portable engine, the combination of the pivoted foot-board support, the fixed spring supporting-bracket, the loop embracing branches of the said foot-board support and provided with a stem working in an aperture of the spring-support, and a spring encircling the said stem and engaging, respectively, with its ends the loop and the spring-support, substantially as set forth.

400,847. STEAM-ENGINE. CHARLES O. HEGGEM, Massillon, Ohio, assignor to Russell & Company, same place. Filed July 24, 1888. Serial No. 280,912. (No model.)

Claim.—1. In a steam-engine, the combination of a slide-valve for steam admission and a cut-off valve seated on the slide-valve and provided with a hollowed-out face in normal communication with the interior of the steam-chest to retain steam between the valves, substantially as described, and for the purpose set forth.

2. In a steam-engine, the combination of a slide-valve for steam admission, having its inner face cut under to admit steam from the steam-chest, and a cut-off valve seated on the slide-valve, substantially as described, and for the purpose set forth.

3. In a steam-engine, the combination of a slide-valve for steam admission, having its inner face cut under to admit steam, and a cut-off valve seated on the slide-valve and having its face hollowed out to retain steam between the valves, substantially as described, and for the purpose set forth.

4. In a steam-engine, the combination, with a slide-valve of the gridiron form, of a cut-off of the gridiron form seated on the slide-valve and having the faces of its bars hollowed out and in normal communication with the interior of the steam-chest to receive and retain steam for the purpose of balancing the valves, substantially as described, and for the purpose set forth.

5. In a steam-engine, the combination, with the steam-admission and steam-cut-off valves, of a pair of rocking exhaust-valves, operating-arms secured to their shafts, a vibrating plate or arm connected with their operating-arms, and means for vibrating the plate or arm, substantially as described, and for the purpose set forth.

6. In a steam-engine, the combination, with the main shaft and the steam-controlling valves, of a box-like portion of the supporting-frame intermediate of the main shaft and cylinder, movable bearings seated in said box-like portion, a pair of rock shafts journaled in the movable bearings, a pair of wedges in engagement with the bearings, and means for operating the wedges to take up wear, substantially as described, and for the purpose set forth.

7. In a steam-engine, the combination, with the main shaft and valves for controlling the admission of steam, of a box-like supporting-frame intermediate of the main shaft and valves, a cover to the said box-like portion, the cover provided with a depending central web having inclined sides, movable bearings on opposite sides of the web, rock-shafts journaled in the bearings, arms secured to the rock-shaft and extending upward through openings in the cover, inclined face blocks inserted between the web and bearings, and means for operating the inclined face blocks, substantially as described, and for the purpose set forth.

8. In combination, the main shaft, the three steam-controlling valves, the intermediate rock-shafts provided with arms—one with three arms and the other with two—connections between the main shaft and one arm of each shaft, and connections between the other arms and the valves, substantially as described, and for the purpose set forth.

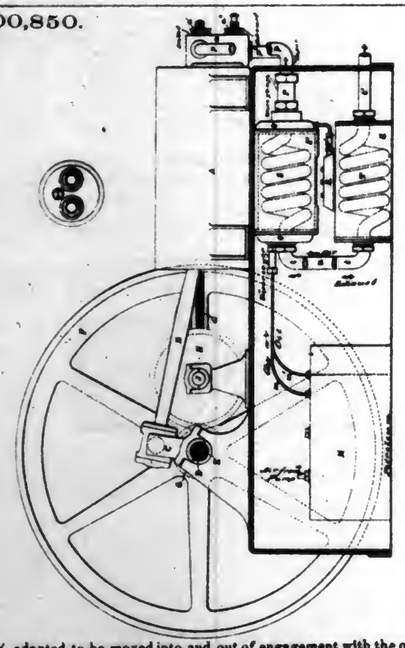
400,848. JOINT FOR FIRE-POT LININGS. STEPHEN D. HORTON, Peekskill, N. Y., assignor to Horton & Mabie, same place. Filed Nov. 19, 1888. Serial No. 291,215. (No model.)

Claim.—1. A joint for fire-pot linings, formed by a female section and a male section, the female section having a top and front wall on its face adapted to engage the top and front faces of the end of the male section, substantially as set forth.

2. A joint for fire-pot linings, formed by two meeting sections, one of the sections having a recess adapted to receive the end of the other section and engage the top and front thereof, and with a projection at the bottom of the recess, the other section having a recess in its end to receive said projection and lock the first-named section against vertical displacement, substantially as set forth.

400,849. GRAIN-METER. GEORGE R. HOWLAND, Pontiac, Ill. Filed June 16, 1888. Serial No. 277,336. (No model.)

Claim.—1. The combination, in a grain-meter, with an intermittent revolving cylindrical grain-measure divided into two compartments, each of which is provided with openings, and studs secured to and projecting from the end of said measure, of a pneumatic brake consisting of a bellows, as described, which is struck and compressed by one of said studs when said measure approaches the position where the openings of said compartments will receive and discharge grain, as set forth.



2. The combination, in a grain-meter, with an intermittent revolving cylindrical grain-measure divided longitudinally and centrally into two compartments, and studs projecting from the ends of said cylindrical measure, of an oscillating beam pivoted in suitable manner parallel to the plane of the adjacent end of the measure, so that studs will alternately strike the shorter end thereof, and a stop or check having a serrated edge pivoted contiguous and parallel with the other end of the measure and engaged alternately by the studs on the same, as and for the purpose set forth.

3. In a grain-meter, the combination of a revolving cylindrical measure having studs projecting from its end or head, a pivoted weighted beam having an arm in position to be struck by the said studs, and a pneumatic brake having a serrated stop or check-surface with which projections on the cylinder engage, substantially as described.

400,850. HYDROCARBURETED-AIR ENGINE. JOHN J. B. HUBBS, Camberwell, County of Surrey, England. Filed Mar. 8, 1887. Serial No. 230,068. (No model.) Patented in England Sept. 4, 1886, No. 11,269; in Germany Feb. 23, 1887, No. 21,510; in France Mar. 3, 1887, No. 181,939; in Belgium Mar. 5, 1887, No. 76,589; in Canada May 20, 1887, No. 44,230; in India Aug. 27, 1887, No. 158; in Italy Feb. 25, 1888, No. 3; in Spain May 10, 1888, No. 7,905, and in Ceylon May 24, 1888.

Claim.—1. The combination, in a hydrocarbureted-air engine, of the exhaust-valve of the motor-cylinder, the rod Q, and intermediate lever, *v*, for actuating said valve at or near the end of the outstroke of said rod, and a pressure-reliever comprising the rocking lever *w*, one end of which takes under the said intermediate lever, and a movable body or sleeve, *x*, on the rod Q, said body having a projecting part,

400,850.

as *x'*, adapted to be moved into and out of engagement with the other arm of lever *w*, substantially as set forth.

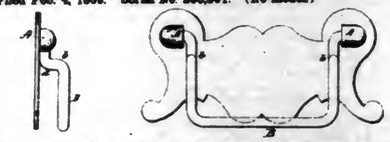
2. In a hydrocarbureted-air engine, the combination, with the reservoir M, containing compressed air and liquid hydrocarbon, of a mechanical vaporizer, N, pipes *m m*, which lead the air and liquid hydrocarbon, respectively, to said vaporizer, and a vapor-chamber connected with the vaporizer N, said chamber being provided with appliances for utilizing the heat of the waste gases for heating its contents, and also with a lamp for heating the contents of said chamber before the engine is started, as set forth.

3. The vapor-chamber Q, provided with an exteriorly-arranged jacket, S', open at its lower side to receive the heated gases from a lamp or like exterior heater, and also provided with an internally-arranged conduit for the passage of the waste gases from the engine, substantially as set forth.

4. In a hydrocarbureted-air engine, the combination, with the reservoir M, for containing compressed air and liquid hydrocarbon, the mechanical vaporizer, and the pipes for leading the air and liquid hydrocarbon to said vaporizer, of the vapor-chamber connected with said vaporizer, the air-chamber U, connected with said vapor-chamber, and conduits for the heated gases, arranged within said vapor and air chambers, said conduits being connected to form a continuous passage for said gases, substantially as set forth.

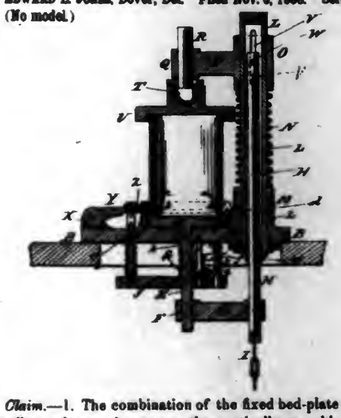
5. The combination, with the main shaft D and the auxiliary shaft D', aligned therewith, of the internal gear-wheel, d^7, loose on shaft D' and provided with one member of a double clutch, the gear-wheel d^4, fixed on shaft D, the pinion-shaft D^4, the pinions d^5 and d^6 on said shaft, meshing, respectively, with wheels d^3 and d^7, the member of the double clutch on shaft D, and the sliding member of said clutch on shaft D', substantially as set forth, whereby shaft D' may be driven in either direction by the shaft D.

400,851. PHONOGRAPH-DOLL. WILLIAM W. JACQUES, Newton, Mass., assignor to the Edison Phonograph Toy Manufacturing Company, of Maine. Filed Nov. 30, 1888. Serial No. 292,949. (No model.)



Claim.—1. The combination of a phonograph and a doll provided with a body containing and carrying said phonograph, and a closed hollow space in communication with the diaphragm and within the doll.

2. The combination of a phonograph and a doll provided with a body carrying said phonograph, and a closed hollow head to act as a resonator.



3. The combination, within the body of a doll, of a phonograph supported thereby, and a globular resonating-chamber divided into two portions by a perforated conical partition, substantially as described.

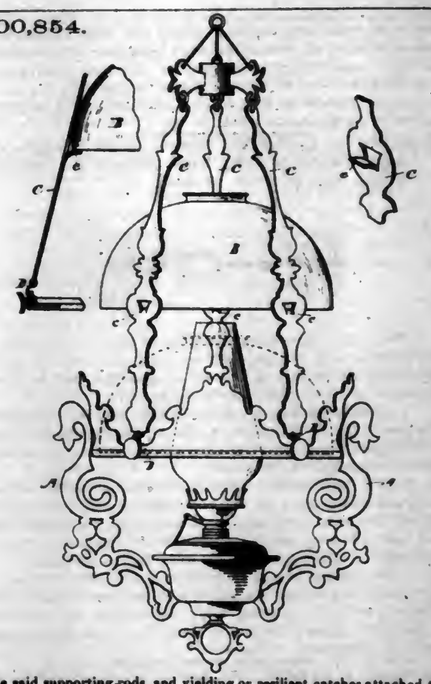
400,852. DRAWER-PULL. AUGUSTUS H. JOHNS, Meriden, Conn. Filed Feb. 4, 1889. Serial No. 298,591. (No model.)

Claim.—In a drawer-pull in which the handle is of U shape, the two legs terminating in pivots turned to the right and left and hung in sockets to the drawer-front, and so as to swing in said sockets, the handle constructed with stops *d* below the pivots, the body of the handle from said stops thrown forward out of the plane of the said stops and pivots, but substantially parallel therewith, and substantially as described.

400,853. MACHINE FOR APPLYING HEADS TO TIN CANS. EDWARD L. JOHNS, Dover, Del. Filed Nov. 6, 1888. Serial No. 290,104. (No model.)

Claim.—1. The combination of the fixed bed-plate having a central collar and central aperture, the vertically-movable bottom plate having a rod inserted loosely through the aperture in the bed-plate, the spring-actuated hinged segments overlapping the rim of the collar, the spider-plate connected to the free ends of the segments by jointed connecting-rods, the springs encircling said rods, the spring and collar upon the rod of the movable bottom plate, and the arm having a sleeve or socket at its outer end through which said rod is loosely inserted and adapted to exert upward pressure on the under side of the spider-plate, substantially as and for the purpose set forth.

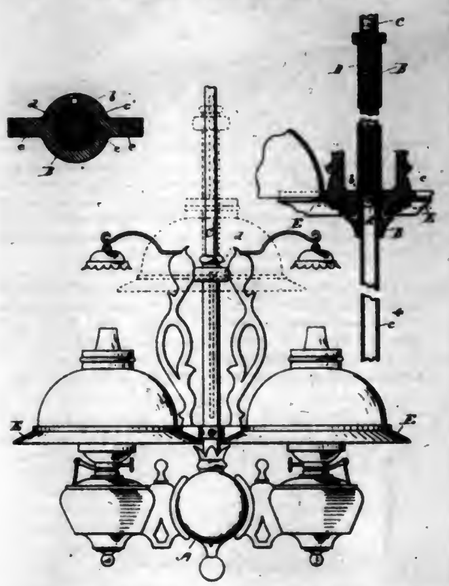
2. The combination of the hinged segments, jointed rods secured in and projecting downwardly from the free ends of the same, the springs encircling said rods, the bed-plate through which said rods are loosely inserted, the spider-plate in which their lower ends are fastened, and the described mechanism for raising and lowering said plate, substantially as and for the purpose set forth.



3. The combination of the bed-plate having a central collar and central aperture, the movable bottom plate and its downwardly-projecting rod having a flanged collar, and the described tripping mechanism, whereby the plate is lowered suddenly within the encircling collar of the bed-plate after it has been pushed up flush or even with the top thereof, substantially as and for the purpose set forth.

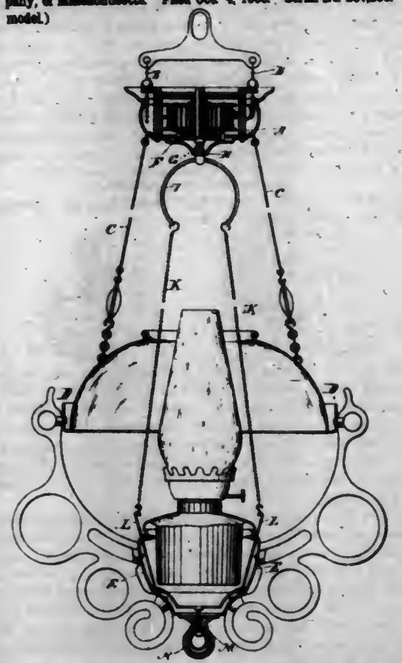
4. The combination of the tubular slotted standard, the spring encircling the same, the movable rod within said standard, the pin or bolt inserted transversely through the upper end of the inside rod and projecting through the slots in the tubular standard, the collar sliding upon said standard and fastened to the projecting ends of the transverse bolt or pin, the arm projecting from said collar and having a sleeve at its outer end, the rod inserted adjustably through said sleeve, and the plate connected to the lower end of said rod by a universal joint, substantially as and for the purpose set forth.

400,854. LAMP-SHADE HOLDER. JOSEPH KEITH, Ballard Vale, Mass. Filed Sept. 21, 1888. Serial No. 286,019. (No model.)



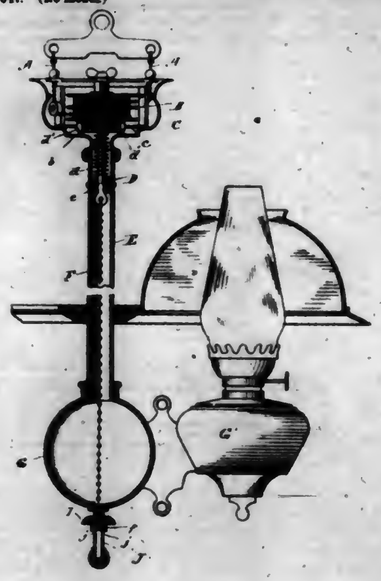
Claim.—In a suspension-lamp, the combination of a plurality of supporting-rods, a lamp-shade adapted to be raised and lowered within

400,854.



the said supporting-rods, and yielding or resilient catches attached to the supporting rods and adapted to spring inwardly against and engage directly with the shade to support it in an elevated position, all substantially as set forth.

400,855. LAMP-SHADE SUPPORT. JOSEPH KEITH, Ballard Vale, Mass. Filed Sept. 21, 1888. Serial No. 286,020. (No model.)



Claim.—In a chandelier, the improvement in shade elevating and supporting devices herein described, consisting of the standard C, provided with the vertical slot *c* and the upper horizontal slot, *c'*, and the sleeve B, having the lamp-shade holders attached, said sleeve being provided with a stud, *b*, adapted to enter the said slots, whereby the shade-holder and shades may be raised, lowered, and secured in position, all substantially as set forth.

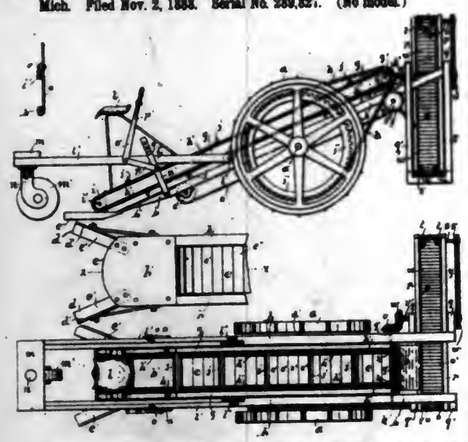
400,856. SUSPENSION-LAMP. JOSEPH KEITH, Ballard Vale, Mass., assignor to himself and the Craighead & Kintz Manufacturing Company, of Massachusetts. Filed Oct. 4, 1888. Serial No. 287,208. (No model.)

Claim.—In a suspension-lamp of the character described, the combination, with the mechanism which controls the motion of the raising and lowering drum, of a hollow lamp-fount-cup support, K, a stirrup, L, located and vertically movable therein and having its upper portions passing through the upper portion of the lamp-fount-cup support, a finger-grasp, N, attached to the lower part of the stirrup, and connections K, extending upwardly from the upper ends of the said stirrup and attached to the extremities of a cross-bar, I, connected with the drum-controlling latch, all substantially as set forth.

400,857. EXTENSION-CHANDELIER. JOSEPH KEITH, Ballard Vale, Mass., assignor to himself and the Craighead & Kintz Manufacturing Company, of Massachusetts. Filed Oct. 24, 1888. Serial No. 289,047. (No model.)

Claim.—In an extension-chandelier, the combination of the supporting-chains A A, winding-drum B, provided with notches *b* on its under side, the drum-case C, provided with the internally-located perforated plate *c*, the catch-piece D, having a fork, *d'*, arranged to work vertically through the perforations in the said plate to engage with the said notches, the coiled spring *d*, supporting said catch-piece, the shell E, hub G, shell J, provided with the vertical slots *j j*, finger-slide I, surrounding the said shell J and provided with a pin, *f*, and the chain F, connected at its upper end to the said catch-piece and at its lower end to the said pin, whereby the catch-piece may be operated to check or release the drum as the elevation, depression, or suspension of the fixture may require, all substantially as set forth.

400,858. LOCK. FRANK KRUPP, New Orleans, La. Filed Sept. 22, 1888. Serial No. 286,107. (Model.)



Claim.—1. In a tumbler-lock, the combination, with the lock-bolt having a recess and provided with an opening having a shoulder arranged above and in rear of a notch or pocket lying behind the stump on the bolt, of an independent latch-plate having a stud or pin lying in said notch and projecting beyond the outer face of the bolt, a latch-tumbler provided with a shoulder lying behind said pin or stud, and a lock-spindle having a cam slotted to receive the key, substantially as described.

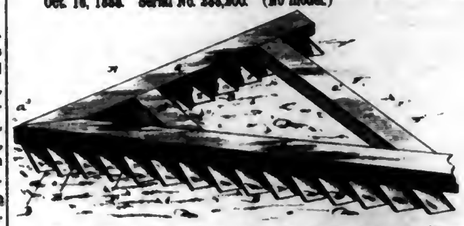
2. In a tumbler-lock, the combination, with a series of ordinary tumblers, and with a lock-bolt having a stump, of an independent latch-plate lying in a recess behind the said bolt and provided with a pin or stud projecting through a shouldered opening in the bolt and normally lying behind the stump, a latch-tumbler adjacent to the bolt having a shoulder lying behind and a point resting upon said pin or stud, a lock-spindle having a cam which lifts and retracts the independent latch-plate, and a key which raises the latch-tumbler, substantially as described.

3. In a tumbler-lock, the combination, with a lock-bolt having a stump and guided and supported by a post, 6, on the case, of a series of ordinary slotted tumblers, 7, a latch-plate, 28, sliding upon said post and having a pin or stud, 30, projecting through a notch, 32, forming part of an opening, 31, in the bolt, said opening having shoulders 33 and 40, a latch-tumbler, 36, having a point, 37, and a shoulder, 38, lying behind the stud 30, a lock-spindle, 12, having a slotted cam, 14, limited in rotation by lugs 17 on the case, and provided with a bearing, 18, lying in a shell, 22, having a notched flange, 23, an auxiliary key having a single projection, 39, lying partly in the slot in the cam 14, and a primary key having shoulders 41, acting on the ordinary tumblers and having a notch, 25, which receives the flange 23, substantially as described.

400,859. DITCHING-MACHINE. JOSEPH LALONDE, Brooxville, Mich. Filed Nov. 2, 1888. Serial No. 289,827. (No model.)

Claim.—The combination, in a ditching-machine, of the side pieces, *b*, supported at an incline by the axle *a'* and driving-wheels *a*, and provided on their front ends with a shovel-blade, *b'*, and the endless apron *c*, in rear of the shovel-blade, and devices, as described, for imparting a rearward movement to the upper run of the apron, with the levers *f*, with their rear ends pivoted at *f'* to the side pieces, *b*, and provided on their front ends with a cross-piece, *m*, the wheel *m'*, having a caster-bearing, *n*, secured to the said cross-piece, and the regulating-pieces *n'*, with their lower ends secured to the side pieces, *b*, and provided with the gage-stops *o* above the levers *f*, substantially as and for the purpose set forth.

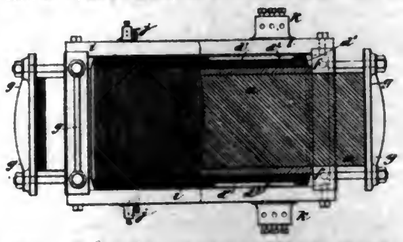
400,860. HAND-STAMP. EDWIN W. LEHMAN, Philadelphia, Pa., assignor of one-half to David C. Walker, Edgewater, N. J. Filed Jan. 11, 1888. Serial No. 260,414. (No model.)



Claim.—1. A hand-stamp having a head with an opening to receive type and a lip to engage with one side thereof, and a laterally-movable washer having a lip adapted for engagement with the opposite side of the type, substantially as described.

2. A hand-stamp having a head with a shoulder and a lip at one side thereof, and a sliding washer with an elongated opening and lip, which is opposite to the lip of the head and engages with the shoulder thereof, substantially as described.

3. In a hand-stamp, a collar receiving the pin or screw of the head, and a stem connected with said collar, forming a shoulder at the base thereof, in combination with a rubber handle partly encircling said stem and resting against said shoulder, the remaining portion of the handle being clear of the stem, substantially as described.



4. In a hand-stamp, the combination of the head A, with opening 1, having the lip 2 at one side thereof, and the shoulder 3, the washer B, with lip 4, extending below said shoulder, and type with inclined sides embraced by said lips 2 and 4, and right-angular adjacent sides, substantially as described.

400,861. HARROW. PHILANDER C. LOVELAND, Fairfield, Ill., assignor of one-half to John A. Moffitt and W. P. Bunch, same place. Filed Oct. 16, 1888. Serial No. 288,200. (No model.)

Claim.—In a harrow, the combination of the triangular frame A, having the rearwardly-divergent side bars, *a a*, the parallelogram-shaped teeth B B, affixed to the side bars and having their horizontal lower edges in the same plane, each succeeding tooth being inclined inward more than the preceding tooth, whereby the lower edges of all the teeth converge toward a common center on the line of draft in rear of the harrow, substantially as specified.

400,862. SECONDARY GENERATOR FOR THE CONVERSION OF ELECTRICAL ENERGY BY INDUCTION. WILLIAM LOWRIE and CHAS J. HALL, London, County of Middlesex, England. Filed May 24, 1887. Serial No. 239,366. (No model.) Patented in England Aug. 23, 1886, No. 10,765; in France May 28, 1887, No. 183,676; in Belgium May 28, 1887, No. 77,639, and in Italy Dec. 31, 1887, XXI, 22,594, XLIV, 398.

Claim.—1. A secondary generator or induction apparatus comprising one or more unit pairs of straight magnetic cores, each core being separately built up of flat thin plates square or rectangular in shape without re-entering angles, and having centrally mounted thereon superposed primary and secondary coils, a pair of the said straight cores being subsequently magnetically and mechanically united close to the

coils by bending and alternately overlapping the extended ends of the several plates and clamping them together in the form of an elongated link, substantially as and for the purpose described.

2. In a secondary generator, the combination of a magnetic core composed of thin flat plates in the shape of a solid square or rectangle with strips rounded upon their outer edges adapted to stiffen the said core-plates and to receive coils wound thereon, the ends of the said strips being cut away close to the coils, substantially as and for the purpose described.

3. In a secondary generator, the combination of two or more laminated magnetic cores, forming a complete magnetic circuit with flattened sides, on each of which are mounted superposed primary and secondary straight-wound coils, the junctions of the core ends being effected by bending, overlapping, and clamping the plates of the said cores, substantially as described.

4. In a secondary generator, the combination of two straight magnetic cores, each core composed of thin flat plates of square or rectangular form without re-entering angles, having mounted upon the central part of each core superposed primary and secondary coils, each end of each core being magnetically joined to the corresponding end of the other core, close to the said coils, in the form of a link with straight sides, substantially as and for the purpose set forth.

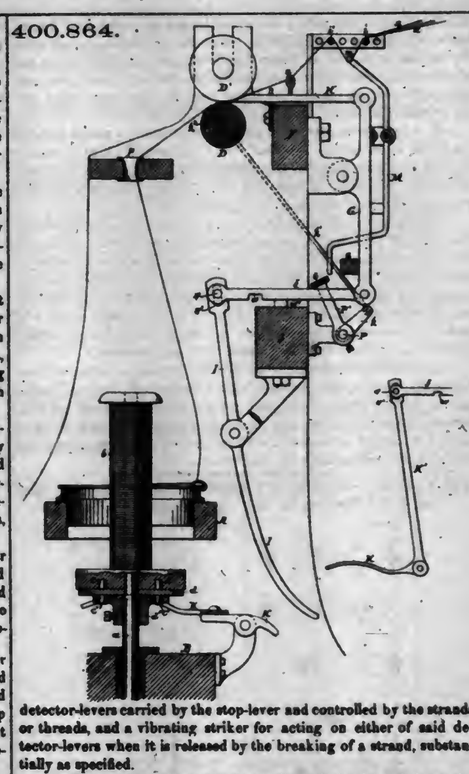
5. In combination, two or more magnetic cores of square or rectangular shaped plates without re-entering angles, superposed primary and secondary coils on central part of each core, alternately-lapped ends of protruding component core-plates close to coils, with the corresponding plates in adjoining core or cores in magnetically-continuous layers, and clamping devices at the junction of said plate ends, substantially as and for the purpose set forth.

6. Two or more laminated iron cores of square or rectangular shape without re-entering angles, and having superposed coils wound or mounted thereon, combined with distance pieces or blocks adapted to receive the end portions of the cores, and clamping devices to clamp the blocks and cores together in their relative positions, substantially as described.

7. In combination, two or more magnetic cores of square or rectangular shaped plates without re-entering angles, primary and secondary coils centrally mounted thereon, a frame or frames adapted to receive the said cores, and bolts, nuts, and plates adapted to clamp together the several plate ends in closed magnetic circuits without perforating the said ends, substantially as and for the purpose described.

400,863. REFRIGERATING AND VENTILATING CAR. CHRISTIAN R. LUCAS and ALBERT A. WOOD, Atlanta, Ga. Filed July 10, 1888. Serial No. 279,600. (No model.)

Claim.—1. The combination, in a refrigerating and ventilating car, of an ice-receptacle formed in the end of the car, the chambers on either side of said receptacle containing flues made by vertical partitions placed at right angles to the sides of the car, said flues being separated into upper and lower parts by horizontal partitions, the inner flues connecting with the ice-chamber, the interior of the car, and with the outer flues by openings in the partitions separating them, respectively, and the said outer flues connecting with the exterior of the car, substantially as set forth.



2. In a refrigerating and ventilating car, the chambers on either side of an ice-chamber formed in the car, containing flues formed by vertical partitions placed at right angles to the sides of the car, and horizontal partitions separating them into upper and lower flues, the inner flues connecting with the ice-chamber, the interior of the car, and with the outer flues by openings in the partitions separating them, respectively, the outer flues connecting with the exterior of the car by suitable openings, in combination with the valves for closing the openings in the partitions between said flues, and the mechanism for operating said valves, substantially as set forth.

400,864. STOP-MOTION DEVICE FOR SPINNING AND TWISTING MACHINES. WILLIAM LORD, Philadelphia, Pa. Filed Dec. 20, 1888. Serial No. 294,136. (No model.)

Brief.—The object of the invention is to provide simple, cheap, and effective means whereby, on the breaking of a strand, there will be a stoppage of the feeding devices and of the bobbin.

Claim.—1. The combination, in a spinning or twisting machine, of the feed-rolls and the drive-disk on the spindle with a separator-bar for the feed-rolls, a lifting-lever for the drive-disk, a stop-lever, connections between the same and the separator-bar and lifting-lever,

400,864.

detector-levers carried by the stop-lever and controlled by the strands or threads, and a vibrating striker for acting on either of said detector-levers when it is released by the breaking of a strand, substantially as specified.

2. The combination of the feed-rolls and the drive-disk on the spindle, the stop-lever, its detector-levers, the feed-roll separator-bar, the vibrating striker for acting on the detector-levers, a lifting-lever for acting on the drive-disk, an intermediate lever acting on said lifting-lever, and connections between the stop-lever and intermediate lever and between the stop-lever and separator-bar, substantially as specified.

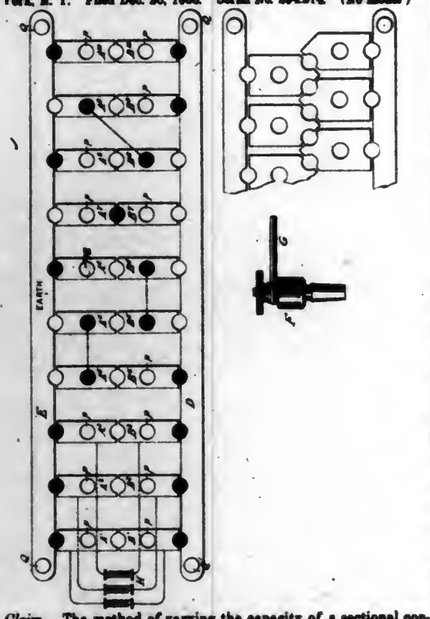
3. The combination of the feed-rolls, the drive-disk on the spindle, the stop-lever, its detector-levers, the feed-roll separator-bar, the lifting-lever for the drive-disk, the vibrating striker-bar for acting on the detector-levers, a connection between the stop-lever and separator-bar, and a connection between said stop-lever and the lifting-bar, said connection having a notched link for engaging with a retainer-bar when the link is in its retracted position, substantially as specified.

4. The combination of the feed-rolls, the drive-disk on the spindle, the stop-lever, its detector-levers, the vibrating striker for the latter, a lifting-lever for the drive-disk, connections between the stop-lever and lifting-lever, and a wedge-shaped feed-roll separator-bar hung to the stop-lever, all substantially as specified.

400,865. FASTENER FOR GLOVES. GEORGE W. MANDRILL, Gloversville, N. Y., assignor to Eugene Pringle, same place, and Madison D. Shipman and Charles E. Bradt, De Kalb, Ill. Filed Nov. 21, 1888. Serial No. 291,425. (No model.)

Claim.—1. In a ball-and-socket glove-fastening, a socket member consisting of an eyelet provided with a downward-curved top, and a tube formed below the same having slits in the lower end, which slits do not sever the continuity thereof, and an elastic washer, the slotted end of the tube being adapted to extend through the glove and be upset against said washer on the under side of the glove, as set forth.

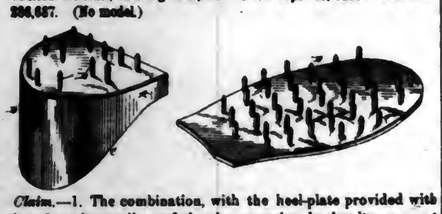
2. In a ball-and-socket glove-fastening, a socket member consisting



of an eyelet provided with a downward-turned top, and a tube formed below the same having slits at the lower end, which slits do not sever the continuity thereof, an elastic washer against which the lower end of said tube is upset on the under side of the glove, and an ornamental downwardly-flanged top or cap fitting over the top flange of the eyelet, as set forth.

3. A ball-and-socket glove-fastening comprising a socket member consisting of an eyelet provided with a downwardly-turned flanged top and a lower slitted end, an apertured and slitted washer against which the said lower tubular end of the eyelet is upset, and a stud adapted to engage said parts, as set forth.

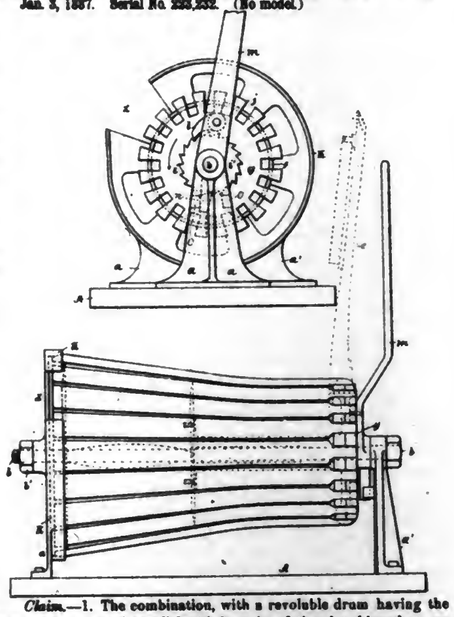
4. A ball-and-socket glove-fastening comprising a socket member consisting of an eyelet provided with a downwardly-curved flanged top and a lower slitted tubular end, a centrally-apertured radially-slotted washer having the ends of its separated parts struck down to engage the struck-up ends of the slitted parts of the lower tubular end of the eyelet, an ornamental cap or covering arranged over said eyelet, and a stud constructed of two sections united by flanges formed in each to provide a shoulder, substantially as described.



5. A ball-and-socket glove-fastening comprising a socket member consisting of an eyelet provided with a downwardly-curved flanged top and a lower slitted tubular end, and a centrally-apertured radially-slotted washer having the ends of its separated parts struck down to engage the struck-up ends of the slitted parts of the lower tubular end of the eyelet, substantially as specified.

400,866. ELECTRIC CONDENSER. WILLIAM MARSHALL, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,214. (No model.)

Claim.—The method of varying the capacity of a sectional condenser, which consists in grouping two or more sections in series to reduce the individual capacity of the sections and combining the group thus formed in multiple arc with one or more individual sections.



400,867. SOLE AND HEEL PLATE FOR BOOTS OR SHOES. GEORGE MEYERS, Sterling Run, Pa. Filed Sept. 26, 1888. Serial No. 286,657. (No model.)

Claim.—1. The combination, with the heel-plate provided with a series of teeth or spikes, of the rim or casing having its rear part extending upward a greater distance than the front portion thereof, and also provided with a conoidal perforation or hole, substantially as set forth.

2. The combination, with a boot or shoe, of the heel-plate provided with a series of teeth or spikes having enlarged upper ends terminating in a point, the rim or casing having its rear part extending upward a greater distance than the front portion thereof, and also provided with a conoidal perforation or hole, and the sole-plate provided with a series of teeth or spikes having enlarged upper ends terminating in a point, substantially as set forth.

400,868. CIGAR-MOLD. FREDERICK C. MILLER, Newport, Ky. Filed Jan. 3, 1887. Serial No. 223,232. (No model.)

Claim.—1. The combination, with a revoluble drum having the lower cups arranged parallel with its axis, of the slats hinged at one end to said drum, so as to project over the lower cups parallel therewith, and the upper cups secured to said slats, substantially as set forth.

2. The combination, with a revoluble drum having the lower cups arranged parallel with its axis and a disk having connection with said drum, so as to revolve therewith, of the slats of greater length than said cups hinged to said disk, so as to project over the lower cups parallel therewith, and the upper cups carried by said slats, substantially as set forth.

3. The combination, with a frusto-conical drum having the lower cups arranged parallel with its axis, of the hinged slats of greater length than said cups projecting over the lower cups, and the upper cups carried by said slats, substantially as set forth.

4. The combination, with a revoluble drum having the lower cups and the slats hinged at one end and carrying the upper cups, and a band partially surrounding said drum and embracing said slats near their free extremities, substantially as set forth.

5. The combination, with the rotary drum having the lower cups, of the slats carrying the upper cups and hinged at one end, and the stationary band or flange projecting over the free extremities of said slats and formed in part concentric with the drum, substantially as set forth.

6. The combination, with the drum having the lower cups, of the slats hinged at one end and carrying the upper cups, and the stationary band or flange projecting over the free ends of said slats, said band or flange being in part concentric with the drum and in part tangential thereto, substantially as set forth.

7. The combination, with the drum having the lower cups, of the slats carrying the upper cups, said slats being of greater length than said cups, the disk to which said slats are hinged, and the connection *h* between said disk and drum, substantially as set forth.

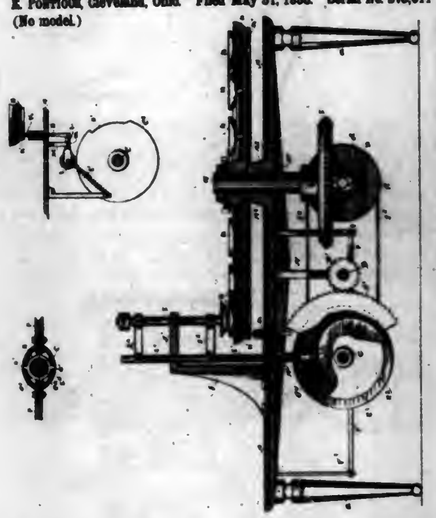
8. The combination, with the revoluble drum having the lower cups, of the hinged slats carrying the upper cups, and the disk connected to the drum and having the radial notches for the reception of the ends of said slats, substantially as set forth.

9. The combination, with the revoluble drum having the lower cups, of the hinged slats carrying upper cups, said slats having perforations *e'*, the flange *h''*, carried by the drum and having the notches in its periphery and the annular grooves in its outer face, the wire *f*, passed through said perforations and occupying said groove, and the disk *i*, having notches and an annular groove corresponding to the flange *h''*, substantially as and for the purposes set forth.

10. The combination, with a rotary drum having a number of flat surfaces and the lower cups arranged in said flat surfaces, of a hinged slat carrying a plurality of upper cups, substantially as set forth.

11. The combination, with the revoluble drum *c*, having the lower cups, of the hinged slats carrying the upper cups, the disk *g*, carried by the drum and to which said slats are hinged, and the sleeve *h*, connecting the disk with the drum, substantially as set forth.

400,869. COMBINED SOLDER AND FLUX. EDWIN NORTON and JOHN G. HODGSON, Chicago, Ill., assignors to said Edwin Norton and Oliver W. Norton, same place. Filed Apr. 5, 1886. Serial No. 197,779. (No model.)

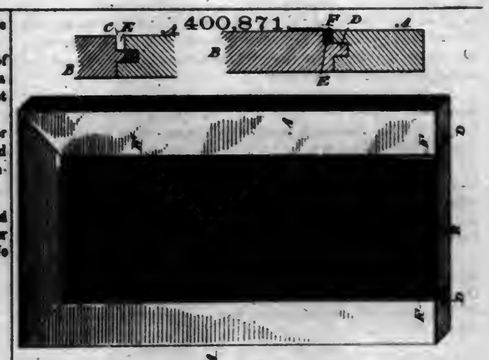


Claim.—1. Wire-solder provided with an outside groove or channel, a flux in said groove or channel, said groove or channel being closed or partially closed about said flux, substantially as specified.

2. Wire-solder provided with an outside dovetail-shaped groove or channel formed in the body of the wire for containing flux, substantially as specified.

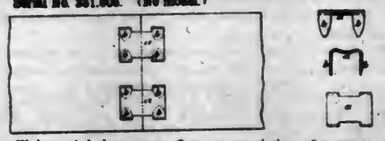
3. Flexible solder-wire provided with a continuous longitudinal bore containing flux, whereby the flux is retained in place therein, substantially as specified.

400,870. MACHINE FOR MAKING BIRD-TARGETS. MARSHAL E. PORTEOUS, Cleveland, Ohio. Filed May 31, 1888. Serial No. 275,611 (No model.)



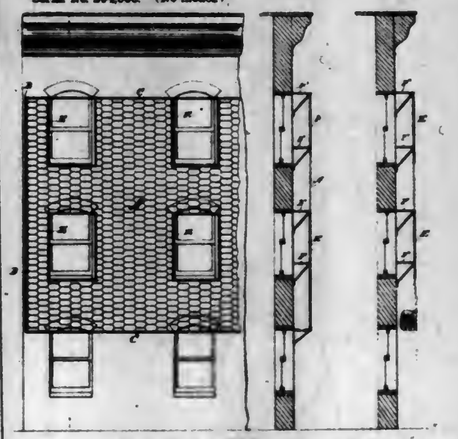
Claim.—1. The combination, with a table carrying a series of molds and gearing for imparting a rotary motion to said table, of a shaft, a clutch thereon, driving mechanism connected with the loose sliding section of the clutch for actuating the table-gearing, and devices for automatically opening and closing the clutch to intermittingly rotate the table, substantially as set forth.

2. The combination, with a table, gearing for rotating the same, molds, friction-clutch, motion-transmitting devices connecting the table-gearing and sliding section of the clutch, and a lever for sliding one section of the clutch, of a spring for actuating the lever in one direction and a cam for moving the lever in the opposite direction, the parts being timed to intermittingly rotate the table the distance from one mold to another, substantially as set forth.



3. In a bird-target machine, the combination, with a rotary table carrying molds, a constantly rotating shaft having a clutch thereon and power-transmitting devices actuated by the loose section of the clutch for rotating the table, of a plunger actuated by the constantly-rotating shaft, and a dog for locking the table against movement, also actuated by said shaft, substantially as set forth.

400,871. TOP FOR DESKS. WILLIAM H. PORTER, Washington, D. C. Filed July 7, 1888. Serial No. 279,300. (No model.)



Claim.—In the manufacture of a desk-top, the combination of the grooved frame A and the panel B, tongued all around its edges, the wood being cut away on the upper side, as described, so that when the panel is in position in the frame a rib-recess will be left between the frame and panel for fastening the cloth cover in place, substantially as set forth.

400,872. JOINT FOR STRAPS. CARL T. RENUS, Dresden, Saxony, Germany, assignor to Jean Schertel, same place. Filed July 31, 1888. Serial No. 281,608. (No model.)

Claim.—A belt or strap fastener consisting of a cramp of sheet metal in the shape of a slightly-downward curved sheet-metal strip, *a*, with four sharp-pointed teeth, *b*, at the corners, a wide space being left between the two teeth on each side, substantially as and for the purpose specified.

400,873. FIRE-ESCAPE. CHARLES O. ROSE, Rochester, N. Y., assignor of one-half to John Heisler, same place. Filed Dec. 27, 1888. Serial No. 294,808. (No model.)

Claim.—1. The herein-described fire-escape, consisting of a strong netting of large mesh secured to a building substantially parallel with the wall thereof, and extending around one or more of the windows, the meshes serving as hand and foot holds, as set forth.

2. In a fire-escape, the combination, with the supporting-brackets permanently secured to the building, of the strong netting of large mesh secured thereto, extending substantially parallel with a wall of the building and around one or more of the windows, the meshes serving as hand and foot holds, as set forth.

3. In a fire-escape, the combination, with the frame, of the strong netting of large mesh secured to the frame and means for securing the latter at top and bottom permanently to the side of a building substantially parallel with the wall thereof and in proximity to one or more of the windows, the meshes serving as hand and foot holds, as set forth.

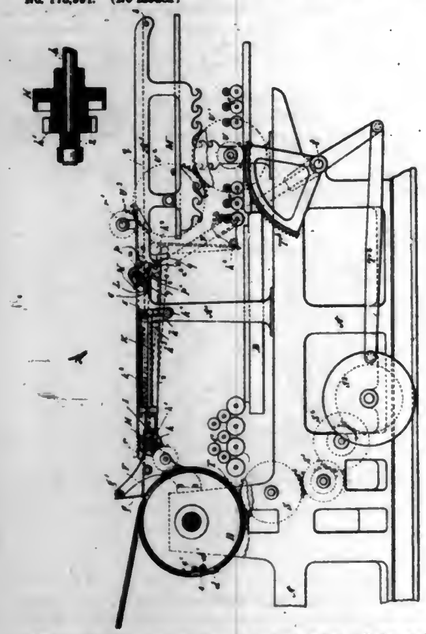
4. In a fire-escape, the combination, with the strong netting of

large, mesh secured to a building substantially parallel with the wall thereof, having openings coinciding with the windows and extending around one or more of them, of the meshes serving as hand and foot holds, substantially as described.

5. In a fire-escape, the combination, with the strong netting of large mesh adapted to be secured to a building having openings coinciding with the windows in the latter, of frames around said openings, substantially as described.

6. In a fire-escape, the combination, with the strong netting of large mesh adapted to be secured to a building, having openings coinciding with the windows in the latter, of the frame in said openings and the brackets securing them to the building, substantially as described.

7. In a fire-escape, the combination, with the building, of the strong wire-netting secured thereto substantially parallel with the wall thereof and extending around one or more of the windows, the bottoms of the meshes being horizontal and formed of two or more strands of twisted wire, forming hand and foot holds, substantially as described.



400,874. NEEDLE-BEAM FOR BRIDGES. EDWIN E. RUSTON, Mountain Spring, Tex. Filed Nov. 22, 1888. Serial No. 291,595. (No model.)

Claim.—1. The combination, with the needle-beams A, of the castings C, the caps B, the supports E and D', and the cables, substantially as described.

2. The combination, with the needle-beams A, of the supports E and D', the caps B, and the cables G and H, substantially as described.

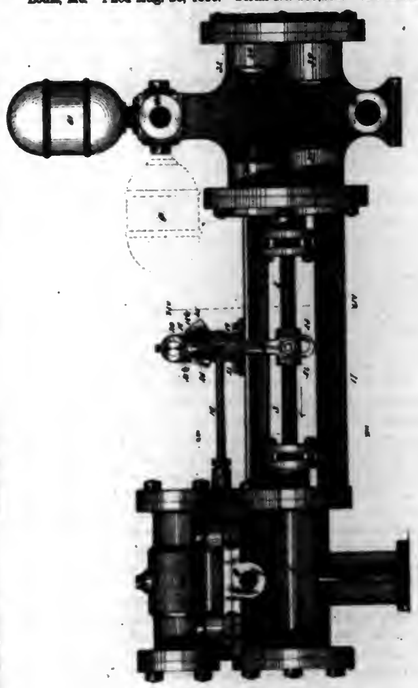
400,875. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Oct. 5, 1885. Serial No. 178,991. (No model.)

Claim.—1. The combination, with the impression-cylinder making two revolutions to each impression, of sheet-strippers upon which the advancing ends of the sheets are passed, endless belts and pulleys to convey the sheets along from the strippers, gripper-fingers to seize the sheet, a cross-bar carrying the grippers, mechanism for giving motion to the cross-bar, and a table upon which the sheet is laid as delivered, substantially as set forth.

2. The combination, with the impression-cylinder and its grippers, of lifting-fingers and their shaft upon the impression-cylinder, stationary sheet-strippers, endless belts and their pulleys, grippers, a cross-bar carrying such grippers, and mechanism, substantially as set forth, for moving the grippers, substantially as set forth.

3. The combination, with the impression-cylinder and grippers of sheet-strippers over which the printed sheet passes, endless belts and pulleys for conveying the sheets, a frictional driving mechanism, substantially as specified, for the belts, and a frictional brake for stopping the pulleys and belts, the grippers, and their actuating mechanism, substantially as set forth.

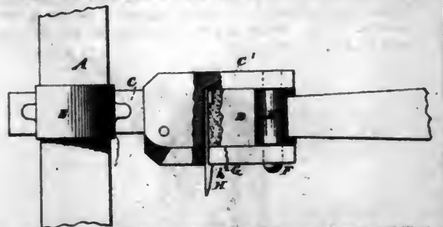
4. The combination, with the impression-cylinder, the sheet-strippers, and the belts and actuating mechanism, of the racks, the cross-bar N, the gripper-fingers, a spring to close the same, an arm and stop to open the grippers, a latch to hold the grippers open, and a stop to act upon the latch and allow the grippers to close, substantially as set forth.



5. The combination, with the impression-cylinder and its grippers, of sheet-strippers, endless conveying-belts, grippers, a cross-shaft for the same, racks at the ends of the cross-shaft, and pinions for moving said racks, substantially as set forth.

400,876. LAST. ELDRED W. STEAD, Stoke Newington, County of Middlesex, assignor to Ralph Lees, Crewe, County of Chester, England. Filed Nov. 15, 1888. Serial No. 290,944. (No model.) Patented in England Aug. 8, 1887. No. 10,855.

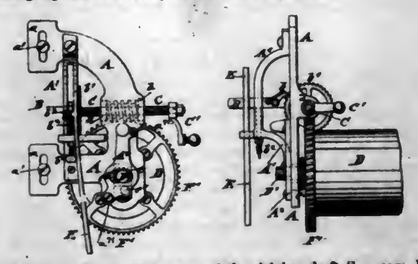
Claim.—A damp-boot drier consisting of a hollow hot-water-containing last formed of heat-conducting material integral with the hollow leg, the instep, the upper, and the sole shaped to fit the interior of the sole, upper, and leg of a boot, and the hollow leg formed at its top with an upwardly-projecting handle, and a transverse diaphragm containing a stoppered filling-aperture, substantially as shown and described.



400,877. STEAM PUMPING-ENGINE. FRANK STEINMANN, St. Louis, Mo. Filed Aug. 20, 1888. Serial No. 283,206. (No model.)

Claim.—1. The combination of the main cylinder provided with a piston and receiving-ports, 4 and 5, and exhaust-ports 6, an auxiliary cylinder located over the main cylinder and having ports 14 15 communicating therewith, an auxiliary piston connected to the valve of the main cylinder, an auxiliary valve for controlling the ports of said auxiliary cylinder, having the exhaust-ports 14½ extending therethrough, adapted to place the exhaust 6 and the ports 14 15 in communication, and mechanism connecting the rod of the main piston to the stem of the auxiliary valve, substantially as and for the purpose set forth.

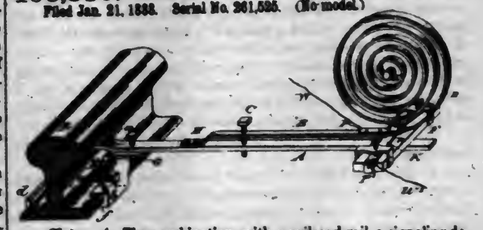
2. The combination of the main cylinder provided with a piston and receiving and exhaust ports, an auxiliary cylinder located over the main cylinder, an auxiliary piston, a valve for controlling the ports of the main cylinder connected to said auxiliary piston, an auxiliary valve for controlling the ports of the auxiliary cylinder, and a connection between the valve-stem and piston-rod of the main cylinder, consisting of a pivoted arm to which said stem is connected and which is provided with lugs and a slot, a lever connected to said piston-rod, a standard to which said arm and lever are connected, and a pin on the standard fitting in a slot in said arm, substantially as and for the purpose set forth.



400,878. THILL-COUPLING. DAVID K. STOUT, Bloomingdale, Mich., assignor of one-half to Albert Taylor, same place. Filed June 20, 1888. Serial No. 277,666. (No model.)

Claim.—A thill-coupling consisting of the eye E on the thill, the head C, carrying the fixed pivot F in its rabbet c', a hinged side latch, G, having pivot-hole g and shoulders g^2, a spring, H, having shoulders h^2, and the cross-barred yoke B C, as shown and described.

400,879. OPERATING MECHANISM FOR THE CLOTH-BEAMS OF LOOMS. CHARLES STRAUBMANN, Jersey City, N. J. Filed June 19, 1884. Renewed Jan. 8, 1889. Serial No. 296,905. (No model.)

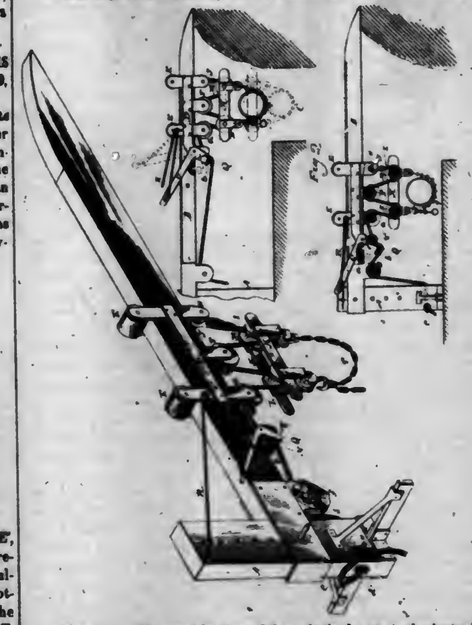


Brief.—A cam on a shaft operated from the driving-shaft acts on a lever, which through a rod gives reciprocatory motion to a lever carrying a spring-actuated pawl, which acts on a ratchet on a worm-shaft, which in turn operates a worm-gear fast on the shaft of the cloth-beam. By a set-screw the throw of the pawl-carrying lever can be adjusted. The shaft of the cloth-beam at one end plays in a journal-block, which is adjusted in a vertical slot of the bracket by means of an auxiliary plate provided with a transverse slot and an inwardly-extending lug and fastened by suitable fastening-screws.

Claim.—1. The combination of the driving-shaft S, a cam, E', intermediate gear-wheels, an oscillating lever-rod, E^3, a vertically-reciprocating rod, E, operated by said cam and having a heel or shoulder, b^3, an oscillating lever, B, a supporting-bracket, A, having a slotted guide-piece, A', and set-screw b^4, for the lever B, a pawl, b, on the oscillating lever B, a shaft, C, having a ratchet-wheel, b', and worm F, and a cloth-beam, D, having a worm-wheel, F', substantially as set forth.

2. The combination of a supporting bracket-plate, A, having a guide-opening, an auxiliary face-plate, A^3, pivoted to the bracket-plate A, said face-plate having a transverse slot, c^4, and a projecting lug, c', a cloth-beam, D, having a shaft, D', a journal-bearing, c, for said shaft guided in said opening and supported by the lug c', and a fastening-screw, a^{12}, for removably retaining said auxiliary plate in position, substantially as set forth.

400,880. RAILWAY-SIGNAL. SAMUEL T. STREET, Deposit, N. Y. Filed Jan. 21, 1888. Serial No. 261,535. (No model.)

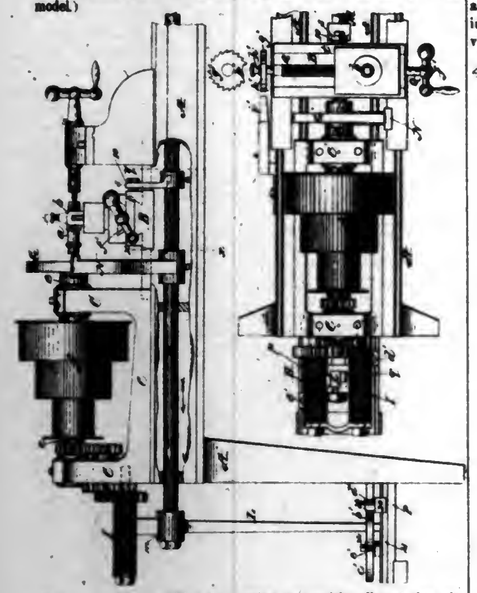


Claim.—1. The combination, with a railroad-rail, a signaling device, and an electric circuit, of a lever mounted to have contact with said rail, a block of non-conducting material mounted upon said lever at its free end, contact-springs secured to said block, and a spring-arm mounted upon the lever in advance of the block of non-conducting material and adapted to vibrate between the contact-springs carried by said block, substantially as set forth.

2. The combination, with a railroad-rail, a signaling device, and an electric circuit, of a lever mounted to have contact with said rail, a block of non-conducting material mounted upon said lever at its free end, contact-springs secured to said block and overlapping at their free ends, and a spring-arm carrying a coiled spring mounted upon the lever in advance of the block of non-conducting material and passing between the overlapping ends of the spring-contacts, substantially as set forth.

3. The combination, with a railroad-rail, a signaling apparatus, and an electric circuit, of a lever mounted to have contact with the rail, a block of non-conducting material carried by the lever at its free end, contact-springs secured to said block, devices secured to the block for regulating the tension of said contact-springs, and a spring-arm mounted upon the lever in advance of the block of non-conducting material and passing between the contact-springs carried by said block, substantially as set forth.

400,881. PIPE-LAYING APPARATUS. DANIEL A. STREETER, Waterbury, Conn. Filed Aug. 27, 1888. Serial No. 283,573. (No model.)



Claim.—1. The combination of the principal post A, the beam B, extending horizontally therefrom, the post provided with a suitable base for its vertical support, a carriage, D, hung upon said beam and adapted to travel thereon, the carriage provided with pulleys F G below the beam, with a cradle, K, carrying pulleys L M, and a rope attached by one end to said carriage and running down around the pulley M on the cradle, up over the pulley F of the carriage, down around the pulley L of the cradle, thence up over the pulley G of the carriage, the said cradle provided with means for supporting the pipe, substantially as and for the purpose described.

2. The combination of the post A, the beam B, extending horizontally therefrom, carriage D, supported and so as to run upon said beam, the carriage carrying pulleys F G below the beam, the cradle K below said carriage, a rope attached by one end to the carriage and running around pulleys in the cradle and over the said pulleys in the carriage, the carriage constructed with an opening in rear of the pulleys, through which the rope runs, and a brake-lever carrying a finger adjacent to said opening in the carriage and adapted to operate as a brake upon the rope, substantially as and for the purpose described.

3. The combination of the post A, the beam B, extending horizontally therefrom, a carriage arranged to travel upon the beam, a cradle below the carriage, a rope by which said cradle is suspended to said carriage, a lever, O P, hung upon said carriage, a beam constructed with one or more notches, *a*, and the lever provided with corresponding studs, *b*, substantially as and for the purpose described.

400,882. MACHINE FOR CUTTING SCREW-TAPS. GEORGE W. TOWER, Boston, Mass. Filed Aug. 22, 1888. Serial No. 283,457. (No model.)

Claim.—1. In a machine for cutting taps with relieved threads, the combination, with the head and tail centers for supporting the work and a slide-rest or tool-carriage, of the reciprocating rock-shaft M, connected with the tool-carriage and provided with means for transversely operating the tool-slide to cause the tool to move toward or from the work, a pattern-wheel or face-plate, G, having a cam-shaped periphery, and a lever secured to the reciprocating rock-shaft and bearing upon the pattern-wheel, whereby the shaft M as it is moved longitudinally is rocked to cause the tool to advance and recede to cut a relieved thread on the top, substantially as set forth.

2. In a machine for cutting taps with relieved threads, the combination, with the head and tail centers for supporting the work and a slide-rest or tool-carriage, of the reciprocating rock-shaft M, provided with a crank-arm, *a*, connected with the tool-slide *t* of the carriage, whereby the tool is caused to advance and recede as the shaft is rocked, the pattern-wheel or face-plate G, having a cam-shaped periphery, the lever N, secured to the rock-shaft and bearing on the pattern-wheel, whereby the shaft is rocked to operate the tool-slide transversely, the feed and return screws H I, geared to the live-spindle, and the lever L, connected with the rock-shaft M and provided with the half-nuts *p q*, the said lever L being vibrated to cause the half-nuts to alternately engage with the feed and return screws, whereby the tool-carriage is reciprocated, all operating substantially as described.

3. In a machine for cutting taps with relieved threads, the combination, with the reciprocating tool-carriage B, its operating rock-shaft M, the lever N, and pattern-wheel G, of the tool-slide *t* and the transverse feed-screw Q, for operating the same, provided with a ratchet-wheel, *g'*, having a blank or toothless portion, *k'*, and the stationary pawl *i'*, whereby the tool is advanced and its motion automatically arrested when the thread on the tap has been cut to the desired depth, substantially as set forth.

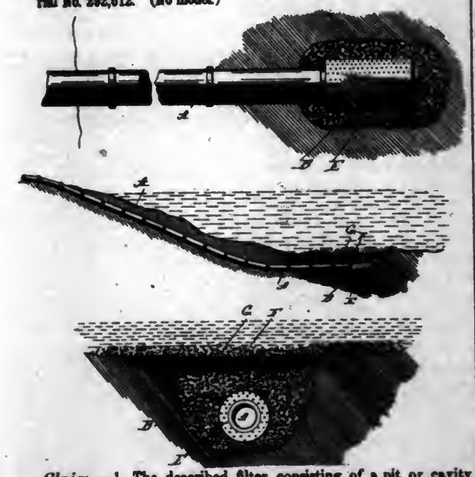
4. In a machine for cutting taps with relieved threads, the combination of the head and tail centers for supporting the work, a slide-rest or tool-carriage, the reciprocating rock-shaft M, connected with the tool-carriage and provided with means for transversely operating the tool-slide to cause the tool to move toward or from the work, a pattern-wheel or face-plate, G, having a cam-shaped periphery, a lever, N, secured to the reciprocating rock-shaft and bearing upon the pattern-wheel, the feed and return screws H I, the lever L, connected with the rock-shaft M, and having the half-nuts *p q* at its upper end and provided at its lower end with the springs *b' c'*, the guide-plate *w*, and the rolls *d' d'*, with which the springs are alternately brought into contact, all operating substantially in the manner and for the purpose set forth.

5. In a machine for cutting taps with relieved threads, the combination, with the reciprocating rock-shaft M, connected with the tool-carriage, and the lever N, attached to said rock-shaft and carrying the half-nuts *p q*, of the feed and return screws H I, having threads with a carrying-face at right angles to the axial line of the screw and tapering from the bottom toward the top on the opposite side or face, and having a flat top and bottom, whereby the half-nuts *p q* are held in constant engagement with the said feed and return screws and prevented from slipping thereon, substantially as described.

400,883. WATER-MOTOR. FREDERICK W. TUBBS, Jr., Syracuse, N. Y., assignor of two-thirds to James C. Hunter, same place, and John Hunter, Sterling Valley, N. Y. Original application filed Jan. 8, 1887, Serial No. 223,728. Divided and this application filed Sept. 21, 1887. Serial No. 250,272. (No model.)

Claim.—1. In an improved water-motor, the combination of the case provided with a water-inlet in one side thereof, a shaft extending through the case central of the water-inlet, and a hub having in the side facing the inlet an annular port around the shaft and hollow radial arms extending therefrom, said shaft being journaled in boxes projecting from the sides of the case and provided with metal sleeves adjustable axially to maintain water-tight joints between the hub and the case, substantially as described.

2. In a water-motor, the case provided with a water-inlet in the center of one side, a shaft extending through the case central of the water-inlet, and a hub mounted on said shaft and provided with an induction-port at the side facing the inlet in the case, and hollow radial arms extending from said port, in combination with an annular anti-friction bearing between the face of the hub at the induction-port and the case at its water-inlet, and the adjustable collar bearing on the opposite end of the hub, whereby the joint between the hub and case at the water-inlet is kept tight, substantially as described.

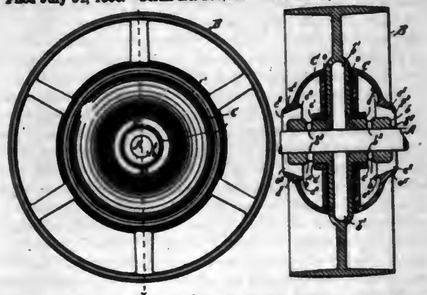


3. In a water-motor, the case having a central water-inlet at one side, the shaft extending therethrough, and the wheel having hollow hub and radial arms extending therefrom with nozzles on their free ends and deflected laterally from the inlet side of in the case, combination with the annular inclined water-shield extending from the opposite side of the case, and the shield depending peripherally from the case and having a V-shaped lip and water-escape openings, substantially as described.

4. In combination with the case having journal-boxes projecting from opposite sides thereof and the driving-shaft extending through said boxes, and the wheel secured to said shaft, a longitudinally-adjustable bushing secured in one of the journal-boxes and bearing against a loose collar on one side of the wheel-hub, a longitudinally-adjustable bushing in the other journal-box, and a collar affixed to the shaft at the inner end of said latter bushing, all constructed and combined to adjust the wheel within the case, substantially as described and shown.

5. The within-described centrifugal governing-valve on the nozzle N, the water-conducting arms A, consisting of the valves *r*, pivoted lever R, and an adjustable spring, S, all substantially as and for the purpose set forth.

6. The water-shield *k*, provided with the V-shaped lip *k'*, depending peripherally from the annular case A of the water-motor, and provided with the water-escape openings k^3, substantially as and for the purpose set forth.



400,884. FILTER. ALFRED WILBUR, Allegheny, assignor of one-half to Benjamin H. Lightfoot, Pittsburg, Pa. Filed Dec. 4, 1888. Serial No. 292,612. (No model.)

Claim.—1. The described filter, consisting of a pit or cavity formed in the river-bed, a line of pipe extending from said pit to a connection upon the shore, as a suitable pump, a strainer upon the end of said pipe located within the pit or cavity, filtering material surrounding said strainer, and a covering of clay across the top of said pit or cavity, substantially as described.

2. The described filter, consisting of a pit or cavity formed in the river-bed, a line of pipe extending from said pit to a connection upon the shore, as a suitable pump, a strainer upon the end of said pipe located within the pit or cavity, filtering material surrounding said strainer, a covering of clay across the top of said pit or cavity, and a covering material above the clay for protecting the same, substantially as described.

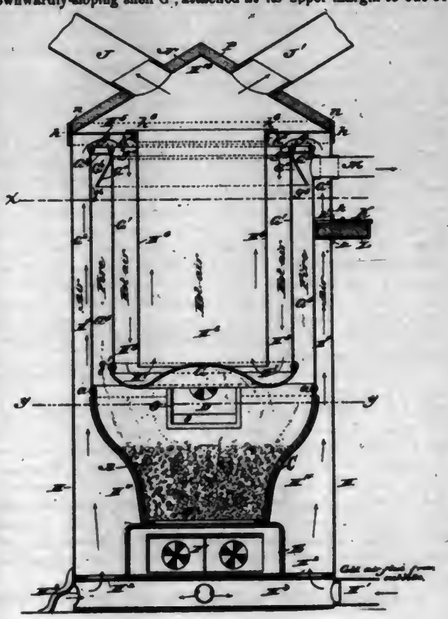
400,885. LUBRICATOR FOR LOOSE PULLEYS. CHARLES W. WILDER, Fitchburg, assignor, by direct and mesne assignments, to Thomas C. Entwistle, Lowell, and William H. Rankin, Lawrence, Mass. Filed July 31, 1886. Serial No. 209,611. (No model.)

Claim.—1. An oil-chamber provided at one end with an opening adapted to receive and fit the hub of a loose pulley and at the other end with an opening larger than said hub and adapted to extend beyond the outer end of said hub, as and for the purpose specified.

2. An oil-chamber circular in cross-section and provided at one end with a central opening adapted to receive and fit the hub of a loose pulley and at the other end with another central opening larger than said hub and adapted to extend beyond the end of said hub, as and for the purpose specified.

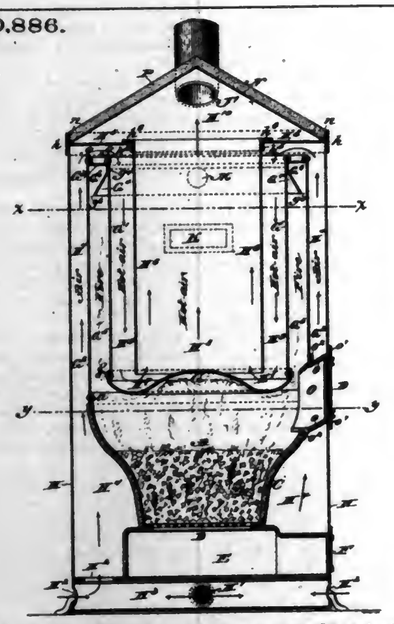
3. An oil-chamber provided at one end with a central opening adapted to receive and fit the hub of a loose pulley and at the other end with another central opening larger than said hub, the outer end of said last-named opening being adapted to extend beyond the end of said hub, said chamber being provided on the inner surface of its outer end with an annular groove surrounding said outer opening, as and for the purpose specified.

4. The combination of a loose pulley provided with a hub and an oil-chamber provided at one end with an opening to receive and fit said hub, the other end of said chamber extending beyond the end of said hub and having a central opening larger than said hub, said hub being provided with one or more oil-passages leading from the eye of said hub to the outside of the same within said chamber, as and for the purpose specified.



5. The combination of a loose pulley provided with a hub and an oil-chamber provided at one end with an opening to receive and fit said hub, the other end of said chamber extending beyond the end of said hub and having a central opening larger than said hub, said hub being provided with one or more oil-passages leading from the eye of said hub to the outside of the same within said chamber, and provided also with an external annular groove connecting the outer ends of said oil-passages, as and for the purpose specified.

6. The combination of a loose pulley provided with a hub and an oil-chamber provided at one end with an opening to receive and fit said hub, the other end of said chamber extending beyond the end of said hub and having a central opening larger than said hub and flaring inwardly and having an annular groove about said last-named opening, said hub provided with one or more oil-passages leading from the eye of said hub to the outside of the same within said chamber, as and for the purpose specified.



400,886. HOT-AIR FURNACE. ALFRED WILLIAMS, Philadelphia, Pa. Filed Apr. 12, 1888. Serial No. 270,475. (No model.)

Claim.—1. In a heating-furnace provided with fire-pot and contained fire-space and an annular combustion-chamber communicating with said fire-space and rising above the crown-sheet G, the smoke-flue M, leading from the upper part of said annular combustion-chamber at one side thereof, and the shelf G^4, surrounding and contained within the said annular chamber beneath the exit of said smoke-flue, there being a crevice, g^6, extending around the said annular chamber between the free edge of said shelf and the opposite wall and adapted to cause the products of combustion to ascend vertically into the space above said shelf and be thence drawn laterally into said smoke-flue M, substantially as described.

2. In combination with the fire-pot C, fire-space A, crown-sheet G, and annular combustion-chamber G^3, the smoke-flue M, opening from the upper part of said chamber G^3 at one side thereof, and the downwardly-sloping shelf G^4, attached at its upper margin to one of

400,886.

the walls of said annular combustion-chamber beneath said smoke-flue and extending around within the same, there being the crevice g^4 around the free margin of said downwardly-sloped shelf, the whole constructed substantially as and for the purposes described.

3. An air-heating furnace consisting of fire-pot C and its attachments, fire-space A, transverse imperforate crown-sheet G, and annular combustion-chamber G^2, surrounding and extending above the level of said crown-sheet, with smoke-flue M leading from one side of said annular combustion-chamber at the upper part thereof, in combination with an annular air-casing surrounding said furnace, having air-inlets beneath said casing closed above, and extended inwardly over said annular combustion-chamber G^2 and downwardly within the inner walls thereof, forming the annular inward passage H^7 between the lower free margin of H^6 and the upper surface of the crown-sheet G, and the central upward air-passage, H^6, said casing adapted to convey a current of air to be heated upward and inward over the top of said combustion-chamber G^2, thence downward within the same, and thence inward beneath the free margin of wall H^6, and finally upward in a central column of highly-heated air, the products of combustion being carried off from the upper part of said combustion-chamber G^2 at one side thereof, substantially as described.

4. In combination with the furnace A C, imperforate crown-sheet G, attached to the inner wall, G', of annular combustion-chamber G^2, said combustion-chamber surrounding and rising above the level of said crown-sheet, open beneath into fire-space A, closed above by the wall G^3, and having external wall, G^4, attached to fire-pot C, the smoke-flue M, leading from the upper part of said annular combustion-chamber G^2 at one side thereof, and an air-guiding casing consisting of external vertical wall, H, surrounding said furnace and provided with air-inlets H^3 H^3 beneath, closed transverse top H^5, attached to the upper part of wall H and extended inwardly over and within the annular combustion-chamber G^2, inner vertical wall, H^6, attached to and depending from the inner margin of H^5 and terminating beneath in a free margin, leaving annular space H^7 continuously extending around and over said crown-sheet G, and central vertical air-passage, H^6, the whole constructed to operate substantially as and for the purposes herein shown and described.

5. In combination with the air-distributing chamber H^{10} above the level of a heating-furnace, and provided with one or more hot-air exits, J J', the upward central air-passage, H^6, opening centrally into H^{10}, annular downward air-passage H^9, leading at its lower part, H^7, into H^8, transverse passage inward over annular combustion-chamber G^2 and beneath plate H^9 into the upper part of passage H^9, annular upward air-passage H^4, external to furnace A C G^2, and leading from inlets H^3 H^3 beneath to passage into H^9 above, said passages separated from each other by continuous annular walls and leading into each other through continuous annular passages from said inlets H^3 to said distribution-chamber H^{10}, substantially as and for the purposes described.

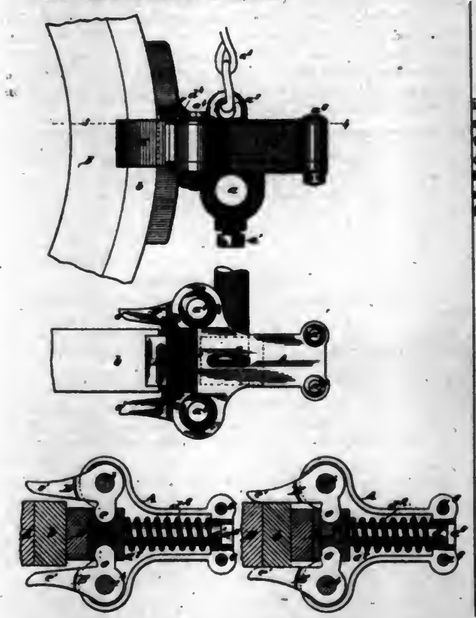
6. In a furnace for heating buildings by hot air conveyed through passages thereof, the furnace proper having ash-pit, fire-pot, entrance for fuel, and the fire-space A, and over said fire-space, relatively near the same, the transverse crown-sheet G, formed entire and imperforate, and the annular combustion-chamber G^2, connecting the outer margin of said crown-sheet with the wall of said fire-pot, and rising above the level of and surrounding said crown-sheet, and having smoke-flue M leading from the upper part of said annular combustion-chamber G^2, in combination with said furnace, an annular air-casing consisting of outer wall, H, external to said furnace, extending above the level of said annular casing and pierced by said smoke-flue M, having external air-inlet, H^3, beneath, and transverse top H^5, continuing said casing H over and within the vertical inner line of said annular combustion-chamber, and downward inner wall, H^6, continuing said casing H H^5 downward within said annular combustion-chamber G^2, having annular space H^9 between said wall H^6 and said combustion-chamber G^2, and central passage, H^8, over the center of said crown-sheet G, separated from said fire-space A thereby, and the inward passage H^7, connecting the lower part of annular air-space H^7 with lower part of central passage, H^8, said passage H^9 forming a central air-passage upward, together with one or more air-distributing pipes, J, above the level of the said furnace, substantially as described.

7. In combination with a stove or furnace having transverse crown-sheet over and relatively near the fire-space A, said crown-sheet formed entire without opening or perforation therein, and an annular combustion-chamber surrounding said crown-sheet above the level of the same and attached by its inner wall to the periphery thereof and by its outer wall to the upper part of the fire-pot C, closed above at G^3 and having smoke-flue M leading from said annular combustion-chamber G^2, the annular wall H^6, extending downward within the inner walls of said annular combustion-chamber, having vertical downward passage H^9 between said wall H^6 and said chamber G^2, and an air-inlet external to its upper part over said combustion-chamber, said wall H^6 extending downward near to and above said crown-sheet G and leaving annular passage H^7, together with the central upward air-passage, H^8, receiving a current of air through the said passage H^7 from said downward passage H^9, the whole constructed to operate substantially as described.

8. The combination of stove or furnace A C D E, solid imperforate crown-sheet G, annular combustion-chamber G^2, surrounding said crown-sheet and extending above the level of the same, smoke-flue M, leading from said annular combustion-chamber, with the annular wall H^6, extending downward within the inner wall, G', of said combustion-chamber and forming an annular downward passage, H^9, open above externally and terminating beneath in a free margin, leaving annular space H^7 between the upper surface of said crown-sheet G and said free margin, said space H^7 continuous around and within the periphery of said crown-sheet, and internal ascending passage, H^8, connected therewith and extending above the upper surface of said furnace, substantially as described.

9. In combination with a heating-furnace having ash-pit, fire-pot, and a fire-space, A, and above and relatively near said fire-space, a transverse crown-sheet, G, attached by its periphery to the inner wall, G', of the annular combustion-chamber G^2, the outer wall, G^3, supported by said fire-pot, said combustion-chamber closed above by transverse wall G^3, and having smoke-flue M leading therefrom, and beneath said smoke-flue the annular shelf G^4, extended around within said chamber G^2, there being a crevice, g^4, the air-casing surrounding said furnace and consisting of external annular wall, H, having inlets H^3, inturned top H^5, forming transverse passage over and within the inner wall, G', of annular combustion-chamber G^2, downwardly-turned inner wall, H^6, forming downward passage H^9, there being an inward passage, H^7, between the lower margin of H^5 and the upper surface of G, and ascending cylindrical passage H^8 within the wall H^6 and connected with passage H^9 through space H^7, chamber H^{10} above and connected with H^8, cover N, and one or more hot-air-distributing pipes, J J', substantially as and for the purposes herein set forth.

10. In a portable metallic hot-air furnace for heating buildings, the furnace proper, having fire-space A, crown-sheet G, relatively near said fire-space and attached to inner wall of combustion-chamber, annular combustion-chamber G^2, and air-casing consisting of outer wall, H, inturned top H^5, connected therewith, and inner wall, H^6, depending therefrom, having ascending cold-air passage H^4 surrounding the outer wall of said furnace, having inlets H^3 beneath, transverse air-passage inward over the top of annular combustion-chamber G^2, downward air-passage H^9, inward passage H^7, ascending central passage, H^8, chamber H^{10} above the same, distributing-pipes J J', and metallic cover N, together with the supplemental non-conducting cover P, adapted to prevent escape of heat from said chamber H^{10} before distribution thereof, substantially as described.



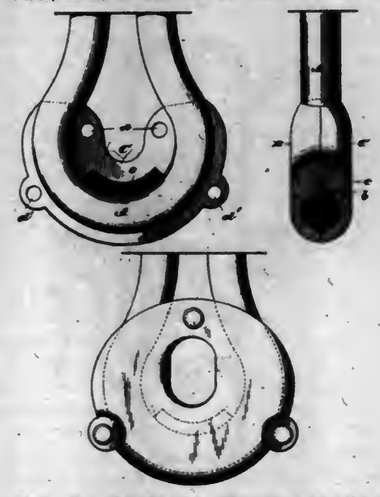
11. In a hot-air furnace, in combination with a fire-space, A, and annular combustion-chamber G^2, and an imperforate crown-sheet, G, within said annular chamber G^2, closing the space within the inner walls, G', thereof and relatively near the fire-space A, the double annular casing H H^5 H^6, there being transverse passages beneath H^5 and H^6, forming continuous annular passages H^4 upward, transverse passage beneath H^5 inward, H^9 downward, H^7 inward, and central cylindrical upward passage, H^8, said passages continuous and adapted to convey currents of air in contact with more and more highly-heated parts of said furnace from fire-pot C to center of crown-sheet G as said currents of air advance along the surfaces of said furnace, together with smoke-flue M, leading from the upper part of said annular combustion-chamber G^2 and receiving the products of combustion at the lowest temperature from contact with the coolest currents of air in their ascent through passage H^4, substantially as described.

12. In a hot-air furnace, an annular combustion-chamber, G^2, supported by its outer wall, G^3, upon the margins of fire-pot C, having annular top G^5, attached hermetically to outer wall, G^3, and to inner wall, G', imperforate crown-sheet G, attached hermetically to lower margin of said inner wall, G', and supported thereby, in combination with a double annular air-casing consisting of vertical outer wall, H, provided with air-inlets H^3 beneath, having annular top H^5, hermetically attached to and supported by said wall H and hermetically attached to and supporting inner annular wall, H^6, said wall H^6 terminating in a free margin near to and above said crown-sheet G, leaving space H^7 and internal upward passage, H^8, the said furnace and said air-casing independent of each other and each self-supporting, substantially as described.

13. In a stove or furnace, the fire-pot C, annular combustion-chamber G^2, solid imperforated crown-sheet G, attached to inner wall of the combustion-chamber, internal annular casing, H^6, downward annular passage H^9 between said casing H^6 and the inner wall of said chamber G^2, open above to receive the currents of air to be heated, there being a continuous annular passage, H^7, connected externally with the lower part of downward air-passage H^9 and internally with the lower part of upward central air-passage, H^8, together with smoke-flue M, leading from said annular combustion-chamber G^2, substantially as and for the purposes set forth.

14. In combination with the fire-pot C, fire-space A, annular combustion-chamber G^2, smoke-flue M, leading therefrom, outer air-casing, H, inwardly-extended transverse top H^5, having joint h^3, and downwardly-extended inner wall, H^6, having joint h^3, there being a space H^7, beneath wall H^6, connecting the downward passage H^9 and upward central passage, H^8, the solid imperforate crown-sheet G, extended over and relatively near the fire-space A, hermetically attached to the lower margin of inner wall, G', of annular combustion-chamber G^2, said crown-sheet having an upward convexity in the center thereof beneath said central passage, H^8, and an annular concavity in its upper surface beneath the free margin of said annular wall H^6, substantially as described.

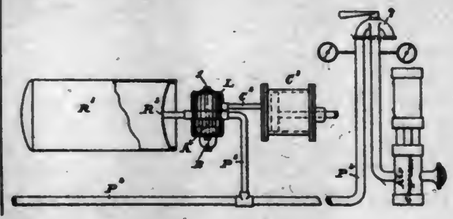
400,887. VEHICLE-BRAKE. ARTHUR H. WILSON, St. Louis, Mo., assignor of one-half to Gustav F. Vogel, same place. Filed Dec. 17, 1888. Serial No. 293,908. (No model.)



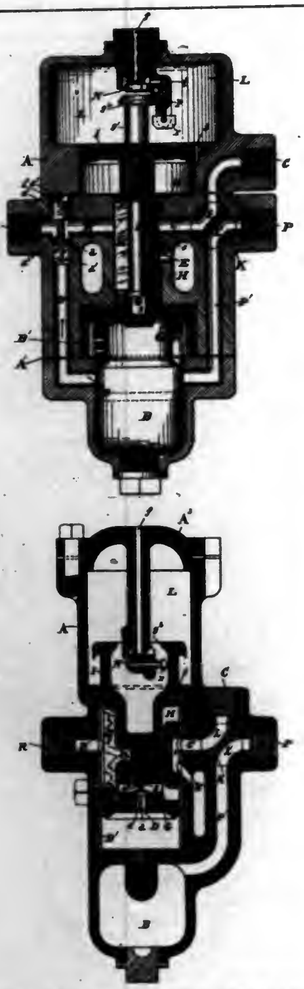
Claim.—1. In a brake, the combination of a pair of pivoted grips, a brake shoe or block, and a lever or beam, all so arranged and combined that the brake lever or beam and the part or parts rigidly attached thereto may be moved forward after the shoe or block is brought into contact with the periphery of the wheel, so as to cause the jaws of the grips to clasp the rim of the wheel, for the purposes set forth.

2. In a brake, the combination of a pair of pivoted grips each provided with a jaw and a lever-arm or analogous part, a brake shoe or block, and a brake lever or beam, all so connected together, arranged, and combined that the brake lever or beam and the parts or part rigidly attached thereto may be moved forward after the shoe or block is brought into contact with the periphery of the wheel, and so move the lever-arms of the grips as to cause the jaws thereof to grip the rim of the wheel, for the purposes set forth.

3. In a brake, the combination of a pair of pivoted grips each having a lever-arm or analogous part and a jaw, a brake-shoe or brake-block, a lever or brake-beam, and a spring, all so arranged and combined that pressure may be transmitted to the shoe or block through said spring, and the brake lever or beam and attached parts or part moved forward, so as to bring pressure upon the lever-arms of said grips and cause the jaws thereof to close upon the rim of the wheel, for the purposes described.



400,888. WEAR-PLATE FOR BUOY-EYES. ALBERT L. WOODWORTH, Norfolk, Va. Filed Nov. 3, 1888. Serial No. 290,314. (No model.)



Claim.—In combination with a buoy-eye, castings B and C, having recesses curved to correspond with the contour of the eye, corresponding recess and projection, b and c, immediately above the center of said curved recesses, and perforations d and d' at opposite sides of the curved recesses, through which bolts or rivets pass for securing the wear-plates upon the eye, so as to be immovable upon each other and upon the buoy-eye, substantially as shown, and for the purpose set forth.

REISSUES.

10,993. FLUID-PRESSURE BRAKE. GEORGE A. BOYDEN, Baltimore, Md., assignor of one-half to Charles R. Mann, same place. Filed Jan. 11, 1883. Serial No. 260,436. Original No. 280,286, dated June 26, 1883.

10,993.

Claim.—1. In a fluid-pressure brake, the combination of a single line of train-pipe, an air-reservoir on the car, a brake-cylinder, a valve moved both ways by air-pressure to open and close communication between the said reservoir and brake-cylinder, and a passage from the train-pipe to the same end of the brake-cylinder which communicates with the air-reservoir, which passage is opened and closed by varying the pressure in the train-pipe.

2. In a fluid-pressure brake, the combination of a single line of train-pipe, an air-reservoir on the car, a brake-cylinder, a valve moved both ways by air-pressure to open and close communication between the said reservoir and brake-cylinder, a passage through which air passes from the train-pipe to the brake-cylinder, and a check-valve which allows air to pass one way only in said passage.

3. In a fluid-pressure brake, the combination of an air-compressing apparatus, a single line of train-pipe, a cock to control the compressed air in the train-pipe, an air-reservoir on the car, a brake-cylinder, a valve moved both ways by air-pressure to open and close communication between the said reservoir and brake-cylinder, a passage through which air passes from the train-pipe to the brake-cylinder, and a check-valve which allows air to pass one way only in said passage.

4. In a fluid-pressure brake, the combination of a single line of train-pipe, an air-reservoir on the car, a brake-cylinder, a valve-casing provided with a passage to admit air from the train-pipe to the same end of the brake-cylinder which communicates with the air-reservoir, which passage is opened and closed by varying the pressure in the train-pipe, and a valve moved both ways by air-pressure to open and close communication between the said reservoir and cylinder.

5. In a fluid-pressure brake, the combination of the single line of train-pipe, a brake-cylinder, an air-reservoir on the car, valve mechanism to open and close connection between said cylinder and reservoir, a chamber for air to resist the movement one way of the shifting parts of the valve mechanism, and an exhaust-valve separate from the shifting parts of said valve mechanism which discharges the resisting air.

6. In a fluid-pressure brake, the combination of the single line of train-pipe, an air-reservoir on the car, a brake-cylinder, a valve moved both ways by air-pressure to open and close communication between the said reservoir and brake-cylinder, a chamber for air to resist the movement one way of the shifting parts of the valve mechanism, and a passage which opens one way only to allow fluid-pressure from the train-pipe to enter the brake-cylinder while the brakes are applied, as set forth.

7. In a fluid-pressure brake, the combination of a brake-cylinder, an air-reservoir on the car, valve mechanism to open and close connection between the said cylinder and reservoir, a chamber for air to resist the movement of the shifting parts of the valve mechanism in that direction which the air-pressure in the train-pipe would force them, air-compressing apparatus on the locomotive, and a single line of train-pipe to connect directly between the air-compressing apparatus and the said appliances on the car, whereby the usual main air-reservoir on or near the locomotive is dispensed with, as set forth.

8. In fluid-pressure brakes, the combination of the single line of train-pipe, the brake-applying devices on the car, valve mechanism which opens and closes communication with the brake-applying devices, and an exhaust-valve to discharge air that is in immediate resistance to the shifting parts of said valve mechanism, whereby the movement of the latter is quickened.

PHOTO LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE TAINTER.

Decided March 25, 1889.

1. DIVISION—PROCESS AND PRODUCT—RE-EXAMINATION OF EX PARTE BLYTHE, (C. D., 1885, p. 82.)

While there is no express provision of the statute limiting or controlling the discretion of the Commissioner in embracing more than one invention in the same Letters Patent, and the courts would not for that reason declare such a patent void, the statute does prohibit the introduction into reissue patents of new matter or other invention than that covered by the original patent. The Supreme Court has held that under this prohibition no new matter could be introduced; that process and apparatus are separate and distinct inventions, and that when a patent for one has issued, although the other was distinctly shown, a reissue for both could not be maintained. (*Burr* v. *Duryee*, 1 Wall., 531; *James* v. *Campbell*, 104 U. S., 356; *Powder Co.* v. *Powder Works*, 98 U. S., 126; *Heald* v. *Rice*, 104 U. S., 737.)

2. The opposite conclusion has been reached in regard to process and product when both were new and the process could produce no other product and the product could be made by no other process. This conclusion is based upon the premise that such process and product contribute one single invention. It must be deemed settled by the highest authority that such processes and products are not separate and distinct but unitary inventions, and that the process and product may be regarded and claimed as parts of such invention, much as different elements in a combination may be separately claimed. This conclusion finds satisfactory support in the nature of the invention itself, as well as in the character of legal property residing in it.

3. This conclusion excludes all other cases of process and product, such as when either process or product is not new, or when the product can be made by some other process or the process will produce some other product.

4. The novelty of the tablet in the present case doubted, but not determined; but the novelty and patentability of the process denied. The question of division in such case, being a preliminary one, must be settled first, and consequently the action of the examiner in requiring division is affirmed for this reason, and not upon the general proposition.

ON petition.

GRAPHOPHONIC TABLETS.

Application of Charles Sumner Tainter filed November 14, 1887, No. 255,082.

Mr. Anthony Pollok for the applicant.

HALL, *Commissioner:*

This application contains the following claims:

1. A tablet for graphophonic records, having a recording-surface consisting, essentially, of ozokerite wax, substantially as described.

2. A tablet for graphophones, comprising a foundation of paper or other suitable material, having a surface coating of concentrated or boiled ozokerite wax, substantially as described.

3. The method of preparing a tablet for use in graphophones by boiling crude ozokerite wax until it loses from ten to thirty per cent. of its weight, and then applying the same to a suitable base or foundation, substantially as described.

Claims 1 and 2 cover a graphophone-tablet as an improved article of manufacture. Claim 3 is for an improvement in the art by which the tablet is made. Applicant claims that both the process or method and the product are new, and that the art cannot be executed without producing the article, and that the article cannot be produced except by the art.

In the first action of the Office the question of division was overlooked by the examiner, and all the claims were rejected for want of invention. In the second letter the oversight was corrected and division required, on the ground that an article and the process of making it could not be included in the same patent. Second action was waived and applicant has appealed from the requirement of division to the Commissioner. It may therefore be said that the requirement of division is based upon the proposition that the art and the product constitute two separate and distinct inventions, which cannot be embraced in one set of Letters Patent, and also upon a declaration that neither of the two alleged inventions is new. The applicant has appealed from the requirement of division to the Commissioner, and relies upon the authority of *ex parte Blythe*, (C. D. 1885, 82.) The examiner, recognizing the fact that in *ex parte Herr* this particular question of division was not passed upon, and also recognizing the authority of *ex parte Blythe*, compares the latter with the authorities upon which it was founded, and gives a construction to it with the following conclusion: That joinder of process and product have been permitted and are allowable in the following cases only: (1.) When both are new, and the product is new not merely as an improvement upon something of the same kind, but absolutely new as being the first of its kind and a new departure in the arts. (2.) To justify such joinder in a single patent the process and product must bear such relation to each other that no other known process will make the particular product and the product can be made by no other process.

Among other cases he quotes from *Merrill* v. *Yeomans*, (5 O. G., 267:)

A patentee who has invented a new process in the arts whereby an article of manufacture is produced, *new in kind* and not before known, may separately claim and patent both the art and the manufacture. He cannot properly combine them in one claim.

Also, *Rubber Company* v. *Goodyear*, (9 Wall., 788:)

Processes and their results *are wholly disconnected and independent facts.* Such is the sound and necessary construction of the statute.

The question of division in almost every conceivable form has come before me, and I have attempted to dispose of it upon certain accepted and recognized principles. (*Ex parte Herr*, C. D., 1887, 105; *ex parte Sartell*, 42 O. G., 295; *ex parte Simonds*, 44 O. G., 445; *ex parte La Borde*, 44 O. G., 700; *ex parte Gillette*, 44 O. G., 819; *ex parte Willcox and Borton*, 45 O. G., 455.)

The case before me presents the question of joinder of process and its product, or method and article of manufacture, in one set of Letters Patent. I might perhaps dispose of it upon the authority of *ex parte Blythe* (C. D., 1885, 82) and *ex parte Young* (*Ib.*, 108) and allow the question to rest there; but it is somewhat singular that while both of these cases have had their controlling influence on this particular question it was involved in neither. In each the question presented was that of division as between process and apparatus, and only as *obiter dicta* can either be accepted as authority upon the present question. As to process and apparatus they are directly opposed to each other, and in their *obiter* reasoning the Young decision goes much further and is much more indefinite than the Blythe decision. The reasoning in the decision in *ex parte Young*, which permits two inventions, process and apparatus, to be included in one patent, would necessarily admit the new product as the third, while the Blythe decision, distinctly recognizing the four statutory divisions of art, also recognizes two specific classes of process and product as constituting unitary inventions which lie partly in two of the separate divisions. In consequence there exists uncertainty as to which decision is the controlling authority and the extent or limitation of its application. In addition, an impression prevails that in some of the later decisions of the present Commissioner, cited above, there are suggestions and opinions which either directly or by analogy overrule or very much shake the ruling in *ex parte Blythe* and *ex parte Young*. I find myself therefore not only justified but required to attempt a re-examination of the question, with the view, if possible, of definitely settling and giving permanence and harmony to the practice in relation to it.

I believe a careful examination of the decisions of the present Commissioner will fail to disclose even a *dictum* which, when properly considered, can be said to bear upon this question, except as subject for mere inference or argument.

Shall all inventions of process and product be joined in one application? If not, shall any such be joined; and, if so, what shall be the limitation? So far as it may be accepted, *ex parte Young* declares that the proper rule will admit of all cases. *Ex parte Blythe* says that is too broad—

> There are perhaps only two cases in which claims to a process (or mode or method) and to a product can properly be included in one patent, and these are: (1) when the product is entirely new, and hence the procedure also; or, (2) where the exercise of the procedure would produce no other result, and where the result (the product) could be produced by no other procedure, (process, mode, method.) In such cases, of course, the invention is unitary, and, being incapable of division, not only may, but must, be included in one patent. If there were two patents upon such an invention, one with a claim to the process and the other with a claim to the product, (hitherto unknown as produced by *any* procedure, or incapable of being made in any way other than by the process, subject of the first patent,) there would be two patents for the same thing.

The last proposition is a very broad one, in view of the fact that separate patents and separate reissue patents have been issued for processes and products, respectively, and have been sustained by the courts. It is not stated that divisional applications may not issue for the process and the product. We have the direct authority of *Plummer* v. *Sargent* (120 U. S., 442) for supporting two patents, for process and product, which constitute one invention, and when the product could be made by no other process. On the other hand, there is the Mosler Safe decision, (127 U. S., 354,) in which it is held that a patent upon an article of manufacture barred a patent upon a contemporaneous application for the mechanical procedure or method by which alone the article could be made. The question as to the validity of either patent was not raised in *Plummer* v. *Sargent* upon the ground that there were two patents for the same invention, or that one patent would bar the other. The Mosler Safe case is a later one, but there is no necessary conflict. In the latter the product or article was such that its process was disclosed in its structure; in the former it was not. It could not be known how the latter product was made except by absolutely ascertaining what process had been employed, although the Tucker bronze could be made by no other process than the Tucker process.

It is not pretended that a new process and an old product, or an old process and a new product, can be prosecuted together. In each case one of the elements or facts lacks novelty and the invention consists of the new process or new product only. Then what class of processes and products constitute unitary inventions? According to *ex parte Blythe* they are limited to *two* classes. It is there distinctly stated:

> Suppose there be invented something in an art, or, as it is ordinarily called, a "process," also the machine for carrying out the process, and also the manufacture or article which is produced in the operation of the process by the machine. There can be no doubt but that the statute calls for three patents for these three things. It makes no difference whether they are invented simultaneously or successively, by one man or by three. Their independence remains the same.

In this supposed case the process, product, and machine were all new, and yet the decision holds that each is a separate distinct invention, found and defined in a distinct statutory class, and must be patented separately. This gives the general rule, viz: All processes and their products which are respectively new and patentable must be applied for and patented separately. Out of this must be excepted only two cases. What are they? I am forced by the language employed to give it a construction: first, when the product is entirely new, and hence the procedure also, *or* where the exercise of the procedure would produce no other result; *and, second*, when (the product being entirely new) the result (product) could be produced by no other procedure, (process, &c.)

The two exceptional cases divide by the word *and*, rather than by the word *or*. Otherwise the first exception embraces cases where the process and product are simply new, which is *a felo de se*, in view of the general rule first stated above. The first excepted class must be construed to mean a case where the product is entirely new, or new in kind, and *hence* its process is new—that is, the process is new *because* the product is new. To illustrate, take the angle-irons in the *Mosler Safe Company* v. *Mosler*: To cut and bend iron in any form or shape was old; but when, as a consequence of the manufacture, the result assumed a specific shape which was novel and useful, then the specific process was new—new because what it had accomplished was new and the process inhered in the product. It was impossible to see the product, understanding its form and construction, without at the same time perceiving, as part of its structure, the process by which it was made, just as you can see a self-luminous body in its own light.

I am not able to discover any distinction between the second excepted case in *ex parte Blythe* and the first, unless the first was intended to cover mechanical methods and the last processes proper. If this be correct, then *Plummer* v. *Sargent* presents an illustration of the last exception. It involved reissued patents for what is known as the "Tucker bronze." The original patent covered claims for the "process of ornamenting iron in imitation of bronze by the application of oil and heat, as described," and also for "the new manufacture, consisting of iron ornamented in imitation of bronze by the application of oil and heat." It was reissued in two patents, for the process and the product, respectively. The question was whether the defendant infringed in consequence of making a very similar article, but one which was easily distinguished, so that the product could not be said to be the same as Tucker bronze, unless it could be shown that it was made by the identical Tucker process. The Court says:

> Although there are two patents, one for a process and the other for a product, *there is in fact but one invention*; and it may be assumed that the new article of manufacture, called Tucker bronze, is a product which results from the use of the process described in the patent, and not one which may be produced in any other way, so that, whatever likeness may appear between the product of the process described in the patent and the article made by the defendants, their identity is not established unless it is shown that they are made by the same process.

Now, what possible distinction with reference to the *oneness* of process and product exists between the two excepted classes and the general classes, according to *ex parte Blythe*? It is difficult to arrange or classify processes and products with regard to such supposed distinctions. There are processes or methods which do not result in any patentable product. Bell's method of transmitting articulate speech is a notable illustration. There are methods which are mere functions of machines which give form or structure to patentable products or articles; but such methods are but functions of machines and not patentable. There are processes which so inhere in the product that a patent on the product leaves nothing in the process that is patentable. (*Mosler Safe case*, 127 U. S., 354.)

The Goodyear process and product furnish illustration of a case when both process and product were new. As far as then, or now, known, the process could result in no other product and the product could be made by no other process. It is true, to assert of such a product that it can be made by no other process is to declare a limitation upon what is possible and to prescribe a limit to the inventive faculties, yet the patent law requires a practical application, and it necessarily follows that it is proper to assert that to be impossible which is at the time beyond the range of human knowledge to accomplish. So it must be said that Goodyear's process would produce no other product and that his product could be produced by no other process. When a new process shall be discovered which will produce that identical product the proposition will cease to be true. It is also true that the Goodyear product, made by his process, may be said to be different from the same product if made by a new and different process, if the product can depend for existence or identity upon the process by which it is made; but the law does not recognize patentable distinctions between products which possess no appreciable difference in qualities and characteristics, and when the only difference consists in a reference to the method or process by which they are produced or made. (*Ex parte Ackerson*, C. D., 1869, 74; *ex parte Truesdale*, C. D., 1870, 123; *ex parte Sellers*, C. D., 1872, 197; *ex parte Mayall*, C. D., 1873, 134: *ex parte Lupton*, C. D., 1874, 40; *ex parte Cobb*, C. D., 1874, 60; *ex parte Arkell*, C. D., 1877, 73; *Draper* v. *Hudson*, 1 Holmes, 208; *Cochrane* v. *Badische Anilin Co.*, 27 O. G., 813; 111 U. S., 293.)

It does not follow that a claim to a product is void because there may be some reference therein to its process, or that a patentee may not limit his claim to the product made by a specific process. It is required that the product shall be described and claimed by definite qualities or characteristics, other than by any reference to its process, for, as above stated, when the product possesses no such qualities and is incapable of distinction except by reference to its process, it is not patentable and the invention exists in the process alone. (*Ex parte Burrage*, Mason, Commissioner, MS. Dec., 1853, Vol. I, p. 93.)

> A patent may sometimes be rightly granted for a product, but never where the only means for describing that product is by a reference to the process by which it is obtained. In such cases the patent should be granted only for the process.

There are also processes which produce more than one product, when possibly neither could be produced by any other process. I had before me recently a case involving a process of treatment of crude oil, which produced two distinct products—a refined deodorized oil and a deposit of useful pigment for paint. It is not impossible that another distinct process could produce the refined oil and a third distinct process the pigment; yet it must be conceded that if the first process could alone produce the two products and neither of the latter could be produced by any other process, the process and the two products would constitute one invention, under the statement of the court in *Plummer* v. *Sargent*.

There are also other procedures, especially mechanical methods and their products or articles, which may be both entirely new, and yet the product or article be capable of production by various other methods, which may suggest themselves at once upon inspection of the product of article. Upon what, if any, line shall a definite distinction be drawn between these various classes or kinds of processes and their products? When shall a process and its product be said to constitute one invention? Or must all processes and all products be held to be separate inventions and be embraced in separate patents? Undoubtedly the question is one of greatest difficulty, unless it be determined arbitrarily, without reference to principles or authorities.

A process and its product are different things or facts. One is a producer, the other the thing produced. One produces the other, executes itself, and as an active agent or instrumentality ceases to exist at the instant the umbilicus of relation is severed and the product is delivered complete from the forces which give it existence. The former is called an art, the latter a machine, manufacture, or composition. Strong reasons can be urged to establish the proposition that process and product are, in the very nature of things, distinct inventions, and therefore not to be covered by the same patent. In the classification of

the arts in the Office, to which great weight is attached in *ex parte Herr* as being an important feature of the American system, the art or process and its product are generally found in different classes of invention and divisions of the Office. The same danger of mistakes on the part of the Office in overlooking references when examining such applications necessarily exists.

However serious and important these considerations, there are others which seem more controlling and conclusive. It is no longer an open question that under our system it was never intended that two or more distinct and separate inventions should be claimed and receive examination in the same application. However much difficulty there might be in ascertaining and determining whether the invention be a single invention, when it has been determined it must be applied for alone, and cannot be joined with other separate and distinct inventions. The only instance in which there has ever been recognized the slightest departure from this practice is in the matter of reissues, where by the statute of July 3, 1832, section 13, it was provided that "improvements" could be subsequently incorporated in a patent by certificate. By the act of March 3, 1837, section 5, it was provided that the improvements could be covered—be separate reissue patents—when a reissue was ordered. This continued to be the law until July 8, 1870, section 3, when this provision was repealed and the introduction of any new matter in the reissue patents was prohibited.

It has been definitely settled by the Supreme Court that under this prohibition no new matter can be introduced. However closely allied or dependent upon each other the process and the apparatus by which it is executed may be, that Court has held them to be separate and distinct inventions, and that when a patent has issued for one, although the other was distinctly shown, a reissue for both could not be sustained. (*Burr* v. *Duryee*, 1 Wall., 531; *James* v. *Campbell*, 104 U. S., 356; *Powder Co.* v. *Powder Works*, 98 U. S., 126; *Heald* v. *Rice*, 104 U. S., 737.)

If, now, process and product are also separate and distinct inventions, it must follow that when a patent has issued for a process, but which also showed the product, a reissue which covered both process and product could not be maintained as to the latter. This is so, not only because it is true that but one single invention can properly be embraced in an original patent, but especially because a reissue must be limited to corrections relative to the single identical invention originally claimed, and cannot embrace claims for another and independent invention. It is largely in the discretion of the Commissioner of Patents to determine whether more than one invention may be embraced in the original Letters Patent; but to introduce a new or second invention in a reissue patent is expressly forbidden by statute.

What are the decisions of the courts in this respect as to process or product? The adjudications upon the Goodyear patents are instructive and bear directly upon this question. The original patent was issued in 1844 and contained a claim for the process. In *Goodyear* v. *The Central R. R. of N. J.*, (1 Fisher, 626,) decided in 1853, it became necessary, in order to sustain the action, to hold that the claim for the process covered the product also, and a sale or use of the composition, except when purchased from licensees under the patent, infringed the process claim. Judge Grier held:

> The product and the process constitute one discovery, the monopoly of which is secured to the inventor or discoverer as a consideration or compensation for making it known to the public. * * *
>
> Now, what is this india-rubber, cured "substantially as herein described?"
>
> It is clearly not merely an improved method or process of producing an old and well-known composition or material, but it is a new product, fabric, manufacture, or composition of matter, having qualities possessed by no other known material. This is what is described and claimed in the patent—a new product as well as a new process.
>
> The product and process being both new and proper subjects of a patent, the patentee has a right to prohibit the sale or use of the composition, unless when purchased from persons licensed by him to use the process and vend the product. If precedent be needed for this doctrine, the case of *Hancock* v. *Sommerville*, in the English court of common pleas, tried in June, 1851, will be found directly in point.

This decision, which probably grew out of a judicial anxiety to save a patent for a "great and useful discovery," will probably be questioned so far as it held that a claim for a process will cover the product. It was doubted in *Goodyear* v. *Wait*, (3 Fisher, 242,) and it shows a dependence upon English precedents, which are not always applicable to cases arising under the American patent statutes.

It appears that the question was so doubtful that the patentee was unwilling to trust the patent, and in 1849 it was reissued "for a new and useful improvement in the processes for the manufacture of india-rubber." It was extended in 1858, and in 1860 was surrendered and reissued in two patents, one for the process and the other for the product.

In *Goodyear* v. *Wait*, *supra*, it was held that in a patent for process and product, both new, a claim for one does not exclude a claim for the other:

> Our conclusion of this point is that the original patent was properly surrendered in order to amend the claim, and that the reissue of two patents is unobjectionable.

Subsequently the suit of *Rubber Co.* v. *Goodyear* was instituted in the United States Circuit Court for Rhode Island, involving the validity of these reissued patents. It was contended by defendant that both reissue patents were invalid for two reasons: (1) because they were broader than the claims of the surrendered patent; (2) because one was for a process and the other for the product of that process. The court below held the first objection fatal to the process claim, but sustained the product claim. No appeal was taken from the decision holding the process claim invalid. In the Supreme Court the second objection was considered. Evidently the question was whether separate reissue patents could be sustained for process and product. The decision and its language must be construed with reference to the case involved. The Court said by way of introduction:

> But liberality rather than strictness should prevail where the fate of the patent is involved, and the question to be decided is whether the inventor shall hold or lose the fruits of his genius and his labors. * * * [*Corning* v. *Burden*, 15 Howard, 269; *Battin* v. *Taggert*, 17 Id., 74.]
>
> Patentable subjects, as defined by the patent law [act of 1836, sec. 6,] are "any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement on any art, machine, manufacture, or composition of matter." A machine may be new, and the product or manufacture proceeding from it may be old. In that case the former would be patentable and the latter not. The machine may be substantially old and the product new. In that event the latter, and not the former, would be patentable. Both may be new or both may be old. In the former case both would be patentable; in the latter, neither. The same remarks apply to processes and their results. Patentability may exist as to either, neither, or both, according to the fact of novelty, or the opposite. The patentability, or the issuing of a patent as to one, in no wise affects the rights of the inventor or discoverer in respect to the other. They are wholly disconnected and independent facts. Such is the sound and necessary construction of the statute.

It is impossible to make a proper application of this language of the Court to the case before it, except upon the hypothesis that the Court held that the process and product were one invention, but different and distinct parts of that invention, and that separate reissue patents for these respective parts (the statute authorized reissues for parts) of the invention were valid. It cannot be supposed that the Court would recognize as valid a reissue for a separate and distinct invention from that covered by the original patent, and yet it will be observed that the claim for the process was the only claim in the original patent. The reissue patents covered, respectively, the process and the product; the reissue process patent was declared invalid, and the reissue patent for the product alone sustained. So that if the process and product are distinct and separate inventions, the case presents an instance in which, after the original invention covered by the original patent had been eliminated, the reissue patent for a separate and distinct invention was upheld.

It is not necessary to a full and proper application of the above language of the Court that they should be understood as holding that the process and product were distinct and different inventions. "They are wholly disconnected and independent *facts*," and such an invention is so far capable of division upon the line dividing those facts that separate reissue patents will be held valid, when—

> Liberality rather than strictness should prevail where the fate of the patent is involved, and the question to be decided is whether the inventor shall hold or lose the fruits of his genius and his labors.

Thus it appears in the history of the adjudications upon the Goodyear patent that in the first adjudication the court ("considerably embarrassed in making it, and from which he would have been relieved if there had been a claim for the product or substance," *Goodyear* v. *Wait*) held that a claim for a process covered the product, in order to save the patent, and in the last and final adjudication the Supreme Court, in order to save the invention, held that a reissue patent for the product was valid, though the original patent was for the process alone, the reissue for which was invalid and could not be enforced. See *Goodyear* v. *Providence Rubber Co.*, (2 Fisher, 499,) where it was held that under section 5 of act of March 3, 1837, separate reissue patents for separate and distinct parts of the things patented were authorized. (*Penn Salt Co.* v. *Gugenheim*, 3 Fisher, 423.) Three reissue patents for product and process were issued upon an original patent for the product alone.

> The amended patent of 11th of April, 1867, (the reissue,) in which *ex major cautela* the improvement had been unnecessarily split into distinct patents, may be treated as one patent with three distinct claims.

Jones v. *Sewall*, (6 Fisher, 343.) Four original patents were issued covering the process of canning corn and the product. Speaking of the second patent, CLIFFORD, *J.*, says:

> Necessarily the details of the process are somewhat fully given in the specification describing the patented product; but the claim of the first patent does not extend to the process, which shows that the Patent Office committed no error in granting the second patent, as it does not include anything patented in the first patent. (*Goodyear* v. *Providence Rubber Co.*, 2 Cliff., 371; *Ib.*, 9 Wall., 788; *Seymour* v. *Osborne*, 11 Wall., 559.)

Both parties agree that it is competent for the Commissioner to grant a patent for the product and one for the process, and it is obvious that the patent under consideration is for the process, which is not included in the prior patent.

In *Seymour* v. *Osborne*, (11 Wall., 544,) cited above, the Court says:

> Reissued Letters Patent must, by the express words of the section authorizing the same, *be for the same invention*, and consequently where it appears on a comparison of the two instruments, as matter of law, that the reissued patent is not for the same invention as that embraced and secured in the original patent, the reissued patent is invalid, as that state of facts shows that the Commissioner, in granting the new patent, exceeded his jurisdiction.

In *Merrill* v. *Yeomans* (94 U. S., 568) MILLER, *J.*, says:

> If the patentee is also entitled to a patent for the product of this distillation and has failed, as we think he has, to obtain it, the law affords him a remedy, by a surrender and reissue.

This conclusion can only be true upon the premise that the process and the product constitute one invention.

In *Anilin et al.* v. *Higgin et al.* (14 O. G., 414; C. D., 1878, 335) the suit was upon reissued patent with claims for both process and product, issued upon an original patent with a claim for the process alone. The defense was that the reissued patent was unauthorized. WHEELER, *J.*

> Nothing is seen to show that the original (patent) was not valid for what it claimed. There was nothing defective or insufficient about the specification of the invention. If the statute, by specification, meant that and no more, then on the patents themselves it would appear that there was no ground for the reissue; but the word seems to be used in a broader sense and to be intended to cover specification of the claim as well. In that sense there was a defective specification of the invention as patented, and the patent was inoperative and invalid *for that part* of the invention not covered by the claim. *The invention specified in each was precisely the same.* The original did not cover the whole of it, and so was inoperative as to part. The reissues do cover the whole. They seem to fall exactly within the intention of the statute in this particular. (*Seymour* v. *Osborne*, 11 Wall., 516.)

Cochrane v. *Badische Anilin Co.*, (111 U. S., 293:)

> We have not deemed it necessary to consider more particularly the question whether the reissue patent (product, original patent for process alone) is or is not for a different invention. It certainly is, *unless* the product claimed in the reissue is precisely that product, and no other, which the process described in the original patent produces.

The case of *Kelleher* v. *Darling* (14 O. G., 673) seems at variance with the foregoing authorities. The original patent was for a shoe made of several parts and by a peculiar seam. It contained no description of the method by which it was made whatever, but was reissued with a description of the process and claims covering both the shoe as an article or product and also claim 4 for a method or process. CLIFFORD, *J.*, held that the new description and claim 4 were new matter, citing *Seymour* v. *Osborne*, and added:

> Beyond doubt the invention described in the original patent, though composed of the several parts therein described, is, in legal contemplation, a new and useful manufacture, and it is equally clear that the process of making an article of manufacture is a different invention from that of the product. Both may be included in the same patent, but the required description is as essential and indispensable in the one case as in the other.

The decision was undoubtedly correct; but the suggestion that the process and product were different inventions was unnecessary, and is in conflict with the cases cited. The article or product and mechanical method presented a case like the Mosler Safe case, where after patent for the product there is no patentable process left. See the cases of *McKay* v. *Dibert* (C. D., 1881, 238) and *McKay* v. *Jackman*, (C. D., 1882, 303,) where finally the claims for the process and the article were held invalid, the invention being covered by the patent for the machine.

Powder Co. v. *Powder Works*, (98 U. S., 126:)

> In another case arising on the original patent of Goodyear, reported in 2 Wall., Jr., 356, Mr. Justice Grier used this expression:

"The process and the product constitute one discovery." The product in Goodyear's invention was the direct result of the process. They were parts of one invention, and, except in imagination, could no more be separated from each other than the two sides of a sheet of paper, or than a shadow from the body that produces it.

This expression, not necessary to the case, and probably *obiter*, yet shows how clearly and definitely was lodged in the mind of the eminent judge who wrote the opinion the judicial conception of process and product as one invention.

In *James* v. *Campbell* (104 U. S., 356) the relations between process and apparatus and process and product were distinctly considered and determined. The original patent contained claims for the letter-stamping apparatus. In the reissued patent there were introduced some new and additional features relating to the stamping apparatus, and also a claim for the process of stamping, carried out by the apparatus. After holding that the reissue patent was invalid for the introduction of new parts to the apparatus, it was said:

The third addition in the reissued patent to the invention described in the original is that of the *process* of stamping letters with a post-mark and canceling the postage-stamp at one and the same blow or operation of the instrument, in the manner and by the means described and set forth. Leaving out of view the history of the art prior to the invention claimed by the patentee, what possible pretense can there be for contending that the general process was part of the invention which formed the subject of the original patent? Suppose it be true that Norton was the first inventor of this process, was that process the invention which he sought to secure in the original patent? A patent for a process and a patent for an implement or a machine are very different things. (*Powder Company* v. *Powder Works*, 98 U. S., 126.) Where a new process produces a new substance the invention of the process is the same as the invention of the substance, and a patent for the one may be reissued so as to include both, as was done in the case of Goodyear's vulcanized rubber patent; but a process and a machine for applying the process are not necessarily one and the same invention. They are generally distinct and different. [There may be many machines for applying the same process.] The process or act of making a post-mark and canceling a postage-stamp by a single blow or operation, as a subject of invention, is a totally different thing in the patent law from a stamp constructed for performing that process. The claim of the process in the present case, however, is not so broad as this. It is for the process or act of stamping letters with a post-mark and canceling the postage-stamp at one and the same blow or operation of the instrument, *in the manner and by the means described and set forth*. Perhaps this claim amounts to no more than a claim to the exclusive use of the patented instrument or device. If it is anything more, it is for a different invention from that described in the original patent. If it is not for anything more, the question is brought back to the instrument or device itself, which forms the subject of the patent, and which has been already considered.

Tucker v. *Burditt* (4 Bann. & Ard., 569) simply holds that where separate patents for process and product are issued the Commissioner did not so far exceed his jurisdiction as to render the patents invalid. The process and product were similar to those involved in *Plummer* v. *Sargent:*

In respect to the issue of two patents a large discretion is left to the Commissioner; the matter is specially made discretionary with him in the existing law, (Rev. Stats., sec. 4916,) and such was the construction of the earlier statute, (*Bennett* v. *Fowler*, 8 Wall., 445,) and especially in the case of a new article made by a new process the reissue of separate patents has been pronounced valid. (*Goodyear* v. *Providence Rubber Co.*, 2 Cliff., 351; 9 Wall., 788.)

When properly understood, the case of *McKay* v. *Dibert* does not conflict with the general proposition. It involved original patents for a process of making a shoe and the shoe as an article. The inventor originally filed an application containing claims for both, and the Commissioner of Patents required him to divide and file separate applications for the process and the product, which was done, and the separate patents issued, but on separate dates. The machine patent expired earlier than the other. During the life of the latter patent and after the expiration of the former suit was brought against the defendants for infringing the process and product patents by using the machine, which, it was claimed, had become public property. The Court said:

As long as separate patents for a machine and the process and the product are allowable they represent distinct inventions, (*Kelcher* v. *Darling*, 14 O. G., 673,) and each one may live without interference or molestation its whole life without regard to the death of the others.

The decision related to the distinction between a machine or apparatus as one invention and the process and product as unitedly or separately constituting the other; but, as said before, as between the process and the product the case more properly falls within the Mosler Safe decisions. (127 U. S., 354.)

The cases of *United Nickel Co.* v. *American Nickel Plating Works* (4 Bann. & Ard., 74) and *United Nickel Co.* v. *California Electrical Works* (25 Fed. Rep., 475) do not, as sometimes supposed, militate against the idea that a process and product may constitute one invention. They simply settle the fact that when a patentee has a patent for a solution (composition) of nickel, which is necessarily employed to carry out a process for nickel-plating for which he has another patent, he does not confer upon a licensee or assignee of his process patent the right to use the solution or composition secured by the former patent. In other words, the patentee or assignee of a process must secure the composition and material, as well as the means of executing the process, from those persons who control, own, or sell them, and if they are secured by other patents the consent of such other patentees must be obtained. These cases may possibly be applicable as between the respective assignees of process and product claims in a patent for both.

With this review of the authorities before me I cannot escape the conclusion that it is settled by the highest authority that a new process which produces a distinct and new product, the product being incapable of production by any other process and the process incapable of producing any other product, and such product constitute a single invention. This conclusion finds satisfactory support in the nature of the invention itself, as well as in the character of the legal property residing in it.

(1.) The procedure, whether mechanical (that is, by the physical force of man's hands or his tools or machinery) or natural (that is, by natural forces, chemical, electrical, &c.,) must have material to operate upon. No process or method creates anything originally. It finds matter or material in one form, shape, or combination of elemental parts, and resolves it into some other form, shape, or arrangement of elements, the latter being called the article or product. When an invention has been made by which these forces can be applied to matter in one form in such a manner that it is resolved into some other new and useful form, we have presented an invention that has a beginning, a progressive intermediate stage or status, and a terminal conclusion. At the outset the material to be changed or metamorphosed goes into the permeating embrace and submits to the all-pervading influence of the forces which appertain to it. From this beginning, along the entire path or course of the process, this condition continues. The process, or presence and effect of the forces, can no more be separated or disassociated from the matter operated on than heat can be disassociated from the iron or other body that retains it, or than the light of a self-luminous body can be separated from the body that emits it. During the progression, from beginning to conclusion, this oneness of matter and operative force, spirit and body, continues; but a point is reached when the transformation is finished and completed; the forces cease to operate, because they have accomplished their totality, and there is no more material to be operated upon by them. It is at this precise instant that the invention is also completed. The product—the changed material—remains, and its existence may continue for years; but it came into being and existed, perfectly complete, as the last expiring influence of the forces operated upon it. Its existence began at the inception of the process and continued during the travail of the entire journey to the end. It involved force and matter, neither of which could exist in the desired state and under the required conditions without the other. The conception which thus unites and employs the two is necessarily one single invention, though, in mental conception, the material and the force may be separately thought of, described, and claimed. In operation they are one and indivisible.

(2.) So, also, when the nature of the property which exists in inventions is considered with reference to legal definitions and relations, the same conclusion will be reached.

It is well known that the property in a thing is something else than the thing itself. It is undoubtedly true that the thing patented is the marketable and vendible thing, whether it be product or process, or both. The right or property secured by a patent is the right to make, sell, and use the thing patented. In the case of a mere process—such as Bell's method of transmitting articulate speech—the right is to exercise, (make,) sell, and use the process. The product of any producing process is that which possesses the principal utility. The patent property possesses value because the patented thing possesses utility and will be demanded and used by the people. The utility of the process is secondary, and depends upon that of the product. The process is valuable, and will find purchasers and users commercially, because it produces a product which finds users and purchasers; but where the process is incapable of producing any other product and the product cannot be made by any other process, what property is vested by the respective separate patents for the process and the product? Or, if a single patent issues for both and the patentee assigns the claim for the process to A and that for the product to B, what is the property conveyed to each? A is authorized to exercise, (make,) use, and vend the process; B to make, use, and vend the product. The rights conveyed are incapable of enjoyment in a legal sense. A must in some manner secure a license or consent from B to carry out the process and make B's product, and B, in order to make his own product, must obtain A's license or consent to use the latter's process. It is said, however, that this is precisely like the case of a patentee of a new combination that contains an element for which another patentee has an earlier patent. The combination cannot be used without the consent of the patentee of the element, and the element cannot be used in its relation in the combination without the consent of the patentee for the combination. (*United Nickel Co.* v. *California Electrical Works*, 25 Fed. Rep., 475.) The same thing may be said of the relations between an apparatus and the process it was made to execute. Separate patents issue for each. The owner of the machine will be unable to use it unless he can get the consent or license of the owner of the process. These results arise from the statute, the purpose of which is to give to the patentee a monopoly which prohibits another from making, using, or vending the subject of the patent, whether the use required be that of ordinary use and consumption or employment as a part or element in some new invention; but as between process and apparatus it cannot be said that the process can be executed by no other apparatus. It is believed no instance of a patentable process can be cited of which it can be said that it can be executed only by the one apparatus first discovered. We know changes and improvements and entirely new apparatus are readily developed, so that the patentee or assignee of an apparatus takes it with the knowledge that possibly the next week a new apparatus may be made, and that the process cannot be used by him or any other inventor of the apparatus except by consent of the owner of the process. So the owner of the process, having parted with the apparatus, is not wholly remediless. He may invent or buy a new apparatus for his process. The relation between process and product, however, is different. The relation is that the process can make no other product and the product can be made by no other process. Separate patents divide the invention into such two parts that each absolutely embargoes the other. Not so in the case of process and apparatus, for while the owner of the process may not use the apparatus without its owner's consent, he *is* at liberty to invent or purchase another new or different apparatus and use that; but as between process and product of the character involved this cannot be done. Each is absolutely dependent upon the other, and if neither will give consent each is barred and the public is deprived of the use and benefit of the invention. If the patent or claim for the process should belong to A and that for the product to B, before A can enjoy his own property he must obtain an interest in B's property, and *vice versa*. If B grants to A the right to make and vend his product, he only secures that which, by the terms of his own patent, is his own property by right, and *vice versa*. In other words, such a division presents a case where there appears to be, but is not, an actual property vested by either patent.

It is legally impossible to grant an absolute right in a process alone when that process can make but one product, and so of the product. If separate patents issue and the process and product come to belong to different persons, an infringement of one would be an infringement of both. Must separate suits be brought, or may both owners unite as complainants? It cannot be denied that these relations and the issue of different patents will tend to create confusion and uncertainty of rights, and will not only complicate business affairs, but may be the means of misleading or defrauding the public.

While it is true that the question determining what inventions may or may not be embraced in a single application is one largely of discretion in the Commis-

sioner, with which the courts do not interfere, it should always be exercised to guard and protect the public as far as possible, while granting to the applicant the full measure of his rights. As frequently stated, the courts would, no doubt, as they have always done, sustain and enforce separate patents for process and product. It may also be said to be discretionary with the Commissioner to so issue them, and that the convenience and certainty of action in the Office, aided by its classification, would be increased, and thereby greater benefits extended to the applicants and patentees. But if it be true that the particular process and product constitute one invention, it is impossible lawfully to deny an applicant's right to embrace them both in the same application and secure them in a single set of Letters Patent. If he elects to prosecute them separately, he should be permitted to do so; but where he joins them he cannot be required to divide them.

The conclusion reached is that a process and its product of the character and relation stated constitute a single entire invention. This of course excludes all other cases of process and product—such as where either process or product is not new, or where the product can be made by some other process, or the process will make some other product.

In the present case I have grave doubts whether there is any patentable novelty in the tablet as claimed in the first and second claims. Similar tablets have heretofore been made, the only difference being that in this ozokerite is employed; but there is no discovery or invention shown in selecting and substituting one substance for another under these circumstances; but without absolutely determining the question of novelty with reference to the article claimed, I concur with the examiner in holding that the method claim, 3, is without novelty. Indeed, it seems to possess no character of a method. The article is a tablet of paper or other material with ozokerite spread over and upon it. The method consists in taking such a paper tablet and spreading the ozokerite upon it. It is true claim 2 speaks of boiling the ozokerite as one of the steps; but clearly the application of boiling water relates solely to the treatment of the ozokerite, and not the tablet.

The question of division is a preliminary one, and must be settled before final action on the merits. When the question depends upon novelty, the latter question must be settled first, which is an exception to the general and wholesome practice. Whenever division is required in such cases, the examiner should advise the applicant generally as to the state of the art and such other matters as will enable him in making division to make an advised election which of the inventions he will prosecute, and not induce him to file a new application which the Office believes presents no patentable matter.

The action of the examiner requiring division is affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern Judicial District of Missouri, Eastern Division.

TAFT *v.* STEPHENS LITHOGRAPHING AND ENGRAVING COMPANY.

Decided March 20, 1889.

JURISDICTION.

The circuit courts have jurisdiction of suits brought to recover penalties imposed by the copyright-laws of the United States.

ON PLEA to jurisdiction.

Mr. W. E. Fisse for the plaintiff.

Mr. Paul Bakewell for the defendant.

THAYER, *D. J.:*

This is a *qui tam* action brought to recover certain penalties imposed by section 4963 Revised Statutes of the United States for violations of the law relating to copyright.

Defendant's attorney contends that the jurisdiction to recover penalties of such character is vested in the United States district court, and not in the circuit court. He has accordingly filed a plea to the jurisdiction. By section 9 of the judiciary act of 1789 United States district courts were given jurisdiction of—

all suits for penalties and forfeitures incurred under the laws of the United States.

This clause has ever since continued in force and reappears in the Revised Statutes of the United States as subdivision 3 of section 563.

Suits to recover penalties imposed by the laws of the United States must accordingly be brought in the United States district court unless jurisdiction to recover a particular penalty is vested in the circuit court by the statute imposing the penalty. It is claimed by plaintiff's attorney that jurisdiction of suits to recover penalties imposed by section 4963 is vested in the United States circuit court by the ninth clause of section 629 Revised Statutes of the United States, which gives that court jurisdiction of—

all suits at law or in equity arising under the patent and copyright laws of the United States.

If the claim was based solely on the phraseology of the ninth clause of section 629, we should be disposed to overrule it and to hold that the suits therein referred to and over which the circuit court is given jurisdiction are ordinary civil suits at law and in equity to recover damages for, or to restrain infringements of, patents and copyrights, and that the clause does not confer jurisdiction upon this court over suits of a penal character—that is, of suits brought to recover penalties imposed by the patent and copyright laws. It must be borne in mind, however, that the ninth clause of section 629 is based on sections 55 and 106 of "An act to consolidate and amend the statutes relating to patents and copyrights," approved July 8, 1870. (U. S. Statutes at Large, vol. 16, pp. 206 and 215.) We infer that the revisers, in drafting the ninth clause of section 629, did not intend to disturb the jurisdiction then vested in the United States circuit court by the two sections of the act last alluded to. By reference to the act of July 8, 1870, it will be seen that section 106 provides that—

all actions, suits, controversies, and cases arising under the copyright laws of the United States shall be originally cognizable as well in equity as at law, whether civil or penal in their nature, by the circuit courts of the United States or any district court having the jurisdiction of a circuit court.

Prior to that enactment Congress had expressly authorized certain other penalties imposed by the copyright laws to be sued for in the circuit as well as in the district courts of the United States. (*Vide* vol. 14 U. S. Stat. at Large, 395, sec. 1 act of February 18, 1867.)

In view of section 106 of the act of July 8, 1870, we think it clear that Congress intended thereby to give the United States circuit courts jurisdiction of suits brought to recover penalties imposed by the copyright laws of the United States, and that it retains such jurisdiction since the revision of the laws of the United States by virtue of clause 9 of section 629, (*supra.*)

The reference made in section 106 of the act of July 8, 1870, to suits of a penal as well as of a civil nature makes it certain that *qui tam* actions arising under the copyright laws were within the contemplation of Congress when that section was enacted, and that jurisdiction of such suits was intended to be conferred on the circuit court.

The plea to the jurisdiction is accordingly overruled.

DECISIONS OF THE U. S. COURTS—	
The Morley Sewing Machine Company *et al. v.* Lancaster	207

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Notice to the Patrons of the Patent Office.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 23, 1889.

Attention is called to Rule 9 of the Rules of Practice, requiring that a separate letter should accompany each subject of inquiry or application, and that assignments, final fees, and orders for copies or abstracts must be sent in separate letters. A strict observance of the provisions of this rule would prevent confusion and delay, and would result in expediting the business, and it is urged that proper attention should be given to this matter.

BENTON J. HALL,
Commissioner.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth $10 00

DESIGNS.

19,005.—BOX-STOVE.—*Henry Clay Bascom*, Lansingburg, N. Y. Application filed February 28, 1888. Serial No. 265,600. Term of patent 14 years.

19,006.—PIPE-COLLAR AND FLUE-STOPPER.—*James I. Flanagen*, Philadelphia, Pa. Application filed December 3, 1888. Serial No. 292,535. Term of patent 7 years.

19,007 to 19,015, inclusive.—CARPET.—*James L. Folsom*, Brooklyn, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed March 7, 1889. Serial Nos. 302,339 to 302,346, inclusive, and 302,348. Term of patents 3½ years.

19,016.—PIPE-COLLAR AND FLUE-STOPPER.—*Zachary T. Hall*, Philadelphia, Pa. Application filed March 9, 1889. Serial No. 302,654. Term of patent 14 years.

19,017 to 19,025, inclusive.—CARPET.—*Henry Horan*, East Orange, N. J., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed March 8, 1889. Serial Nos. 302,566 to 302,574, inclusive. Term of patents 3½ years.

19,026 to 19,028, inclusive.—CARPET.—*Henry Hunt*, Greenville, N. J., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed March 7, 1889. Serial Nos. 302,333 to 302,335, inclusive. Term of patents 3½ years.

19,029.—SCISSORS.—*Henry Herbert Howard*, New York, N. Y. Application filed March 8, 1889. Serial No. 302,535. Term of patent 14 years.

19,030.—COUPLING FOR ELECTRICAL CONDUCTORS.—*John Ellwood Lee*, Conshohocken, Pa., assignor to *The J. Ellwood Lee Company*, same place. Application filed March 14, 1889. Serial No. 303,323. Term of patent 14 years.

19,031 to 19,039, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed March 14, 1889. Serial Nos. 303,328 to 303,336, inclusive. Term of patents 3½ years.

19,040 to 19,042, inclusive.—CARPET.—*Edward Poole*, Brooklyn, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed February 27, 1889. Serial Nos. 301,410, 301,411, and 301,414. Term of pateuts 3½ years.

19,043.—PIPE-COLLAR AND FLUE-STOPPER.—*Joseph B. Rohrman*, Philadelphia, Pa. Application filed February 7, 1889. Serial No. 299,058. Term of patent 3½ years.

19,044.—T-SQUARE.—*Edward G. Soltmann*, New York, N. Y. Application filed January 29, 1889. Serial No. 298,022. Term of patent 14 years.

19,045.—BRUSH OR MIRROR BACK AND HANDLE.—*William M. Welling*, New York, N. Y. Application filed February 23, 1889. Serial No. 300,948. Term of patent 7 years.

19,046.—PICTURE-HOOK.—*William Alex. Williamson*, Newark, N. J. Application filed March 11, 1889. Serial No. 302,905. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,463.—BELTING, HOSE, PACKING, AND OTHER RUBBER GOODS FORMING PARTS OF MACHINERY.—*Boston Belting Company*, Boston, Mass. Application filed February 14, 1889. Used since January, 1864.
"The word 'IMPERIAL.'"

16,464.—BELTING, HOSE, PACKING, AND OTHER RUBBER GOODS FORMING PARTS OF MACHINERY.—*Boston Belting Company*, Boston, Mass. Application filed February 14, 1889. Used since January, 1864.
"The word 'EXCELSIOR.'"

16,465.—DRESS-SHIELDS.—*Charles Boulenger*, Paris, France. Application filed February 26, 1889. Used since October 19, 1888.
"The representation of a lady seated in a swing with the words 'WITH' and 'WITHOUT' under her right and left arms, respectively, and the representation of a dress-shield with ornamental scroll-work."

16,466.—CREAM FOR THE ACCELERATION OF THE MAMMARY GROWTH. *John A. Chard*, Jersey City, N. J. Application filed February 1, 1889. Used since September 15, 1888.
"The name 'MLLE. GOLDSCHMIDT'S' in script letters, accompanied by the words 'CRÈME D'ELEGANCE.'"

16,467.—UNDERWEAR FOR MEN AND WOMEN, AND APRONS.—*Joseph P. Cooper & Son*, Philadelphia, Pa. Application filed February 26, 1889. Used since February 20, 1889.
"The words 'BELMONT MANUFACTURING CO.,' arranged in the shape of an oval inclosing the picture of a bell."

16,468.—SOPORIFIC PREPARATION.—*Farbenfabriken, vormals Fr. Bayer & Co.*, Elberfeld, Prussia, Germany. Application filed March 9, 1889. Used since March, 1888.
"The words 'SULFONAL BAYER.'"

16,469.—DRESS SHIELDS AND PROTECTORS.—*Pierre Paul Guillaume, Fils Aîné*, Paris, France. Application filed January 14, 1889. Used since December, 1886.
"The word-symbol 'G F A K'ALLISTA.'"

16,470.—SALVE.—*Alfred F. Humphrey*, Canton, Conn. Application filed February 8, 1889. Used since 1835.
"The fac-simile signature of 'C. G. GRISWOLD.'"

16,471.—MEDICAL COMPOUND FOR PURIFYING THE BLOOD.—*Charles Rufus King*, Lampasas, Tex. Application filed March 8, 1889. Used since September, 1888.
"The words 'ROYAL GERMETUER.'"

16,472.—PETROLEUM-JELLY FOR MEDICINAL AND TOILET PURPOSES. *Lehn & Fink*, New York, N. Y. Application filed March 5, 1889. Used since January 1, 1888.
"The word 'BLANCOLINE.'"

16,473.—GAME.—*Moses Lyman*, Waverly, N. Y. Application filed February 28, 1889. Used since January, 1889.
"The words 'PIGS IN CLOVER.'"

16,474.—SHIRTS.—*D. McCarthy & Sons*, Syracuse, N. Y. Application filed January 2, 1889. Used since August 15, 1888.
"The representation of a lizard grasped by a hand."

16,475.—EYE-HEALING WATER.—*Thomas McGuire*, Brooklyn, N. Y. Application filed March 15, 1889. Used since February 10, 1889.
"The words 'WATER OF LIGHT.'"

16,476.—BOOTS AND SHOES.—*Pingree & Smith*, Detroit, Mich. Application filed February 25, 1889. Used since September 1, 1888.
"The representation of an outstretched skin or hide, back of which is a calf flanked on either side by a goat and a kangaroo."

16,477.—ELECTRICAL, TELEGRAPHIC, AND TELEPHONIC APPARATUS OR INSTRUMENTS.—*The Phonopore Syndicate, (Limited,)* London, England. Application filed December 19, 1888. Used since June 18, 1886.
"The word 'PHONOPORE.'"

16,478.—CUTLERY AND PLATE.—*Joseph Rodgers & Sons, (Limited,)* Sheffield, England. Application filed February 18, 1889. Used since December, 1883.
"The word 'RODGERSINE.'"

16,479.—MEDICINE FOR THE LIVER, STOMACH, AND KIDNEYS, AND LINIMENT, WORM-REMOVER, AND SALVE.—*Herman Schindhelm*, Philadelphia, Pa. Application filed February 2, 1889. Used since July, 1887.
"The word 'TA-HA.'"

16,480.—BANJOS.—*Samuel Swaim Stewart*, Philadelphia, Pa. Application filed February 27, 1889. Used since February 20, 1889.
"The letters 'S. S. S.'"

16,481.—BAKING-POWDER.—*Josephine Elizabeth Titsworth*, New York, N. Y. Application filed February 27, 1889. Used since January 1, 1889.
"The word 'SILVER-BELL.'"

16,482.—SPOOL COTTON AND THREAD.—*Tootal Broadhurst Lee Company, (Limited,)* Manchester and London, England. Application filed October 12, 1888. Used since August 12, 1886.
"The words 'LEE' and 'BEST SIX CORD.'"

16,483.—MEN'S AND BOYS' HATS.—*Ward, Goldthwaite & Co.*, Chicago, Ill. Application filed February 23, 1889. Used since January 2, 1889.
"The words 'PRIDE OF AMERICA.'"

16,484.—CANNED SALMON.—*Western Alaska Packing Company*, San Francisco, Cal. Application filed February 23, 1889. Used since December 26, 1888.
"The word 'WALRUS' and the pictorial representation of a walrus's head."

16,485.—PREPARATION FOR TREATMENT OF THE FEET.—*Edward Payson Weston*, New York, N. Y. Application filed February 23, 1889. Used since September 14, 1888.
"A full-length picture of the registrant and the words 'WESTON'S FOOT-CURE.'"

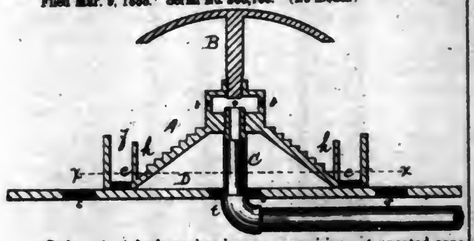
16,486.—RUM.—*Henry White & Co.*, London, England. Application filed February 25, 1889. Used since January 1, 1871.
"The words 'RED HEART.'"

16,487.—ICE-CREAM FREEZERS.—*The White Mountain Freezer Company*, Nashua, N. H. Application filed February 13, 1889. Used since 1878.
"The word 'MOUNTAIN.'"

LABELS.

5,864.—Title: "DR. COLE'S TONIC AND BLOOD PURIFIER."—*Drs. P. C. Cole & Son*, South Solon, Ohio. Application filed March 13, 1889.

5,865.—Title: "DR. COLE'S PILLS."—*Drs. P. C. Cole & Son*, South Solon, Ohio. Application filed March 13, 1889.



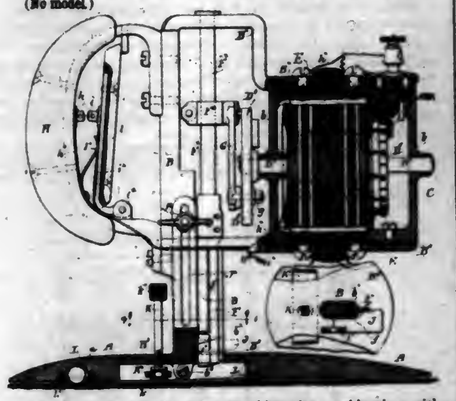
5,866.—Title: "THE RUSSIAN PREVENTIVE OF CONTAGIOUS DISEASES."—*Henry L. Jackson*, Buffalo, N. Y. Application filed March 7, 1889.

5,867.—Title: "CATARRH AND ASTHMA BALL" (FOR A CATARRH REMEDY.)—*Frank S. Newby*, Indianapolis, Ind. Application filed January 26, 1889.

PATENTS

GRANTED APRIL 9, 1889.

400,889. HYDROCARBON-BURNER. JAMES AKIN, Dayton, Ohio. Filed Mar. 9, 1888. Serial No. 266,769. (No model.)



Claim.—1. A hydrocarbon-burner comprising a truncated cone having a series of concentric ledges with a rim at its base, a chamber at the top with eduction-orifices, and an orifice beneath for the introduction of an induction-pipe, substantially as set forth.

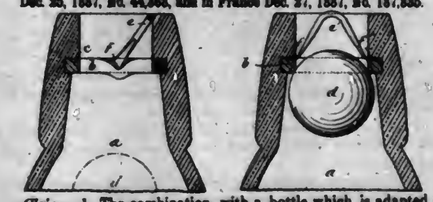
2. A hydrocarbon-burner comprising a truncated cone with a series of ledges and induction-pipe connection at the top, rim *h* at the base, and rim *f*, with a series of air-orifices between said rims, substantially as set forth.

3. A hydrocarbon-burner comprising a truncated cone having a series of concentric ledges, with rim *h* at its base and chambered at the top, with orifice for an induction-pipe and eduction-orifices, and the reflector B, attached to the top, substantially as set forth.

400,890. REGULATION OF ELECTRIC MOTORS. FOREST BAIN, Chicago, Ill., assignor, by mesne assignments, to the Electric Cutting Machine Company, same place. Filed Apr. 6, 1888. Serial No. 269,780. (No model.)

Claim.—1. In a cloth-cutting machine, the combination, with a reciprocating knife and a motor connected with and actuating the same, of a handle for controlling the movement of the machine, resistance-coils for regulating the flow of current to the motor, and an automatically-acting switch or contact device located in position to be acted upon by the operator in grasping the handle of the machine, and operating to throw the said resistance-coils into and out of circuit with the magnet and armature coils of the motor, substantially as described.

2. The combination, with the frame of a cloth-cutting machine, of a reciprocating cutter thereon, a motor for actuating the cutter, a handle attached to said frame for controlling the movement of the machine, a switch-bar movably connected with the handle, a resistance-coil, contact-points upon the switch-bar and handle, and conductors connecting said contact-points with the resistance-coil and with the field and armature coils of a motor, substantially as described.



400,891. BUCKLE. DANIEL B. BAKER, Rising Sun, Ohio. Filed July 18, 1888. Serial No. 280,261. (No model.)

Claim.—1. A buckle provided with the swinging keeper G, arranged transversely across one end of the buckle, for the purpose specified.

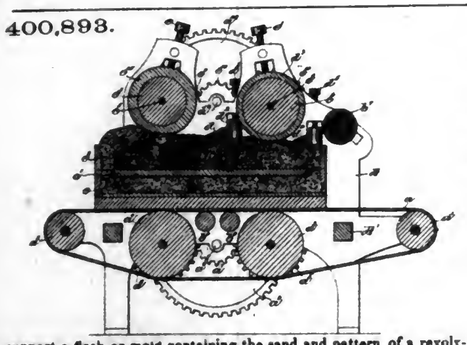
2. In a buckle, the combination, with the stationary tongue or stud, of the swinging keeper G, arranged transversely across one end of the buckle in advance of the stationary stud, substantially as specified.

400,892. MEANS FOR FACILITATING THE OPENING OF INTERNALLY-STOPPERED BOTTLES. HENRY BARRETT and JOHN J. VARLEY, London, England. Filed Dec. 17, 1888. Serial No. 293,784. (No model.) Patented in England Nov. 2, 1887, No. 14,941; in Germany Dec. 25, 1887, No. 44,268, and in France Dec. 27, 1887, No. 187,835.

Claim.—1. The combination, with a bottle which is adapted to be closed by means of a stopper held against an elastic seating in the neck by the pressure of gas contained in the bottle, of a bow-shaped loop or lever whose terminal or end is inserted between the upper shoulder of the recess in which the said seating is located and the seating itself, such terminal or end being flattened or cam-shaped, substantially as and for the purpose set forth.

2. The combination, with a bottle having an elastic seating located in its neck, of a loop or lever, *e*, having flattened ends bent outward and adapted, when the lever is turned over from one side of the mouth toward the other side, to compress or displace the ring, substantially as and for the purpose described.

3. Levers or loops *e*, adapted for compressing the elastic rings in internally-stoppered bottles, made, as set forth, in the form of a bow and having the ends turned outward from each other and made flat or cam-shaped, substantially as and for the purposes described.

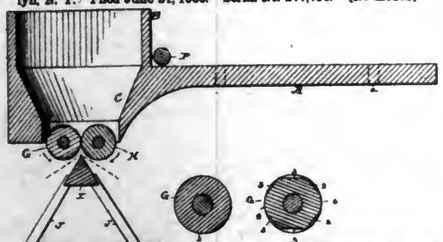


400,893. SAND-MOLDING MACHINE. WILLIAM R. BIRD, Boston, Mass. Filed Sept. 3, 1888. Serial No. 284,290. (No model.)

Claim.—1. In a sand-molding machine, the combination, with a bed to support a flask or mold containing the sand and pattern, of a revolving presser having a yielding surface, the said bed and presser being made movable one with relation to the other, whereby the surface of the sand is acted upon in a direction transverse to the axis of the presser, substantially as described.

2. In a sand-molding machine, the combination, with a bed to support a flask or mold containing the sand and pattern, of a revolving presser having a yielding surface, a leveler, and a second presser, the said bed, pressers, and leveler being made movable one with relation to the other, to operate substantially as described.

3. In a sand-molding machine, the combination, with a bed to



400,893.

support a flask or mold containing the sand and pattern, of a revolving presser having a yielding surface, a leveler, and a second presser, a second leveler, and a brush, the said parts being made movable one with relation to the other, as described, whereby the surface of the sand is acted upon in a direction transverse to the axis of the revolving presser, substantially as described.

4. In a sand-molding machine, a traveling bed to support a flask or mold containing the sand and pattern, combined with a revolving presser having a yielding surface to act on the surface of the sand in a direction transverse to the axis of the presser, substantially as described.

400,894. HAIR-PLUCKING MACHINE. JOHN H. BRIERLEY, Brooklyn, N. Y. Filed June 21, 1888. Serial No. 277,750. (No model.)

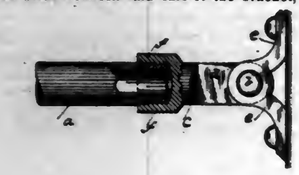
Claim.—1. In a machine for plucking hair from skins, the combination, with a pair of plucking-rollers, of a suction-creating or air-exhausting device for raising the hair.

2. In a machine for plucking hair from skins, the combination of a pair of plucking-rollers, an air-inlet, and a suction-creating or air-exhausting device.

3. In a machine for plucking hair from skins, the combination of a pair of plucking-rollers constructed to form an air-inlet and a suction-creating or air-exhausting device.

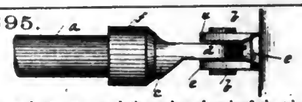
4. In a machine for plucking hair from skins, the combination of a pair of plucking-rollers, one of said rollers being flattened or cut away, and a suction-creating or air-exhausting device.

5. In a machine for plucking hair from skins, the combination of a pair of plucking-rollers constructed to have at all times an air opening or inlet between their peripheries and a suction-creating or air-exhausting device.



6. In a machine for plucking hair from skins, the combination of a ridge-piece and a pair of plucking-rollers.

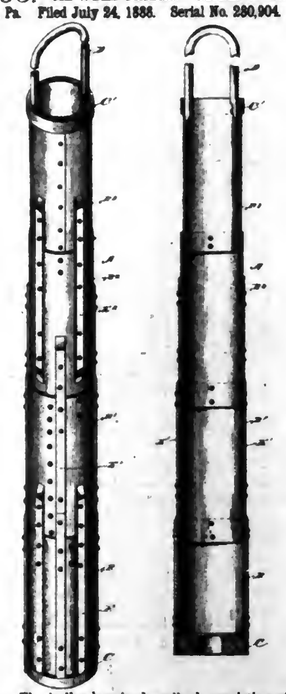
7. In a machine for plucking hair from skins, the combination of a ridge-piece, a pair of plucking-rollers, an air-inlet, and a suction-creating or air-exhausting device.



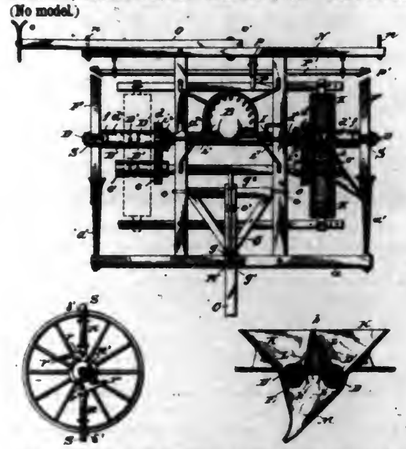
8. In a machine for plucking hair from skins, the combination of the plucking-rollers G H, the air-chamber C, the pipe E, and the fan F.

400,895. AWNING-CLEVIS. WILLIAM M. BROWN, Ingram Station, Pa. Filed Aug. 17, 1888. Serial No. 282,956. (No model.)

Claim.—The combination of a rigid bracket, *c*, securely fixed to a wall or other structure and having the parallel spaced ears, a clevis having a threaded socket, *f*, at one end and its other end reduced in thickness and fitted between said ears of the bracket, a pivot-bolt



400,895.



passing through the ears and the reduced end of the clevis, said clevis adapted to turn on the bolt, and a tubular frame-section, *a*, screwed into the threaded socket, substantially as described.

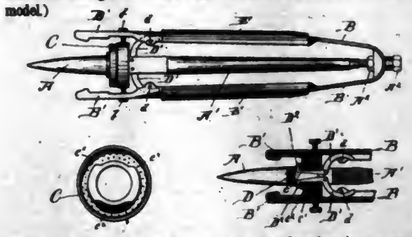
400,896. OIL-WELL BAILER. THOMAS A. BURKELLOW, Washington, Pa. Filed July 24, 1888. Serial No. 280,904. (No model.)

Claim.—The bailer herein described, consisting of the cylindrical metallic sections B, B', B², and B³, fitting, respectively, in each other the edges of the lower sections overlapping those of the upper sections, the thick metallic hoops C and C' on the top and bottom edges of the bailer, and the series of vertically-arranged guards E, E', and E², of a thickness equal to the thickness of the hoops, their upper ends being beveled and projecting beyond the overlapping edges of the sections, substantially as described.

400,897. CORN-PLANTER AND DRILL COMBINED. ANDREW J. CALLAWAY, Chestnut Hill, Ind. Filed Dec. 9, 1887. Serial No. 258,395. (No model.)

Claim.—1. In a seed-planter, a frame having an axle provided with seed-delivering cylinders loosely mounted thereon, formed with

a clutch and provided with wheels having toothed clutches to coact with those of the cylinders, and spiral springs between said cylinders and the frame of the planter, in combination with a lever, I, pivoted to said frame and connected by means of rods to said cylinders.



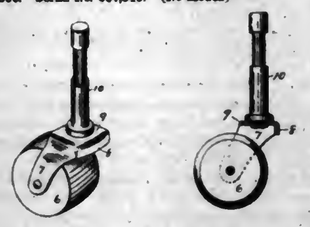
2. In a seed-planter, the axle D and shaft E, provided with cylinders connected by cog-wheels and bearing hollows disposed in circumferential rows, the double box K, fitting over said cylinders and provided with a chute extending downward and to one side, in combination with the beveled wheels F, the tongue C, the lever G, and the grooved runners *a'*, extending in front of the wheels and under the chute on the box K, substantially as described.

3. The combination, with the rotatable cylinders *d d'*, having the circumferential seed-hollows D', in combination with the hopper K, having the inclined dividing partition *k*, terminating in the joint seed-chute M, the guards *l'*, mounted over the cylinders, and the brushes L, projecting from the partition in contact with the cylinders, substantially as and for the purpose specified.

4. In a seed-planter, the driving-wheels provided with the sliding arms R, having curved faces S, and provided with cams *r*, having arms *r'*, substantially as described.

5. In a seed-planter, the driving-wheels provided with the sliding arms R, provided with curved faces S, projecting over the faces of said wheels, and recesses for the reception of said projecting faces, in combination with the cams *r*, as described.

400,898. TOOL FOR FORMING BOTTLE-NECKS. WILLIAM A. CASWELL, Chicago, Ill. Filed May 15, 1888. Serial No. 273,978. (No model.)

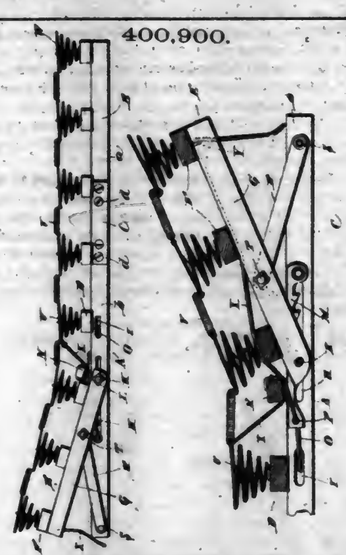


Claim.—1. The combination, in a tool for forming bottle-necks, of the exterior clamping-jaws, the interior spindle, and the loose washer-mold, the latter being provided with fine perforations or holes to permit the glass to come into close contact with the surface of the mold, substantially as specified.

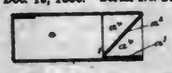
2. In a tool for forming bottle-necks, the combination, with the interior spindle and exterior clamping-jaws, of projectible points in the spindle for forming an internal groove, and a loose washer-mold fitted to revolve with the bottle, substantially as specified.

3. In a tool for forming bottle-necks having external clamping-jaws and an internal spindle, the combination of said parts with the loose molding-washer, and the projectible points for forming the internal groove, said points being operated by the clamping-jaws, substantially as specified.

400,899. CASTER. GEORGE D. CLARK, Plainville, Conn. Filed Oct. 8, 1888. Serial No. 287,513. (No model.)



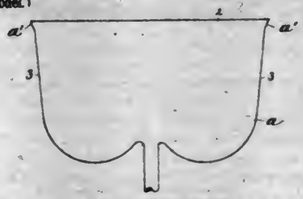
Claim.—The herein-described caster-frame, consisting of the bridge 9, the horns or arms 7 at each end thereof, and the flange 8, bent at an angle to said bridge in the same general direction as the horns, all formed integral with seamless corners at both ends and one side of said flange at its junction with the horns and bridge, substantially as described, and for the purpose specified.



400,900. SPRING BED-BOTTOM. JULIUS M. DAVIS, Columbia, Tenn. Filed June 12, 1888. Serial No. 276,848. (No model.)

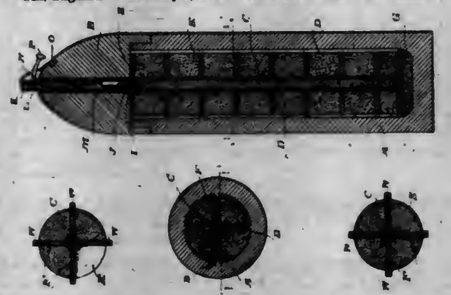
Claim.—In a spring bed-bottom, the frame comprising the longitudinal and transverse bars, each of which is formed of separable members or sections arranged end to end, and the cleats overlapping the meeting ends of said separable members or sections and secured to and connecting the same, substantially as described.

400,900.



400,901. LID FOR RECEPTACLES. CHARLES W. ELLIOTT, Boston, Mass. Filed Dec. 19, 1888. Serial No. 294,052. (Model.)

Claim.—1. The combination of a receptacle, *a*, with a spring-controlled lid, a^2, having one or more lips, a^3, the lid a^2 being secured in place with one end within the receptacle *a*, substantially as and for the purpose set forth.



2. The herein-described combination of receptacle *a* and spring-controlled lid a^2, the lid having a let-off, a^4, projecting from that surface which is toward the chamber of the receptacle when the lid is closed, substantially as and for the purpose set forth.

400,902. HOE-BLANK. HENRY G. ELY, St. Johnsbury, Vt., executor of George B. Ely, deceased. Filed Aug. 7, 1888. Serial No. 282,186. (No model.)

Claim.—A hoe-blank having a finished form otherwise than the projecting portions *a'* at the points of intersection of the sides of the plate with the edge thereof.

400,903. HIGH-EXPLOSIVE SHELL. STEPHEN H. EMMES, London, England. Filed July 2, 1888. Serial No. 278,725. (No model.)

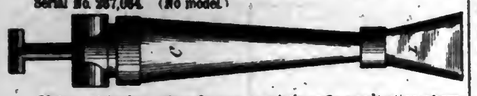
Claim.—1. In a shell for high-explosives, the combination, substantially as hereinbefore specified, of a hollow cylindrical shell-body having internal longitudinal ribs, a charge-holder comprising transverse diaphragms notched to coact with said ribs, and radial webs be-

tween said diaphragms coinciding with the ribs for preventing internal friction, in the manner set forth.

2. In a shell for high-explosives, the combination, with an axial bursting-tube and its charge, of a detonator in front of said charge, a flexible time-fuse attached to said detonator, and an inwardly-yielding striking-tube, through which said time-fuse extends, arranged in front of said detonator and protruding at the nose of the shell, substantially as hereinbefore specified.

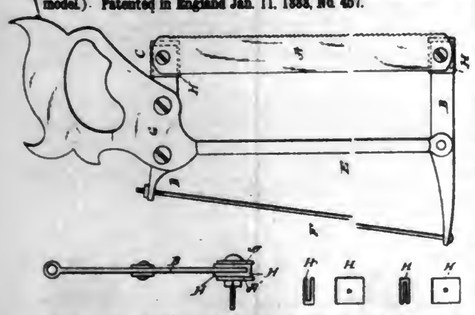
3. In a shell for high-explosives, the combination, with an axial bursting-tube and its charge, of an anvil-plunger in front of the latter, a detonator in front of said plunger having a flexible time-fuse attached thereto, a striking-tube through which the time-fuse extends, provided with a cross-pin to limit its intrusion in advance of contact, an external detonator to which said time-fuse is connected, and an inertia-actuated firing-hammer pivoted on said cross-pin, substantially as hereinbefore specified.

400,904. HAIR-CURLER. FERDINAND FAUST, Brooklyn, N. Y.



Filed Feb. 10, 1888. Serial No. 263,654. (No model.)

Claim.—1. The combination, in a hair-curling device, consisting of a clamp having its upper and lower parts provided with tongues C C in the center of an opening at the end of such parts, and the edges of the lower part turned up, and a rolling stick provided with the slot *a*, all substantially as set forth.



2. A clamp having its upper and lower parts provided with tongues C C in the center of and opening at the end of such parts and the edges of the lower part turned up, all substantially as shown, for the purpose aforesaid.

400,905. HYDROCARBON-BURNER. ARCHIBALD F. FLETCHER, Brooklyn, N.Y., assignor of two-thirds to Valentine Clemson, New York, N. Y., and John Victor Carraher, Washington, D. C. Filed Mar. 13, 1888. Serial No. 267,064. (No model.)

Claim.—A hydrocarbon-furnace consisting of a combustion-chamber, a burner for heavy hydrocarbons entering said combustion-chamber and provided with an inner and outer passage concentric with each other, a supply-pipe for furnishing hydrocarbon to one of said passages, a supply-pipe for furnishing superheated steam or air to the other of said passages, a superheating-coil located within the combustion-chamber, and pressure-chambers intermediate between said coil and burner, and said coil and supply-pipe, substantially as described.

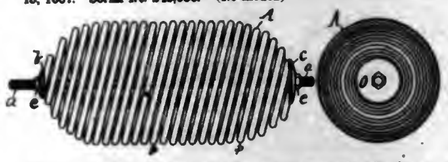
400,906. SAW FOR CUTTING TENONS. THOMAS FORSAITH, Adelaide, South Australia. Filed Mar. 1, 1888. Serial No. 265,883. (No model.) Patented in England Jan. 11, 1888, No. 457.

Claim.—The adjusting-clips H, in combination with the front and back pieces, B and D, the main bar E, the straining-rod F, the fastening-screws C, and the saw-blades, substantially as shown and described.

400,907. WHEEL. JOSEPH FRENIER, La Porte, Ind. Filed Aug. 7, 1888. Serial No. 282,191. (No model.)

Claim.—1. The combination, with a metallic wheel hub-box having a flange and being screw-threaded, of the spoke-holder having a screw-threaded hub and provided with an annular flange and a concentric ring connected by ribs, both the flange and ring having holes radially in line for inserting and holding the spoke ends, substantially as set forth.

2. The combination, with a metallic wheel hub-box screw-threaded and provided with a rigid flange having a circular sharp-edged side projection, of the spoke-holder screwed upon such hub-box and provided with an annular flange and a concentric ring connected by ribs, both the flange and ring having holes radially in line for inserting and holding the metal spokes notched at their inner ends for engaging the sharp-edged side projection of the hub-box, substantially as set forth.

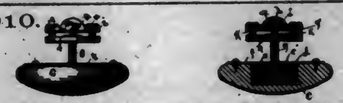


400,908. PAIL-COVER. GUSTAV FUCHS, New York, N. Y. Filed Jan. 4, 1889. Serial No. 295,395. (No model.)

Claim.—1. The combination of the ring B, having an outer annular groove to receive the upper edge of a receptacle, and a horizontal part, E, with a plate, D, secured to the inner edge of the ring B, the plate D, having an opening, F, and with the oscillatory segment or plate G, pivoted on the plate D and adapted to cover the opening F, substantially as described.

2. The combination of the pail or receptacle A, having the cover H, with the ring B, having an outer annular groove to receive the upper edge of the receptacle, and a horizontal part, E, and with the plate D, secured to the inner edge of the ring B, and the oscillatory segment or plate G, pivoted on the plate D, the plate D having an opening to be covered by the segment G, substantially as described.

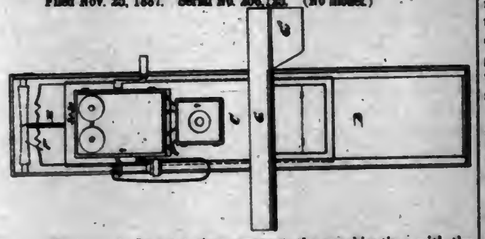
400,909. FUEL-MAGAZINE. JEREMIAH D. GREENE and JAMES C. TREMAN, Troy, N. Y., assignors to James Lacey, same place. Filed Aug. 15, 1887. Serial No. 246,936. (No model.)



Claim.—1. In a hydrocarbon-burner, a magazine having oval ends, and a central bolt having its ends screw-threaded, concave caps provided with flanges and fitting said oval ends, and nuts fitting the ends of said central bolt, whereby the magazine may be compressed or elongated, as and for the purposes set forth.

2. In a hydrocarbon-burner, a magazine formed of coiled wire and having oval ends, a central bolt having screw-threaded ends passing through said magazine, concave caps provided with flanges and fitting said oval ends, and nuts fitting the ends of said screw-threaded bolt, substantially as and for the purposes set forth.

3. In a hydrocarbon-burner, the combination of a magazine having a central bolt with projecting ends, with a trough adapted to receive and hold centrally said magazine, said trough provided with longitudinal supporting-ribs, whereby such trough and magazine may be placed on a grate or plate and remain upright, substantially as and for the purposes set forth.

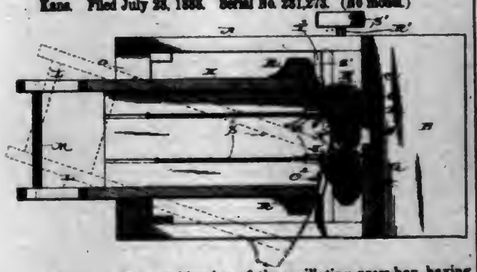


4. In a hydrocarbon-burner, the combination of the magazine, the containing-trough, and the case having ribs at intervals on front and back longitudinally arranged inside of said case, whereby the said trough is kept in a central and horizontal position, substantially as set forth.

400,910. TRUSS. ABEL C. HAINES, Columbus, Ohio. Filed Mar. 23, 1888. Serial No. 268,197. (No model.)

Claim.—In an abdominal support, the combination of the pad, its spring-actuated bolt *g*, pivoted to plate *h* and having head *g'*, clamping-plate *i*, detachably connected, as described, with plate A, and the rounded and angular grooved adjustable bearing-piece *l* with the body-band *a*, having one of its sides half-rounded in form and its remaining side angular, substantially as and for the purpose specified.

400,911. TELEPHONE-SUPPORT. PHILO R. HALL, Detroit, Mich. Filed Nov. 25, 1887. Serial No. 256,125. (No model.)



Claim.—1. In a telephone-support, the combination, with the frame B, of the supporting-board C, sliding vertically within said frame and having attached thereto the signaling apparatus, transmitter, and battery-box, the shelf G on the battery-box, the hinged leaf G' at the front and to one side of said shelf, and the counterpoise D, situated in a space in said frame B and connected to the upper end of the supporting-board by the chain E, said frame B, with all the other appliances attached, made portable and adapted to be fastened against the wall of a room, substantially as described.

2. The combination, with the supporting-board having the signaling apparatus, transmitter, and battery-box attached thereto, of the shelf having the hinged leaf and located on the top of said battery-box, the chain E and weight D, and the chain or flexible cable H, for permitting the vertical movement of the parts without breaking the connection with the telephone-line, all operating in the frame B, said frame B, with all the other appliances attached, made portable and adapted to be fastened against the wall of a room, substantially as described.

3. The combination, with the frame B, having a space for the reception of the weight and chain, the weight and chain within said space, and a space for the reception of the supporting-board, and the supporting-board sliding therein, of the shelf G and flexible cable H, said frame B, with all the other appliances attached, made portable and adapted to be fastened against the wall of a room, substantially as described.

400,912. BALING-PRESS. WILLIAM H. HEWITT, Osage Mission, Kans. Filed July 28, 1888. Serial No. 281,273. (No model.)

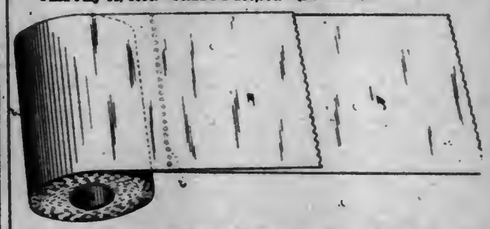
Claim.—1. The combination of the oscillating press-box having an open mouth, the drums journaled in fixed supports at points opposite the mouth of the press-box and geared together so as to vibrate simultaneously in the same direction, and the straps provided with teeth or spurs, connecting said drums, respectively, to opposite sides of the mouth of the press-box and adapted each to coil and uncoil alternately thereon, whereby the mouth of the press-box is oscillated, substantially as specified.

2. The combination of the oscillating press-box having an open mouth, the vibrating drums journaled in fixed supports beyond the mouth of the press-box and geared together to revolve simultaneously in the same direction, the straps coiled on the said drums and connected, respectively, to opposite sides of the mouth of the press-box, and the slats or cleats secured to the straps and provided with spurs or teeth, substantially as specified.

3. The combination, in a baling-press, of the oscillating press-box having an open mouth, the gate at the rear end of the press-box, the vibrating drums arranged opposite the mouth of the press-box in proximity to each other and geared together to revolve simultaneously in the same direction, the said direction being reversed alternately, and the straps connecting the drums, respectively, to opposite sides of the mouth of the press-box and coiled on the drums, whereby as the latter are vibrated the press-box is oscillated.

4. In a baling-press, the combination of the shaft K', having the loose gear-wheels T', the clutches feathered on the said shaft and adapted to alternately engage their respective gear-wheels, the revolvable shafts G, having drums at the upper ends and having their lower ends geared together and provided with gears I^3, engaging the gear-wheels T', the pivoted press-box adapted to oscillate and having its mouth presented to the drums, the straps connecting opposite sides of the mouth of the press-box to the drums, the levers connected to the clutches and adapted to move them longitudinally on the shaft to engage the gear-wheels T', and connections, substantially as described, to the press-box and the levers to operate the latter, substantially as specified.

5. The combination of the reciprocating bar K', having the cam-slots, the pinion engaging the rack on said bar and having the weighted arm, the clutch-levers engaging the cam-slots, and the oscillating press-box, having the stop-plates to engage and operate the bar K' alternately, substantially as described.



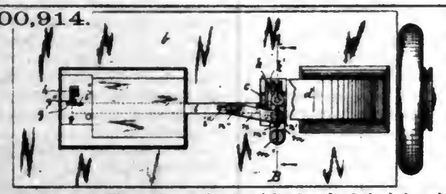
6. The combination of the oscillating press-box, the drums arranged at the mouth thereof, straps connecting said drums to opposite sides of the mouth of the press-box, gearing for rotating the drums simultaneously in the same direction, the power-shaft, the clutch members mounted on the shaft and adapted to alternately engage the said gearing, the clutch-levers connected to the clutch members, the reciprocating bar K', having the cam-slots engaged by the clutch-levers and provided by the arm M', and the stops secured to the press-box and adapted to engage said arm, for the purpose set forth, substantially as described.

7. The combination, in a baling-press, of the oscillating press-box, the stop-plates secured thereto and adjustable laterally thereon, and the reciprocating bar having the arm engaged by the stop-plates, for the purpose set forth, substantially as described.

8. The combination of the oscillating press-box having the vertical longitudinal slots in its upper sides and the guides in its lower side near its mouth, the drums arranged opposite the mouth of the press-box, the straps connecting said drums to opposite sides of the mouth of the press-box, the reels or spools, and the cords or wires thereon directed by the guides and passed upward and rearward through the press-box, and the slots therein, substantially as described.

9. The combination of the oscillating press-box open at its front and rear ends, the vibrating drums arranged opposite the mouth of the press-box and adapted to rotate simultaneously in the same direction, the straps connecting said drums to opposite sides of the mouth of the press-box, and the gate pivoted in the rear end of the press-box, substantially as described.

400,913. TOILET-PAPER ROLL. OLIVER H. HIGBEE, Chicago, Ill. Filed July 13, 1888. Serial No. 280,200. (No model.)

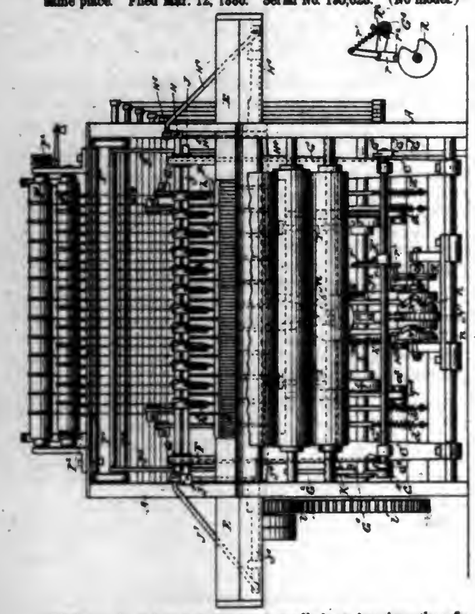


Claim.—A roll or bundle of paper consisting of two or more lengths of paper each weakened transversely at intervals, wound together with the lines of weakness of one length between those of the adjoining length, whereby upon drawing upon the end of one of the lengths to detach a sheet therefrom the end of the adjoining length will be brought into position to be grasped for the next operation, substantially as described.

400,914. SEWING-MACHINE FOR FINISHING BUTTON-HOLE PIECES. GEORGE S. HILL, Lynn, assignor, by direct and mesne assignments, to John Reece, Boston, Mass. Filed Apr. 8, 1887. Serial No. 234,112. (No model.)

Brief.—A reciprocating bar has an end projecting upward through a hole in the throat-plate just in front of the needle-hole. The button-hole piece of a shoe is fed to the needle so that the cords from one button-hole to the next are engaged by a notch in the end of the reciprocating bar, thus gathering them in line to be stitched down by the vibrating needle-bar.

400,914.



Claim.—1. The reciprocating bar *i*, having the forked thread-guide *i'* in its outer end projecting upwardly through the needle-plate, combined with the vertically-reciprocating needle *e* and needle-plate *g* with its perforation for the thread-guide for the purpose of alternately carrying the loose threads, as described, to opposite sides of the stitches being made, for the purpose set forth.

2. The rotary shaft *c* and its grooved cam *k k'*, combined with the reciprocating bar *i* and its forked thread-guide *i'*, and the intermediate connecting mechanism, consisting of the connecting-rod *n*, lever *m*, pivoted to plate *b* and having tooth or projection *l*, engaging in the groove *k'* of said cam *k*, as and for the purpose set forth.

3. The rotary shaft *c* and its grooved cam *k k'*, the rock-lever *m* and its tooth or projection *l*, and the bar *i* with its forked thread-guide *i'*, combined with the connecting-rod *n*, its studs or pins *n' n''* and slots *i''* and *m'* in the bar *i* and lever *m*, respectively, for the purpose of regulating the amount of throw on bar *i*, as herein set forth and described.

400,915. LAPPET-LOOM.

GEORGE H. HODGES and THOMAS LONERGAN, Canton, Mass.; said Lonergan assignor to Thomas D. Lonergan, same place. Filed Mar. 12, 1886. Serial No. 195,023. (No model.)

Claim.—1. A lay, one or more needle-bars, bearings therefor, and ways on the lay in which said bearings may move vertically, the roller K, located as described upon one of the swords of the lay, a cam-lever, G^2, located as described with respect to said roller K, whereby said lever may be raised during a portion of the forward movement of said lay and allowed to fall during the backward movement of said lay, and connections, substantially as described, between said cam-lever and said bearings, whereby each movement of the lever shall cause a corresponding movement of the bearings, all as and for the purposes set forth.

2. A lay, one or more needle-bars, bearings therefor, and ways on the lay in which said bearings may move vertically, the roller K, located as described upon one of the swords of the lay, a cam-lever, G^2, located as described with respect to said roller K, whereby said lever may be raised during a portion of the forward movement of said lay and allowed to fall during the backward movement of said lay, and connections, substantially as described, between said cam-lever and said bearings, whereby each movement of the lever shall cause a corresponding movement of its bearings, in combination with a stop located to receive the mechanism above described for operating the needle-bar bearings during the backward movement of the lay and limit the downward movement of said bearings, all as and for the purposes set forth.

3. The lay, a needle-bar, bearings therefor in which said needle-bar may be moved longitudinally and ways on the lay in which said bearings may be moved vertically, means, substantially as above described, whereby there is given to said needle-bar a vertical reciprocating movement during each oscillation of the lay, a grooved pattern-wheel, means, substantially as described, whereby said pattern-wheel is rotated step by step, treadles H^3 J^3, cams H' J', located as described with respect to said treadles, an oscillating lever supported on said lay and connected with said treadles in substantially the manner described, and means, substantially as described, whereby one end of said lever is connected with said needle-bar, the other end of said lever being located in the groove of said pattern-wheel, all as set forth.

4. In combination with the needle-bar, the bearings therefor, the lay C, the ways thereon for said bearings, roller K, attached to one of the swords of said lay, cam-lever G^2, pivoted upon the frame, rocker-arm G^4, link G^5, rock-shaft G^3, connections, substantially as above described, between said rock-shaft and the bearings, whereby the oscillating motion of the lay imparts an intermittent vertically-reciprocating movement to the bearings and needle-bar, all as set forth.

5. In combination with the needle-bar, the bearings therefor, the lay C, the ways thereon for said bearings, roller K, attached to one of the swords of the said lay, cam-lever G^2, mounted upon the frame, rocker-arm G^4, link G^5, rock-shaft G^3, arms G^2, and connections, substantially as above described, between said arms and the bearings, whereby the oscillating motion of the lay imparts an intermittent vertically-reciprocating motion to the needle-bar and a stop, G^6, the lower surface, G^7, of one of said arms G^2 being adapted to engage intermittently with said stop G^6, as and for the purposes set forth.

6. The needle-bar and mechanism, substantially as described, for giving it a vertically-reciprocating motion, in combination with the rotating notched wheel R and mechanism, substantially as above described, whereby said needle-bar is periodically held from its downward movement, all substantially as described.

7. A lay, one or more needle-bars mounted thereon, the rock-shaft G^3, means, substantially as above described, whereby said rock-shaft is oscillated, and means, substantially as described, whereby each oscillation of the said rock-shaft imparts a vertically-reciprocating motion to said needle bar or bars, the rocker-arm R', mounted upon said rock-shaft, the lever *r*, having pin r^2, and the spring *r'*, constructed and connected to said rocker-arm substantially in the manner described, in combination with the notched wheel R and mechanism, substantially as above described, whereby said notched wheel is rotated step by step, as and for the purposes set forth.

8. In combination with a needle-bar and means, substantially as above described, whereby said needle-bar is reciprocated vertically, the grooved pattern-wheel N and means, substantially as above described, whereby it is rotated intermittingly, the cam-shaft, cams H' J', located upon the cam-shaft, the treadles H^3 J^3, located beneath and operated by said cams, the drum M, the springs and straps connecting said treadles with said drum, the oscillating lever H^2, connected with said drum, as described, the lower end of said lever being located in the groove of said pattern-wheel, and devices, substantially as described, whereby the upper end of the lever is connected with said needle-bar, all as and for the purposes set forth.

9. The combination, with the lay and reed, of the needle-bars H J, each provided with a set of thread-carrying needles, and mechanism, substantially as above described, whereby said bars are reciprocated vertically and horizontally, the needles *j* on one bar lying nearer the reed than those, *k*, of the other bar, the points of the said needles *k* being above the line of the threads passing from the needles *j* to the fabric when the bars are moving laterally, and the thread-guides k^3 k^4, said guides k^3, belonging to said needles *k*, being located directly above said needles *k*, all substantially as and for the purposes set forth.

10. In combination, a lay, one or more needle-bars, H J, mounted thereon, and mechanism, substantially as above described, whereby they are given a vertical reciprocating movement with respect to the lay, the guard-carrying bar T, provided with auxiliary guards *t* and mounted upon uprights, the treadles T^4 and their cams and cam-shaft, and means of connection, substantially as described, whereby each movement of the treadle is imparted to the bar, as and for the purposes set forth.

11. The pattern-wheel N, provided with its ratchet N', in combination with the pawl V^4, its latch V', and the pin V, the lever V^3, and cam J', all substantially as and for the purposes set forth.

12. The pattern-wheel above described, made in two parts, in combination with one or more washers located between the parts of said pattern-wheel, as and for the purposes set forth.

13. In combination with the lay, needles, and tension mechanism of a lappet-loom, the take-up mechanism above described, consisting of the bars p^4 p^5, the levers p^7, connected at one end to and operated by the lay, and the take-up bar p^8, lying between the bars p^4 p^5 and carried by the other ends of such levers, whereby at each forward movement of the lay the otherwise slack thread is drawn tight over the said bars p^4 p^5, as and for the purposes set forth.

14. The cam shaft L, the cams H' J', mounted thereon, a pair of treadles H^3 J^3, actuated by said cams, the lay, a wheel, N, axled to the lay, the strap *m'*, passing over and attached to said wheel, springs *j'*, forming an elastic connection between said strap and said treadles, a lever, J^3, attached to said wheel, a grooved pattern-wheel, N, one end of said lever being located in the groove thereof, a needle-bar, J, and means, substantially as described, whereby said needle-bar is connected to said lever, all adapted for the purposes set forth.

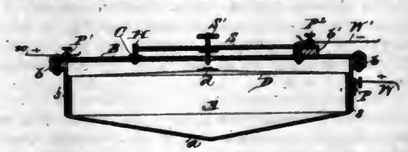
15. The lay, the needle-bar J, mounted upon the lay in substantially the manner described, in combination with the pivoted connecting-rod J^6, upright J^5, attached to said needle-bar, slide J^6, located and free to move in straps upon the lay, and the brace J^7, rigidly connected at one end to the outer end of said slide and at the other end with the upper end of said upright J^5, and means, substantially as described, whereby said rod J^6 is reciprocated laterally, as set forth.

400,916. CURRENT-COLLECTING DEVICE FOR ELECTRIC RAILWAYS.

RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed Nov. 8, 1888, Serial No. 290,302. Divided and this application filed Dec. 13, 1888. Serial No. 293,455. (No model.)

Claim.—1. The combination of a flexible suspended conductor of circular cross-section, supports therefor at intervals in its length, a traveling vehicle, a grooved collector-wheel located below said conductor, and in the groove of which the conductor is received and guided against lateral displacement, and a support for said grooved collector-wheel hinged to the vehicle on a transverse axis.

2. The combination of a flexible suspended conductor of circular cross-section, supports therefor at intervals in its length, a traveling vehicle, a grooved collector-wheel located below said conductor, and in the groove of which the conductor is received and guided against lateral displacement, a support for said grooved collector-wheel hinged to the vehicle on a transverse axis, and a spring acting on said support to press the wheel against the under surface of the conductor.

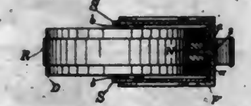


3. The combination of a flexible suspended conductor of circular cross-section, supports therefor at intervals in its length, a traveling vehicle, a grooved collector-wheel located below said conductor, and in the groove of which the conductor is received and guided against lateral displacement, and a pivoted spring-support for said grooved collector-wheel.

4. In an electric railway, a suspended conductor free to rise and fall, in combination with a traveling electrically-propelled vehicle, an upwardly-extending pivoted collector having a collecting-wheel running upon the under side of the conductor, and a spring to press the collector-wheel up against the conductor, whereby the collector-wheel and conductor both rise and fall to accommodate themselves to each other and maintain a constant contact.

5. In an electric railway, a flexible suspended conductor, in combination with a traveling electrically-propelled vehicle, an upwardly-extending pivoted collector having a collecting-wheel running upon the under side of the conductor, a spring to press the collector-wheel up against the conductor, whereby the collector-wheel and conductor both rise and fall to accommodate themselves to each other and maintain a constant contact, and means to adjust the tension of the spring.

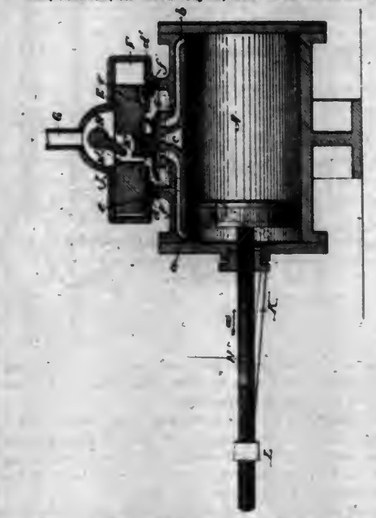
400,917. THERMAL CIRCUIT-CLOSER FOR FIRE-ALARMS.



ARMAND C. IWANOWSKI, Moscow, Russia. Filed Feb. 23, 1888. Renewed Mar. 9, 1889. Serial No. 302,746. (No model.)

Claim.—The combination, with the receptacle A, its diaphragm D, provided with a contact, *d*, and binding-post P, of the cross-bar B, provided with an anvil, C, and binding-post P', said cross-bar being insulated from the receptacle A, the spring-actuated hammer H, and binding-post P^3, insulated from the cross-bar and the contact-screw S', substantially as and for purposes specified.

400,918. SPRING SASH-BALANCE.



WALTER S. JENNINGS, Rochester, N. Y., assignor, by mesne assignments, to Adelbert Cronise, same place. Filed Sept. 4, 1888. Serial No. 284,542. (No model.)

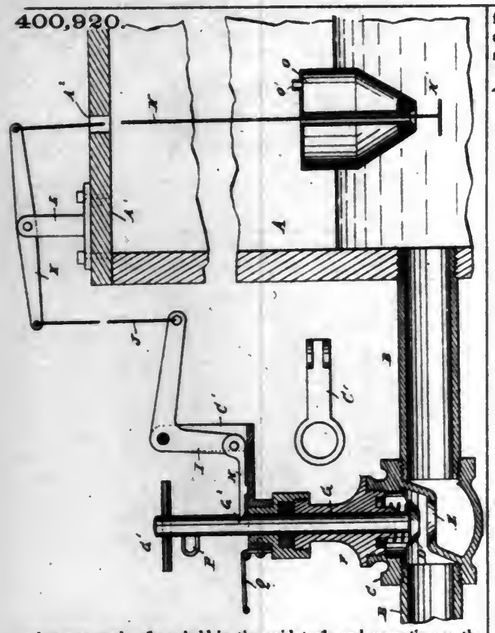
Claim.—In a spring sash-balance, the adjustable opposing brakes S S, fitted to press toward each other against the opposite sides of the interposed drum, substantially as shown and described.

400,919. VALVE FOR STEAM-ENGINES.

SAMUEL M. KEPLINGER, Franklin, Pa. Filed May 21, 1888. Serial No. 274,496. (No model.)

Claim.—1. The combination, with a steam-cylinder and a slide-valve operating over the usual ports of the steam-cylinder, of an auxiliary piston loosely connected with the said slide-valve and an auxiliary cylinder receiving the auxiliary piston, and having ports connecting its ends directly with the steam-chest and other ports connecting it with the exhaust, and a rocking finger loosely connected to said auxiliary piston to give it an initial movement, which traps live steam from the steam-chest in that end of its cylinder toward which said auxiliary piston is moving to cushion the piston, and lets in live steam at the other end of the said cylinder to finish the stroke of the auxiliary piston and the slide-valve, substantially as described.

2. The combination, with a steam-cylinder and a slide-valve operating over its ports, of an auxiliary piston loosely connected with the slide-valve and having an exhaust-channel in each end, and an auxiliary cylinder for said piston provided with channels leading from the live-steam chest to each of its ends, and also provided with channels extending to the exhaust-port of the cylinder and adapted to register with the exhaust-channels of the auxiliary piston, and an initial motor for the auxiliary piston—such as a finger rocked from the main piston-rod—which moves the auxiliary piston a distance sufficient to put one or the other of its channels in communication with the exhaust and to open the live-steam channel in the auxiliary cylinder at the opposite end to let in live steam from the steam-chest, which live steam, acting upon the auxiliary piston, moves it to close the exhaust, and thereby entrap some live steam at the leading end to cushion the piston, and completes the stroke of the auxiliary piston, and through it finishes the stroke of the slide-valve, substantially as described.



400,920. CUT-OFF VALVE FOR TANKS.

NATHANIEL W. KROONE, Washington, Pa. Filed July 11, 1888. Serial No. 279,630. (No model.)

Claim.—1. The combination, with an oil-tank and a pipe-line connected with the said oil-tank, of a valve located in the said pipe-line, a spring pressing against the said valve, a bolt engaging the stem of the said valve, and a float operating on the said bolt to withdraw it whenever the oil in the tank reaches a low level, substantially as shown and described.

2. The combination, with an oil-tank and a pipe-line connected with the said tank, of a valve located in the said pipe-line, a spring pressing against the said valve, a valve-stem supporting the said valve and provided with a notch, a bolt engaging the notch of the said

400,920.

valve-stem, and a float held in the said tank and operating on the said bolt to withdraw it whenever the oil in the tank reaches a low level, substantially as shown and described.

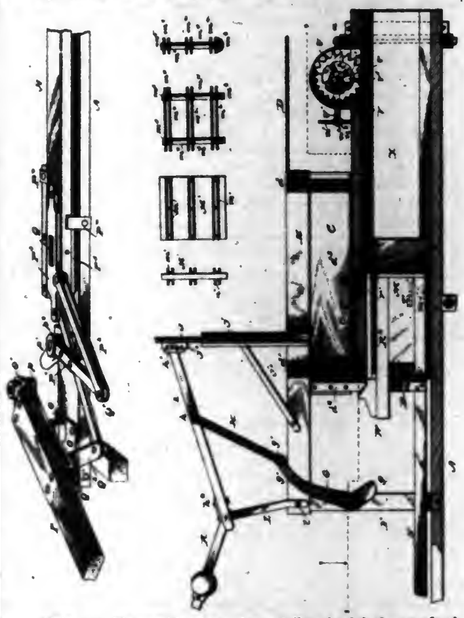
3. The combination, with a valve located in the pipe-line, of a spring pressing against the said valve, a bolt adapted to engage the stem of the said valve, and a float located in the oil-tank and operating on the said bolt to withdraw it whenever the oil in the tank reaches a low level, substantially as shown and described.

4. The combination, with a float held in the oil-tank, of a rod on which the said float is guided loosely, a cross-arm secured on the lower end of the said rod, a lever connected with the said rod, a bell-crank lever connected with the said lever, a bolt pivotally connected with the said bell-crank lever, a valve-stem having a notch engaged by the said bolt, a valve secured on the said valve-stem and adapted to open and close the pipe-line, and a spring pressing the said valve downward on its seat in the pipe-line, substantially as shown and described.

5. The combination, with a float held in the oil-tank, of a rod on which the said float is guided loosely, a cross-arm secured on the lower end of the said rod, a lever connected with the said rod, a bell-crank lever connected with the said lever, a bolt pivotally connected with the said bell-crank lever, a valve-stem having a notch engaged by the said bolt, a valve secured on the said valve-stem and adapted to open and close the pipe-line, a spring pressing the said valve downward on its seat in the pipe-line, and a lock for locking the said valve-stem in place, substantially as shown and described.

400,921. ARTIFICIAL TOOTH. CHARLES H. LAND, Detroit, Mich. Filed Mar. 14, 1888. Serial No. 267,132. (No model.)

Claim.—1. In a tooth-filling appliance, an anchoring-post, in combination with a porcelain head molded thereon, substantially as set forth.



2. In a tooth-filling appliance, a porcelain-headed screw, in combination with a tubular anchoring device provided with a tubular stem, substantially as set forth.

3. In a tooth-filling appliance, a screw consisting of a metal screw-threaded shank, in combination with a porcelain head molded thereon, substantially as set forth.

4. The combination, with an anchoring device embedded in a cavity, of a porcelain section fitted upon the tooth, and a porcelain-headed anchoring-post for locking the porcelain section to the tooth, substantially as set forth.

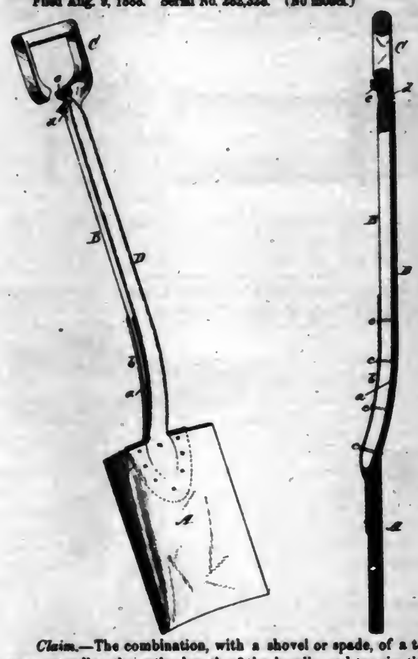
5. The combination of the anchoring device, embedded as set forth, the plate D', an intervening protecting substance to exclude the fluids of the mouth, the matrix, and the porcelain section, said section engaged in place by a porcelain-headed screw, substantially as described.

400,922. BALING-PRESS. JOHN LA DOW, Denver, Colo. Filed Sept. 8, 1888. Serial No. 284,867. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the follower, the pitman secured thereto, the sweep, the jointed arms Q' Q^2, pivotally connected therewith and forced inward by the sweep to push the pitman forward, the link P^3, pivoted to the pitman, the bell-crank lever P', jointed to the link and with which the sweep engages to return the pitman, and the rollers Q^3 and p on the sweep.

2. The combination, substantially as hereinbefore set forth, of the follower, the pitman secured thereto, the sweep, the casting on which it is mounted, the jointed levers for forcing the pitman forward, the bell-crank, jointed levers for returning the pitman, and the rollers on the under side of the sweep at its inner end operating upon said levers.

3. The combination, substantially as hereinbefore set forth, of the compressing-chamber, the reciprocating follower, the condensing-chamber, the vertically-reciprocating feed-board, the trip-lever having a projecting end or nose, g, at its lower end, connections between the trip-lever and the feed-board, and the block W, having an inclined upper surface mounted on the rear end of the follower, which engages with the trip-lever.



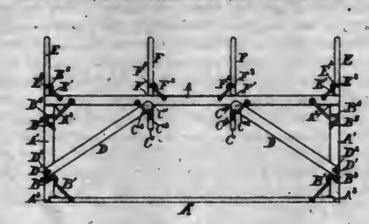
4. The combination, substantially as hereinbefore set forth, of the side casing of the compressing-chamber, the hollow folder, the bolt extending through the folder and secured to the casing, and the spring incased within the folder and bearing against the bolt and the folder.

5. The combination, substantially as hereinbefore set forth, of the main frame, the compressing-chamber, the reciprocating follower, the folder having a lower beveled side, the guideways at the ends in which it moves vertically, the spring attached to the frame for forcing the folder down, and the beam secured to the top of the plunger against which the lower beveled side of the folder bears.

6. The combination, substantially as hereinbefore set forth, of the compressing-chamber and a partition-follower consisting of the combination of the flat rods, the bars on which they are mounted, the spacing-thimbles, and devices for securing the rods and thimbles on the bars.

7. The combination, substantially as hereinbefore set forth, of the baling-chamber, the compressing-chamber, the plunger which reciprocates within the compressing-chamber, the condensing-chamber located above the compressing-chamber, the folder below the condensing-chamber and above the compressing-chamber, the pitman-arm connected to the plunger, the vertically-reciprocating feed-board, the guideways in which it moves, the uprights F, secured to the main frame, the jointed levers L and I, flexibly connected to the uprights F and the upper end of the feed-board, a weighted arm, K, secured to said levers, the pivoted bell-crank trip-lever G, pivoted to the uprights F, the hinged arm H, connecting the upper end of the lever G with the arm I, and the block W, carried by the plunger, with which the lower end or nose, g, of the bell-crank lever G engages.

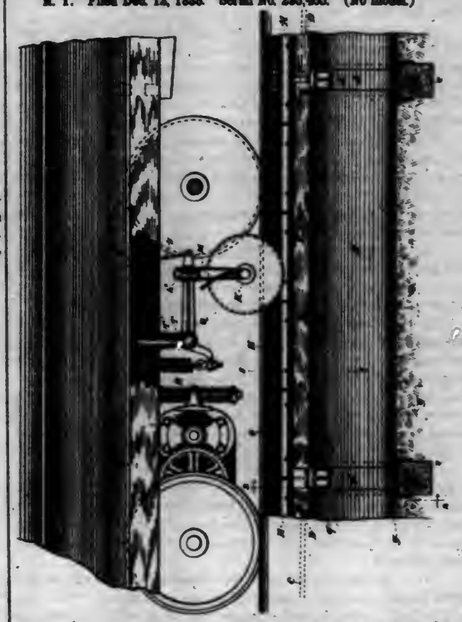
400,923. SPADE OR SHOVEL. JAMES A. LITTLE, Cartersburg, Ind. Filed Aug. 9, 1888. Serial No. 282,338. (No model.)



Claim.—The combination, with a shovel or spade, of a tension-strap extending the entire length of the handle, and terminating in a screw-bolt which extends obliquely through the same, and a nut engaging with the bolt, whereby the necessary tension of the strap may be had, substantially as and for the purpose set forth.

400,924.

WITHDRAWN.



400,925. BOOK-CASE. RICHARD W. LOVERING, Poplar Grove, Ill. Filed Dec. 17, 1888. Serial No. 293,539. (No model.)

Claim.—1. As a new article of manufacture, a book-case consisting, essentially, of an upper shelf, A, the folding end pieces, A', hinged thereto, a lower shelf, A^4, connected with said end pieces, the auxiliary folding end pieces, E, hinged to the shelf A, the lower folding partitions, C, jointed to the lower side and the upper partitions, F, jointed to the upper side of said shelf A, substantially as described, and for the purpose specified.

2. The herein-described book-case, consisting of the upper and lower shelves, A A^4, the end pieces and auxiliary end pieces, A' E, the upper and lower folding partitions, F C, the braces D, and the hooks, eyes, and hinges securing said parts together, in the manner shown, and for the purpose set forth.

400,926. ELECTRIC RAILWAY. ROBERT LUNDELL, New York, N. Y. Filed Dec. 12, 1888. Serial No. 293,605. (No model.)

Claim.—1. The combination, with an open-slot conduit, of an insulated line-conductor laid therein, in the upper part thereof, and a service-conductor arranged in said conduit, subdivided into sections, and said sections supported from said insulated line-conductor.

2. In an electric railway of the described class, a service-conductor divided into short sections mechanically separated from one another, in combination with springs for pressing up the sections and rigid vertical guides for each section adapted to prevent lateral displacement thereof in its up-and-down movement.

3. In an electric railway of the described class, a service-conductor divided into short sections mechanically separated from one another, in combination with elastic supports therefor, consisting each of a vertical plunger attached to one of the sections, a socket which the plunger may rise and fall, and a spring for pressing the plunger up.

4. In an electric railway of the described class, a service-conductor divided into short sections mechanically separated from one another, in combination with two elastic supports for each section constructed to engage its opposite end portions through the medium of horizontal pivots, whereby the section may be depressed at one end before being depressed at the other.

5. In an electric railway of the described class, a service-conductor

divided into short sections mechanically separated from one another, in combination with elastic circuit-closing supports for the sections, consisting each of a plunger attached to the section at its upper portion and arranged with its lower end normally just above a contact-surface in connection with the line-conductor, a vertical socket in which said plunger may move up and down, and a spring for pressing it up.

6. In an electric railway of the described class, the combination, with the line-conductor inclosed in insulation with its upper surface exposed at intervals, of a succession of vertical plungers arranged with their lower ends adjacent to said exposed surfaces, respectively, springs for pressing said plungers up to prevent normal contact of their ends with said surfaces, insulated sockets in which said plungers may move up and down, and the service-conductor divided into sections and mounted on said plungers.

7. In an electric railway of the described class, the combination, with the line-conductor, of an insulating and supporting casing therefor, consisting of an insulating-sheath surrounding the line-conductor and a supporting-bar of strong material to which said sheath is fastened,

8. In an electric railway of the described class, the combination, with the line-conductor, of an insulating and supporting casing therefor, consisting of an exterior shell of rigid material and an insulating sheath or filling within said shell surrounding the line-conductor.

9. In an electric railway of the described class, the combination with the line-conductor, of an insulating and supporting casing therefor, consisting of an exterior shell made in two parts, the one a metal plate of U-shape in cross-section and the other a channel-bar closing the open side of said U-shaped plate and fixed thereto, and an insulating sheath or filling surrounding the line-conductor and inclosed within said shell.

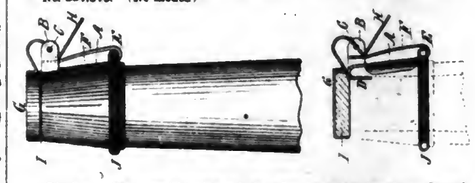
10. In an electric railway of the described class, the combination, with the line-conductor and its insulating-casing made in sections of convenient length, of means for connecting together the ends of adjoining sections, consisting of conducting fish-plates arranged to lap over the adjacent end portions of the line-conductor, and a hood embracing the end portions of the two sections of casing.

11. In an electric railway of the described class, the combination, with the line-conductor and its insulating-casing, of a plug of insulating material inserted in said casing and formed with a socket extending to and exposing the surface of the line-conductor, and a plunger in said socket adapted, when pressed down, to make contact at its lower end with said conductor.

12. In an electric railway of the described class, the combination, with the line-conductor and its insulating-casing, of a plunger-shell fixed to said casing and insulated thereby from the line-conductor, a plunger in said shell, and a spring for pressing up said plunger.

13. In an electric railway of the described class, the combination, with the line-conductor and its insulating-casing, of a circuit-closing plunger movable up and down and arranged, when pressed down, to make circuit-connection with the line-conductor, a plunger-shell fixed to said casing and having a neck through which the plunger projects upwardly, and a thimble fixed on said plunger and having an annular flange extending downward and embracing the top of said neck.

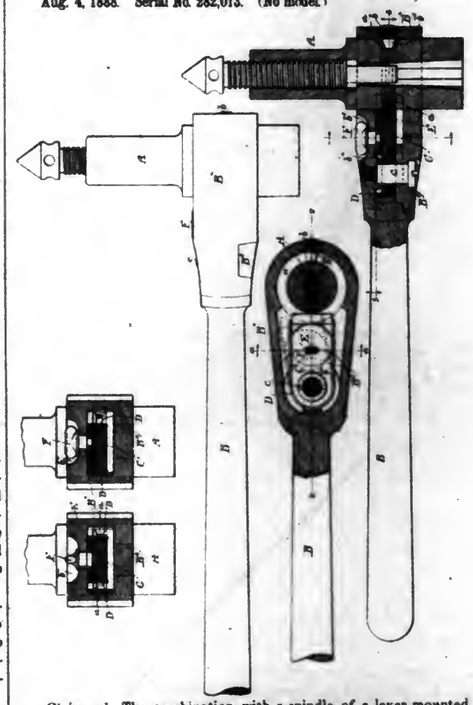
14. In an electric railway of the described class, a current-collector for the motor-car, consisting of a conducting-disk, and two insulating-disks on opposite sides thereof and of larger diameter to form flanges projecting beyond the periphery thereof, fastened together to form a wheel, and a bearing in which said wheel is rotatively mounted.



15. In an electric railway of the described class, a current-collector for the motor-car, consisting of the combination, with a collector-wheel having a conducting-journal, of a conducting-bearing for said journal, a bearing-frame carrying said bearing, an insulation interposed between said bearing and said frame, and an electric conductor joined to said bearing.

16. In an electric railway of the described class, the combination, with the motor-car, of a collector-wheel, its bearing-frame, a lever extending longitudinally of the car and to which said frame is swiveled on a vertical axis, and a swiveled connection between said lever and the car-body, arranged also on a vertical axis, whereby the collector-wheel is adapted to travel in an open slot and to adjust itself to changes of direction in said slot.

17. In an electric railway of the described class, the combination, with the motor-car, of a collector-wheel, its bearing-frame, a lever extending longitudinally of the car and to which said wheel is swiveled on a vertical axis, a vertically-swiveled part to which said lever is fulcrumed, whereby the collector-wheel is adapted to travel in an open slot and to adjust itself to changes of direction in said slot, and a spring acting against said lever in such direction as to impart a downward tension to said wheel.

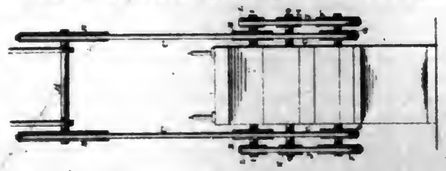


18. In an electric railway, the combination, with an open-slot conduit and a conductor laid therein beneath the slot, of a motor-car and a collector-wheel carried by said car and traveling in said slot, with its periphery riding upon and in conductive contact with said conductor and mounted to turn in a bearing above said slot, whereby the wheel may be lifted out of the slot at will.

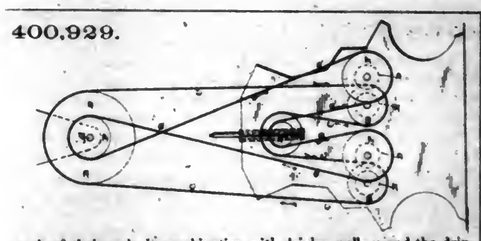
400,927. BOTTLE-STOPPER. SOLOMON MARKS, Cincinnati, Ohio, assignor to Rachel B. Hyams, same place. Filed Jan. 28, 1889. Serial No. 297,873. (No model.)

Claim.—The combination of the plate A, carrying jaws B and spring F, cap G, having cushion I, lever H, secured to the cap and pivoted to the jaws, and ring J, as and for the purpose set forth.

400,928. DRILL-BRACE. THOMAS C. MASSEY, Chicago, Ill. Filed Aug. 4, 1888. Serial No. 282,013. (No model.)



Claim.—1. The combination, with a spindle, of a lever mounted to turn about said spindle, a single pawl mounted upon said lever, said spindle and the free end of the pawl being provided with engaging wedge-shaped surfaces, springs located at opposite sides of said pawl, and a revolving cam-plate acting to hold either of said springs out of engagement with the said pawl, substantially as described.

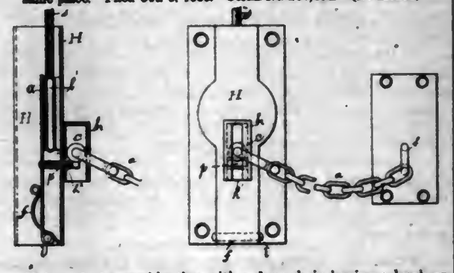


2. The combination, with a spindle provided with a circumferential groove, of a lever adapted to turn about said spindle, a spring-pawl upon the said lever engaged with said groove, and a screw secured in said lever and engaged at its inner end with said groove, substantially as described.

400,929. REDUCTION ROLLER-MILL. MILES MASTERS, Bureau, Ill. Filed Nov. 21, 1887. Serial No. 255,800. (No model.)

Claim.—1. In a roller-mill, the rolls provided with pulleys upon

400,929.



each of their ends, in combination with driving-pulleys and the driving-belts which are applied to the roll-pulleys from above, whereby all of the rolls are driven with an upward pull simultaneously or alike from each end, substantially as shown.

2. The combination of the driving-shaft provided with pulleys and located above the plane of the rolls, and suitable driving-belts extending from the pulleys, with the grinding-rolls provided with pulleys upon each of their ends, and around which the driving-belts pass, and a counter-shaft which extends through the frame and is provided with pulleys upon each of its ends, and around which the driving-belts also pass, whereby the rolls are driven from each end alike from above, substantially as described.

3. The combination of the driving-shaft A, provided with a driving-pulley, B, the two driving-belts, with the grinding-rolls, each provided at each end with a pulley, and a counter-shaft which extends through or above the frame and is provided with pulleys at each end, and around which both of the belts pass, substantially as set forth.

4. The combination of the driving-shaft provided with driving-pulleys, the two driving-belts, reducing-rolls provided with driving-pulleys at each end, a counter-shaft which extends through or above the frame and is provided with pulleys at each end, and around which pulleys the two belts pass, and adjusting devices for the counter-shaft, whereby the pulleys upon the ends of the counter-shaft can be adjusted freely, so as to tighten the two driving-belts, substantially as specified.

400,930. DOOR-CHAIN AND UNCOUPLING DEVICE THEREFOR. HERMANN MAUL, Dresden, Saxony, Germany, assignor to MAX ROST, same place. Filed Oct. 3, 1888. Serial No. 287,484. (No model.)

Claim.—1. In combination with a door-chain having a knob on its detachable end, a casing slotted to receive said knob, a movable shelf or bracket for retaining said knob in said casing, and pneumatic device arranged to move said shelf from a distance, in order to set free said knob and chain, substantially as set forth.

2. A compressible ball, *g*, tube *r*, and expansible cushion *b'*, in combination with a pivoted plate, *a'*, arranged in proximity to said cushion, a shelf or bracket carried by said plate, a spring bearing against the rear of said plate, a casing, which contains said plate and cushion, and is provided in front with a supplemental vertically-slotted casing entered from the rear by said shelf, and a door-chain provided with a knob which enters said slotted supplemental casing from below and rests therein on said shelf or bracket until released, as set forth.

400,931. MANUFACTURE OF BARS OR ROUNDS OF STEEL OR IRON. SIDNEY MCCLOUD, Chicago, Ill. Filed Dec. 22, 1888. Serial No. 294,391. (No model.)

Claim.—1. As a new article of manufacture, a bar or round of steel or iron, comprising multiple layers superposed from the same plate or plates by bending the metal of said plate or plates upon itself, substantially as described.

2. As a new article of manufacture, a bar or round of iron or steel, comprising multiple layers formed by winding a sheet or plate (one or more) of metal upon itself, substantially as described.

3. As a new article of manufacture, a bar or round of steel or iron having the grain of the metal extending in the direction of its length, said bar or round being formed from a plate (one or more) coiled or wound upon itself, substantially as described.

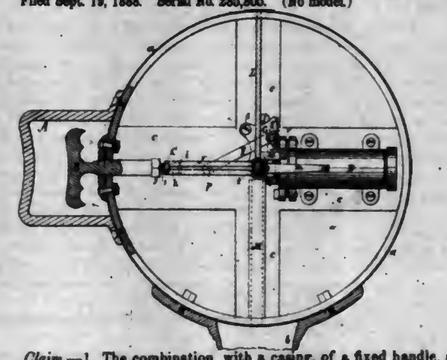
4. As a new article of manufacture, a bar or round of steel or iron formed from a plate (one or more) wound spirally upon itself, substantially as described.

400,932. WHEELED HARROW. DANIEL R. MCSHERRY and HORACE G. SWOPE, Dayton, Ohio, assignors to D. R. McSherry & Co., same place. Filed Jan. 24, 1889. Serial No. 297,490. (No model.)

Claim.—1. In combination with the beam A and the rearwardly-extending drag-bars provided with harrow-teeth, the wheels or runners supporting said beam, and an adjustable seat standard or support mounted upon said beam, whereby the teeth may be raised out of the soil or caused to enter therein, according as the standard is moved forward or backward.

2. In combination with the frame A, supported upon wheels or runners and having the rearwardly-extending drag-bars and teeth, the adjustable seat-standard provided with a seat, and means for locking the said standard in its adjusted positions.

3. In combination with beam A and wheels or runners B, bar C, projecting from the beam A, a seat-standard, D, provided with a seat, E, means for securing the seat-standard to the bar C, and drag-bars provided with harrow-teeth and extending rearwardly from the bar A, as shown.



4. In a harrow, the combination, with a frame and its wheels or runners, of a series of drag-bars extending rearwardly of the wheels (or runners) and provided with harrow-teeth, and a seat-standard adjustably secured to the frame in advance of the wheels, (or runners,) as and for the purpose set forth.

5. In a harrow, the combination, with a main frame and its wheels or runners, of the elastic or yielding drag-bars G, projecting in rear of the main frame and provided with harrow-teeth K and an adjustable seat-support, in advance of the bearing-point of the wheels or runners.

6. In combination with beam A and drag-bars G, the clips I, provided with arms *a b*, to clasp the front and rear faces of the beam, and provided also with an inclined bottom, *c*, and a bolt, H, passing through the beam, drag-bar, and clip.

7. The clip I, comprising arms *a b*, to clasp the front and rear faces of the beam, an inclined bottom, *c*, and side flanges, *d d*, provided with lugs i.

400,933. COIN-OPERATED HAND-POWER-TESTING MACHINE. ALBERT C. MEADY, Somerville, and CHARLES B. BOSWORTH, Everett, assignors to the Crosby Steam Gage and Valve Company, Boston, Mass. Filed Sept. 19, 1888. Serial No. 285,805. (No model.)

Claim.—1. The combination, with a casing, of a fixed handle, a movable handle supported in the casing within the fixed handle, a rod adjustably connected to the shank of the movable handle and having in it a notch, *l*, reductions *s s'*, an abutment, *o*, and fixed to it a piston, a cylinder secured to the casing to receive the piston, a spring operated by the piston-rod and handle, and an automatic locking device arranged to hold said rod from movement, substantially as shown and set forth.

2. The combination, with a casing provided with a chute, M, and stop I, of a handle fixed thereto, a rod provided with a handle, piston provided with the notch *l*, and the reductions *n n'*, and abutment *o*, a cylinder secured within the casing and provided with heads, a spring arranged within the cylinder and operated by the rod and piston, a dog pivoted in the casing, grooved, and provided with a tooth, *l*, spring *m*, and screw *i*, substantially as shown and set forth.

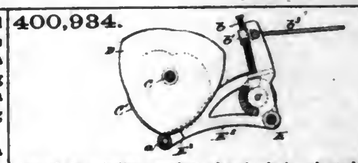
3. The combination, with a casing, of a handle fixed thereto, a rod mounted therein and provided with a piston and handle, a cylinder to receive said piston, a spring arranged within the cylinder to resist the movement of said piston in a direction toward the center of the case, a link pivoted to the rod and connected to a toothed sector, the said sector, a pinion, H, with which it engages, the arbor *t*, and index *w*, substantially as shown and set forth.

4. The combination, with a casing, of a handle fixed thereto, a rod provided with a handle and piston supported in said casing and in a cylinder secured thereto, the said cylinder, a spring arranged therein, as shown, the link F, pivoted to the rod and connected to the toothed sector G, the said sector, the pinion H, its arbor *t*, and index-hand *w*, provided with the pin 4, the auxiliary hand *x*, its pivot, the friction-spring *z*, glass plate *y*, and button *b'*, substantially as shown and set forth.

5. The combination, with a casing provided with the chute M and stop I, of a handle fixed thereto, a rod provided with a handle and piston having a notch, *l*, and reductions *n n'*, and abutment *o*, and supported in the frame and in a cylinder, the said cylinder, a spring arranged therein for the purpose described, and operated by said rod, a dog grooved, as shown, and provided with a tooth, *k*, adjusting-screw *i*, and spring *m*, and pivoted within the frame, the guide-tube L, the link F, pivoted to the rod, provided with a slot, and connected to a toothed sector, the said sector, the pinion H, with which it engages, the pinion-arbor *t*, index-hand *w*, provided with pin 4, the auxiliary hand, and the mechanism applied to the glass plate for supporting it in position, all arranged with a case, substantially as shown and set forth.

6. The rod C, provided with the notch *l*, reductions *n n'*, and abutment *o*, handle, and piston, in combination with the cylinder and spring arranged therewith, as shown, the grooved dog provided with a tooth, an adjusting-screw, and a spring, and pivoted within the casing, the link F, the toothed sector G, engaging the pinion H, its arbor and hand, the auxiliary hand and mechanism for holding it, the button by which it can be turned back to starting-point, the casing and the handle fixed thereto, the stop I, the chute M, and the guide-tube L, all being arranged within a casing, *a*, substantially as shown and set forth.

7. The dog J, provided with the groove *k*, to receive the coin to unlock the dog, as described, and the tooth *l*, adjusting-screw *i*, and the spring *m*, said dog pivoted within the frame, in combination with the rod C, provided with the notch, reductions, abutment, piston, and handle, the latter adjustably connected to the rod, the cylinder and spring arranged about the rod and piston, essentially as shown, the link F, the toothed sector and the engaging pinion, its arbor and index-hand, and mechanism connected therewith by which it can be moved, the casing *c*, provided with the stop I, chute M, and guide-tube L, all being arranged with the casing and supported in the case, having a handle fixed thereto and to the frame, substantially as shown and set forth.



8. The combination, with a casing provided with a stop, I, of a rod, C, mounted therein and having a notch, *l*, reductions *n n'*, abutment *o*, and a piston, as shown, a cylinder secured to the casing to receive the piston, a spring operated by said rod and piston, a dog pivoted within the casing and provided with a groove, an adjusting-screw, spring, and a tooth to operate with said rod, as described, a link, F, pivoted to the rod and to a sector, the said sector, and the mechanism connected therewith to operate the index and registering hands, and the tube L, all being arranged in a case and to operate with a coin deposited in the dog, substantially as shown and set forth.

9. The combination, with a casing, of a handle fixed thereto, a rod mounted in the casing, movable therein, and provided with a handle, a spring operated by said rod, a link pivoted to the rod and to a toothed sector, the said sector pivoted to the casing, a pinion engaging said sector secured to an arbor supported in the casing, the said arbor, and the mechanism connected thereto for indicating on the dial the pressure applied to the handle and rod, substantially as shown and set forth.

10. The combination of the rod C, mounted in the frame, the spring operated thereby, the toothed sector G, pivoted to the frame, the link F, connecting the rod and sector, the pinion H, engaging the sector, the arbor *t*, and mechanism connected therewith for indicating the pressure applied to the rod, substantially as shown and set forth.

400,984. RING-SPINNING FRAME. JOHN T. MEATH, Taunton, Mass. Filed Dec. 3, 1887. Serial No. 256,891. (No model.)

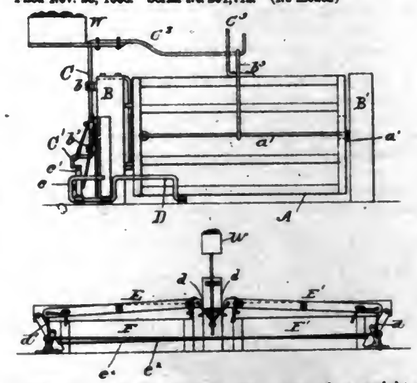
Brief.—The invention has for its object to improve the construc

tion of the winding motion, whereby it is adapted for warp or for weft, and of the frame to permit the easy adjustment or removal of the spindle-driving drum.

Claim.—1. The lifter or builder-rail and the bifurcated quadrant-lever having stud-receiving openings therein, a quadrant-screw, nut, and pulley thereon, and intermediate connections between it and the said rail to raise the latter and permit it to descend, combined with two cams side by side, as C' and D, in line with and adapted to actuate the bifurcated quadrant-lever, either of which cams may be made to act upon one of the bifurcations of said lever by means of a stud placed in the opening therein to move the said rail for either the warp or weft wind, substantially as described.

2. The rail B, the shaft C, the two cams C' and D, fixed side by side thereon for warp and weft wind, respectively, and the bifurcated quadrant-lever having a screw, a nut, and a pulley, and a removable stud, *a*, which may be adjusted to be acted upon by either of the said cams, combined with the screw-threaded draw-bar b^3, adapted to be attached to the quadrant-nut either directly or through a chain or flexible connection, and with the rod c', the stud, and intermediate connections between the said rod and the rail, substantially as and for the purpose described.

3. The combination, with the lifting-rod, of the rock-shaft c^4, having the ears 18 19, and cross-bar 20 of the arm c^5 connected thereto, and having its inner end extended under and engaging the said shaft, substantially as described.



4. The rod c' and rock-shaft having the ears 13 and 14, and cross-bar 15 to connect them, combined with the arm c^5, having the foot and connected to the said rock-shaft, substantially as described.

5. The combination, with the intermediate stand, G, of a spinning-frame, the said stand being open at its center, and the drum, of the independent bearing therefor transversely adjustable by means of the slotted and removable bar *h*, to which it is removably attached by the bolt 31, whereby the drum may be lowered to the floor, substantially as described.

6. The combination, with the intermediate stand, G, of a spinning-frame open at its center, and the drum, of the independent removable bearing consisting of the parts 25, 28, and 30, adjustably bolted together and supported by the cross-bar *h*, removably attached to said stand, whereby the drum may be lowered to the floor, and with the detachable legs *m*, substantially as described.

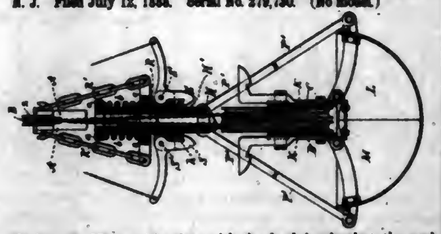
7. The combination, with the stand G, having conical seats therein, of the cross-bar *h*, provided with bosses adapted to fit into the said seats to enable the cross-bar and stand to be readily assembled, the bearing adjustable upon the cross-bar, and the bolts 36, substantially as described.

400,985. AUTOMATIC GATE. WILLIAM H. MILLER, Enon, Ohio. Filed Nov. 23, 1888. Serial No. 291,712. (No model.)

Claim.—1. The combination, with a gate, of an upright shaft supported in a bearing in which it is adapted to turn and also move in a vertical direction, arms extending in opposite directions from said shaft in the same plane with the gate, a weight on said shaft, wheel-irons on either side of said gate, connections, substantially as described, from said wheel-irons to the rear extending arm, said connections having a flexible portion which extends downwardly and rearwardly to connect with the said arm, and a connection from the forwardly-extending arm to said gate, substantially as specified.

2. The combination, with the gate, of an upright shaft having oppositely-extending arms connected, respectively, to the said gate and to pivoted fingers on opposite sides thereof, as described, and the wheel-irons adapted to engage and move said fingers when turned toward the gate and to be disengaged from said fingers when turned from the gate, substantially as specified.

3. The combination, with the gate and the loop-connecting piece attached thereto, of the upright shaft having the forwardly-extending arm extending through said loop, the latch on the said gate connected to said arm, and wheel-irons on either side of said gate connected to said upright shaft, substantially as described, so that an inward movement of either of said wheel-irons will cause the said shaft to turn upon its axis and move vertically in its bearings, substantially as and for the purpose set forth.



4. The combination, with the gate, the upright shaft and its oppositely-extending arms, as described, of the wheel-irons, each having a finger adapted to be moved by it connected to the said upright shaft, the pivoted stops to engage said wheel-irons when turned toward said gate, and connections from the respective wheel-irons to the stops of the other wheel-irons, substantially as and for the purpose set forth.

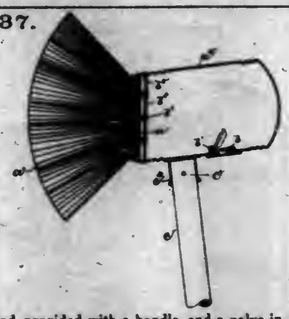
5. The combination, with the gate having the loop-connecting piece attached thereto, of the upright shaft journaled in suitable bearings, in which it is adapted to move longitudinally, provided with oppositely-extending arms, one of which passes through said loop-connection and is connected to the latch on said gate, the pivoted operating-levers forming the connection between wheel-irons on the opposite sides of the said gate and the other extended arm, and means, substantially as described, for holding each of said wheel-irons in a downward position when turned toward said gate until the opposite wheel-iron is turned in the opposite direction, substantially as specified.

6. The combination, with the gate, of the vertical shaft having the oppositely-extended arms, the loop-connection and latch on the said gate connected to one of said arms, and the pivoted levers connected to the other of said arms, the wheel-irons having fingers connected to said operating-levers, pivoted stops adapted to engage said wheel-irons and connections from each of said wheel-irons to the pivoted stop of the other wheel-iron, substantially as and for the purpose set forth.

7. The combination, with the gate, of the upright shaft having the oppositely-extended arms, a connection from one of said arms to the gate and also to the latch of said gate, supporting-frames on each side of said gate having operating-levers pivoted thereto, wheel-irons having pivoted fingers connected to said operating-levers, pivoted stops on the said supporting-frames to engage said wheel-irons, and connections, substantially as described, from each wheel-iron to the pivoted stop of the other wheel-iron, substantially as specified.

400,936. DREDGING-BUCKET. CHARLES A. MOREE, Bloomfield N. J. Filed July 12, 1888. Serial No. 279,790. (No model.)

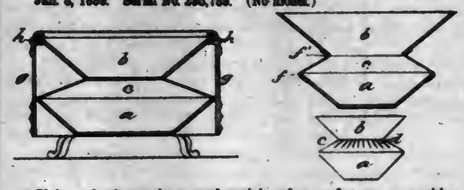
Claim.—1. The combination, with the dredging-bucket, the conical flange, the runner, and the latches, of suspending chains or links, and a spring intervening between the latches and the suspending device, substantially as and for the purposes set forth.



2. The combination, with the dredging-bucket and the conical flange upon the head-block thereof, of a tubular runner, through which the hoisting-chain of the bucket passes, latches pivoted upon the said runner, a follower around the runner, links for suspending the same, a spring around the tubular runner, and a flange connected with said tubular runner and acting against the end of the spring, substantially as set forth.

400,937. FOUNTAIN WINDOW-CLEANER. HENRY W. MUNCH, Somerville, Mass. Filed May 14, 1888. Serial No. 273,798. (No model.)

Claim.—1. The combination, with a brush composed of a perforated head and bristles attached thereto, of a receptacle or reservoir secured to the said head and provided with a handle, and an automatically-operated valve, substantially as described.

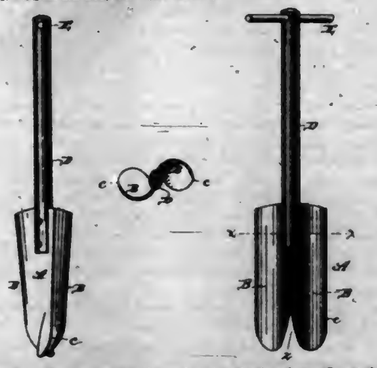


2. The combination, with a brush composed of a perforated head and bristles attached thereto, of a receptacle or reservoir secured to

400,937.

said head and provided with a handle, and a valve in said reservoir intermediate of the said handle and end of the reservoir, whereby the latter may be filled by dipping it into a pail, substantially as described.

400,938. CUSPIDOR. DANIEL H. MURPHY, Hartford, Conn. Filed Jan. 6, 1888. Serial No. 295,789. (No model.)

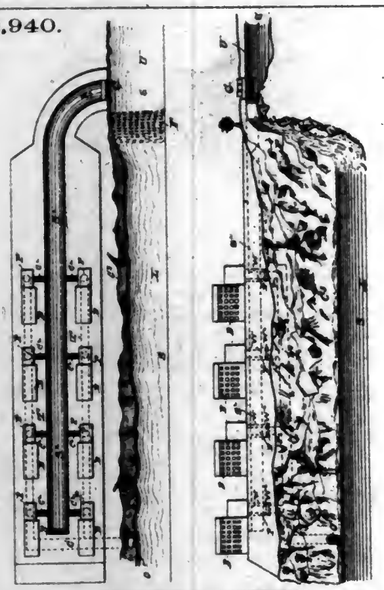


Claim.—1. As an improved article of manufacture, a cuspidor formed of paper, having a base, *a*, shield *b*, and a flexible cover, *c*, joining the base and shield, with flexible seams at the joints, substantially as specified.

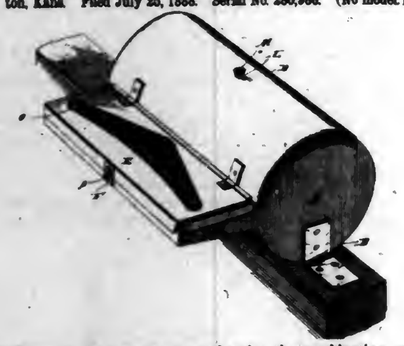
2. As an improved article of manufacture, a cuspidor formed of paper, having a base, *a*, shield *b*, and a cover, *c*, joining the base and shield, with flexible seams at the joints, said cover being slitted to render it flexible, substantially as specified.

3. In combination, in a cuspidor, a shell, *g*, with an overturned top and an inward-projecting flange below the top, and an inner receptacle having a base, *a*, a shield, *b*, and a flexible cover, *c*, joining the base and shield, substantially as specified.

400,939. POST-HOLE AUGER. NELSON NEWMAN, Springfield, Ill., assignor of one-half to George A. Sanders, same place. Filed July 25, 1888. Serial No. 280,973. (No model.)



Claim.—The auger-head made of a single piece of metal and having the oppositely-inclined blades B, concavo-convex in cross-section, said blades being further provided with the separated rounded lower ends and with the sharpened cutting-edges C, substantially as described.



400,940. SYSTEM FOR UTILIZING WATER-POWER. WILLIAM ORR, Troy, N. Y. Filed Jan. 15, 1889. Serial No. 296,498. (No model.)

Claim.—The system for utilizing water-power herein described, consisting of a sluiceway arranged to receive water from the elevated level of a stream or pond, a tunnel-form tail-race having a lower level than the sluiceway, a series of wheel-pits containing turbine wheels having their stand-pipes connected with and so as to receive water from said sluiceway, and each provided with a vertical discharge or draft pipe connecting the discharge from the wheels with the tunnel-form raceway, substantially as and for the purposes set forth.

400,940.

400,941. SPONGE-CUP AND SEALER. JAMES C. PARKER, Woodston, Kans. Filed July 25, 1888. Serial No. 280,966. (No model.)

Claim.—1. In a sponge-cup and sealer, the combination, with a receptacle containing a moistened absorbent material, of the movable perforated spring-actuated cover, covering an opening in the receptacle and arranged adjacent to the said absorbent material, and adapted, when depressed, to compress the absorbent material and force the moisture therein through the perforations, the envelope or other article to be moistened being arranged over the perforations on the outer side of the cover, substantially as specified.

2. In a sponge-cup and sealer, the combination, with a suitable reservoir, of the adjoining receptacle provided with a movable cover having an opening, N, therein, covered by a screen, O, and the absorbent material H in the reservoir extending into the receptacle under the said opening, substantially as specified.

3. In a sponge-cup and sealer, the combination, with the reservoir, of the adjoining receptacle having a movable cover provided with an opening, N, the draining-plate located in the receptacle slightly above the bottom of the same, and the absorbent material in the reservoir, having an extension which rests on the said draining-plate, substantially as specified.

4. In a sponge-cup and sealer, the combination, with the reservoir, of the receptacle having its bottom inclined toward the reservoir, the inclined draining-plate J, the movable cover on the receptacle, and the absorbent material in the reservoir extending over the draining-plate, substantially as specified.

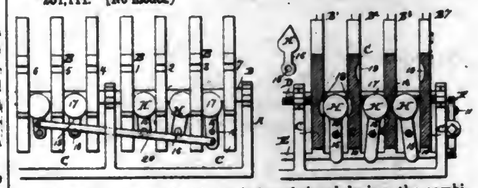
5. In a sponge-cup and sealer, the combination, with the reservoir, of the receptacle having its bottom inclined toward the reservoir, the draining-plate located above the bottom of the receptacle and inclined toward the front of the same, the said plate being corrugated or fluted, for the purpose specified, and removed from the front of the receptacle to form a slot, K, the cover on the receptacle, and the absorbent material, arranged as and for the purpose specified.

6. In a sponge-cup and sealer, the combination, with the reservoir and the adjoining receptacle having a sponge or absorbent arranged therein, of the sliding cover fitting on the open front side on the reservoir and the swinging cover hinged to the front edge of the sliding cover and fitting over the receptacle, substantially as specified.

7. In a sponge-cup and sealer, the combination, with the reservoir and the adjoining receptacle, of the sliding cover D, fitting over the opening in the reservoir and provided with an aperture having a stopper, and the swinging cover hinged to the front edge of the sliding cover and provided with an opening, N, substantially as specified.

8. In a sponge-cup and sealer, the combination, with the reservoir and the adjoining receptacle and the absorbent material arranged therein, of the sliding cover on the reservoir, the swinging cover hinged to the front edge of the sliding cover and provided with a slotted catch, F, fitting over a stud on the receptacle, and the spring-flange on the front edge of the sliding cover extending under the swinging cover and adapted to hold the same normally raised, substantially as specified.

400,942. WAGON-BRAKE. PHILIP PILON, Hinesburg, Vt. Filed Jan. 2, 1889. Serial No. 295,250. (No model.)



Claim.—1. The combination, with the running-gear and the plates M, secured upon the ends of the bolsters, of the levers supported by the running-gear and carrying the brake-shoes, the supplemental reach connected to said levers, the secondary bolsters secured to the supplemental reach, and the plates J, secured to said secondary bolsters and sliding on the plates M, as set forth.

2. In a wagon-brake of the character described, the combination of the plate M, having the dovetailed ribs on its side edges, the plate J, having ribs on its under side engaging said dovetailed ribs, and the anti-friction rollers arranged between the said plates, as set forth.

3. In a wagon-brake of the character described, the combination of the plate M, having the ribs L and the stops N, the plate J, having ribs on its under side engaging the ribs L and stops N, and rollers arranged between the said plates, as specified.

4. The combination, with the running-gear, of the levers mounted thereon and carrying the brake-shoes, the sliding supplemental reach H, mounted on the running-gear, the cross bars G G, secured to said supplemental reach, and the rods F, connecting said cross-bars with the levers, as set forth.

400,943. INTERLOCKING DEVICE FOR RAILROAD-SWITCHES. HOBART B. POTTER, Hillburn, N. Y. Filed Sept. 30, 1887. Serial No. 251,111. (No model.)

Claim.—1. In interlocking switch and signal devices, the combination, with two switch or signal operating levers, each having a recess located in different positions with respect to each other, of a pivoted locking-piece adapted to said recesses and to be locked and unlocked therefrom by the movement of one of the levers, substantially as described.

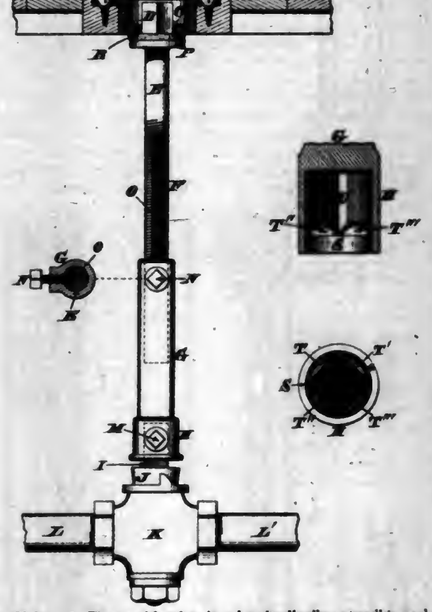
2. In interlocking switch and signal devices, the combination with three adjacent levers, of a pivoted locking-piece mounted between each of the levers and engaging one of the levers and adapted to be locked thereto and unlocked by the movement of each of the other levers, substantially as described.

3. In interlocking switch and signal devices, the combination, with three adjacent levers, of a pivoted locking-piece mounted between each of the levers, one locking-piece engaging with one lever and the other locking-piece engaging with either of the other two levers, whereby the movement of one lever will lock the locking-piece to one lever and unlock the other locking-piece from the other lever, substantially as described.

4. In interlocking switch and signal devices, the combination, with two or more levers, each having one or more recesses therein, and their respective pivoted locking-pieces adapted to said recesses, of a rod, 20, connecting two locking-pieces together, whereby the movement of one locking-piece to free one lever will prevent the other locking-piece from moving to free the other lever, substantially as described.

5. The combination of the levers B^5 and B^7, each provided, respectively, with a recess, as 18 19, and a locking-piece adapted to engage with one recess in one lever in one position of the levers and with the other recess in the other lever when the position of the levers is changed, substantially as described.

6. The combination of the levers B^5 and B^7, each provided, respectively, with a spherical recess, as 18 19, and a locking-piece provided with a spherical-shaped head adapted to engage with the recesses in said levers, substantially as described.



7. The combination of the levers B^5 and B^7, each provided, respectively, with a spherical recess, as 18 19, and a pivoted locking piece provided with a spherical-shaped head adapted to be vibrated to engage with the recesses in said levers, substantially as described.

8. The combination, with two or more switch or signal operating levers having enlargements C, formed therewith, of a pivoted locking-piece contacting with the enlargement of one lever and adapted to be locked thereto and unlocked therefrom by the movement of another lever, substantially as described.

9. The combination, with switch or signal operating levers, as B^5 B^7, having enlargements formed therewith upon the side of their fulcra opposite the operating or long arm of the levers, each of said enlargements having recesses therein, of a pivoted locking-piece adapted to said recesses and to be locked therein and unlocked therefrom by the movement of one of the levers, substantially as described.

10. The combination, with a plurality of interlocking switch or signal levers each having a notch and their respective locking-pieces adapted to recesses in the levers, of a movable bar provided with tongues for engagement with the notches of levers, whereby all the levers may be either simultaneously locked or unlocked independent of the locking-pieces, substantially as described.

400,944. FLOOR-KEY FOR COCKS. JAMES POWELL, Cincinnati Ohio. Filed Jan. 21, 1887. Serial No. 225,028. (No model.)

Claim.—1. The combination, in a longitudinally-extensible cock-key, of the nut-section G, having a socket, H, and clamp-screw N, and the screw-threaded section E F, engaged with said nut-section G, this section E F being provided with a turning device at its outer end, and having a longitudinal groove, O, that admits the point of said screw N, as described.

2. A cock-key provided with a socket whose outer end has a cylindrical bore, S, terminating with four concaves, T T' T'' T''', where the inner end of said bore joins the square chamber U, as herein described.

400,945. RETAIL-CASE AND SUPPORT FOR STORES. GEORGE W. PYLE, Geneva, Ind. Filed Sept. 12, 1888. Serial No. 285,214. (No model.)

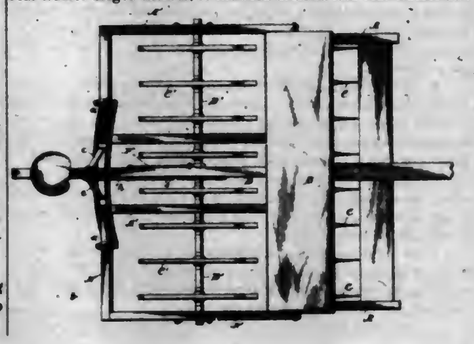
400,945.

Claim.—1. In a retail case for stores, the combination of a top or counter having a recess or opening therein, a slide or cover to close said opening, a holder or compartment thereunder, and a revolving base for carrying said holders.

2. In a retail-case for stores, the combination of the top or counter having a recess or opening therein, a slide or cover therefor, serving the double purpose of closing the opening in the top and the upper end of one of the holders at the same time, a series of holders or combinations, and a revolving base, substantially as described.

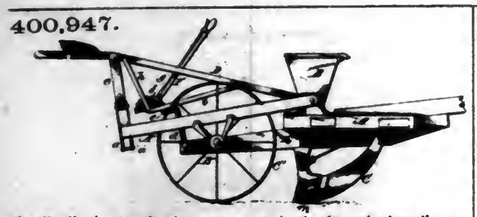
3. In a retail-case for stores, the combination of a circular case, A, top A', having an opening, G, cover H, holder E, shaft C, extending above the top, shelf J, and arms K, substantially as and for the purposes described.

400,946. LAST. JOHN REBECK, Gladstone Terrace, Wellingborough Road, Rushden, Higham Ferrers, County of Northampton, England. Filed Sept. 24, 1888. Serial No. 286,268. (No model.) Patented in England Jan. 9, 1888, No. 337.



Claim.—1. In combination with a last which has a recess in its bottom, a spiked plate set entirely into said recess, the edge of said plate being cut away, as at b', for the purpose set forth.

2. In combination with a last recessed in its bottom, a spiked plate set into said recess with downwardly-projecting spikes, the bottom of the last being provided with perforations, through which the points of said spikes protrude, said last being constructed in removable sections, exposing the spiked plate in the center, in order that the upper part of the last and the spiked plate may be removed before removing the bottom section of the last, substantially as set forth.



400,947. GRAIN-DRILL. JOHN W. RHODES, Havana, Ill. Filed Oct. 9, 1888. Serial No. 287,686. (No model.)

Claim.—1. In a grain-drill, the combination, with the runner-frame, of the rear frames hinged thereto, the axles journaled in the hinged frames, the press-wheels mounted thereon, and the distributing-bar pivotally connected at its opposite ends to the rock-arms, said arms being pivoted to the ends of the rear frames, substantially as and for the purpose specified.

2. In a grain-drill, the combination, with the front frame and the rear frames hinged thereto, of the rock-arms on said rear frames and

400,947.

the distributing-bar for the seat-support, having its ends pivotally connected to the free ends of said rock-arms, substantially as and for the purpose specified.

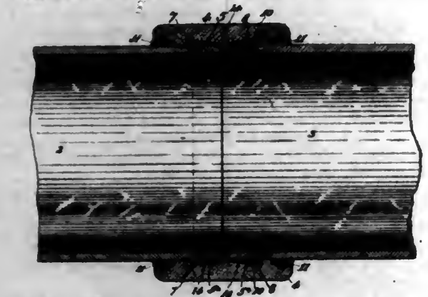
3. In a grain-drill, the combination, with the front frame and the rear frames hinged thereto, of the seat-beam pivoted to the seed-box on the pivot of the rear frames, substantially as shown and described.

4. In a grain-drill, the combination, with the front frame and the rear frames hinged thereto, of the seat-beam pivoted on the pivot of the rear frames and the rigid seat-supports connected to the seat-beam near its rear end and to the rear frames, substantially as described.

5. A runner for grain-drills, having the front portion only of its shank extended to the bottom of the runner, substantially as and for the purpose specified.

6. In a grain drill, the combination, with the axles and wheels, of the front frame having its main beam extended to the rear of said axles, substantially as and for the purpose specified.

400,948. FASTENING FOR GLOVES. WILLIAM S. RICHARDSON, Boston, Mass. Filed July 30, 1888. Serial No. 281,468. (No model.)



Claim.—1. In a fastening for gloves and other articles, the member having the socket *b*, held at the apex of a conical piece, b^3, the conical piece b^3, collet b^4, cap b^5, and eyelet C, substantially as described.

2. The combination of the cap b^5, the collet b^4, the cone-piece b^3, and socket *b*, held at the apex of the cone, substantially as described.

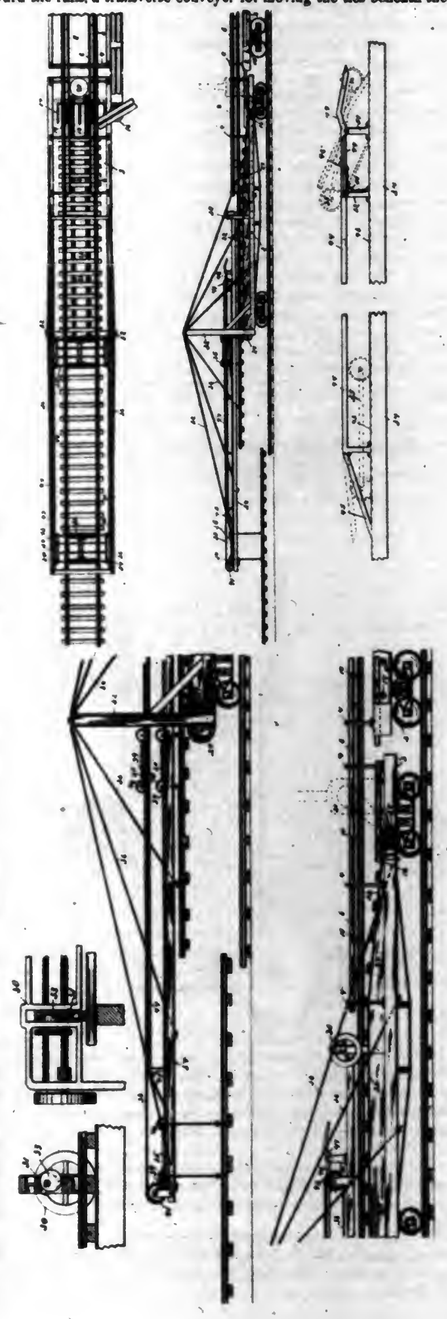
3. The combination of the cap b^5, the collet b^4, the cone-piece b^3, the socket *b*, held at its apex, and the eyelet C, with a ball member, A, substantially as described.

400,949. PIPE-COUPLING. GEORGE N. RILEY, Braddock, Pa. Filed Sept. 8, 1887. Serial No. 249,074. (No model.)

Claim.—1. In a pipe-coupling, a pipe having an encircling sleeve or socket provided with a calking-recess and inclosed movable catch adapted to grip and hold the end of the opposite pipe during the insertion of the calking or packing, substantially as and for the purposes described.

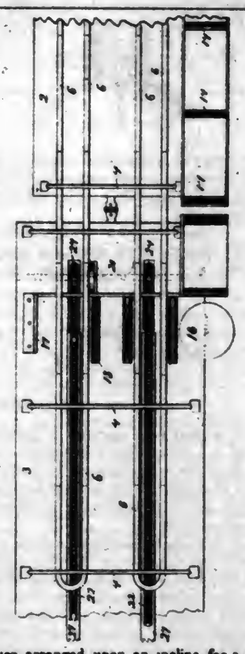
2. In a pipe-coupling, the combination, with the pipes, of an encircling sleeve having calking-recesses at its opposite ends, and inclosed movable spring-catches adapted to grip the ends of the pipes when inserted in the sleeve and hold the same during the application of the calking or packing, substantially as and for the purposes specified.

3. In a pipe-coupling, the combination of a pipe having a catch-notch, an encircling sleeve provided with a catch-recess which is enlarged at its end, and an interposed spring-catch, substantially as and for the purposes specified.



4. In a pipe-coupling, the combination of a pipe having a catch-notch with inclined bottom, an encircling sleeve provided with a catch-recess enlarged at its end, and an interposed spring-catch, substantially as and for the purposes specified

5. In a pipe-coupling, the combination of pipes having a catch-notch, a sleeve having a catch-recess, and an interposed catch having its hook end rounded, substantially as and for the purposes specified.



400,950. TRACK-LAYER. SOLOMON W. ROBERTS and EDWARD P. CALDWELL, Minneapolis, Minn. Filed Mar. 5, 1888. Serial No. 266,242. (No model.)

Claim.—1. The combination, in a track-layer, of carriers for moving forward the rails at the required gage for the track, means for introducing the ties beneath the rails, and a conveyer for moving forward the ties and bringing them against the under surfaces of the rails, substantially as described.

2. The combination, in a track-layer, of carriers for moving forward the rails, a transverse conveyer for moving the ties beneath the

400,950.

rails, and a conveyer arranged upon an incline for a portion of its length and adapted to carry the ties against the under surface of the rails, and then to move forward the ties and rails together, during which latter operation they may be spiked together.

3. The combination, in a track-layer, of a car or platform, a conveyer traveling longitudinally on said platform, upon which the cross-ties are distributed and by which they are carried forward, and suitable carriers delivering the rails at the required gage upon the cross-ties while said ties are upon the conveyer, substantially as described

4. The combination, in a track-layer, of a car or platform, a conveyer traveling longitudinally of said platform, upon which the cross-ties are distributed and by which they are carried forward, suitable carriers delivering the rails at the required gage upon the cross-ties while the said ties are on the conveyer, and a spiker for fastening the rails to the cross-ties as they are brought in contact, as described.

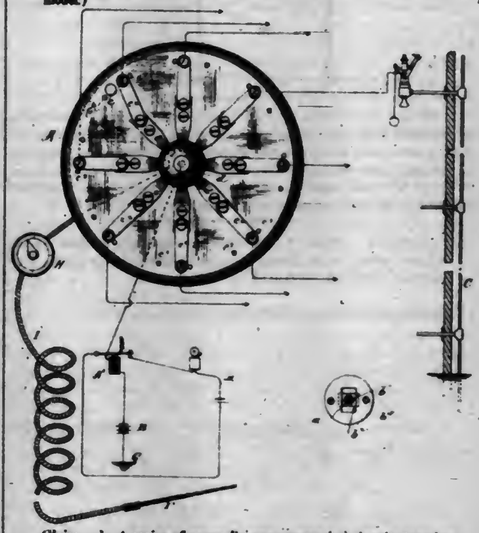
5. The combination, in a track-layer, of a car, a conveyer traveling longitudinally of said car for distributing the ties, carriers delivering the rails upon said ties while said ties are upon the conveyer, the projecting or overhanging frame secured to the car and provided with a track or tramway, and a truck traveling on said track and adapted to receive the completed sections from the conveyer and deliver them upon the road-bed, substantially as described.

6. The combination, in a track-layer, of a car, a frame supported upon said car and projecting longitudinally in front thereof, trucks arranged to travel on said frame, a suitable track, 43, on which the trucks are drawn in one direction, and the stationary track 44, arranged over said track 43, and provided with switches 45 and 47 for transferring the trucks from one track to the other, substantially as described.

7. The combination, in a track-layer, of the track 43, the track 44, arranged above said track 43, and provided with the switches 45 and 47, the driving-chain 38, and the carriage 35, arranged to be moved forward on the lower track and to be returned upon the upper track, substantially as described.

8. The combination, in a track-layer, with the track 43 and the track 44, arranged above the track 43, of the carriage 35, arranged to travel on either of said tracks, and the driving-chain 38, connected to said carriage, substantially as described.

9. The combination, with the track 43, of the track 44, arranged above said track 43, the switch 45, pivoted in line with the track 44 and adapted to rest on said track 43, the carriage 35, arranged to travel over said tracks, the endless driving-chain 38, the sprockets 41, and the connecting-chain 39 between said chain 38 and said carriage and adapted to pass around said sprockets, for the purpose set forth.

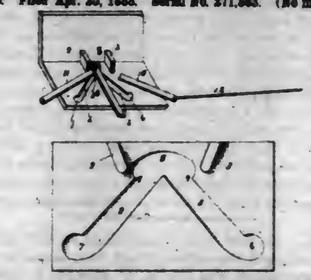


10. The combination, with the tracks 43 and 44, arranged one above the other, of the automatic switches 45 and 47, arranged at the ends of said upper track, the carriage and the endless driving-chain connected therewith, whereby said carriage may be moved over said tracks and automatically transferred from one to the other, substantially as described.

11. The combination, with the car 2, of the tracks 6, extending over said car, and the carriages 8, arranged to travel on said tracks and provided with the grippers 10, adapted to hold the rails, substantially as described.

12. The combination, with the car 2, of the tracks 6, extending for ward and back over said car and provided with the curved portion connecting its forward ends, and the carriage 8, arranged to travel on said tracks and provided with the grippers 10, adapted to hold the rails, substantially as described.

13. The combination, in a track-layer, with the cars 2 and 3, of the tracks 6, extending forward over said car 2, and provided with the carriages 8, adapted to support and carry the rails, of the conveyer 22, arranged upon said car 3, and adapted to move forward the cross-ties and distribute them beneath the rails as they are moved forward by the carriages 8, a spiker, 30, arranged upon the car 3 and adapted to spike the rails and ties together, the projecting frame 34, supported upon the forward end of said car 3, and the carriages 35, arranged upon said frame and adapted to take the completed sections of track from said conveyer-frame 2 and move them forward and deposit them upon the road-bed, substantially as described.

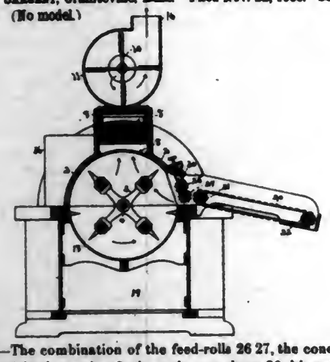


400,951. ELECTRIC-CIRCUIT-TESTING DEVICE. MINER ROBINSON, Newton, Mass. Filed June 11, 1888. Serial No. 276,709. (No model.)

Claim.—1. A series of normally-open grounded circuits terminating at a testing-board, gas-igniting apparatus in said circuits, a series of manually-operated switches on said board for connecting the circuits with a generator, a sparking-coil between the circuits and the generator, and a local bell-circuit adapted to be closed by the sparking-coil, as set forth.

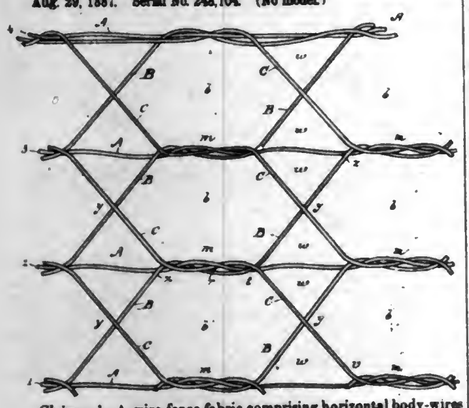
2. The base or board A, having central post, *a*, the knob *d*, strips c' and c^2, and contacts *c*, for the purpose set forth.

400,952. AUTOMATIC GATE. JOHN C. ROCK, near West Liberty, Ohio. Filed Apr. 26, 1888. Serial No. 271,863. (No model.)



Claim.—1. The combination, with a gate, of the hinge-plate having the V-shaped guide-slot (formed with the oval recess 8 at its apex, the rounded ends of which project beyond corners 9) and also provided with fulcrums 2 and 3, levers 10 and 11, pivoted to the gate-

pintle, and rods 12, connecting said levers to the wheel-irons, all substantially as shown and described.



2. The combination of the gate having an upper hinge-plate forming a brace for the stay-rods, a spring-latch, and the sleeve 23, surrounding the latch-bolt, for supporting the gate when closed, with the lower hinge-plate having the V-shaped guide-slot (formed with the oval recess 8 at its apex, the rounded ends of which project beyond corners 9) and also provided with fulcrums 2 and 3, levers 10 and 11, pivoted to the gate-pintle, and rods 12, connecting said levers to the wheel-irons, all substantially as shown and described.

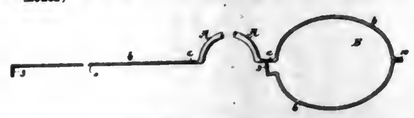
400,953. CONE-DUSTER FOR FIBROUS SUBSTANCES. FREDERICK G. SARGENT, Graniteville, Mass. Filed Nov. 22, 1888. Serial No. 291,585. (No model.)

Claim.—The combination of the feed-rolls 26 27, the cone-duster 3, provided with the casing 2, the valve or door 30, hinged to the casing above the feed-rolls, the screen 8 above the cone-duster, its inclosure 9, and the suction-fan connected with said inclosure and adapted to create a current of air from said valve 30 through said screen and inclosure, substantially as described.

400,954. WIRE-FENCE FABRIC. BENJAMIN SCARLES, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed Aug. 29, 1887. Serial No. 248,104. (No model.)

Claim.—1. A wire-fence fabric comprising horizontal body-wires and diagonal crossing filling-wires, forming alternately a vertical series of hexagonal meshes and a vertical series of triangular meshes, the joint between said wires being formed by an interbraiding of the filling-wires with one of the body-wires, substantially as described.

2. A wire-fence fabric comprising horizontal body-wires and diagonal crossing filling-wires, forming alternately a vertical series of hexagonal meshes and a vertical series of triangular meshes, the joint between said wires being formed by an interbraiding of the filling-wires with one of the body-wires, said fabric having a selvage composed of the outer horizontal body-wire interbraided with the filling-wires, which respectively extend along said body-wire a distance equal to the space between two hexagonal meshes, substantially as described.



400,955. PROCESS OF SECURING RIGID SOCKETS IN RUBBER PIPES. AUGUSTUS D. SCHLESINGER, College Point, assignor to the India Rubber Comb Company, New York, N. Y. Filed Jan. 31, 1888. Serial No. 262,518. (No model.)

Claim.—The process of securing sockets in necks and pipes herein described, which process consists in inserting a hard-rubber socket, B, in an unvulcanized neck or pipe, A, having a flange, a, and

in then, by one operation, vulcanizing the unvulcanized rubber around and on top of the socket, thereby intimately uniting them, and forming said rubber neck or pipe into a holder and washer for the socket, substantially as specified.

400,956. SPECTACLE OR EYEGLASS FRAME. JAMES E. SEARING, New York, N. Y. Filed Aug. 19, 1886. Serial No. 211,300. (No model.)

Claim.—1. A blank for a spectacle or eyeglass frame of a single piece from end to end, provided with grooves extending from each end toward the center of the blank and adapted to be formed into lens-containing rims, and the central ungrooved portion adapted to form the bridge-piece and terminating in perforated enlargements, substantially as described.

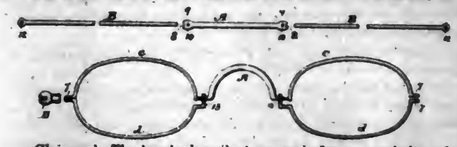
2. A blank for a spectacle or eyeglass frame of a single piece from end to end, provided with grooves extending from each end toward the center of the blank, which ends are adapted to be doubled each upon itself and formed into lens-containing rims, and the central portion of the blank adapted to form the bridge-piece and terminating in perforated enlargements, substantially as described.

3. A blank for a spectacle or eyeglass frame of a single piece from end to end, provided with grooves extending from each end toward the center of the blank and adapted to be formed into lens-containing rims, and the extremity of each end provided with means adapting it to be secured to the body of the blank at or near the central portion, and the central ungrooved portion adapted to form the bridge-piece and terminating in flattened enlargements, with which said ends engage, substantially as described.

4. A spectacle or eyeglass frame consisting of lens-containing rims provided with grooves extending from each end toward the center of the frame, and a bridge-piece terminating in perforated enlargements, said rims each having a side projection formed therewith, the whole being made from a single piece of metal continuous from end to end, substantially as described.

5. A spectacle or eyeglass frame consisting of lens-containing rims and a bridge-piece made from a single piece of metal continuous from end to end, and having perforated enlargements upon opposite sides of the bridge-piece, each of said ends being secured to the body of the frame by being passed through the perforations in said enlargements, substantially as described.

6. A spectacle or eyeglass frame consisting of lens-containing rims and a bridge-piece terminating in perforated enlargements, said rims each having a side projection formed therewith, the whole being made from a single piece of metal continuous from end to end, and each of said ends being secured to the body of the frame by engagement with said perforated enlargements, substantially as described.



7. A spectacle or eyeglass frame consisting of lens-containing rims and a bridge-piece made from a single piece of metal having free ends detachably secured to the body of the frame at the base of the bridge-piece, substantially as described.

8. A spectacle or eyeglass frame made of a single piece of metal having a bridge-piece and two lens-containing rims, said rims being formed by curving each of the ends of the blank from which the frame is made back upon itself, and which are adjustably connected to the body of the frame at the base of the bridge-piece, so as to be capable of varying the size of the rims within small limits, substantially as described.

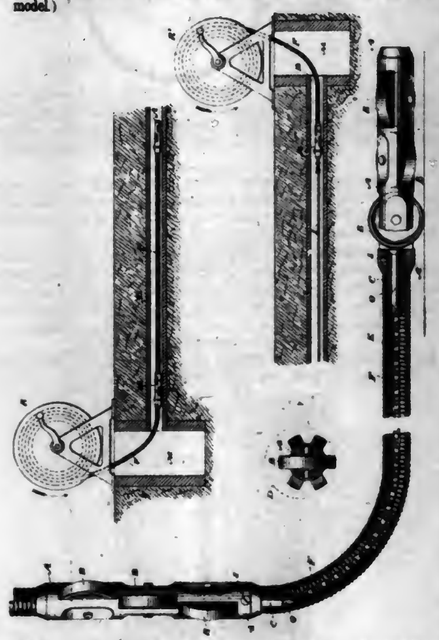
9. A spectacle-frame made from a single piece of metal having lens-containing rims and a bridge-piece, said rims carrying projecting attaching ends formed therewith, and temple-joint pieces formed separately therefrom and adapted to be secured to said attaching ends, substantially as described.

10. A spectacle-frame made from a single piece of metal having lens-containing rims and a bridge-piece, said rims being each provided with an attaching end formed continuous therewith by doubling the metal upon itself and adapted to receive and secure a temple-joint piece, and the end of each rim terminating in a stud adjustably secured to the frame at the base of the bridge-piece by a thumb-nut, substantially as described.

400,957. SPECTACLE-FRAME. JAMES E. SEARING, Mount Vernon, N. Y. Filed Dec. 27, 1888. Serial No. 294,796. (No model.)

Claim.—1. The herein-described spectacle-frame, consisting of a nose-piece and closed lens-containing rims formed independent of each other, one end of each rim being permanently secured to the nose-piece and the other end detachably secured to the nose-piece.

2. The herein-described frame, consisting of a nose-piece and lens-containing rims formed independent of each other, one end of each rim being permanently secured to the nose-piece and the nose-piece having a perforation for detachably securing the other end of the rim.



3. The herein-described spectacle-frame, consisting of a nose-piece and lens-containing rims formed independent of each other and secured together, the said rims each being formed of two pieces secured together at one end, one of the opposite ends of the rims having ends detachably secured to the nose-piece.

4. A blank for a spectacle-frame, the same consisting of a nose-piece having perforated and flattened enlarged ends, and lens-containing rims each having an end permanently attached to the nose-piece and another end provided with a pin or stud for detachable engagement with the perforation in the nose-piece, substantially as described.

5. A blank for a spectacle-frame, the same consisting of a nose-piece having perforated and slotted ends and lens-containing rims each having an end provided with a pin or stud for detachable engagement with the perforation in the nose-piece, substantially as described.

6. A blank for a spectacle-frame, the same consisting of a nose piece having perforated enlarged ends, and lens-containing rims formed of two pieces having ends 7 for securing them together and attachment of joint-pieces, and one of the opposite ends of the rims having a pin or stud for detachable engagement with the perforation in the end of the nose-piece, substantially as described.

400,958. LEADING-IN APPARATUS FOR CONDUITS. JOHN A. SEELY, Brooklyn, N. Y. Filed Feb. 2, 1889. Serial No. 298,509. (No model.)

Claim.—1. In a leading-in apparatus for conduits, the combination of two or more anti-friction devices constructed substantially as described, and a flexible mechanical connection uniting said devices, said connection being capable of limited expansion and contraction, whereby the distance between any two such devices is maintained substantially unchanged under the action of a power applied to push or to pull the apparatus through a conduit.

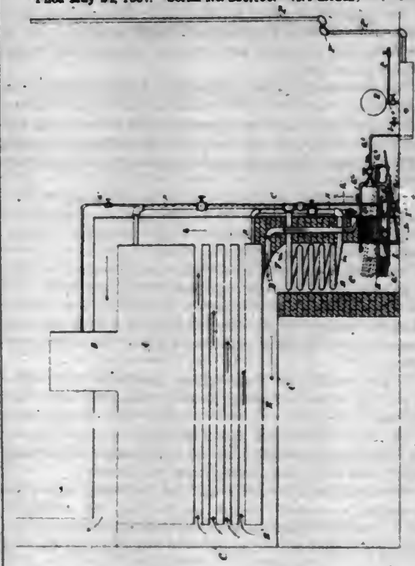
2. In a leading-in apparatus for conduits, the combination of two or more anti-friction devices constructed substantially as described, a flexible mechanical connection uniting said devices capable of limited expansion and contraction, and a supplemental mechanical connection between said devices capable of contraction only, whereby the distance between any two such devices is maintained substantially unchanged under the action of a force applied to push or to pull said apparatus through the conduit.

3. In a leading-in apparatus for conduits, the combination of two or more anti-friction devices composed of wheels or rollers united by a flexible connection composed of a helically-disposed wire or strip, substantially as described.

4. In a leading-in apparatus for conduits, the combination of two or more anti-friction devices united by a flexible mechanical connection consisting of a helically-disposed wire or strip and a chain, substantially as described.

5. In a leading-in apparatus for conduits, two or more anti-friction devices, each composed of a support or bearing-piece and two or more wheels or rolls, the plane of rotation of such wheels or rolls being parallel with the line of movement of translation, but forming an angle with respect to each other, in combination with a mechanical connection uniting said devices, substantially as described.

6. In a leading-in apparatus for conduits, two or more anti-friction devices, each composed of a support or bearing-piece and two or more wheels or rolls, the plane of rotation of each of such wheels or rolls being parallel with the line of movement of translation and forming an angle with respect to each other, in combination with a flexible connection mechanically uniting successive devices, substantially as described.



7. In a leading-in apparatus for conduits, the combination of a cylindrical section or bearing-piece and three wheels or rolls pivoted on the line of its major axis, the bearings being separated from each other a distance slightly greater than the diameter of a wheel or roll, substantially as described.

8. In a leading-in apparatus for conduits, the combination of two or more cylindrical sections or bearing-pieces, wheels or rolls pivoted on the line of their major axes, and a flexible connection uniting successive or adjacent sections, substantially as described.

9. In a leading-in apparatus for conduits, the combination of two or more cylindrical sections of metal, wheels or rolls pivoted on the line of their major axes, and a flexible connection mechanically uniting each pair of sections into one continuous cylinder of extended length, said connection consisting of a helically-disposed resilient wire or strip, substantially as described.

10. In a leading-in apparatus for conduits, the combination of a series of cylindrical sections of metal, wheels or rolls pivoted on the line of their major axes, and flexible connections mechanically uniting successive sections into one continuous cylinder of substantially uniform diameter and extended length, said connections consisting of a helically-disposed resilient wire or strip and a chain terminating in a swivel-joint, substantially as described.

400,959. HYDROCARBON APPARATUS. JAMES F. SEERY, New York, N. Y., assignor to the Empire Hydro Carbon Company, of New York. Filed May 24, 1887. Serial No. 239,196. (No model.)

Claim.—1. In combination with the fire-box of a furnace, a vapor-burner located therein, and a pivoted coil of pipes forming a superheater for steam surrounding the burner, and means whereby said coil may be raised above the said burner at will, substantially as and for the purpose set forth.

2. In combination with a furnace having a hydrocarbon-burner, a superheating-coil surrounding the burner and being pivotally connected to its supply and exit pipes, a lever connected at one end to the coil-pipe, and a fulcrum for said lever, the free end of the lever being made to extend outward and adapted for prehension, as and for the purpose set forth.

3. The combination, in a furnace provided with a fire-box having an arched top forming a deflecting-plate, of a steam-generating coil placed below said arch, a vapor-burner, and a superheating-coil surrounding the burner, substantially as and for the purposes set forth.

4. In combination with the fire-box of a furnace having a suitable burner and an arched or curved deflecting-plate, a draft-pipe opening into the fire-box above the deflecting-plate, a steam-generating coil placed below the deflecting-plate and above a burner, and a superheating-coil surrounding the burner, substantially as described.

5. In combination with the fire-box of a furnace, a hydrocarbon-burner, a steam-superheating coil, a mixing-chamber, pipe for supplying oil to said mixing-chamber, an air-pipe leading from the fire-box above the burner and connected to the mixing-chamber, and a steam-pipe connected to the superheating-coil and mixing-chamber, forming an injector, all substantially as shown and described.

400,960. REVERSE-LINK FOR STEAM-ENGINES. JOHN R. SNYDER and JAMES DEETS, Agency, Mo. Filed Nov. 3, 1888. Serial No. 289,922. (No model.)

Claim.—1. The combination, with a reverse-link for steam-engines, of an adjustable facing therefor, bolts projecting outwardly from the facing, and screws projecting through the adjacent side of the link, said bolts and screws being adapted for the adjustment of the facing, substantially as set forth.

2. The combination, with a reverse-link for steam-engines, of an adjustable facing, screws for adjusting the latter, and bolts for retaining the same against further play, whereby the facing is held rigid in adjusted position, substantially as set forth.

3. The combination, with a reverse-link for steam-engines, of an adjustable facing provided with contracted ends adapted to slide in grooves in the ends of the link and screws for adjusting said facing, substantially as set forth.

4. The combination, with a reverse-link for steam-engines, of an adjustable facing, bolts having their heads countersunk in the latter, said bolts projecting through the adjacent upright portion of the link and provided on their ends with nuts, and adjusting-screws passing through said upright portion and bearing against the facing, substantially as set forth.

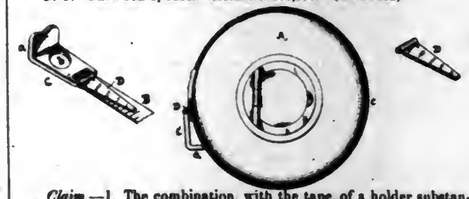
5. The combination, with a reverse-link for steam-engines, of a facing secured thereto by screws having their heads countersunk in said facing, the latter being adjustable for the insertion of packing, substantially as and for the purpose set forth.

6. In a reverse-link for steam-engines, the combination, with the hanger provided at one end with a transverse elongated recess, of a sectional bearing-block for the reception of a pivot pin or bolt for connecting the hanger with the lever-crank and screws for adjusting the outer section of the block against said pin or bolt, substantially as set forth.

7. In a reverse-link for steam-engines, the combination, with a hanger provided at one end with a transverse elongated recess, of a bearing-block comprising two sections provided upon their opposing faces with oppositely-disposed approximately-semicircular grooves, forming a bearing, and screws in the end of the hanger for adjusting the outer section of the block, substantially as set forth.

8. The combination, with a reverse-link for steam-engines and lugs projecting from one side thereof and provided with rectangular recesses, of bearing-blocks disposed in the latter and comprising two sections provided upon their opposing faces with oppositely-disposed approximately-semicircular grooves, forming bearings, screws bearing against the backs of the outer blocks and adapted to adjust the same inwardly, and jam-nuts upon the screws for locking them in adjusted position, substantially as set forth.

9. The combination, with a reverse-link for steam-engines, composed of two sections bolted together, the inwardly-projecting ends of one section being grooved upon their interior faces, of an adjustable facing provided with contracted ends adapted to slide in said grooves and screws for adjusting the facing, substantially as set forth.



10. In a reverse-link for steam-engines, the combination, with the link-saddle provided with a conical pin and the lever-crank provided with a bifurcated end, of a hanger provided at one end with a conical bearing for the reception of said pin and at the other end with an elongated recess carrying a sectional adjustable bearing-block embraced by the bifurcated end of the lever-crank, and a bolt passing through the latter and said block, substantially as set forth.

11. The combination, with a reverse-link for steam-engines, of a sliding block provided with a shoulder upon one side and with a conical bearing through the same and the shoulder, and a corresponding pin adapted to be seated in said bearing and connecting the link-block with the valve-rod, substantially as set forth.

12. In a reverse-link for steam-engines, and with the link-saddle provided with a conical pin having a reduced screw-threaded outer end, a hanger provided with a bearing corresponding to and embracing said pin and retained thereon by a binding-nut and a securing-nut, substantially as shown and described.

13. In a reverse-link for steam-engines, the combination, with the link-block provided with a conical bearing, of a corresponding pin seated therein and provided with perforations in its larger end for adjusting it and a reduced outer screw-threaded end, said pin being screwed through a screw-threaded perforation in the valve-rod, and a nut applied upon the projecting end, substantially as set forth.

400,961. TAPE-MEASURE. EDWARD G. SOLTMANN, New York, N. Y. Filed Oct. 9, 1888. Serial No. 287,635. (No model.)

Claim.—1. The combination, with the tape, of a holder substantially equal in width to the tape, and having at its outer end a rigid stop projecting at right angles therefrom, said stop being approximately of the same width as the body of the holder, substantially as described.

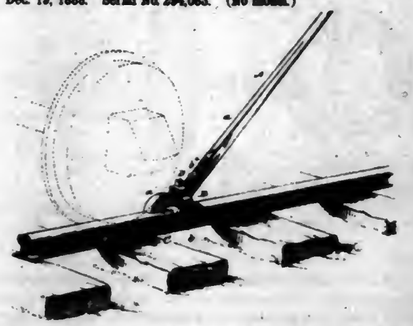
2. The combination, with the tape, of a holder having at its outer end a projecting stop provided with a recessed upper edge, said holder being so located that the recess receives the bead of the casing when the tape is wound up, substantially as described.

3. In a tape-measure, the combination of a metallic tape, a holder, and the flexible metallic strap G, uniting the holder and the tape and embracing the latter, the opposite arms of said strap gradually tapering to a point, whereby the resistance to bending of the triple thickness of metal is gradually decreased, substantially as set forth.

400,962. CALF-FEEDER. WILLIAM I. SPENCER, Clinton, Iowa. Filed July 13, 1888. Serial No. 279,851. (No model.)

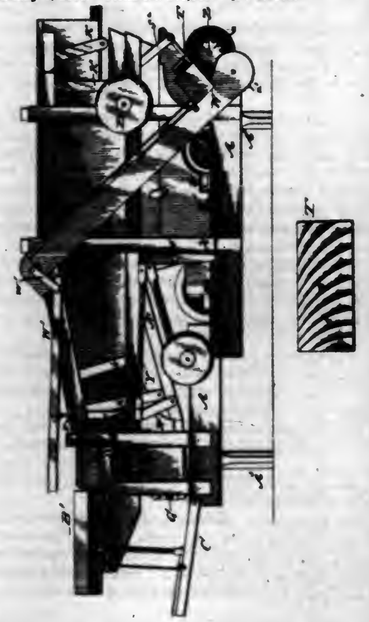
Claim.—1. In a calf-feeder, a trough or pail, in combination with a nipple formed of flexible tubing and a perforated arched nipple-receiving plate, forming a milk-passage, for securing the same to the bottom of said trough or pail, substantially as specified.

2. The pail 1, having the bottom 2, in combination with the tube 3, bifurcated, as at 11, the nipple-plate 4, arched and perforated, as



at 9 and 10, and formed with the ears 5, perforated, as at 6, and the screws 8, substantially as specified.

400,963. COFFIN-PLATE. JOHN H. SPICER, Harrisburg, Pa. Filed May 10, 1888. Serial No. 273,467. (No model.)



Claim.—As an improved article of manufacture, the herein-described coffin-plate, consisting of the central block, A, the fabric having affixed thereon an inscription or design stretched over said block and secured to the under face thereof near the edge, the strips or molding B, covered with fabric, and the strip C, secured to the bottom of said block and to the bottom of all of said strips, with an air-space, *a*, between said strip C and the bottom of the central block, substantially as shown, and for the purpose specified.

400,964. PINCH-BAR. SPENCER H. ST. JOHN, Chicago, Ill. Filed Dec. 19, 1888. Serial No. 294,063. (No model.)

Claim.—The combination of a bar, removable fulcrum-piece wholly external thereto, and a clevis fitting upon said bar, having downwardly-projecting arms adapted to embrace the rail, substantially as described.

400,965. GRAIN-SEPARATOR. HERMAN STOKER, Potosi, Wis. Filed May 9, 1888. Serial No. 273,365. (No model.)

Claim.—1. The combination, with the grain-table N and the screens P P', of the shaft O', the rock-arms O, the fan R, the shoe provided with the grooved plate S, grooved bed S', screen P², and means for oscillating the shaft, substantially as described.

2. The combination, with the grooved grain-table N, of the links N', the screens P and P', the shaft O', the rock-arms O and *o*, the links *p*, the shoe provided with the inclined grooved plate S under screen P', the grooved plate S', receiving the tailings from screen P', and means for oscillating the shaft O', substantially as described.

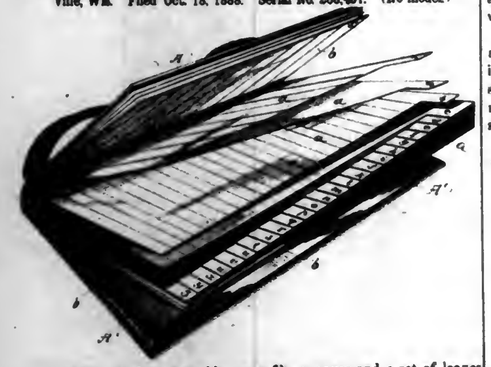
3. The combination of the shaft O', the rock-arm *o'*, the grain-spout V, bell-crank lever V', attached to the spout, rod *v*, connecting the lever and the rock-arms, the tailings-spout W', the hangers *w'*, supporting the rear end thereof, the lever X, supporting the front end of the spout, and the rod Y, connecting the lever X with the rock-arm *o'*, substantially as described.

400,966. COMBINED TOBACCO-TAMP AND PIPE-STEM CLEANER. JOSEPH STRACHAN, Brooklyn, N. Y. Filed June 9, 1888. Serial No. 276,602. (No model.)

Claim.—1. A combined tobacco-tamp and pipe-stem cleaner, consisting of a hollow casing having a longitudinal slot formed therein, a tamp-button at one end of the casing of greater diameter than the casing, and a wire pipe-stem cleaner sliding within the casing, the tamp-button being connected to the pipe-stem cleaner, substantially as shown and described.

2. A combined tobacco-tamp and pipe-stem cleaner, consisting of a hollow slotted casing, a pipe-stem cleaner fitting within the casing, and a tamp-button passing through the slot of the casing and pivoted to the stem-cleaner so as to assume two positions, in one sliding freely in the slot and forming a handle for moving the pipe-stem cleaner within the casing and in the other held at the end of the slot and adapted to be used as a tamp, substantially as shown and described.

3. A combined tobacco-tamp and pipe-stem cleaner, consisting of a hollow cylindrical slotted casing, a wire pipe-stem cleaner held in a plunger sliding within the casing, and a disk-shaped tamp-button passing through the slot of the casing and pivoted to the plunger so as to assume two positions thereon at right angles to each other, in one sliding freely in the slot and forming a handle for moving the pipe-stem cleaner within the casing and in the other held at the end of the slot and adapted to be used as a tamp, substantially as shown and described.



4. A combined tobacco-tamp and pipe-stem cleaner, consisting of the hollow casing *a*, having the slot *a'* and notches a^3 a^3 formed therein, the looped wire stem-cleaner *c*, carried by the plunger *b*, and the disk-shaped tamp-button *d*, projecting through the slot of the

casing and pivoted to the plunger c, substantially as shown and described.

400,967. OINTMENT. CAROLINE V. SUTHERLAND, Lathrop, Cal. Filed Oct. 19, 1888. Serial No. 288,598. (No specimens.)

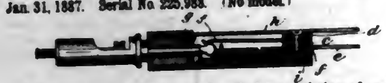
Claim.—The herein-described medical compound, as a salve, consisting of an extract from wormwood stalks and leaves; rosin-weed, stalks, and leaves; yarrow stalks, leaves, and flowers; thorn-apple stalks and leaves; Australian blue gum twigs and leaves; plantain stalks and leaves, with beeswax, fresh hogs lard and camphor, in the proportions specified.

400,968. PORTABLE SCRAP-FILE. CLARENCE W. TAYLOR, Janesville, Wis. Filed Oct. 18, 1888. Serial No. 288,437. (No model.)

Claim.—1. In a portable scrap-file, a cover and a set of leaves which are joined in pairs at one end to form pockets, each open at the side and one end, the leaves being adapted to receive written memoranda, substantially as set forth.

2. In a scrap-file, a cover and a set of leaves which are secured together in pairs at one end to form pockets, open at the side and one end, and indexed on their edges, substantially as set forth.

3. In a scrap-file, a cover, a single pocket open at the side only formed adjacent to one lid of the cover, and a series of pockets open at the side and one end, the said pockets being formed of ruled leaves joined in pairs at one end, substantially as set forth.



4. In a scrap-file, a cover, a series of blank leaves, and a series of pockets, each open at the side and one end, substantially as set forth.

5. In a scrap-file, a cover, a series of leaves, a series of pockets, each open at the side and one end, and a pocket closed at both ends, substantially as set forth.

6. In a scrap-file, the combination, with a body consisting of a series of pockets, each open at the side and one end, of a cover removably secured to said body, substantially as set forth.

7. The combination, with a body secured together by rivets having sockets in their ends, of a cover and the spring-clasps having end projections to enter the sockets in the rivets, substantially as set forth.

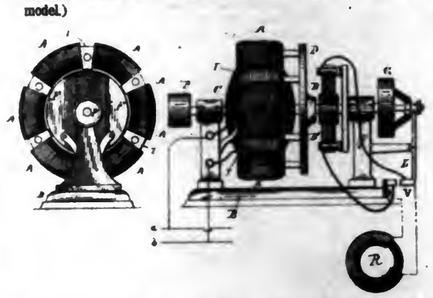
400,969. SPRING-JACK SWITCH. HARRY B. THAYER, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Jan. 31, 1887. Serial No. 225,983. (No model.)

Claim.—1. A strip of spring-jack switches consisting of a supporting-base of insulating material, in combination with the springs of the different spring-jacks placed with corresponding springs in the same plane, the springs of each of the different spring-jacks being placed in parallel planes one above the other, the separating-pieces *e f*, and bushing *i* around the screw of each spring-jack for insulating the springs *e f* of the different spring-jacks, substantially as shown and described.

2. The combination, with the insulated springs of a spring-jack switch placed in parallel planes one above the other, of a socket or test-piece, *a*, provided with a slot, and the upper or test spring resting in said slot, substantially as shown and described.

3. The combination, in a spring-jack switch, of three springs or contact-pieces placed in different parallel planes one above the other, the upper one of said springs being connected with the test piece or socket of the switch and the central spring normally resting against a point of the lower spring, and a plug which, when inserted, lifts the central spring from its normal contact with the lower spring and forms connection therewith, while the test-piece is at the same time connected with the shank of the plug.

400,970. ROPE OR CABLE. COLIN M. THOMPSON, Brooklyn, N. Y. Filed Feb. 10, 1885. Serial No. 155,505. (No model.)



Brief.—The object of the invention is to produce an improved cable for use in connection with cable railways and in transmitting power generally.

Claim.—1. A cable consisting of a non-extensible slightly-elastic and flexible core, a wrapper of rubber surrounding said core, and an external wrapper of large wire spirally arranged about said resilient wrapper, substantially as described.

2. A cable composed of a core formed of hemp or other slightly-elastic material inclosed by small wire, a wrapper of rubber surrounding said core, and an external wrapper inclosing said rubber wrapper, said external wrapper formed of large wire spirally arranged with regard to the longitudinal axis of the cable, as and for the purpose specified.

400,971. ALTERNATING-CURRENT ELECTRIC MOTOR. ELIHU THOMSON, Lynn, Mass. Filed July 30, 1888. Serial No. 281,433. (No model.)

Claim.—1. In an alternating-current electric motor in which the reaction between an alternating field and currents induced by such field in a closed-circuit armature is employed as the motive force, a ring or endless structure of iron, I, carrying coils A, operated on closed local circuit.

2. In an alternating-current electric motor having an alternating field and a closed-circuit conductor, the reaction between which and the field produces motive effects, an external ring, I, carrying coils A on locally-closed circuit, and an internal electro-magnet, F, carrying coils C, connected to an alternating source, as and for the purpose described.

3. In an alternating-current electric motor, an alternating-current field-coil, C, fixed in position, as described, and wound over a suitable core, F, and a revoluble ring-magnet, I, carrying the coils which form the circuit for the induced currents by whose reaction the ring is revolved.

4. In an alternating-current electric motor having a closed electric circuit for induced currents, by the reaction of which on an inducing alternating field the motor is operated, a laminated external ring-magnet, in combination with a laminated internal magnet formed, as shown and described, with a central reduced portion for the coils and enlarged polar portions conforming to the circular internal line of the outer ring-magnet, both said magnets being wound with suitable coils, one set of which is closed on itself.

5. In an alternating-current electric motor having a closed armature-circuit, as described, forming the path of induced currents by whose reaction motion is produced, means for varying the resistance to such induced currents for the purpose of regulating the speed or power of the motor.

6. In an alternating-current electric motor, the combination, with the closed circuit for the induced currents, of means for varying the resistance to the induced currents and a speed-governor for adjusting the devices which vary the resistance.

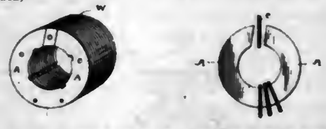
7. The combination, substantially as described, of the speed-governor, a double flange disk or clutch, S, connected therewith, a roll, H, and a screw and worm wheel, T X, the worm-wheel X carrying an arm, J, which supports the device for producing variations in the resistance to the alternating currents.

8. The combination, substantially as described, of the circular-shaped core I, carrying coils A, an internal inducing alternating field-magnet, F C, and a commutator, K, for closing the circuit of coils A in the same plane, when, by reason of rotation of the shaft with the motor, such plane is parallel with the plane of the coils C.

400,972. INDUCTION-COIL AND SELF-INDUCTIVE APPARATUS. ELIHU THOMSON, Lynn, Mass. Filed Oct. 15, 1888. Serial No. 288,161. (No model.)

Claim.—1. In an electro-magnet having a closed magnetic circuit threading its coils, a laminated core-piece having a notch or gap for application of the coils closed by a driven laminated plug or stopper whose laminations are parallel to and in magnetic connection with those of the body of the core and form a butt-joint with the same, as and for the purpose described.

2. A horseshoe electro-magnet having coils placed upon the legs of the horseshoe and a core-piece for said magnet made up of a bundle or pile of plates of general U form, in combination with a laminated plug or stopper driven or forced into the gap between the legs of the horseshoe, with its laminations parallel to and in direct magnetic contact with those of the core to form a closure of the magnetic circuit threading the coils, as and for the purpose described.



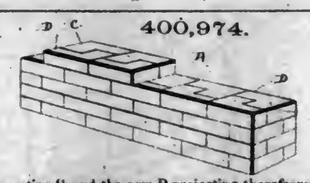
3. The combination, with the laminated magnet-core having a gap or notch, of a closing-piece for the magnetic circuit consisting of a tapered laminated plug or stopper forced or driven tightly into the gap or notch, with its laminæ parallel to and forming magnetic contact with the ends of the laminæ for the core by butt-joints.

4. In an induction or self-inductive coil, a magnetic circuit threading the coil or coils and composed of a number of discontinuous plates or laminæ of iron piled up together and insulated flatwise, in combination with a magnetic circuit-closing plug or block composed of iron laminæ of a width adapted to fit tightly into the gap in the continuity of the first-named plates and driven or forced tightly into place in the socket formed by the gap, the laminations of both sets of plates being in substantially the same plane.

5. An induction or self-inductive coil constructed of a laminated core in U shape, coils slipped over the limbs of the laminated core, and a magnetic circuit-closing plug or stopper driven or forced into the socket formed by the notch or opening between the legs of the core, as and for the purpose described.

6. An electro-magnet having an endless core formed in two parts, one of which is the greater portion of said core, while the other consists of a plug or stopper driven into place in an opening or gap between the ends of the larger piece, said plug and gap being accurately fitted to one another, so that the plug when driven in place will be tightly held, and will form a complete closure of the endless magnetic circuit for the core.

400,973. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. ELIHU THOMSON, Lynn, Mass. Filed Oct. 15, 1888. Serial No. 288,162. (No model.)



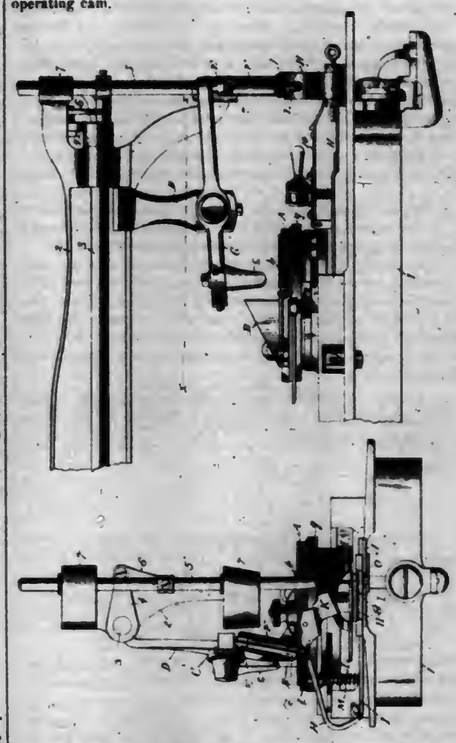
Claim.—1. In a ring-armature for dynamo-electric machines or motors, a laminated core having a notch or gap at one side for the insertion of the coils closed magnetically by a laminated plug or bundle fitted tightly into the notch or gap to complete or restore the magnetic circuit after application of the coils, in combination with suitable fastening devices for holding said plug against displacement by revolution of the armature.

2. In a ring-armature, a laminated ring-core having a notch or gap at one side filled by a laminated plug fitted tightly therein with the ends of its laminæ abutting against and closing the magnetic circuits for the laminæ of the body of the core, in combination with coils applied over said plug, and binding-rings of wire for holding the coils and plug in place.

3. In a ring-armature, a laminated ring-core having a gap or notch at one side closed by a tightly-fitting plug or bundle of plates abutting against the ends of the plates of the body of the core, so as to close the magnetic circuits of the latter and form practically a uniform continuous laminated ring-armature, as and for the purpose described.

400,974. BRICK. THEODORE THOER, St. Clair, Pa. Filed Oct. 22, 1888. Serial No. 288,746. (No model.)

Claim.—As a new article of manufacture, the rectangular brick A, having the rectangular recess B in one corner, the said recess being equal in length to one-half the length of the brick, and equal in width to one-half the width of the brick, thereby forming the approximately-

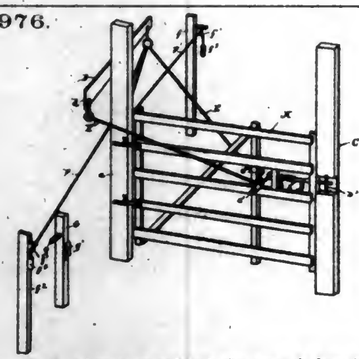


400,974.

square portion C, and the arm D projecting therefrom at right angles, substantially as described.

400,975. BUTTON-HOLE CUTTER FOR SEWING-MACHINES. ADELBERT L. TRAVER, Philmont, N. Y., assignor of one-half to James Aken, same place. Filed July 6, 1887. Serial No. 243,564. (No model.)

Brief.—A slotted plate moves with the vibrations of the clamp. To an arm of this plate is pivoted the cutter-carrying arm. This cutter-carrying arm is depressed by a lever pivoted to the frame of the machine. The lever is operated by a cam mounted upon the clamp-operating cam.



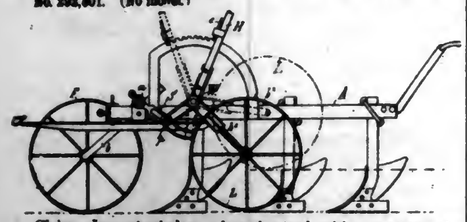
Claim.—1. The combination, in a button-hole machine, and with the cloth-holder thereof, of the traveling plate J, having a slot for the cutter, the arm I, moving therewith, the cam 9, for moving said arm and plate, the cutting-lever H, attached to said arm, the cutter-blade connected with the said lever, with the wedge-cam R, mounted on said cam 9, and intermediate connections for depressing said lever by said wedge-cam, substantially as described.

2. The combination, in a button-hole machine, and with the cloth-holder thereof, of the traveling cloth-plate J, having a slot for the cutter, the arm I, attached thereto, the cam 9, for moving said arm and plate, the cutting-lever H, pivoted to the arm I, the cutter-blade connected with the said lever, the link F, the lever C, and the cam R moving with said cam 9 and operating the cutting-lever H, substantially as described.

3. The combination, in a button-hole machine, and with the cloth-holder thereof, of the cam 9, the traveling cloth-plate J, having a slot for the cutter, the arm I, attached thereto, the slide 11, connected with the cam 9, the cutting-lever H, pivotally connected to said arm I, the cutter-blade connected with the said lever, the link F, the lever C, supported by the arm 2, and the wedge-shaped cam B, mounted on the cam 9 and operating the cutting-lever H, substantially as described.

400,976. GATE. JAMES H. TUDOR, Lexington, Ky. Filed Sept. 26, 1888. Serial No. 286,474. (No model.)

400,976.



Claim.—1. As an improvement in swinging gates, the lever having the friction-rollers projecting therefrom and working in a circular groove or recess of the post to which said lever is pivoted, in combination with the gate, to which said lever is connected, substantially as shown and described.

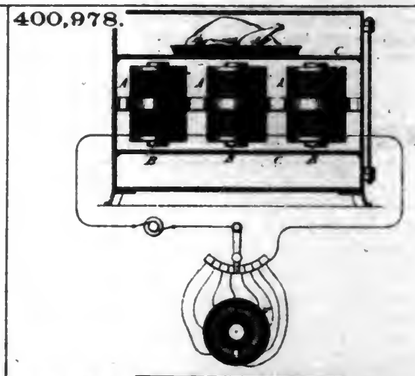
2. The combination, with the swinging gate and the post to which said gate is secured, of the lever fulcrumed on said post near its upper end and having a weighted end, the ropes or chains connecting said lever to the gate, and the spring-held latch-rod, to the inner end of which one of said ropes or chains is connected, substantially as set forth.

3. The combination, with the swinging gate having the hooked arm, of the retaining-post having a stud or pin and the bent spring secured to said post, substantially as shown and described.

4. The herein-described improved gate, comprising the post having a circular groove, the swinging gate having the spring-held latch-rod and the hooked arm, the lever having a weighted end and provided with friction-rollers working in said circular groove, the ropes or chains, the latching-post having the pivoted arm, and the retaining-post having a stud or pin and a bent spring, substantially as shown and described.

400,977. ADJUSTING DEVICE FOR WHEEL-PLOWS. AUGUST J. VENTZKI, Graudenz, Prussia, Germany. Filed Dec. 6, 1888. Serial No. 292,801. (No model.)

Claim.—In a wheel-plow, a lowering and raising apparatus for furrow-wheel and land-wheel, characterized by the arrangement of a slotted lever, S, curved at one end concentric to the segment B of the hand-lever H, but straight or curved not concentric to the segment B at the other end, the fixed axle *a* of said slotted lever being also the pivot for the furrow-wheel F, while the pivot of land-wheel L is at the same time the fulcrum of the hand-lever H, substantially as herein shown and described.



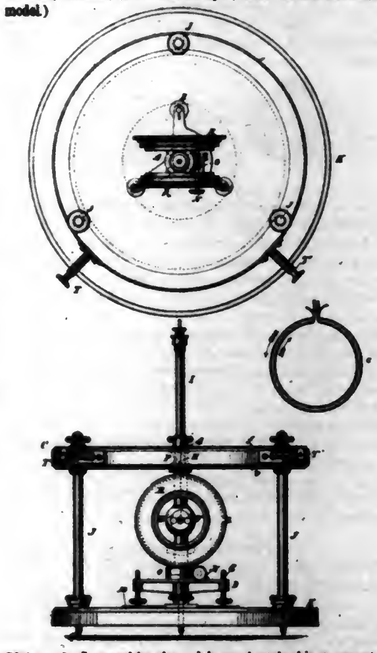
400,978. ELECTRIC HEATING APPARATUS. HENRY P. WATTS, Sandusky, Ohio. Filed Nov. 22, 1888. Serial No. 291,563. (No model.)

Claim.—1. In an electric heating apparatus, a coil or coils in which alternating currents flow, said coil or coils having magnetic cores, in combination with a metallic plate or plates arranged adjacent to the said cores, whereby the flow of said alternating currents will cause the heating of said plates.

2. In an electric oven, a coil or coils having magnetic cores, in combination with the metallic wall or walls of said oven, the said cores extending into close proximity to said wall or walls, whereby the flow of alternating currents in the coils will cause the walls of the oven to become heated.

400,978.

400,979. DIE FOR UPSETTING EYE-BARS. WILLIAM R. WEBSTER, Philadelphia, Pa. Filed Jan. 12, 1888. Serial No. 296,157. (No model.)



Claim.—1. In dies for forming eye-bars substantially as specified, a central longitudinal projection recessed or cut away in that part of the die-surface which rests upon the end of the finished eye, all substantially as and for the purpose specified.

2. In dies for forming eye-bars substantially as specified, a sliding die having a central longitudinal projection cut away at its end, which rests on the end of the eye, in combination with a plunger formed with or secured on said end of the die, all substantially as and for the purpose specified.

3. In dies for forming eye-bars substantially as specified, a central longitudinal projection formed with a groove along its apex, substantially as and for the purpose specified.

4. In dies for forging eye-bars substantially as specified, a central longitudinal projection formed with a groove along its apex and cut away in that part which rests on the end of the finished eye, all substantially as and for the purpose specified.

400,980. STANDARD TANGENT-GALVANOMETER. EDWARD WESTON, Newark, N. J. Filed May 3, 1888. Serial No. 272,634. (No model.)

Claim.—1. In combination with an electrical instrument contain-

ing a vibrating index-mirror, a curved surface extending around said mirror and concentric with the axis of vibration thereof, and a scale upon said surface for showing the angular deflections of said mirror, substantially as described.

2. In combination with an electrical instrument containing a vibrating index-mirror, a curved surface extending around said mirror and concentric with the axis of vibration thereof, and a scale upon said surface for showing the deflections of said mirror, the zero-point of said scale being marked at a point on said surface distant forty-five degrees in arc from the point at which a radius from the mirror-center drawn perpendicular to the face meets said surface when no current traverses the instrument, substantially as described.

3. In combination with an electrical instrument containing a vibrating index-mirror, a curved surface extending around said mirror and concentric with the axis of vibration thereof, and a scale upon said surface for showing the deflections of said mirror, the said scale having two zero-points marked, respectively, at points on said surface distant forty-five degrees in arc and at each side of the point at which a radius from the mirror-center drawn perpendicular to the mirror-face meets said surface when no current traverses the instrument, substantially as described.

4. In combination with an electrical instrument containing a vibrating index-mirror, a curved surface extending around said mirror and concentric with the axis of vibration thereof, and a scale upon said surface for showing the deflections of said mirror, the said scales having two zero-points marked, respectively, at points on said surface distant forty-five degrees in arc and at each side of the point at which a radius from the mirror-center drawn perpendicular to the mirror-face meets said surface when no current traverses the instrument, and the said scale being laid off in regular successive divisions from each of said zero-points toward the other, substantially as described.

5. In combination with an electrical instrument containing a vibrating index-mirror, a wall extending around said mirror and having its inner periphery curved and concentric with the axis of vibration of said mirror, a scale on said periphery for showing the angular deflections of said mirror, and a sight-opening in said wall in line with said mirror, substantially as described.

6. In combination with an electrical instrument containing a vibrating index-mirror, a wall extending around said mirror and having its inner periphery concentric with the axis of vibration of said mirror, a scale on said periphery for showing the angular deflections of said mirror, and a sight-opening in said wall in line with said mirror, the position of said opening in said wall being such that a line of sight drawn from said opening to said mirror shall make an incident angle of forty-five degrees with the reflecting-surface when no current traverses the instrument, substantially as described.

7. In combination with an electrical instrument containing a vibrating index-mirror, a wall extending around said mirror and having its inner periphery concentric with the axis of vibration of said mirror, a scale on said periphery for showing the angular deflections of said mirror, and two sight-openings in said wall and in line with said mirror, the positions of said openings in said wall being such that lines of sight drawn from said openings to said mirror shall make equal incident angle with the reflecting-surface when no current traverses the instrument, substantially as described.

8. In an electrical instrument, a vibrating index-mirror and a scale-chamber inclosing said mirror, substantially as described.

9. The combination of an electrical instrument containing a standard, a vibrating index-mirror supported thereby, an independently-supported scale-chamber inclosing said mirror and surrounding said standard, and means—such as screws—for vertically adjusting said standard in said chamber, substantially as described.

10. In an electrical instrument, a base, a circular scale-chamber supported thereon, a central hollow standard resting on said base and passing through said scale-chamber, and an index-mirror supported in said standard and inclosed in said scale-chamber, substantially as described.

11. In an electrical instrument, a base, a circular scale-chamber supported thereon, a central hollow standard resting on said base and passing through said scale-chamber, an index-mirror supported in said standard and inclosed in said scale-chamber, universal-joint connections between said standard and the top and bottom walls of said chamber, means—such as screws—for leveling said base and chamber, and means—such as screws G—for leveling said standard upon said base, substantially as described.

12. In an electrical instrument, a central hollow standard, a vibrating index-mirror supported therein, an independently-supported scale-chamber inclosing said mirror, (through which chamber said standard passes,) and means—such as a tangent-screw and toothed segment—for rotating said standard on its axis within said chamber, substantially as described.

13. In a galvanometer, a central hollow standard, a vibrating index-mirror supported therein, an independently-supported chamber having side, top, and bottom walls inclosing said mirror, (through which chamber said standard passes,) and universal-joint connections between said standard and the top and bottom plates or walls of said chamber, substantially as described.

14. A galvanometer-coil containing an annular spool or bobbin and two encircling conductors located, respectively, upon the periphery and upon one face of said spool, substantially as described.

15. A galvanometer-coil containing an annular spool or bobbin having two encircling grooves or channels formed, respectively, in its periphery and in one face, and conductors located in said grooves, substantially as described.

16. A galvanometer-coil containing an annular spool or bobbin and two conductors forming loops of different diameters, located, respectively, upon the periphery and upon one face of said spool, substantially as described.

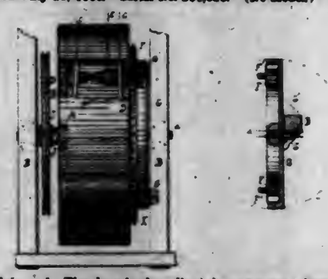
17. In a galvanometer, a coil containing two separate conductors of unequal lengths, but each making the same number of loops or turns, substantially as described.

18. In a galvanometer, a coil containing two separate conductors forming loops, respectively, of different diameters, substantially as described.

19. In a galvanometer, a coil containing two separate conductors each making the same number of loops or turns, but relatively varying in electrical resistance, substantially as described.

20. In a galvanometer, a coil having its leading-out terminals disposed in a line radial to the coil-center and in the horizontal plane of vibration of the magnet-needle, substantially as described.

21. The combination, with a galvanometer containing a vibrating index-mirror and a central hollow standard, A, of the collars *c* and Q, scale-chamber C, having upper plate, *f*, and lower plate, *b*, and the flexible disk *e*, interposed between said collar Q and plate *b*, substantially as described.



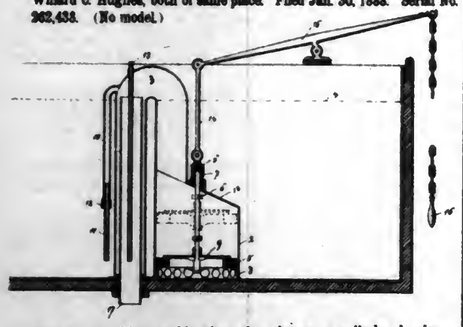
22. The combination, in a galvanometer, of a magnet-needle and two rings supported in parallel planes on opposite sides thereof with their centers in line with and equidistant from the center of the needle, and two conducting-coils supported concentrically by each of said rings, one conductor being on the face of the ring adjacent to the needle and the other conductor being on the periphery of said ring, the diameters of said coil being relatively such that the circumferences of both coils will lie in the periphery of a cone having its apex at the needle-center, substantially as described.

23. The combination of the standard A, index-mirror H, chamber C, containing the rim C', top plate, *f*, and bottom plate, *b*, the said plates *f* and *b* encircling said standard, respectively, above and below the position of the mirror therein, and a scale on the inner periphery of rim C', substantially as described.

24. The combination, with a galvanometer containing the standard A and index-mirror H, of the base K and curved wall C', having a scale on its inner periphery and supports upon said base for said wall, substantially as described.

25. The combination, with a galvanometer having the central standard, A, and tripod-base B, of the base K, scale-chamber C, supported on said base and surrounding said standard, and the centering-plate M on said base K, substantially as described.

400,981. DRIVING-GEARING. JOHN C. WHITTOAN, Stockton, Cal. Filed July 26, 1888. Serial No. 281,023. (No model.)

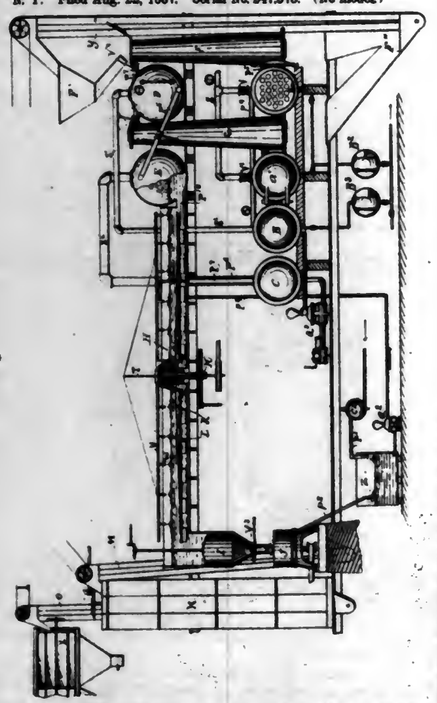


Claim.—1. The herein-described improvement in machine driving-gearing, comprising the beams B, the wheel A and its axle *a*, the internal gear-wheel, G, having the lugs G' G', the spur-pinions F F, the shafts F' F' and their boxes D, the spur gear-wheels H H, and the V-faced pulley I, with the spur-pinions J upon its hub intermeshing with the spur gear-wheels H.

2. As an improvement in driving-gearing, the main driving-wheel A, having the journal-bearings of its axle *a* in boxes secured to the beams B B, in combination with the transverse shafts F' F', having their journal-bearing in boxes D, secured to the spokes of the wheel A, such shafts F' F' having at their ends suitable gear-wheels intermeshing at one end with a large gear-wheel on the end of the axle

a, and at the other end intermeshing with a pinion on the end of the hub of a suitable driving-pulley upon the end of the axle *a*, the whole operating substantially as and for the purpose specified.

400,982. CISTERN-VALVE FOR WATER-CLOSETS. JOSEPH WICKS, Utica, N. Y., assignor of two-thirds to George H. Hughes and Willard C. Hughes, both of same place. Filed Jan. 30, 1888. Serial No. 262,433. (No model.)



Claim.—1. The combination of a cistern, a cylinder having a plunger adapted to move therein, said plunger having a valve, a siphon connected with the cylinder, and a vent or air tube extending down the longer arm of the siphon to a point above the bottom of the cistern, substantially as set forth.

2. A cylinder having an inclined top, in combination with a siphon provided with an air-vent, 13, extending to a point above the bottom of the cistern, and having a pipe, 17, extending up into it, substantially as described.

3. A cylinder with an inclined top, in combination with a siphon provided with a vent-pipe, 13, extending to a point above the bottom of the cistern, a downwardly-extending pipe, 10, entering said siphon near its highest point, and a pipe, 17, extending up into said siphon, substantially as described.

400,983. APPARATUS FOR THE MANUFACTURE OF SALT. HORACE WILLIAMS, JOHN L. ALBERGER, and LOUIS R. ALBERGER, Buffalo N. Y. Filed Aug. 22, 1887. Serial No. 247,573. (No model.)

Claim.—1. The combination of the gravel-box F with the closed evaporators D and E, the open grainer H, the pipes P, the shaft [illegible] stantially as described.

2. The combination of the grainer H with the pipes P, the rotating arms R, having scrapers L, the shaft K, the shaft T, and the agitator-arms U, provided with flippers W, in the manner as and for the purpose described.

3. The dam, in combination with the grainer H, the pipes P, and the inlet and exit pipes P^{10} and P^9, in the manner as and for the purpose described.

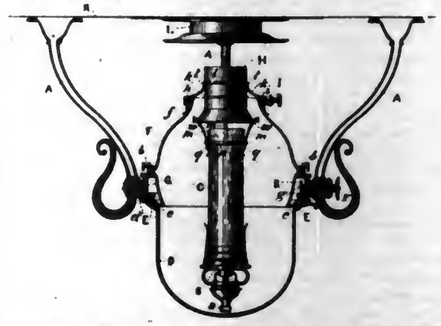
4. The dam, in combination with the grainer H, the flippers W, the arms U, and means for supporting and rotating them, in the manner as and for the purpose described.

5. The combination of the tubular heaters A B, the gravel-box F, the evaporators D and E, the grainer H, and the heater C with the pump A^2 and connecting-pipes, in the manner as and for the purpose described.

6. The combination of the grainer H with the agitator-arms U, the pendent parts *b c d*, and the shaft T, in the manner as and for the purpose described.

7. The combination of the heaters A A' with the gravel-boxes F G, the heater B, the pump A^2, and connecting-pipes, in the manner as and for the purpose described.

8. The combination, in a grainer, of a series of arms provided with scrapers submerged in the brine, a series of agitator-arms above the brine, provided with flippers, and shafts T and K, in the manner as and for the purpose described.



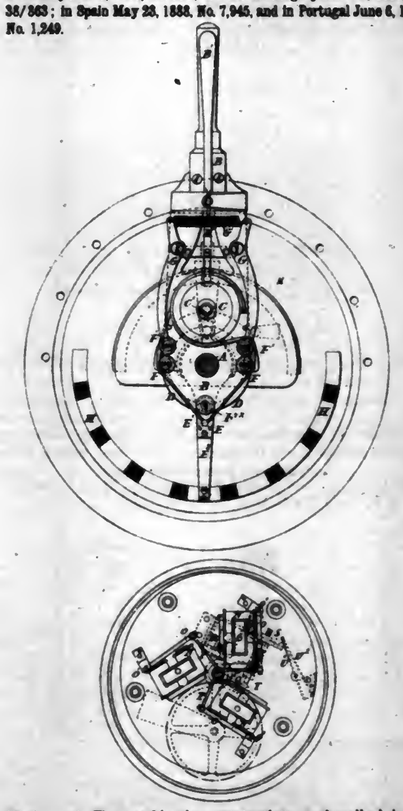
9. The combination of the grainer H with the suction-pipe P^8, the jacket-pipe P^6, inclosing it, the heater C, and the pump A^2, together with means for returning the brine through the apparatus to the grainer, in the manner as and for the purpose described.

10. The combination of the pump A^2, the grainer H, and the pipe P^4 with the pipe P^8, the heater C, pump A^2, and connecting-pipes, and means for conveying the brine through the apparatus to the grainer, in the manner as and for the purpose described.

11. The combination of the grainer H with the inlet-pipe P^{10}, the exit-pipe P^9, the pipes P, the dam, the rotating arms having scrapers, and the agitating-arms provided with flippers, in the manner as and for the purpose described.

12. The combination of the heaters A A', the gravel-boxes F G, evaporators D and E, grainer H, heating-pipes P, suction-pipe P^8, and heaters B and C with the pump A^2 and connecting-pipes, in the manner as and for the purpose described.

400,984. LAMP FIXTURE AND VENTILATOR FOR RAILWAY-CARS. JOHN WILLIAMS, Jersey City, N. J., and EDWARD J. FROST and WILLIAM DAWSON, Philadelphia, Pa. Filed June 5, 1885. Serial No. 167,774. (No model.)



Claim.—1. The combination, with the burner and its chimney, of the inclosing bell-glass and the inclosing dome-shaped reflecting-shade, the edges of which meet together, so as to form an unobstructed space around said burner and chimney, the supporting ring or frame surrounding the joint of said shade and glass, and a perforated support in the upper contracted open end of said shade surrounding and supporting the upper end of said chimney and admitting air to feed the burner, substantially as described.

2. The combination, with the burner and its chimney, of the dome-shaped reflecting-shade having a contracted upper open end, the perforated clamp-ring fitted to said shade and securely supporting a separable chimney-piece therein, and a spring-clamp connection of said chimney-piece supporting the upper end of said chimney, substantially as described.

3. The chimney-piece supporting-ring consisting of the annular ring fitted around the reflecting-shade, the perforated extension or fingers fitted to support said chimney-piece, and the movable clamp-segment of said supporting-ring and its adjusting clamp-screw I, substantially as described.

4. The combination of the chimney, the separable chimney-piece fitted above it, and the double-ring clamp-connection between said chimney and chimney-piece, consisting of a ring secured to the lower end of said chimney-piece and connected by fingers with a second ring grasping the upper end of said chimney by interposed springs, substantially as described.

400,985. TELEGRAPH APPARATUS FOR SHIPS. JAMES B. WILLER, Portsmouth, County of Hants, England. Filed Feb. 7, 1888. Serial No. 263,256. (No model.) Patented in England Jan. 16, 1887, No. 800; in France Dec. 7, 1887, No. 187,446; in Belgium Dec. 8, 1887, No. 79,839; in Germany Dec. 21, 1887, No. 45,392; in Italy Dec. 31, 1887, No. 22,756; in Norway Feb. 6, 1888, No. 884; in Austria-Hungary Mar. 29, 1888, No. 38/363; in Spain May 23, 1888, No. 7,945, and in Portugal June 6, 1888, No. 1,249.

Claim.—1. The combination, substantially as described, in an electric-telegraph transmitter, of a contact-making arm, a series of contacts over which it travels and to any one of which it may be moved, an electric signaling-circuit in which the arm and contacts are included, a movable handle whose movement is to be signaled, yieldingly coupled with said arm and by which the arm may be moved to any of said circuit-completing contacts, and a speed-controller connected with the contact-arm and regulating the speed of its forward movement as it follows the handle independently of the movement of the handle, whereby whether the handle be moved rapidly or slowly good contacts are obtained, as described, and a locking-bolt for holding the handle in any desired position.

2. The combination, substantially as described, of a transmitter which when operated by the movement of a handle transmits currents in succession through three line-wires, an electric telegraph-receiver consisting of three electro-magnets symmetrically arranged around a circle and each included in one of said wires, armatures to these magnets, a central axis with eccentric-pin, connecting-rods passing from the armatures to the eccentric-pin, and gear connecting the central axis with an axis on which is an index or pointer showing the signals upon a dial, as herein set forth, the return-wire, and the arc on the transmitter to which the return-wire is connected.

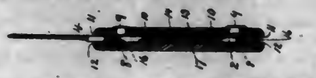
3. The combination of a transmitter having a contact-maker, a series of contacts, a handle yieldingly connected with the contact-maker, and a speed-controller connected with the contact-maker, for the purpose described, line-wires connected with said contacts, a receiver having an electro-magnet in each of said line-wires, and an indicator operated by said magnets, as set forth, and a return-conductor with which all of said wires are connected after passing through their magnets, returning to the contact-maker of the transmitter, and circuit making and breaking devices for opening and closing the circuit of the return-conductor.

4. The combination of a transmitter having a contact-maker, a series of contacts, a handle yieldingly connected with the contact-maker, and a speed-controller connected with the contact-maker, for the purpose described, line-wires connected with said contacts, a receiver having an electro-magnet in each of said line-wires, and an indicator operated by said magnets, as set forth, a return-conductor with which all of said line-wires are connected after passing through their magnets, returning to the contact-maker of the transmitter, a magnet, R, in said conductor, contacts $U' U^2$, included in a sub-circuit operated by said magnet R, and signal-bells in said sub-circuit at the transmitter and receiver.

5. The combination, substantially as described, in an electric-telegraph transmitter, of a contact-making arm, a series of contacts over which it travels and to any one of which it may be moved, an electric signaling-circuit in which the arm and contacts are included, a movable handle pivotally connected with the contact-making arm, the pulleys on the arm, the chains secured to the arm and passing over the pulleys, the spring-actuated drum to which the chains or cords are connected, the fly-wheel, gearing between the fly-wheel and the contact-making arm, the pivoted levers G, the spring connecting them at their upper end, and the pulleys on their lower ends, over which the chains pass which connect the contact-making arm with the operating-handle.

400,986. FEED-REGULATOR FOR ROLLER-MILLS. JOSEPH W. WILSON, Brookville, Kans. Filed Mar. 16, 1888. Serial No. 267,390. (No model.)

Claim.—1. In a feed-regulator, a vibrating shoe, in combination with a rake having teeth with parallel sides, forming spaces of equal width from top to bottom of the teeth, substantially as and for the purpose set forth.



2. In a feed-regulator, the combination of the vibrating shoe, a hinged rake having teeth with parallel sides forming spaces of uniform width, and a spring acting on the rake, substantially as and for the purpose set forth.

3. In a feed-regulator, the combination of the vibrating shoe, a hinged rake having teeth with parallel sides, a spring, and a pin on the spring bearing against the rake, substantially as and for the purpose set forth.

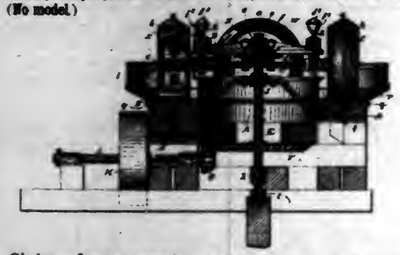
4. In a feed-regulator, the combination of the vibrating shoe, a hinged rake, a spring, and an adjustable pin passing through the spring and bearing against the rake, substantially as and for the purpose set forth.

5. In a feed-regulator, the combination of the vibrating shoe, a hopper, a rake hinged to the hopper by a strip, 6, and adjustable on said strip, a spring, and a pin made adjustable by nuts 13, by which it is secured to said spring, substantially as and for the purpose set forth.

400,987. POCKET-KNIFE. ARTHUR WILSIN, New York, N. Y. Filed Sept. 10, 1888. Serial No. 285,086. (No model.)

Claim.—1. A pocket-knife comprising a handle, a blade with the usual shouldered heel to engage the back-spring when the blade is fully opened and be locked thereby, and a back-spring of the full regular length and with the usual straight end, but differing from the ordinary back-spring in having its inner edge formed with a projection bearing against the heel portion of the blade when closed on the edge adjacent to the knife-edge and forward of the pivotal point of the blade, for the purpose of holding the blade normally partially open or projected, in combination with a locking device engaging the blade when fully closed and holding its portion in rear of its pivotal point out of contact with the knife-spring, substantially as shown and described.

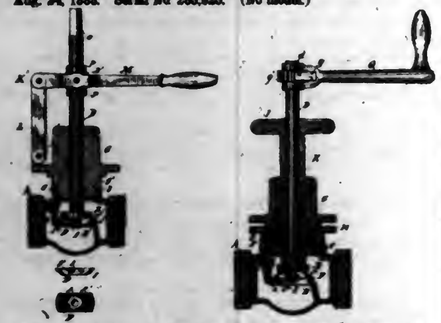
2. In a pocket-knife, a spring in back of the blades, of the full regular length and with the usual straight end, but differing from the ordinary back-spring in having its inner edge formed with a projection adapted to bear against the heel portion of the blade when closed on the edge adjacent to the knife-edge and forward of the pivotal point of the blade, substantially as shown and described.



3. A pocket-knife constructed with a spring in back of the blades, with the usual straight end, having its inner edge formed with a pro-

jection bearing against the pivotal portion of the knife-blade on the edge adjacent to the knife-edge and forward of the pivotal point of the blade, in combination with a spring-actuated locking device for the same blade mounted on the knife-handle and extending into a recess in the knife-blade, substantially as shown and described.

4. A pocket-knife constructed with a spring in back of the blades, with the usual straight end, having its inner edge formed with a projection bearing against the pivotal portion of the knife-blade on the edge adjacent to the knife-edge and forward of the pivotal point of the blade, in combination with a locking device for the same blade mounted on the knife-handle and extending into a recess in the knife-blade, substantially as shown and described.



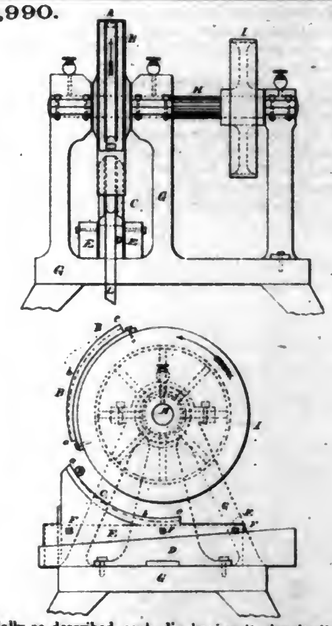
5. In a pocket-knife, a spring-arm formed at its free outer end with a knob projecting through the covering, and with a lateral extension projecting through the linings and engaging the knife-blade and locking it in its closed position from the side opposite to the one on which the knob is located, substantially as shown and described.

400,988. ORE-CRUSHER AND METAL-SEPARATOR. JACOB C. WIXWELL, Medford, Mass., assignor to the Wixwell Electric Mining Machinery Company, Portland, Me. Filed Sept. 30, 1887. Serial No. 251,086. (No model.)

Claim.—In an ore-crusher and metal-separator made substantially as described, the combination of the bed A, plates B, rolls C, with the curb I, provided with one or more openings fitted with screws, with the insulated plate or plates *s*, electric excitant, and connections therewith, substantially as and for the purpose hereinbefore set forth.

400,989. VALVE-RESEATING TOOL. PLINY J. WRIGHT, Minneapolis, Minn., assignor of one-half to Clara E. Sampson, same place. Filed Aug. 24, 1888. Serial No. 283,035. (No model.)

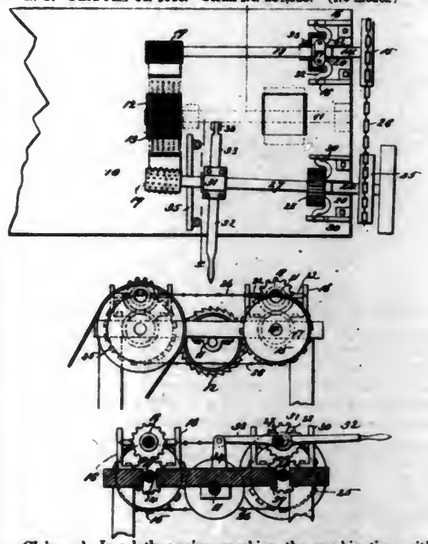
Claim.—1. In a valve-reseating device, the combination, with a revoluble shaft, of a file connected to the lower end of said shaft at right angles to its axis, of a size to cover at any one time only a part of the surface to be dressed, whereby the file is rendered self-clearing, substantially as described.



2. In a valve-reseating device, the combination, with a revoluble shaft, of a cutter detachably connected thereto, having a flat file-surface on its under side and inclined file-surfaces on its ends, substantially as described, whereby the tool is adaptable to dressing both flat and conical valve-seats.

3. The combination, with the shaft D, of the cutter F, having flat and inclined file-surfaces *f' f''*, the centering-guide G, the bushing H, the screw K *j*, and the ratchet-crank Q *q q'*, substantially as described.

400,990. MACHINE FOR MAKING STEEL BALLS. WILLIAM H. WRIGHT, Buffalo, N. Y. Filed Aug. 3, 1886. Serial No. 209,027. (No model.)



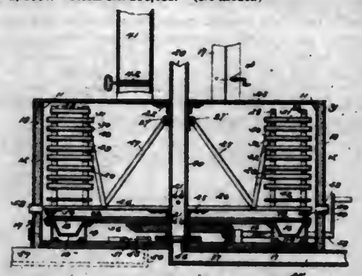
Claim.—In a machine for making balls or other similar articles, the combination of a longitudinally outwardly-curved grooved die having curved edges Q, and mounted on a disk secured to the shaft of the machine, with a longitudinally inwardly-curved grooved die having similar curved edges Q and mounted on the bed of the machine,

400,990.

substantially as described, each die having its longitudinal groove gradually enlarging and its edges curved, for the purposes set forth.

400,991. LATH-SAWING MACHINE. DAVID S. ABBOTT, Olean, N. Y. Filed July 31, 1888. Serial No. 281,525. (No model.)

Claim.—1. In a lath-sawing machine, the combination with a lower feed-shaft provided with a cogged pinion and hangers at each side of said shaft, of an upper parallel feed-shaft, a box supporting said upper shaft, provided with arms pivoted in said hangers, and a cog-wheel recessed to receive the body of said box, meshing with the cog of the lower shaft, substantially as shown and described.



2. In a lath-sawing machine, the combination, with a lower feed-shaft provided with a cogged wheel, vertical hangers at each side of the said shaft at its forward end, and a second parallel and upper shaft, of a box supporting the forward end of the upper shaft, provided with arms pivoted in the hangers, a recessed cog-wheel inclosing the body of the box, meshing with the cog of the lower shaft, a pivoted box supporting the inner end of the upper shaft, and a handle attached to said box, substantially as shown and described, whereby the upper shaft may be vertically adjusted without separating the cogs, as set forth.

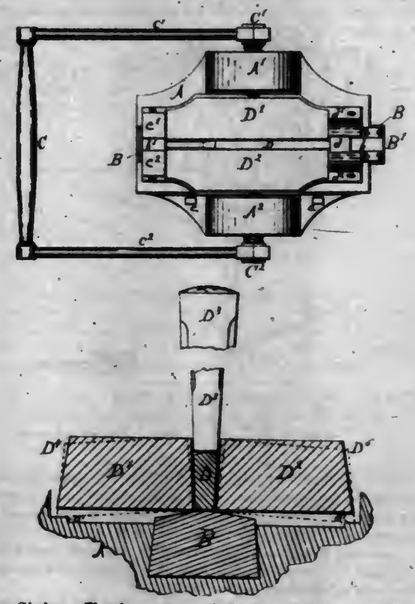
3. In a lath-sawing machine, the combination, with a feed-shaft and hangers at each side of the same, of a box supporting the shaft, provided with oppositely-projected arms pivoted in the hangers, and a cogged wheel secured upon said shaft, recessed to receive the body of the box, substantially as shown and described.

400,992. LINIMENT. JULIA A. AGNARD, Lodi, Cal. Filed Nov. 30, 1888. Serial No. 292,346. (No specimens.)

Claim.—The herein-described medical compound as a liniment, consisting of chloroform, ether, laudanum, gum-camphor, tincture arnica, tincture cayenne, beef-gall, fresh butter, alcohol, and water, in the proportions specified.

400,993. FRUIT-DRIER. FREDERICK ALTMAN, San José, Cal. Filed Dec. 2, 1887. Serial No. 256,783. (No model.)

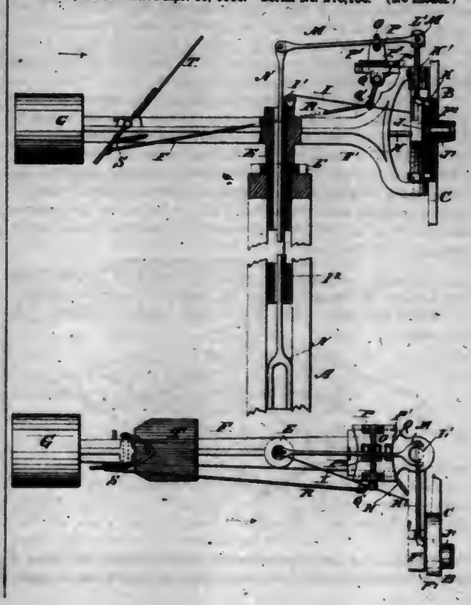
Claim.—1. In a fruit-drier, a drying-chamber having a ventilating-flue with a regulating-damper located at its top, a central vertical air-pipe extending from top to bottom of the drying-chamber and having apertures opening into the drying-chamber, the upper end of the central vertical air-pipe having an air-discharge outlet, an air-supply pipe having a regulating-valve and connecting with the lower end of the central vertical air-pipe, a furnace at one side of the drying-chamber, with a circular hot-air flue located in the drying-chamber, and a rotary fruit-tray rack located above the circular hot-air flue, substantially as described.



2. In a fruit-drier, a drying-chamber having a ventilating-flue with a regulating-damper located at its top, a central vertical air-pipe extending from top to bottom of the drying-chamber and having apertures opening into the drying-chamber, the upper end of the central vertical air-pipe having an air-discharge outlet, an air-supply pipe having a regulating-valve and connecting with the lower end of central vertical air-pipe, a pit, and carbonic-acid discharge-pipe located in the bottom of the drying-chamber, and having a regulating-valve with means for operating the same, a furnace located at one side of the drying-chamber, with a circular hot-air flue located in the drying-chamber, and rotary fruit-tray rack located above the circular hot-air flue, substantially as described.

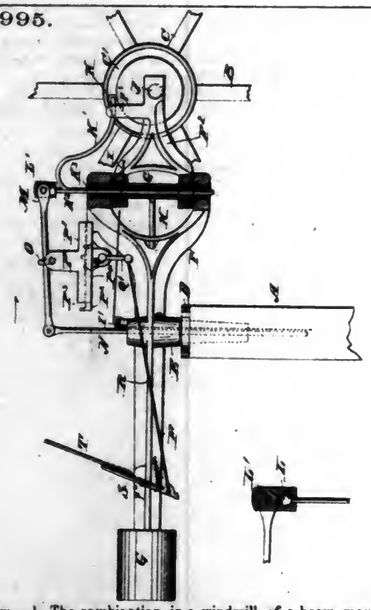
3. In a fruit-drier, a drying-chamber with air-supply openings in its walls, a central hollow shaft, 20, having air-supply apertures opening into the drying-chamber and an air-supply pipe at its lower end, a rotary frame mounted on the shaft 20 and having at its periphery fruit-tray racks, a furnace with a circular hot-air flue extending beneath the fruit-tray racks, and perforated plates extending between the hot-air flue and the fruit-tray racks, substantially as shown and described.

4. A fruit-drier consisting of a drying-chamber having air-supply openings 58 in its walls, a rotary vertical hollow shaft, 20, with air-supply perforations 21, an air-supply pipe, 20', at its lower end, and a valve, 56, with operating rod and handle 57, radial arms 26, secured to and braced on the shaft 20, and having at their outer ends casters 59, resting on a circular track, 60, and standards 28, with horizontal wires 29, forming racks for supporting fruit-trays, a ventilator-chimney, 41, with damper 42 at the top of the drying-chamber, a pit, 50, at the bottom of the drying-chamber, with door or valve 51, having operating rod and handle 53, and discharge-conduit 54, a furnace, 15, located adjacent to the drying-chamber, with a hot-air flue, 16, extending beneath fruit-tray racks and terminating in a stack, 17, with valve 40, located above the furnace 15, perforated plates 33, mounted at the bottom of the fruit-tray racks above the flue 16, and a mechanism, substantially as described, for rotating the shaft 20 and fruit-tray racks, substantially as shown and described.



5. A fruit-drying apparatus consisting of a drying-chamber having an air-escape chimney and damper at its top, an opening in its bottom, with a pit, valve, and conduit, a rotary circular open-work frame located in the drying-chamber, supporting a series of fruit-trays, and mounted on a vertical rotary hollow shaft having perforations for the admission of air, a damper at its lower end, and an air-pipe, a circular heating-flue extending beneath the series of drying-pans and connecting at one end to a furnace located at one side of the drying-chamber and at the other to a chimney located above the furnace and adjacent thereto, and a mechanism for rotating the hollow shaft and circular fruit-tray frame, substantially as described.

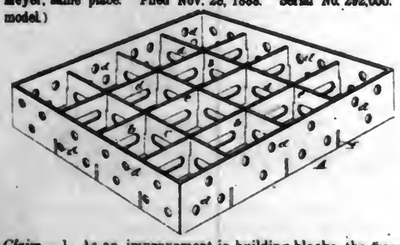
400,994. FITTING COMMUTATOR-BARS. FERDINAND BAILLEY, Schenectady, N. Y. Filed May 24, 1888. Serial No. 274,983. (No model.)



Claim.—That improvement in the art of finishing commutator-bars that have already been formed approximately, whether by the action of a drop-press or any other means producing substantially similar results, which consists in placing the blanks in a die the bottom and sides of which are constructed of the exact shape and dimensions which the finished bar is to have, and then hammering the upper exposed edge of the bar to reduce said bar to the right breadth, and at the same time to straighten the bar and also secure a hardened surface on the edge (so hammered) of the bar, substantially as described.

400,995. WINDMILL. EDGAR C. BEEBE and RILEY STONER, Glen Elder, Kans. Filed Apr. 10, 1888. Serial No. 270,180. (No model.)

400,995.



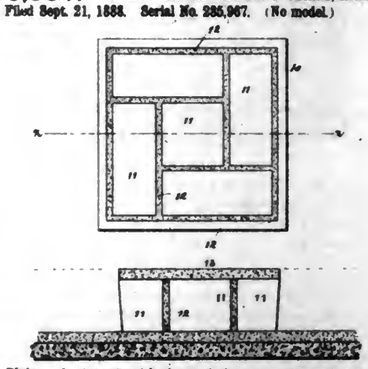
Claim.—1. The combination, in a windmill, of a beam mounted to swing in the horizontal plane, a bracket, a tubular pivot connecting the beam and bracket, a wind-wheel mounted on the bracket, a reciprocating yoke having a shank guided in the bore of the said pivot, operating mechanism, substantially as described, connecting the yoke and wind-wheel, a pitman, and connections between the same and the yoke, substantially as described.

2. The combination, in a windmill, of a hollow standard, a beam journaled on the standard, a bracket connected by a swing-joint to the beam, a wind-wheel mounted to turn on the bracket, an eccentric groove on the body of the wind-wheel, a reciprocating yoke carrying an arm provided with an anti-friction bearing adapted to travel in the eccentric groove, a lever fulcrumed on the beam, a universal joint connecting the yoke and lever, and a main pitman working in the hollow standard and beam-journal and in operative connection with the said lever, substantially as described.

3. The combination, in a windmill, of a standard, a horizontally-turning beam, a wind-wheel mounted to turn thereon, a pitman, a rocking lever in operative connection with the same, operating-connections, substantially as described, between the wind-wheel and rocking lever, a sliding carriage having a rocking bearing mounted upon it and through which bearing said rocking lever freely passes, a governor-vane, and connections, substantially as described, between said vane and the carriage, substantially as set forth.

4. In a windmill, the combination, with a beam adapted to swing in the horizontal plane, a wind-wheel mounted on the beam, a pitman, and a rocking lever in operative connection both with the wind-wheel and pitman, of a fulcrum for the rocking lever supported on an adjustable carriage provided with gear-teeth, a carriage-guide on the wind-beam, a rocking gear in engagement with the teeth of the carriage, a movable wind-pressed wing on the beam, and connections substantially as set forth, between the said wing and the rocking gear, substantially as described.

400,996. **FRAME FOR BUILDING-BLOCKS OR PAVING-TILES.** BENJAMIN W. BELDEN, St. Louis, Mo., assignor of one-half to Gustave J. Meyer, same place. Filed Nov. 28, 1888. Serial No. 292,055. (No model.)

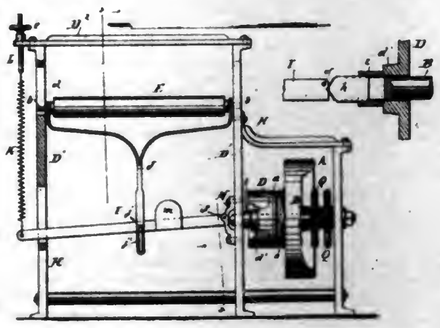


Claim.—1. As an improvement in building-blocks, the frame A, formed of thin strips of non-corrosive material, said frame consisting of an outer shell or casing, and parallel strips arranged at right angles to each other provided with apertures, said strips forming communicating compartments adapted to receive the plastic material, substantially as and for the purpose described.

2. As an improvement in building-blocks, the frame A, formed of suitable thin strips of non-corrosive material, said frame consisting of an outer shell and inner strips arranged parallel to and crossing each other at right angles, the walls of said shells and the strips provided with horizontally-arranged apertures and vertically-arranged slits, whereby said strips and shell may be interlocked, thereby forming compartments communicating with each other, said compartments adapted to receive the plastic material, substantially as and for the purpose described.

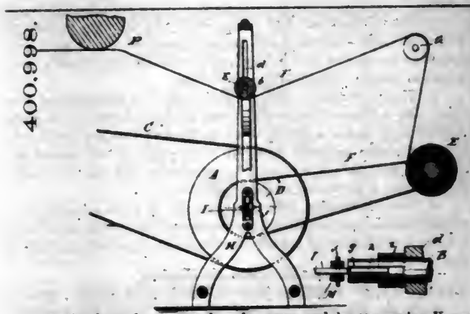
3. As a new article of manufacture, a block for building or paving purposes consisting of the frame A, formed of thin apertured strips arranged parallel and at right angles to each other and interlocked, as described, and a plastic composition disposed within said compartments and through the apertures in the walls thereof, all arranged substantially as shown, and for the purpose specified.

400,997. **PAVING-BLOCK.** ROBERT B. BERRIE, Lexington, Mo. Filed Sept. 21, 1888. Serial No. 285,967. (No model.)



Claim.—1. A paving-block consisting of a series of bricks grouped to form a rectangle, having the spaces between the said bricks filled with a cement grouting, the top covered with a cement mortar and the sides with a coat of coal-tar, with the exception of the top, substantially as shown and described.

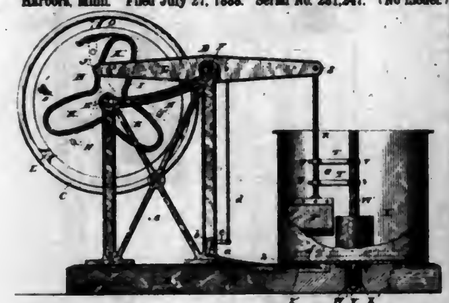
2. A paving-block consisting of a series of porous bricks arranged to form a predetermined shape, and the spaces between the same filled with a cement grouting, and the top of the said bricks covered with a cement mortar, substantially as shown and described.



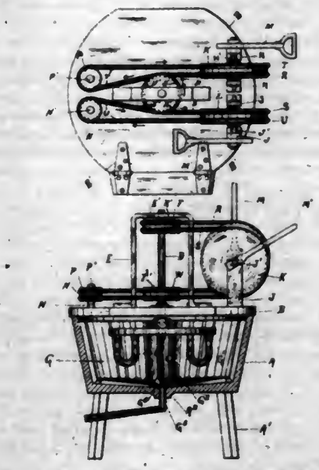
3. A paving-block consisting of a series of porous bricks arranged to form a predetermined shape, having the spaces between the same filled with a cement grouting, a cement mortar covering the upper faces of the bricks, and the said block being provided with a coat of coal-tar upon all sides with the exception of the top, substantially as shown and described.

400,998. **AUTOMATIC CLUTCH AND TENSION MACHINE.** JEREMIAH C. BILL, Willimantic, Conn. Filed June 8, 1888. Serial No. 276,489. (No model.)

Claim.—1. The automatic clutch and tension machine comprising pulleys A D, adapted to be clutched together, a tension weight or roller, E, supported on a lever, I, and intermediate mechanism placed between the lever I and pulley D, whereby vertical movement of the lever I will impart horizontal movement to the pulley D, substantially as described.



400,998.



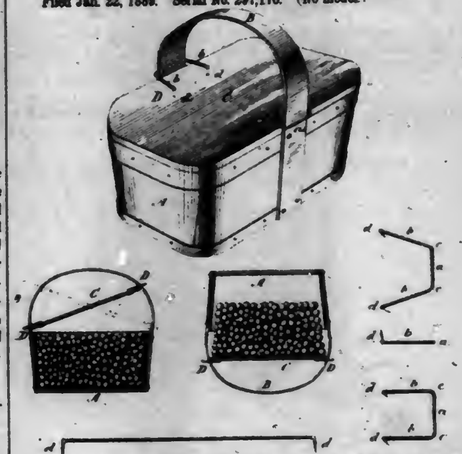
2. The lever I, supported at its outer end by the spring K and pivoted at its opposite end at *f*, in combination with the roller E, frame J, pulleys A D, plate Â, and ring *i*, the plate Â impinging against the end of the lever I below its pivot *f*, substantially as described.

400,999. **MEAT-CHOPPING MACHINE.** FRANK BLOOMQUIST, Two Harbors, Minn. Filed July 27, 1888. Serial No. 281,347. (No model.)

Claim.—In the herein-described meat-chopping machine, the combination of the frame, the trefoil wheel journaled thereto, the working-beam, also journaled to said frame, a pin secured to said working-beam and traveling in said trefoil, a bell-crank lever pivoted at the base of the frame, a rod connecting the bell-crank lever and the working-beam, a spring-pawl connected to said bell-crank lever and engaging the ratchet around the lower periphery of the meat-receptacle, a jointed rod connected to said working-beam and provided with a reciprocating knife, the upright shaft and guides, and a seat located beneath the floor of the meat-receptacle, all arranged and adapted to operate in the manner and for the purpose substantially as described.

401,000. **WASHING-MACHINE.** CARL BRANDTNER, Reading, Pa. Filed May 21, 1888. Serial No. 274,538. (No model.)

Claim.—1. The combination, with the main shaft provided with pulleys F and W, of drivers secured to independent shafts, idlers P and N, and a flexible driving-connection between said drivers and pulleys, whereby the simultaneous movement of said drivers in opposite directions is adapted to co-operate in rotating said main shaft, substantially as set forth.



2. The combination, with the main shaft provided with pulleys F and W, of drivers secured to independent shafts supported at right angles to said main shaft, idlers P and N, and separate ropes R and S and T and U, having one end of each fastened to said drivers and the opposite ends to said pulleys F and G, respectively, whereby the simultaneous movement of said drivers in opposite directions is adapted to co-operate in positively rotating said main shaft, substantially as set forth.

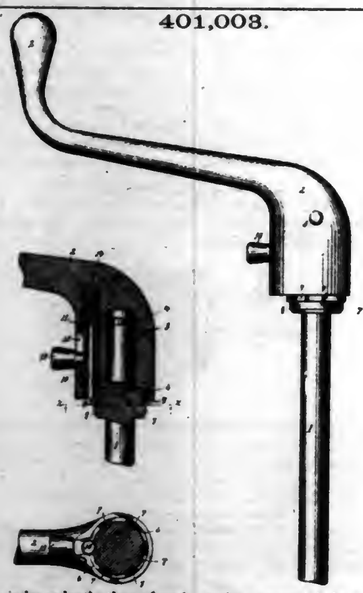
401,001. **FEED-BAG.** WILLIAM M. BROOKE, New York, N. Y., assignor of one-half to James J. Ebert, same place. Filed Oct. 27, 1888. Serial No. 289,273. (No model.)

Claim.—The herein-described feed-bag, consisting of the body 10, provided with the pocket 12, the apertured bottom 13, the grommets 14, near the top edge of the bag, the ropes 15 and 16, secured in the grommets, the rings 17, to which the ropes 15 and 16 are secured, and the ropes 18 and 19, secured to the rings 17, as specified.

401,002. **FRUIT-BASKET-COVER FASTENING.** FRANK BURNS, Westfield, N. Y., assignor of one-half to Elijah W. Holt, same place. Filed Jan. 22, 1889. Serial No. 297,170. (No model.)

Claim.—1. The combination, with a covered fruit-basket having a handle arched over its top, of a cover-fastening consisting of two staples driven into the cover on opposite sides, and each embracing the handle, whereby the cover is held in place on top of the basket, and it may be raised to inspect the contents thereof, and the lateral spreading of the basket is prevented.

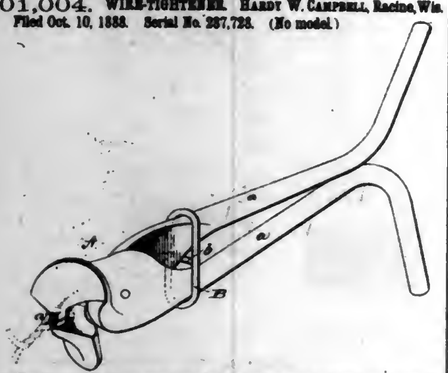
2. The combination, with a covered fruit-basket having a handle arched over its top, of a cover-fastening consisting of a staple applied to the top of the cover, with its ends bent down and driven into the cover, and its middle portion bent to embrace the handle.



3. The combination, with a covered fruit-basket having a flat handle arched over its top, of a cover-fastening consisting of two staples driven into the cover on opposite sides thereof, each staple formed with a straight middle portion, *a*, extending outside of the handle, side portions, *b b*, extending thence inwardly over the cover and confining the edges of the handle between them, and turned-down sharpened end portions, *d d*, driven into the cover, whereby the endwise displacement of the cover is prevented.

401,003. **BRAKE-HANDLE.** SAMUEL A. BURR, Bridgeport, Conn. Filed Feb. 4, 1889. Serial No. 298,553. (No model.)

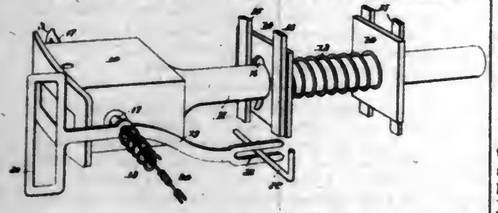
Claim.—1. In combination, a brake-staff having an enlargement provided with notches at its outer edge, said notches terminating abruptly in a flange, 8, a handle secured to said staff, but free to rotate thereon, and a bolt socketed in said handle and adapted to engage said notches, as and for the purpose set forth.



2. The brake-staff having an enlargement with notches 9 and flange 8, in combination with a handle secured to said staff, but free

401,003.

to rotate independently thereof, and a spring-actuated bolt socketed in said handle and adapted to engage said notches, said bolt being provided with a finger-piece for convenience in operation.

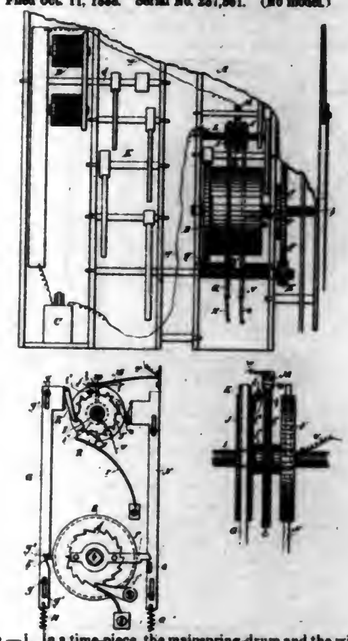


401,004. WIRE-TIGHTENER. HARDY W. CAMPBELL, Racine, Wis. Filed Oct. 10, 1888. Serial No. 287,723. (No model.)

Claim.—1. The herein-described device for twisting or tightening wire, consisting of a pair of levers bent at their upper ends and having the auger-bit-shaped jaws, and a projection upon the inner edge of each of said jaws adapting them to receive and retain the wire, substantially as described and shown.

2. The herein-described device for twisting or tightening wire, consisting of a pair of levers bent at their upper ends and having the auger-bit-shaped jaws, and a projection upon the inner edge of each of said jaws adapting them to receive and retain the wire, in combination with the ring B, substantially as described.

401,005. CAR-COUPLING. MANUEL M. CARMONA Y VALLE, Mexico, Mexico. Filed Dec. 1, 1888. Serial No. 292,581. (No model.)



Claim.—1. The combination, with a draw-head, of a coupling-pin, a spring arranged in connection with the pin, and a coupling-link pivotally connected to the pin, substantially as described.

2. The combination, with a draw-head, of a coupling-pin formed with a forwardly-extending and inwardly-inclined arm, a spring arranged in connection with the pin, and a coupling-link pivotally connected to the pin, substantially as described.

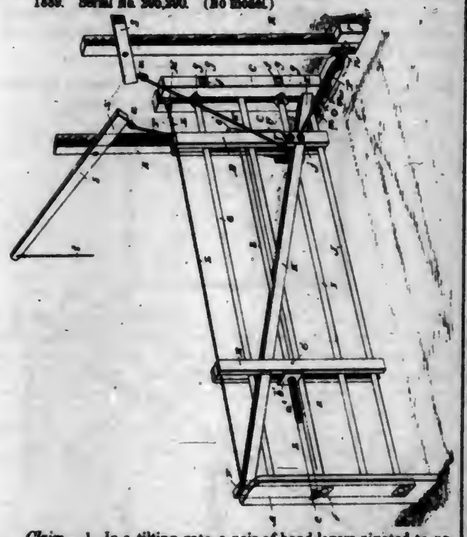
3. The combination, with a draw-head, of a coupling-pin provided with a forwardly-extending arm, auxiliary draw-bars through which the pin passes, a saddle by which the draw-bars are connected, a lever pivotally mounted upon the coupling-pin, a link carried by the lever, and springs arranged in connection with the lever and coupling-pin, substantially as described.

4. The combination, with a coupling-pin, of a link pivotally connected thereto, auxiliary draw-bars through which the pin passes, and a follower-plate through which the draw-bars pass, substantially as described.

401,006. ELECTRIC SELF-WINDING TIME-PIECE. MANUEL CARRANZA, Guatemala, Guatemala, and José M. TINOCO, San Francisco, Cal. Filed Oct. 11, 1888. Serial No. 287,861. (No model.)

Claim.—1. In a time-piece, the mainspring-drum and the winding-arbor, the electric motor connected with the winding-arbor, and an electric circuit, including the motor, in combination with the separable contacts forming the poles or electrodes of the circuit, a rotary wheel carrying one of the contacts, and a mechanism for operating the wheel, consisting of a ratchet-wheel having a lug, a fixed pin on the rotary wheel with which the lug of the ratchet-wheel is adapted to come in contact, a vertically-movable bar having a pawl for engaging and turning the ratchet-wheel, and the lug on the mainspring-drum for operating the movable bar, substantially as herein described.

2. In a time-piece, the mainspring-drum, the winding-arbor, and the holding ratchet-wheel thereon, an electric motor connected with the winding-arbor, and an electric circuit, including the motor, in combination with the separable contacts forming the poles or electrodes of the circuit, the rotary wheel carrying one of the contacts and having a fixed pin, the mechanism for moving the wheel to bring the contacts together and close the circuit, consisting of a ratchet-wheel, J, having a lug adapted to come in contact with the pin of the rotary wheel, the vertically-movable bar G, having the pawl engaging the teeth of the ratchet-wheel, and the lug on the mainspring-drum for operating the bar, and the mechanism for returning the rotary wheel to position and opening the circuit, consisting of the second ratchet-wheel, J', connected with the ratchet-wheel J, the vertically-movable bar N, having an arm, Q, and a pawl for engaging the ratchet-wheel J' and reversing both ratchet-wheels, and the arm P, secured to the holding-ratchet of the winding-arbor and adapted to engage and operate arm Q of the vertically-movable bar N, substantially as herein described.

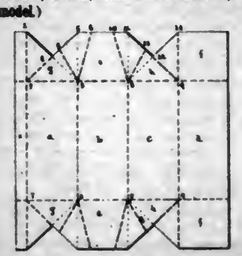


401,007. FASTENING FOR SHOES. PAUL CASPARY, Chicago, Ill. Filed Jan. 29, 1889. Serial No. 297,960. (No model.)

Claim.—A fastening for shoes, consisting of a continuous wire bent into substantially a V form, with a coil outside of or exterior to its meeting angle and comprising two arms or members, one of which is provided with hooks and the other with eyes, substantially as shown and described.

401,007.

401,008. GATE. CLARK CHIDESTER, Decatur, Ind. Filed Jan. 3, 1889. Serial No. 295,290. (No model.)



Claim.—1. In a tilting gate, a pair of hand-levers pivoted to upright standards, a bell-crank lever pivoted to the gate and consisting of a rod bent to form a yoke and extending on either side of the gate, and a spring-actuated bolt engaged by said yoke and operated thereby, in the manner and for the purpose described.

2. In a tilting gate, the combination of a pair of hand-levers pivoted to upright standards erected on either side of the gate, a bell-crank lever consisting of a U-shaped portion and a pair of short arms located on either side of the gate, a pair of rods connecting the hand-levers and the short arms of the bell-crank lever, and a spring-actuated bolt engaged by the U-shaped portion of said bell-crank lever and operated thereby, all arranged and adapted to operate as set forth.

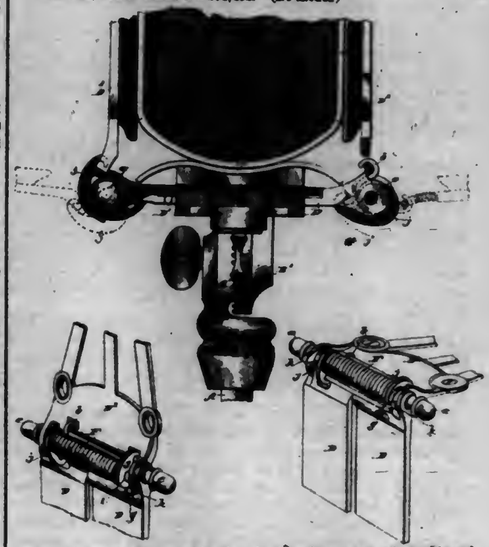
3. In a tilting gate, a bell-crank lever pivoted to the gate and consisting of a U-shaped portion and a pair of short arms extending on either side of the gate, in combination with a pair of hand-levers, a spring-actuated bolt, a projection upon the end of said bolt engaging the U-shaped portion of the bell-crank lever, and a slot in said bolt engaged by a pin which limits the play of the bolt, substantially as described.

401,009. PAPER BOX. DWIGHT S. CLARK, Cambridge, assignor to William H. Forbes, Boston, Mass. Filed Dec. 29, 1888. Serial No. 294,943. (No model.)

Claim.—1. A blank for an angular paper box, scored or indented for folding, so as to form the sides *a b c d*, and the pasting-strip *x*, the back and front flaps, *e* and *f*, and the side flaps, *g* and *h*, the last two being notched, as shown, and subdivided by the lines 7 2 and 3 4 in one, and 9 12 and 8 13 in the other, substantially as shown and described.

2. A blank for a rectangular paper box, scored or indented for folding, and consisting of four fields for the sides, a pasting-strip to unite the first and last sides, and four connected flaps at each end for closing the box, each set of four having a front flap to cover the whole cross-section of the box, a back flap having converging edges, and two notched side flaps, each divided by scored or indented lines into two triangular and one irregular four-sided figure, substantially as shown and described.

3. An angular paper box consisting of the sides *a*, *b*, *c*, and *d*, united to form a four-sided prism, and closed by ends constructed of the side flaps, *g* and *h*, folded upon themselves, the front flap, *f*, and the back flap, *e*, inserted between the front and side flaps, substantially as described.



4. An angular paper box consisting of the sides *a*, *b*, *c*, and *d*, united to form a four-sided prism, and closed by ends consisting, first, of the triangular fields 7 4 3 and 9 13 8, then the triangular fields 7 2 1 and 9 12 14, then the four-sided figures 3 4 5 6 and 8 13 11 10, then the pointed flap *e*, and upon that the square front flap, *f*, substantially as described.

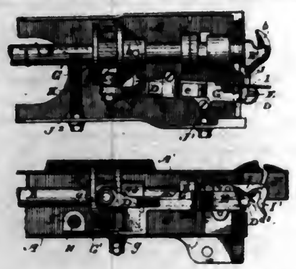
5. In the closed end of an angular paper box, the side flaps, *g* and *h*, notched by cutting through the lines 1 2 2 5 and 11 12 12 14, and subdivided each by indented lines into three fields folding on each other, in combination with the pointed entering flap *e* and the rectangular flap *f*, covering the whole end of the box, substantially as described.

401,010. PROCESS OF TOUGHENING FORGED ARTICLES OF STEEL. JOHN COFFIN, Johnstown, Pa., assignor to The Cambria Iron Company, same place. Filed Feb. 8, 1888. Serial No. 263,327. (No specimens.)

Claim.—The within-described process of toughening steel articles that have been forged, consisting in first forging the article, then immediately subjecting it to the cooling action of a bath of water or other cooling mixture or medium to partially cool its mass, and finally removing the article from the bath while it has sufficient contained heat in its body to show after diffusion a low red color in the dark.

401,011. BOOK-SUPPORT. JAMES W. COULTAS, Clinton, Ill. Filed Nov. 21, 1888. Serial No. 291,482. (No model.)

Claim.—1. The combination, in a book-support, of two hinged plates jointed together about a fixed axial line, a spiral spring arranged parallel and adjacent to that line and having one end attached to one hinged plate and the other end to the other hinged plate, and link-bars connected loosely to the opposite ends of the spring and opposite hinged plates, whereby the axis of the spring is thrown away from the axis of the hinge when the latter is opened and the hinge locked in open position, substantially as shown and described.



2. The combination, in a book-support, of two pairs of hinges, each having one leaf formed in two different planes and arranged to lap together reciprocally, and a clamp for fastening the same together, consisting of an upper plate, which forms a rest for the back of the book, a subjacent frame-plate, and set-screws holding the two together, substantially as shown and described.

401,012. CORN-HUSKING IMPLEMENT. JOHN L. CULBERSON, Hendrysburg, Ohio, assignor of two-thirds to Robert Boyd and Alexander Pryor, same place. Filed Nov. 16, 1888. Serial No. 291,018. (No model.)

Claim.—The corn-husker herein described, consisting of the main portion A, having a slot, as a^3, in its rear end, with obliquely-inclined end walls, its rear end being bent to form a ring, as a, and its forward end being bent up and serrated, of a series of upwardly-extending teeth, as b^3, on the portion A near its serrated end, an arm, as D, pivoted in the said slot, having a curved forward end with a serrated edge, and the spring E, secured to the outer end of portion A and impinging against the rear end of the arm, substantially as described.

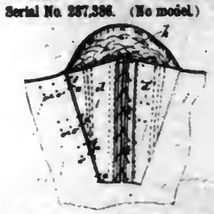
401,013. BAND-SECURING MECHANISM FOR GRAIN-BINDERS. JOHN S. DAVIS, Cleveland, assignor to the Davis Platform Binder Company, Rockport, Ohio. Filed Nov. 2, 1887. Serial No. 254,034. (No model.)

Claim.—1. The combination of the knotter, the reciprocating cord-holder and the laterally-moving guide-bracket in which it is mounted, a spring to press the bracket away from the knotter, an adjustable stop to limit its outward movement, and a fixed stop to limit its movement toward the knotter, substantially as and for the purpose hereinbefore set forth.

2. The combination of the guiding-horn I', the bar D, reciprocating across the recess under the horn, and the spring-actuated bar E, which follows the bar D partly across the recess, holding the cord end until it is freshly gripped between the bar D and the horn.

3. The combination of the guiding-horn I', the bar D, reciprocating across the recess under the horn and inclined at its front end to ride under the cord, the hooks or clamping-abutment d' d^3 on the upper surface of the bar, and the spring-actuated bar E, against the end of which the abutment bears to clamp the cord, substantially as set forth.

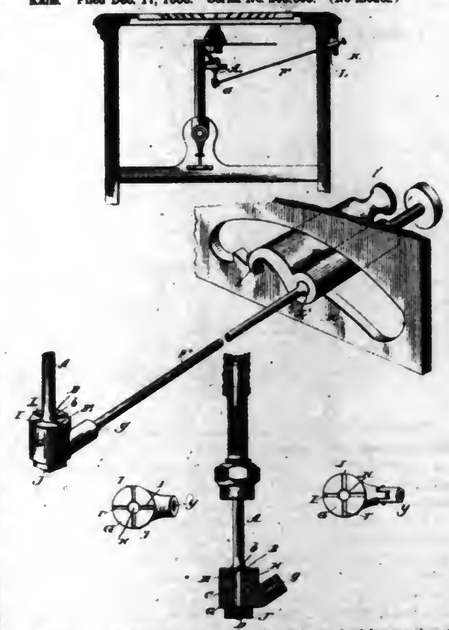
4. The combination of the guideway and its fixed horn I with the reciprocating bar D, inclined and rounded at its front end and formed with projecting hooks or abutments on its upper side and a recess or throat on its lower side, substantially as hereinbefore set forth.



5. The combination of the bar D, inclined and formed with a clamping hooked projection on its front end, the clear groove d, dividing said hook into two separate parts, the spring-actuated bar E, formed with a tongue, E', on its front end that slips into the groove, and having the shoulders at each side of the tongue shaped to fit into clamping-hooks on the bar D, substantially as hereinbefore set forth.

6. The combination of the knotter, a laterally-moving guideway, a cord-holder consisting of bars D and E mounted therein, the horn I', and shear i^3, mounted on the guideway, which is adapted to be drawn toward the knotter by the cord held in the grasp of the holder with a spring, H, which urges the holder away from the knotter, and means by which its force may be adjusted, substantially as and for the purpose hereinbefore set forth.

401,014. INSULATING AND COATING COMPOUND. ANTOINE DE FIGANIÈRE, Philadelphia, Pa.; Gibson Peacock, committee of said de Figanière (lunatic.) Filed Aug. 12, 1886. Renewed Nov. 10, 1888. Serial No. 290,473. (No specimens.)



Claim.—The hard, fusible insulating and coating composition of matter herein described, consisting of pulverized coal, lime, and coal-tar pitch, in about the proportions specified.

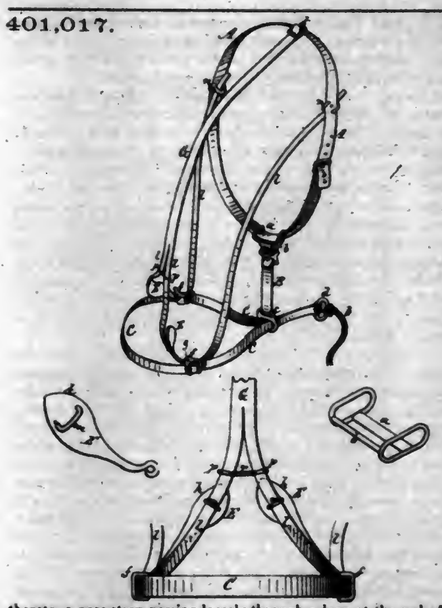
401,015. CORSET. FANNIE E. DENKEL, Glen Ullin, Dak. Filed Oct. 6, 1888. Serial No. 287,386. (No model.)

Claim.—The combination, with a corset and its bust-section, of double flaps disposed inside the bust-section and secured thereto, and a series of rows of lacing-holes diverging or radiating from a common point at the base of the bust-section upwardly to the top thereof, whereby the bust of the corset is given more or less prominence, substantially as set forth.

401,016. GASOLINE-STOVE. WILLIAM P. DURHAM, Belleville, Kans. Filed Dec. 17, 1888. Serial No. 293,893. (No model.)

Claim.—1. A gasoline-stove valve-shaft formed with a portion, C, and an opening, b, combined with the lever-connecting piece having an opening fitted to receive portion C, and provided in its face with a groove or grooves registering with opening b, and the pin E, fitting in said grooves and opening, substantially as set forth.

2. In a gasoline-stove, the combination of the rack K, the valve shaft, the lever whereby to turn said shaft, and the pawl pivoted on the lever arranged to engage the rack, and having a handle-like portion extended adjacent to the handle of the lever, substantially as set forth.



3. The improvement in gasoline-stoves herein described, consisting of the valve-shaft having shoulder B, opening b, non-circular portion C, and threaded part D, the connection-piece G, having socket g, opening H, and grooves I, and having opening H formed to receive portion C of the shaft, the nut-securing piece G on such portion, the pin E, fitted in groove I and opening b, the pawl L, pivoted on the lever-arm near its outer end and having a handle portion, l', and the rack arranged for engagement by said pawl, substantially as set forth.

401,017. HALTER. JAMES DUNN, Brockport, N. Y. Filed July 28, 1888. Serial No. 281,260. (No model.)

Claim.—1. In a halter, the combination of a neck-strap, a hanger attached thereto, a nose-strap passing loosely through a loop at the end of the hanger, and a front strap attached to the top of the neck-strap, thence extending down to the nose-strap, and thence passing up again at the lower ends to the sides of the neck-strap and attached thereto, as herein shown and described.

2. In a halter, the combination of a neck-strap, a hanger attached

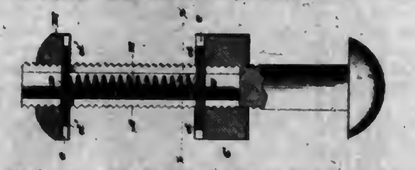
401,017.

thereto, a nose-strap passing loosely through a loop at the end of the hanger, a front strap attached to the top of the neck-strap, extending down to the nose-strap, branched at the lower end, the branches extending through loops attached to the nose-strap, and extending upward and attached to the neck-strap, and pads pivoted to the nose-strap and connected with the branches of the front strap and bearing against the nose, as herein shown and described.

401,018. FRICTIONAL GEARING. GEORGE F. EVANS, Somerville, Mass. Filed July 26, 1888. Serial No. 281,064. (No model.)

Claim.—1. The device for transmitting motion between two lines of shafting not parallel, substantially as described, composed of two shafts, two beveled frictional gears mounted on their adjacent ends, and a loose endless band encircling one of said gears and adapted to pass between and be gripped by said gears, as specified.

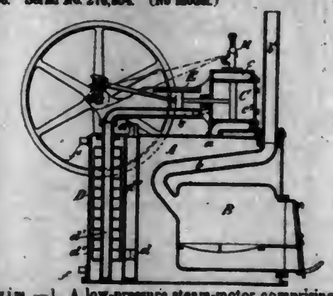
2. In frictional gearing by which motion is transmitted between two shafts not in parallelism, the combination, with two beveled frictional gears and their supporting-shafts, of a loose endless band encircling one gear and adapted to be gripped by both, and means for adjusting one of said gears to control the pressure upon the band, substantially as and for the purposes herein set forth.



3. In frictional gearing of the class described, the combination, with two beveled gears, one of which is flanged, and the shafts upon which they are mounted, of the loose endless band encircling one of said gears and gripped by the adjacent surfaces of the latter, and adjusting mechanism by which the gears are caused to approach or separate, substantially as described.

4. In a device for transmitting motion between shafts not in parallelism, the shaft 2, its frictional beveled gear 4, the shaft 3, having endwise motion, and the frictional gears 5 10, oppositely disposed thereon and positioned diametrically of said gear 4, combined with two endless bands which loosely encircle said gears 5 10 and co-operate with the gear 4, substantially as set forth and stated.

5. In frictional gearing of the class described, the mechanism for transmitting motion and for reversing the motion transmitted, as described, composed of a shaft which carries a frictional gear provided with a re-entering active surface, a shaft having endwise movement carrying a gear formed with two reversely-conical surfaces, and two adjustable endless bands which operate independently upon said conical surfaces and are gripped between the latter and the re-entering surface of the co-operating gear, substantially as herein set forth.



6. In mechanism for transmitting motion from one shaft to another not parallel with the first, a shaft provided with a beveled frictional gear, and a second shaft furnished with conical gears oppositely disposed thereon, combined with two endless bands loosely encircling said conical gears and gripped between said gears and the beveled gear upon diametrically-opposite portions of the latter to render the driven shaft revoluble in either direction, as herein specified.

401,019. NUT-LOCK. LEWIS W. EVANS, Upper Tygart, Ky. Filed Nov. 30, 1887. Serial No. 256,570. (No model.)

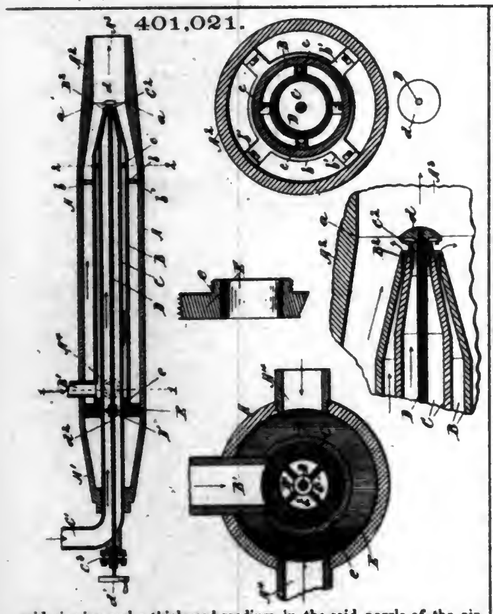
Claim.—The combination, with a bolt, A, having the end opposite the head hollow and slotted, nuts C and E, provided with recesses, plates D and D', adapted to engage with said recesses, and a spring, B, located within the hollow portion of the bolt to bear upon said plates, substantially as shown, and for the purpose set forth.

401,020. LOW-PRESSURE STEAM-MOTOR. RICHARD K. EVANS, Whiston Grange, Rotherham, County of York, England. Filed June 12, 1888. Serial No. 276,854. (No model.)

Claim.—1. A low-pressure steam-motor comprising a boiler, a surface-condenser secured to the boiler, a steam-engine secured on top of the boiler and condenser and having its steam and exhaust apertures connected directly with said boiler and condenser, respectively, an air-pump driven by said engine and forcing the condensed water into the upper part of the condenser-jacket, and a feed-water pipe provided with an automatic regulator and connecting the upper part of said condenser-jacket with the boiler, whereby the steam is caused to go through a constantly-recurring cycle of changes within the motor, substantially as set forth.

2. In a low-pressure steam-motor, the combination, with a boiler, of a steam-jacketed cylinder and connection, valve-chest, guides, bearings, and exhaust-passage cast in one, an upright surface-condenser, an air pump with a delivery-pipe, p, to upper part of condenser, a feed-pipe, S, from top of condenser to steam-space of boiler, automatic feed-regulating float t, suspended lever and weight w, and valve v, all arranged substantially as herein described.

3. In a low-pressure steam-motor, the combination, with a boiler carrying on its top a steam-jacketed cylinder fitted and cast in one with the piston-rod guides and crank-shaft bearings, and an upright condenser arranged as specified, of steam-pipe with regulating and equilibrium valves placed in the steam-jacket of the cylinder, and a governor actuating the latter, all arranged as set forth.

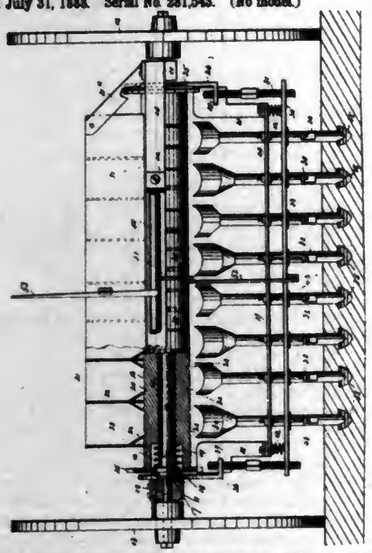


401,021. HYDROCARBON-BURNER. ERNEST W. FELLOWES, South Chicago, Ill., assignor to Ernest T. Fellowes, New York, N. Y. Filed Mar. 26, 1888. Serial No. 268,578. (No model.)

Claim.—1. In a hydrocarbon-burner, the combination of the partition E, screw-threaded on its periphery and having an aperture therein, the sections of pipe A A', having their ends internally screw-threaded and meeting upon said partition, a screw-threaded boss surrounding the aperture in said partition, the steam pipe B, screwed upon said boss, and the oil-pipe fitted hermetically within the said aperture and located concentrically within the pipe B, as set forth.

2. In a hydrocarbon-burner, the combination, with the perforated partition having peripheral screw-threads, of the cylindrical section of pipe A, having its ends interiorly and exteriorly screw-threaded respectively, the conical section A^3, screwed upon one end of section A, and the other end of section A and an interiorly-threaded section, A', having their ends meeting upon said partition, the oil-pipe passing through said partition, a screw-threaded boss on said partition surrounding said oil-pipe, and the steam-pipe screwed upon said boss, as set forth.

3. In a hydrocarbon-burner, the combination, with the concentrically-arranged air, steam, and oil pipes, of a converging nozzle on



401,021.

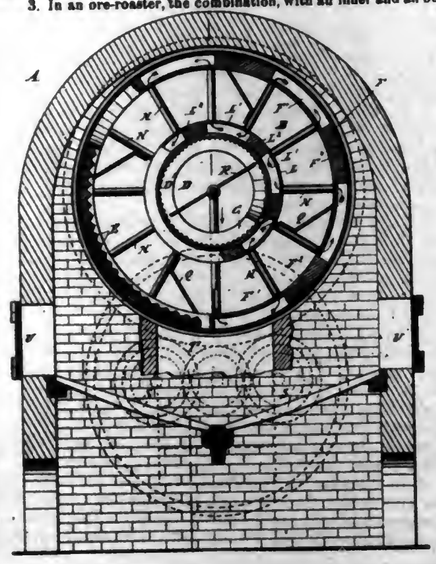
said air-pipe and a thickened medium in the said nozzle of the air-pipe, located even with the outlets of the steam and oil pipes, substantially as set forth.

4. In a hydrocarbon-burner, the combination, with the steam and oil pipes arranged concentrically one within the other, of a stuffing-box on the end of the oil-pipe, a rod passing through said stuffing-box and oil-pipe, and having a screw-threaded portion and carrying the shield *d* at one end, a screw-threaded nut on said rod, having screw-threaded sockets, screws d^5, passing through the oil-pipe into said sockets, and the partition E, arranged over the heads of said screws d^5, for retaining them in place, as set forth.

401,022. GRAIN-DRILL. CHARLES J. FENDEL, Butte City, Mont. Filed July 31, 1888. Serial No. 281,543. (No model.)

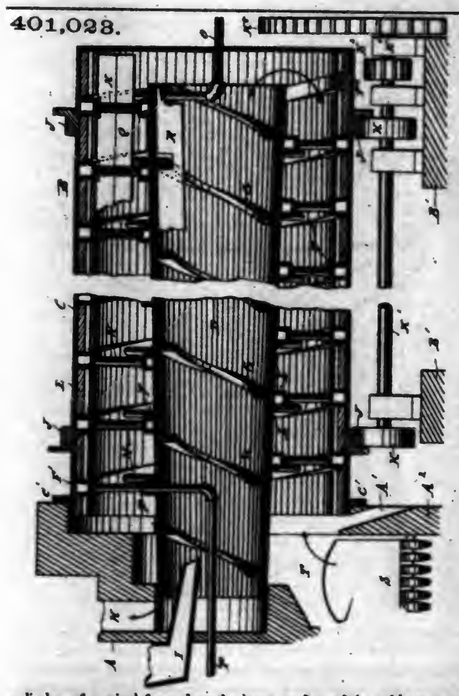
Claim.—1. In a grain-drill, the combination, with a cylinder provided with a fixed number of circumferentially-grouped pockets arranged a set distance apart, and a sleeve passing longitudinally through said cylinder having teeth produced in the extremities, of an axle passing through said sleeve, a spring-actuated clutch-section splined upon said axle engaging the toothed surface of the sleeve, drive-wheels secured to the axle of as many times greater diameter than said cylinder as the desired distance between the seed when dropped is times greater than the distance between the pockets, brackets pivoted to the bearings of the said axle engaging the movable clutch-section, and drills supported from said brackets beneath the several groups of pockets, substantially as shown and described.

2. In a grain-drill, the combination, with a cylinder provided with a number of circumferentially-grouped pockets arranged a set distance apart, a sleeve longitudinally fitted in said cylinder having toothed extremities, a hopper supported above the cylinder, partitions dividing said hopper into a series of chambers, embracing two of said groups of pockets, said chambers having inclined bottoms, and toothed wheels secured to the extremities of said cylinder, of an axle passing through the sleeve of the cylinder, a spring-actuated clutch splined upon said axle, brackets journaled in the bearings of the axle, a lip engaging said clutch, a platform adjustably suspended from said brackets, drills alternately secured in said platform, and a spring-actuated frame engaging the toothed wheels of the cylinder and adjustably attached to the dropping mechanism of the drill, substantially as shown and described.



3. In a grain-drill, the combination, with a cylinder provided with a number of circumferentially-grouped pockets arranged a set distance apart, a sleeve longitudinally fitted in said cylinder having toothed extremities, a hopper supported above the cylinder, partitions dividing said hopper into a series of chambers embracing two of said groups of pockets, said chambers having inclined bottoms, and toothed wheels secured to the extremities of said cylinder, of an axle passing through the sleeve of the cylinder, a spring-actuated clutch-section splined upon said axle, brackets journaled in the bearings of the axle having a lip engaging said clutch, a platform adjustably suspended from said brackets, drills alternately secured in said platform, a spring-actuated frame engaging the toothed wheels of the cylinder and adjustably attached to the dropping mechanism of the drill, a frame supported upon the axle surrounding the cylinder, arms projected from said frame, a rock-shaft journaled in said arms, a connection between said rock-shaft and drill-carrying frame, and a lever projected from said rock-shaft, substantially as shown and described, whereby the drill-carrying frame may be elevated or depressed, as desired.

401,023. ORE-ROASTER. CHARLES J. FENDEL, Anaconda, Mont. Filed Oct. 11, 1888. Serial No. 287,790. (No model.)

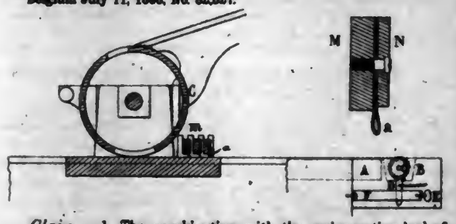


Claim.—1. The combination, in an ore-roaster, with the outer cylinder and the inner cylinder extending therethrough, of the tubes connecting said cylinders, and series of imperforate passages on both cylinders, the tubes alternately connecting the forward end of a passage on one cylinder with the rear end of a passage on the other cylinder and the forward end of the latter passage with the rear end of the next passage on the first-named cylinder, whereby a continuous serpentine passage is formed, substantially as set forth.

2. In an ore-roaster, the combination, with an inner and an outer cylinder, of a spiral formed on the inner surface of the said outer cylinder and made of alternate hollow and solid sections, a second spiral formed on the outer surface of the inner cylinder and also made of hollow and solid sections, and hollow spokes connecting the hollow sections of one spiral with the hollow sections of the other spiral, substantially as shown and described.

3. In an ore-roaster, the combination, with an inner and an outer

401,028.

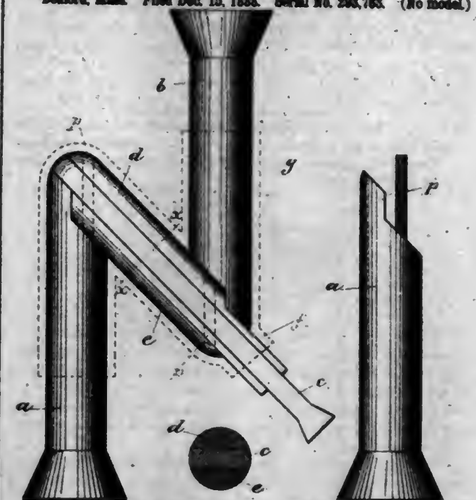


cylinder, of a spiral formed on the inner surface of the said outer cylinder and made of alternate hollow and solid sections, a second spiral formed on the outer surface of the inner cylinder and also made of hollow and solid sections, hollow spokes connecting the hollow sections of one spiral with the hollow sections of the other spiral, a water-supply pipe leading to one of the outermost spokes, and a discharge-pipe leading from the last hollow section of one of the spirals to the outside of the roaster, substantially as shown and described.

401,024. YELLOW DYE. EUGEN FRANK, Elberfeld, Prussia, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed July 15, 1884. Serial No. 137,789. (Specimens.) Patented in Germany June 14, 1884, No. 31,658, and in England July 1, 1884, No. 9,008.

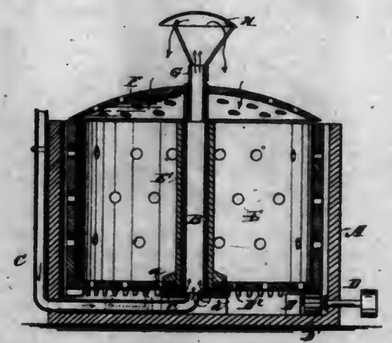
Claim.—The coloring-matter herein described, which is produced by the action of tetrazo-ditolyl upon salicylic acid, and which is a brown-red powder, forming a yellow solution when dissolved in hot soap-water, and which forms a brown coloring-matter with alkali and with concentrated sulphuric acid produces a dark violet color and dyes unmordanted cotton a yellow color fast to soap solution and sunlight, substantially as described.

401,025. DAMPING APPARATUS FOR LITHOGRAPHIC AND ZINCOGRAPHIC PRESSES. ALBERT GENET, Paris, France, assignor to Jules Michaud, same place. Filed May 26, 1888. Serial No. 275,345. (No model.) Patented in France Apr. 4, 1887, No. 182,680; in Germany Apr. 19, 1888, No. 44,859; in England May 7, 1888, No. 6,781, and in Belgium July 11, 1888, No. 82,567.



Claim.—1. The combination, with the reciprocating bed of a lithographic or zincographic press, of a rectilinear damper fixed to the frame of the press and composed of flexible material, a dampingtable attached to said bed, and a water-supply roller, also attached to said bed, whereby as the bed reciprocates the roller and table will be passed in contact with the fixed damper, substantially as described.

2. The combination, with the reciprocating bed of a lithographic or zincographic press, of a fixed damper composed of flexible material and a water-supply roller attached to said bed, whereby as the bed reciprocates the roller is caused to travel under and come into contact with the damper, substantially as set forth.



3. The combination, with the damper or dampers *a*, of the roller C, which is caused to rotate in a trough, B, containing water, and is carried by the traveling bed of the machine, so as to automatically supply the dampers *a* with the necessary amount of water for damping the stones or plates of lithographic or zincographic printing-presses, the amount of water being capable of being regulated at will by varying the extent of rotation of such roller, substantially as specified.

401,026. CORE FOR CASTING S-TRAPS. JOHN I. GIFFORD, New Bedford, Mass. Filed Dec. 15, 1888. Serial No. 293,763. (No model.)

Claim.—A metallic core for casting an S-trap, consisting of the end sections, *a* and *b*, provided with pins *p*, passing through the central part of the core to hold it in position, said central portion being divided longitudinally into the sections *c*, *d*, and *e*, all as shown and described.

401,027. DYEING-VAT. JAMES W. GREAVES, Providence, R. I., assignor of one-half to William R. Arnold, same place. Filed May 25, 1888. Serial No. 275,102. (No model.)

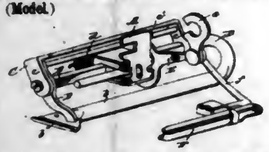
Claim.—1. The vat A, central pipe, B, held in the vat, and the perforated basket E, placed upon the said pipe B and of less depth than the length of the pipe, in combination with the steam-pressure pipe C, entering the vat, and the pipe B, substantially as described.

2. The vat A and perforated revolving basket E, placed therein, in combination with a steam-pressure pipe, C, and vertical pipe B, perforated spreader F, placed over the basket, and the spreader H, held above the top of the pipe B, substantially as described.

401,028. BOSOM-FORM. JACOB W. GREBER, Chillicothe, Mo. Filed Oct. 30, 1888. Serial No. 289,544. (No model.)

Claim.—1. In a breast-form and suction-cup, the combination of a compressible spring-frame, substantially as described, constructed to rebound when forcibly compressed and released, and an elastic rub-

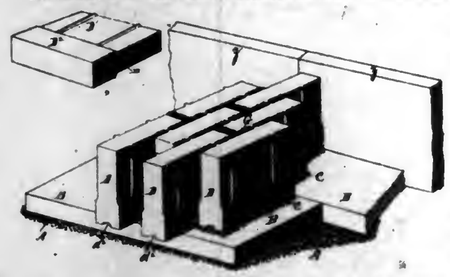
401,028.



ber cup inclosing said frame capable of holding itself in place by suction against the part to which it is applied, for the purpose described

2. A bosom-form and suction-cup consisting of an elastic rubber cup having a series of integral stiffening-braces, substantially as described, said braces extending along one face of the cup from a point near its open end to the apex thereof, for the purpose specified.

3. A bosom-form and suction-cup consisting of an elastic cup made of a single thickness of rubber and stiffening-braces extending radially from the open end of the cup toward the apex thereof, said braces being composed of inner wire springs and integral ribs inclosing the springs, substantially as and for the purpose described.

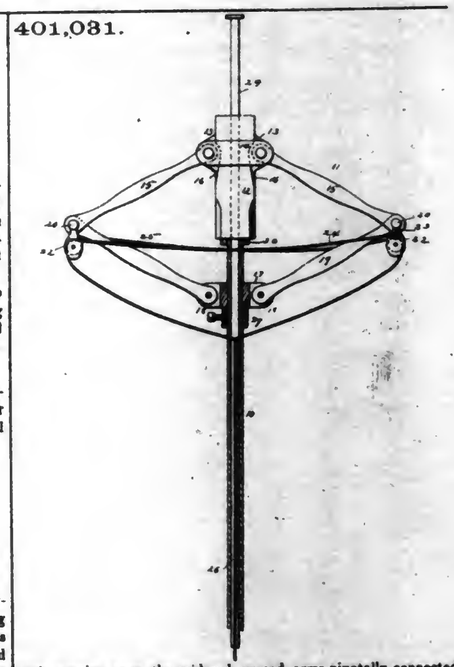


401,029. **TUCK CREASER OR MARKER FOR SEWING-MACHINES.** JOHN M. GRIMM, Bergen Point, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Nov. 8, 1888. Serial No. 290,273. (Model.)

Claim.—1. In a tuck creasing or marking attachment for sewing-machines, the combination, with a rigid rocking bar extending lengthwise of the attachment and oscillating at right angles to its length and means for supporting and operating said bar, of a rigid creasing-arm, a spring forming a yielding connection between said arm and rocking bar, and a lower creasing lip or device co-operating with said creasing-arm.

2. In a tuck creaser or marker, the combination, with the supporting-bar B, having a return-bend provided at its forward end with a creasing-lip, of the rocking bar C, pivoted on said bar B and oscillating at right angles to its length, the rigid arm or lever D, the spring-rod *d*, connecting said rocking bar with the said arm or lever, and the operating-lever E.

401,030. **PAVEMENT AND PAVING-BRICK.** DAVID HARGER, Des Moines, Iowa. Filed Dec. 21, 1888. Serial No. 294,279. (No model.)



Claim.—A pavement or roadway consisting of a foundation of sand or the like, a tile or brick laid upon said sand, a second layer of sand, and a brick or block set upon said second layer in an upright position, said brick or block having a longitudinal groove in its bottom and an enlarged base projecting on each side, a reduced upper portion being provided with vertical projections or ribs on each side of the brick for equalizing the spaces between the bricks or blocks when set, said spaces being filled with sand or like material, as set forth.

401,031. **DRIVE APPARATUS FOR PILES, &c.** THOMAS J. HARRIMAN, New Paris, Ind. Filed July 14, 1888. Serial No. 279,939. (No model.)

Claim.—1. The combination, with a tube, post, pile, or similar article and a perpendicular guide, of a hammer reciprocating upon said guide, spaced arms pivoted to opposite sides of said hammer, a single arm pivotally connected between the extremities of the upper or spaced arms, a reciprocating guide bar or cap pivoted to the lower ends of the said single arms, and means, substantially as shown and described, for extending the pivoted arms, whereby the hammer is reciprocated upon the guide-rod, as and for the purpose specified.

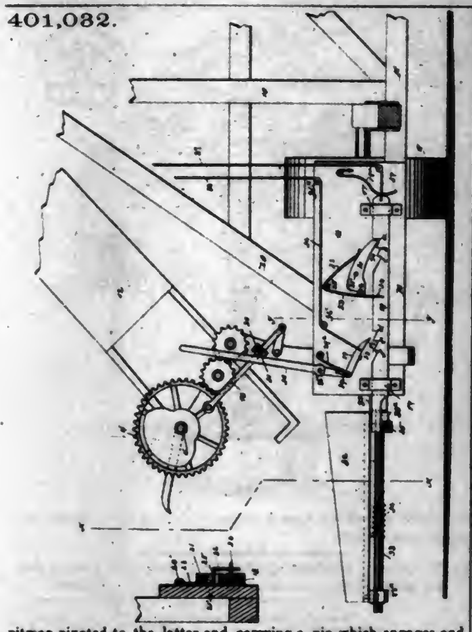
2. The combination, with a perpendicular guide-rod, of a hammer

401,031.

reciprocating upon the said rod, spaced arms pivotally connected to opposite sides of said hammer, single lower arms pivoted between the outer extremities of the spaced arms, a guide bar or cap pivoted to the lower ends of the single arms, and means, substantially as shown and described, for contracting and extending the arms, as and for the purpose specified.

3. The combination, with a perpendicular guide-rod, of a hammer reciprocating upon said rod, spaced arms pivoted to opposite sides of said hammer, lower single arms pivoted between the outer extremities of the said spaced arms, a guide bar or cap pivoted to the lower ends of the said single arms, blocks and eyes secured to the pivotal connection of the upper and lower arms upon opposite sides at opposite ends, and a rope or chain secured to said eyes and passing over said blocks, substantially as shown and described, and for the purpose specified.

4. The combination, with a tube, post, or pile and a perpendicular guide-rod, of a hammer reciprocating upon said guide-rod, spaced arms pivoted to opposite sides of said hammer, lower single arms pivoted between said spaced arms, a sliding block or cap connecting the lower extremities of the single arms, blocks and eyes secured, respectively, to the pivotal connection of the arms upon opposite sides at opposite ends, ropes secured to said eyes passing over said blocks, and means, substantially as shown and described, for clamping the said pile, post, or tube, as and for the purpose specified.



5. The combination, with a reciprocating hammer, spaced arms pivoted to opposite sides of said hammer, and single arms pivoted between said spaced arms, of a cap uniting the said single or lower arms, a perpendicular guide-rod secured to said cap, adapted to pass through the hammer, and means, substantially as shown and described, for securing a post, pile, or tube to said cap, and for reciprocating the hammer, as and for the purpose specified.

401,032. **BUNDLE-CARRIER.** FRED HECKMANN, Philothea, Ohio. Filed Aug. 23, 1888. Serial No. 283,576. (No model.)

Claim.—1. The combination, with the tilting bundle-carrier and a latch secured to the under side of the same, of a sliding bar adapted to engage said latch, provided with two groups of notches in its upper edge, a pawl engaging one group of notches, a spring pressing on one end of said pawl and engaging its other end when the pawl is tilted upward, a dog engaging the other group of notches, and a pivoted lever for operating said dog, substantially as shown and described.

2. The combination, with the tilting bundle-carrier and a latch secured to the under side of the same, of a sliding bar adapted to engage said latch, provided with two groups of notches in its upper edge, a pawl engaging one group of notches, a spring pressing on one end of said pawl and engaging its other end when the pawl is tilted upward, a dog engaging the other group of notches, and a pivoted lever for operating said dog, the knotter-shaft and its gear, and the

401,032.

pitman pivoted to the latter and carrying a pin which engages and trips the aforesaid lever, substantially as shown and described.

3. The combination, with a tilting bundle-carrier and a spring-actuated latch secured to the under side of the same, of a sliding bar engaging said latch and provided with an inner and outer group of notches in the upper edge, a pawl engaging the inner group of notches and provided with a shoulder at the outer end, a spring bearing upon the said pawl and provided at its outer end with a horizontal projection to engage the said shoulder, a pin attached to the bar and engaging the outer end of the said spring, a dog pivoted above and engaging the outer group of notches, and means connected with the binder, substantially as shown and described, for operating the said dog, as and for the purpose specified.

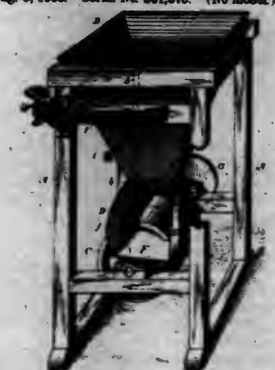
4. The combination, with a tilting bundle-carrier, a latch secured to the under side of the same, and a horizontal sliding bar on the harvester engaging with the said latch and provided with an inner and an outer group of notches in the upper edge, the inner group being lower than the outer, of a pawl pivoted above the inner group of notches provided with a shoulder at the outer end, a spring, its upper end bearing upon the upper surface of the inner end of the pawl, passing downward to the outer end of the pawl, and provided with a horizontal projection adapted to engage the shoulder of the pawl, a pin in the bar bearing against the inner surface of the lower end of the spring, a lever pivoted above the outer group of notches, a spring-dog pivoted to the extremity of the said lever, and a sleeve carrying a forwardly-extending pin engaging the said lever, which sleeve is attached to the pitman connecting the needle and knotter shafts of the binder, substantially as and for the purpose specified.

5. The combination, with the knotter-shaft, of a binder, the needle-shaft, the pitman-connection between the two shafts, a sleeve adjustably mounted upon the pitman carrying a forwardly-extending pin, a tilting bundle-carrier below the binding mechanism, and a (spring-actuated) latch secured to the under face of the said carrier, of a sliding bar engaging the latch of the carrier and provided with an outer and inner group of notches in the upper edge, a pawl pivoted above the inner group of notches, a lever fulcrumed above the outer group of notches, a dog pivoted to the lower end of the said lever, and means, substantially as shown and described, for elevating the pawl out of engagement with the inner group of notches, as and for the purpose specified.

401,033. **TIME-STAMP.** BENJAMIN B. HILL, Philadelphia, Pa. Filed Feb. 16, 1887. Serial No. 227,812. (No model.)

Claim.—1. The combination, with the fixed inscription-plate of a hand-stamp and a handle connected with said plate for pressing the same upon the paper, of multiple time-indicating printing-disks, wheel-work connecting them together and moving them simultaneously, and a shaft attached to one of the wheels provided with a knob for turning the same, substantially as described.

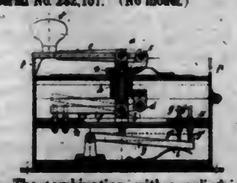
2. The combination, with the fixed inscription-plate and the handle



401,033.

of a hand-stamp constructed to be pressed downward on the upper surface of the paper to be impressed, of multiple time-indicating printing-disks, wheel-work connecting said printing-disks to cause them to move simultaneously, a cover for said wheel-work, and a shaft extending through said cover and connected with said wheel-work, and having on its upper end means, as the milled head Q, for turning said shaft, substantially as described.

3. The combination, with the fixed inscription-plate and handle of a hand-stamp, of multiple time-indicating printing-disks, wheel-work connecting them together, a back plate covering said wheel-work and carrying the handle of the stamp, and a shaft attached to one of the wheels rising through the back plate and handle and provided with a knob for turning the same, substantially as described.



401,034. **ORE-FEEDER.** GEORGE JOHNSTON, San Francisco, Cal. Filed Aug. 3, 1888. Serial No. 281,875. (No model.)

Claim.—1. In an ore-feeder, the combination of the hopper, the horizontal rotary cylinder mounted under the mouth of the hopper, with its axis parallel to the side thereof and to the flow of the material, the fixed scraper or feed flange extending from one side of the hopper over the cylinder to its forward end and at an angle with the plane of its axis, the fixed guide-flange extending from the other side of the hopper over the cylinder to its forward end and at an angle with the plane of its axis, and the discharge-plate between the projecting ends of the two flanges and at the end of the cylinder, substantially as herein described.

2. In an ore-feeder, the combination of the hopper, the horizontal rotary cylinder mounted under the mouth of the hopper with its axis parallel to the side thereof and to the flow of the material, said cylinder having a recessed end, the fixed scraper or feed flange extending from one side of the hopper over the cylinder to its forward end and at an angle with the plane of its axis, the fixed guide-flange extending from the other side of the hopper over the cylinder to its forward end and at an angle with the plane of its axis, and the discharge-plate between the projecting ends of the two flanges and at the end of the cylinder, said discharge-plate having a lip extending into the recessed end of the cylinder and forming a close joint, substantially as described.

401,035. **ELECTRICAL NIGHT-SIGNALING APPARATUS.** EMIL KAMELOWSKY, Berlin, Germany, assignor to the Berliner Maschinenbau-Actien-Gesellschaft, vormals L. Schwartzkopff, same place. Filed Aug. 7, 1888. Serial No. 282,161. (No model.)

Claim.—1. The combination, with a cylindrical casing having a notched rim, a sleeve revoluble centrally in the casing, a spindle vertically adjustable and revoluble in the sleeve, a lever fulcrumed on the

sleeve and pivoted to the spindle, having a nose adapted to the notched rim of the casing, and concentrically-arranged groups of contact-springs in the casing in electrical connection with a main circuit-wire, and with opposite groups of electric lamps in electrical connection with a dynamo or electric battery, of a contact-lever fulcrumed on and pivoted to the opposite ends, respectively, of the sleeve and spindle and adapted to enter the groups of contact-springs, substantially as shown and described, whereby as the spindle is raised, rotated, and lowered the lamps are switched into and out of the circuit, and during such rotation the contact-lever is held clear of the contact-springs, as herein set forth.

2. The combination, with a cylindrical casing having a notched rim, a sleeve revoluble centrally in the casing, a spindle vertically adjustable and revoluble in the sleeve, a lever fulcrumed on the sleeve and pivoted to the spindle, having a nose adapted to the notched rim of the casing, concentrically-arranged groups of contact-springs in the casing, one having downwardly-projecting extensions in electrical connection with a main circuit-wire and with opposite groups of electric lamps in electric connection with a dynamo or electric battery, and a contact-lever fulcrumed on and pivoted to the opposite ends, respectively, of the sleeve and spindle and adapted to enter the groups of contact-springs, of an auxiliary spring-pressed contact-lever fulcrumed at the base of the casing and adapted to enter the lower extensions of one of the groups of contact-springs as the contact-lever carried by the sleeve and spindle is raised, substantially as shown and described, whereby, as the lamps are switched into and out of the circuit and the main contact-lever held clear of the contact-springs, a constant current is maintained, as herein set forth.

401,036. HINGE. WILLIAM S. LARIMER, Glen Eden, Ohio. Filed July 27, 1888. Serial No. 281,177. (No model.)

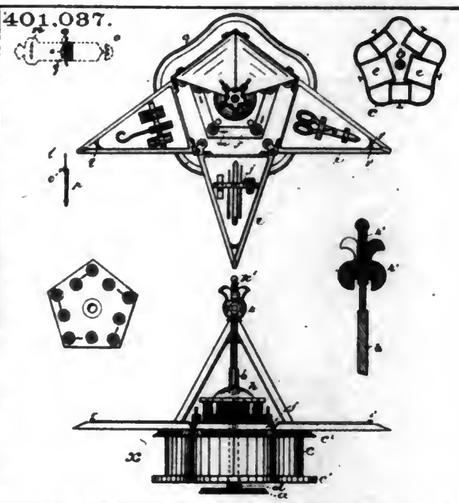
Claim.—1. A hinge consisting of two securing-plates provided with lugs, the lugs of one plate being square and those of the other plate having convex sides, and an intermediate supporting-piece provided with concave recesses on one side and with convex lugs on the opposite side, substantially as described.

2. A hinge consisting of the securing-plate 1, with lugs 10, having pintle-holes 14 and convex sides 11, the securing-plate 2, having square lugs 12, with pintle-holes 14, and the concave edge 15, adjacent thereto, and the intermediate rotary supporting-piece, 4, having the plane face 5 extending throughout its length, the concave recesses 6, in which are located lugs 10, the lugs 7, with convex sides 8, the lugs 12, located between lugs 7, and the piece 4, having pintle-holes 14, and pivoted to plates 1 and 2 by removable pins 13, substantially as shown and described.

3. In a hinge, the combination of the plate 1, provided with the lugs 10, having apertures 14 and convex sides 11, and the plate 2, having concave edge 15, and provided with the square lugs 12, having apertures 14, substantially as herein shown and described.

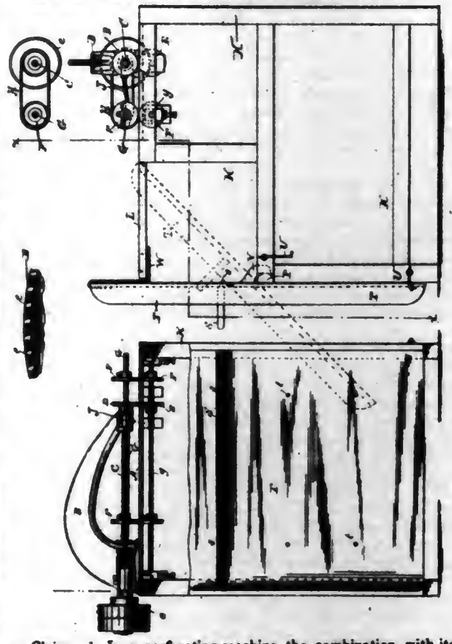
401,087. WORK-BOX. CHRISTIAN LATSCHAR, New Brunswick, N. J. Filed Apr. 26, 1888. Serial No. 271,971. (No model.)

Claim.—1. The improved work-box herein shown and described, combining a spindle, a revolving plate having a series of hinged triangular tablets thereon, and a spool-holder provided with spool-spindles, the said tablets inclosing said spool-holder, substantially as and for the purposes set forth.



2. The improved work-box herein shown and described, combining therein a revolving or rotary case, *c*, a spindle, a spool-holder arranged on said spindle, and a series of tablets hinged to said case *c* and adapted to be turned against said spindle to inclose the spool-holders, substantially as set forth.

3. The improved work-box for ladies, providing a series of revolving tablets having yarn-holding arms at their outer extremities and tool-receptacles *j*, said parts being arranged and adapted to operate substantially as and for the purposes set forth.

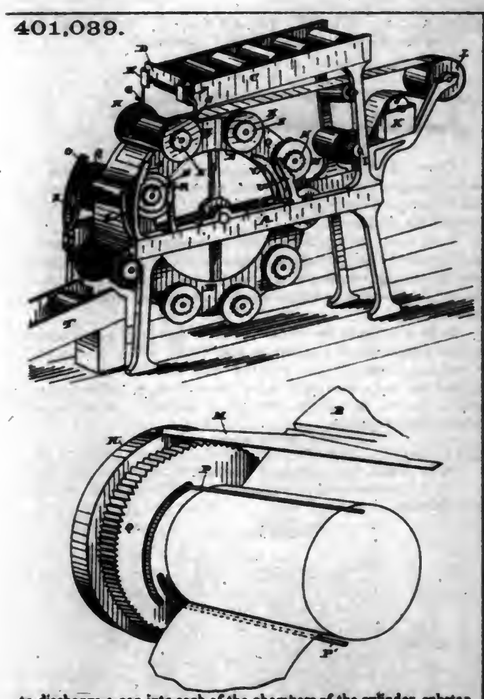


4. The improved work-box for ladies, combining therein a series of hinged tablets arranged upon a plate, c^2, a spindle, and open tool-receptacles formed on the inner or upper sides of said tablets and adapted to receive the tools and hold them in a concealed position when said tablets are closed against the spindle, substantially as set forth.

5. The improved work-box for ladies, combining a spindle and a series of triangular tablets hinged to open and close against said spindle, and a catch sliding on said spindle and adapted to hold the extremities of said tablets against said spindle, substantially as and for the purposes set forth.

401,087.

401,038. PERFORATING-MACHINE. STEPHEN D. LAYMAN, Boston, Mass. Filed Jan. 13, 1887. Serial No. 224,233. (No model.)



Claim.—1. In a perforating-machine, the combination, with its frame, the bed, and the perforating and feed mechanism, of the table supported by and rocking on the frame, and the detachable leaf L, supported by said table, substantially as and for the purpose specified.

2. In a perforating-machine, the combination, with its frame, the bed, and the perforating and feed mechanism, of the table T, catch V on said table, engaging a cross-bar, P, on said frame, the bracket W on the under side of said table, and the detachable leaf L, supported by said bracket, substantially as shown and described.

401,039. MACHINE FOR LABELING CANS. WILLARD LEE, Los Gatos, Cal. Filed May 3, 1888. Serial No. 273,220. (No model.)

Claim.—1. In a machine for labeling cans, a rotary cylinder having chambers upon its periphery, a chute from which the cans are delivered successively into said chambers, in combination with a vertically-sliding gate controlling the mouth of the chute, arms connected with said gate, and lugs or projections by which the gate is opened

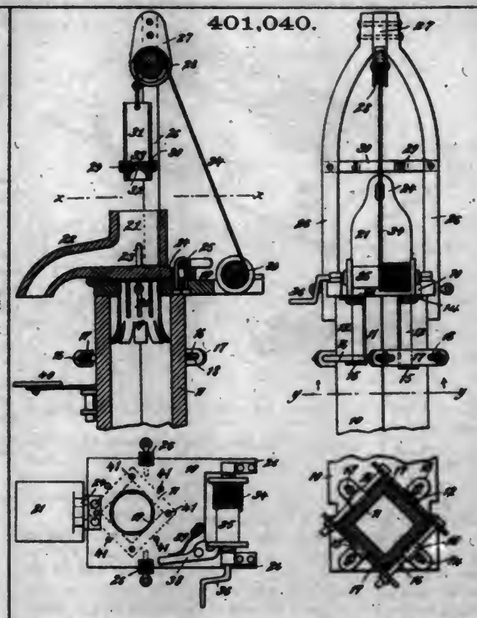
401,039.

to discharge a can into each of the chambers of the cylinder, substantially as herein described.

2. The rotary cylinder having chambers upon its periphery, a chute having a gate operated periodically by the rotation of the cylinder, so as to deliver cans into the chambers, in combination with a paste-roller and direction roller or rollers, whereby the labels are delivered upon the periphery of the cylinder and across the can-receiving chambers, substantially as herein described.

3. The rotary cylinder having semi-cylindrical chambers upon its periphery into which the cans are delivered automatically during its rotation, a mechanism, substantially as described, for applying the paste to one side of the label-band and delivering it across the chambers of the cylinder, so that the cans are placed upon the label-band, in combination with the rotary disks, cutters M, and gear-wheels N and racks O, by which the cutters are moved, so as to sever the labels, substantially as herein described.

4. The rotary cylinder having chambers upon its periphery across which the continuous label-band is carried after paste has been applied to one side, and means, substantially as specified, for depositing cans upon that portion of the label which lies across the chamber, a cutter, and mechanism, substantially as set forth, for operating the same, whereby the labels are severed after the can has been placed upon them, in combination with the rods P and P', gear-wheels Q, and stationary racks R and S, with which said gear-wheels engage, so as to cause the rods to move over the ends of the label and paste it upon the can, substantially as herein described.



5. The rotary cylinder chambered upon its periphery to receive cans from a constant source of supply, means, substantially as described for supplying paste to the label-band and guiding it across the chambers in the cylinder, so that the cans when delivered to the same will rest upon the labels, in combination with disks carrying cutters, a mechanism, substantially as set forth, for rotating said disks and cutters so as to sever the labels, and rods extending transversely across the cylinder, and having their ends connected with gears by which the rods are moved alternately, so as to press the ends of the labels down upon the cans, substantially as herein described.

6. The rotary cylinder with the chambers containing cans, the means for applying the labels thereto during the rotation of the cylinder, in combination with the fixed racks U and V, which engage the gear-wheels Q and N, and return the cutters and rods to the proper position for again cutting and applying a label before the cylinder completes its rotation, substantially as herein described.

401,040. ATTACHMENT FOR WELL-CURBS. JOHN T. LEGGER, Columbia, Miss. Filed Nov. 3, 1888. Serial No. 289,809. (No model.)

Claim.—1. The combination, with the curb-plate 10, having a vertical opening, of the upwardly and forwardly swinging trunk 21, hinged on its lower side to the upper side of the curb-plate, and a fastening in rear of said hinge for securing the trunk to the curb-plate, substantially as set forth.

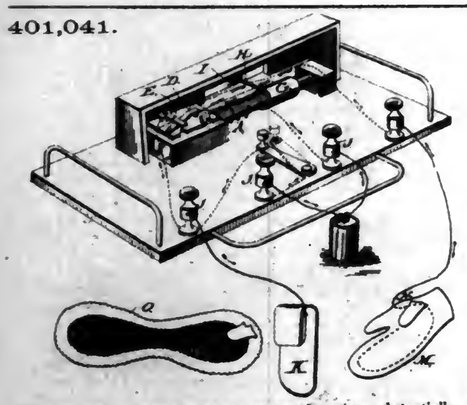
401,040.

2. The combination, with a well-curb and an apertured curb-plate attached thereto, of a guide-cylinder secured to the curb-plate, extending downward within the curb, and a trunk provided with a delivery-spout hinged at one side of the said curb-plate, substantially as and for the purpose specified.

3. The combination, with a well-curb and an apertured curb-plate secured thereto and provided with a staple, of a guide-cylinder attached to the curb-plate, extending downward within the curb, and a trunk pivoted upon one side of the curb-plate, provided with a delivery-spout, and having an apertured projection to receive said staple, substantially as set forth.

4. The combination, with a well-curb and a curb-plate, of hinged strap-plates having the upper member adjustably secured to the curb-plate, binding-plates clamping the lower member of the strap-plates, and rods connecting the binding-plates, substantially as shown and described.

5. The combination, with a well-curb and a curb-plate provided with a well-opening and having a series of apertures arranged around said opening, of hinged strap-plates having the lower member securely attached to the well-curb, and bolts passing through the upper member and through the registering aperture in the curb-plate, substantially as shown and described.



6. The combination, with a well-curb, an apertured curb-plate attached to the same, a guide-cylinder attached to the said curb-plate, extending downward within the curb, and provided with an outwardly-flaring lower end, of a trunk provided with a delivery-spout hinged at one side of the curb-plate, a vertical pin secured within the body of the trunk, a well-bucket provided with a valve in the bottom, and means, substantially as shown and described, for raising and lowering the well-bucket, as and for the purpose specified.

7. The combination, with a well-curb, a curb-plate secured thereto, a guide-cylinder provided with a series of longitudinal slots at the upper end, and an outwardly-flaring lower end, hinged to the curb-plate and extending downward within the curb, of a trunk provided with a delivery-spout hinged at one side of the curb-plate, a vertical pin secured within the body of the trunk, arms extending upward from the curb-plate, a drum pivoted at one side of the curb-plate and provided with a spring-actuated pawl, a pulley located at the upper end of the said arms, a well-bucket provided with a valve in the bottom, and a rope connecting the drum and well-bucket passing over the said pulley, all combined for operation substantially as set forth.

401,041. ELECTRO-MEDICAL APPARATUS. JOHN J. LEWIN, San Francisco, Cal. Filed May 26, 1887. Serial No. 239,709. (No model.)

Claim.—1. In an electro-medical apparatus, the core composed of fine parallel wires extending horizontally and having the ends upturned, in combination with the insulated wire wound around said

401,041.

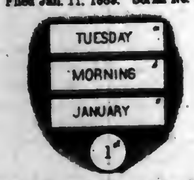
core from end to end and upon the upturned portion, substantially as described.

2. In an electro-medical apparatus, the horizontal core of an electro-magnet having one end upturned and the exterior insulated wire wound from end to end, in combination with the sliding sleeve inclosing the horizontal portion, the pin projecting therefrom, and the slide or plate by which it is moved, substantially as described.

3. In an electro-medical apparatus, an electro-magnet consisting of the parallel soft-iron wires having one end turned up at right angles with the body of the magnet, the horizontal and upturned end being wound with coils of insulated conducting-wire, and the supporting blocks or standards in which the ends of the coil are fixed, in combination with the vertically-moving armature, the inclined spring-arm to which it is attached, and the horizontally-moving arm or lever swinging above said spring, so as to adjust its vibrations, substantially as described.

4. In an electro-medical apparatus, the horizontally-supported electro-magnet composed of parallel wires having the upturned end and the regulating-sleeve sliding upon the horizontal portion, in combination with the armature vibrating vertically above the upturned end of the magnet, having the inclined spring-arm by which it is supported, and the horizontally-swinging arm by which the current is communicated to the spring, said arm acting to regulate the movement of the armature, substantially as described.

5. In combination with an electro-medical apparatus, the conducting-wires having the ends connected with broad flat metallic hooks, substantially as herein described.



6. In an electro-medical apparatus, the electro-magnet and armature constructed as shown, in combination with the electrodes composed of the hook-shaped pieces of metal, substantially as described.

7. The electro-magneto apparatus with its connecting-wires, hook-shaped electrodes, and the gloves and pads to which the wires may be connected, so that the current may be passed through the person of the operator and to the patient, substantially as described.

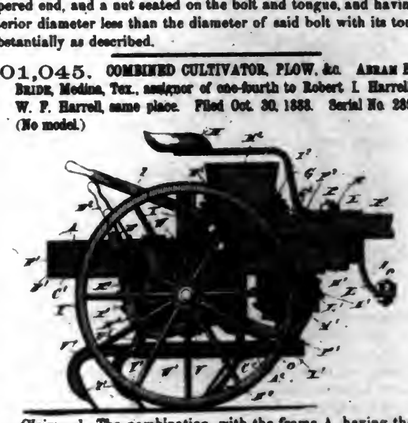
401,042. COMPOSITION FOR WATERPROOFING AND PREPARING SHEATHING AND BUILDING PAPER. GEORGE MANAHAN and HENRY GADE, New York, N. Y. Filed Aug. 17, 1888. Serial No. 283,004. (Specimens.)

Claim.—The within-described composition of matter to be used on paper for sheathing and building purposes, consisting of glue, amber mineral oil, rosin-oil, eucalyptus-oil, and a drier, in or about the proportions specified.

401,043. EDUCATIONAL APPARATUS. ABRAHAM I. MANNING, Philadelphia, Pa. Filed Jan. 11, 1889. Serial No. 296,061. (No model.)

Claim.—The blocks or cards herein described, one set, rectangular in shape, having marked thereon the names of the months; a second set, similar in shape, having marked thereon the names of the days of the week; a third set, similar in shape, having marked thereon the names of the different parts of the day, and a fourth set, of circular or disk-shaped blocks or cards, smaller in area than the other blocks or cards, and having numbers marked thereon indicating the days of the month.

401,044. NUT-LOCK. BENJAMIN MARSHALL, San Francisco, Cal. Filed Nov. 30, 1888. Serial No. 292,326. (No model.)



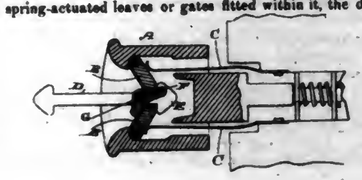
Claim.—1. A bolt for locking a nut thereon, having a spring or resilient tongue, the free end of which is toward the head of the bolt, and its place of junction with said bolt is toward the end of the bolt, substantially as described.

2. In a nut-lock, the combination of a bolt having a correspondingly-threaded spring or resilient tongue joined to or formed with it near its end, the free end of said tongue being toward the head of the bolt, and a nut seated upon said bolt and spring, substantially as described.

3. In a nut-lock, the combination of a bolt having a spring or resilient tongue joined to or formed with it near its end, the free end of said tongue being toward the head of the bolt, said bolt having a tapered end, and a nut seated on the bolt and tongue, and having an interior diameter less than the diameter of said bolt with its tongue, substantially as described.

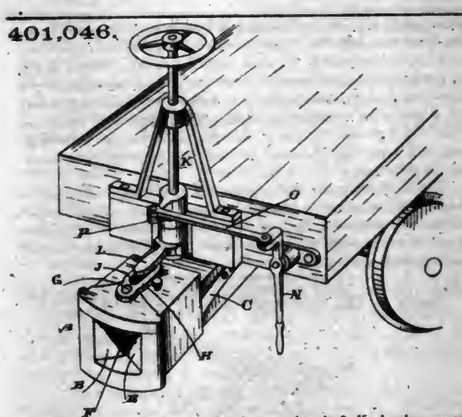
401,045. COMBINED CULTIVATOR, PLOW, &c. ABRAM B. MCBRIDE, Medina, Tex., assignor of one-fourth to Robert I. Harrell and W. P. Harrell, same place. Filed Oct. 30, 1888. Serial No. 289,529. (No model.)

Claim.—1. The combination, with the frame A, having the supporting-wheels, and a supplementary detachable and removable frame carrying the implements and adapted to bear against the lower side of frame A, and the devices to detachably secure said frame to the frame A, whereby the machine is adapted for using various cultivating and cutting devices, substantially as described.



2. The combination, with the frame A, having the supporting-wheels, and a supplementary detachable and removable frame carrying the implements and adapted to bear against the lower side of frame A, said supplementary frame being provided with the vertical right-angular brackets adapted to engage the sides and rear end of the frame A, and the bolts to secure the said supplementary frame to the frame A, whereby the machine is adapted for using various cultivating and cutting devices, substantially as described.

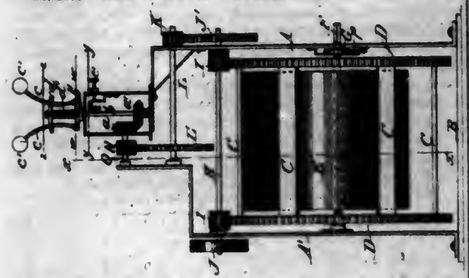
3. The combination, with the main frame A, having the driving or supporting wheels, of the frame B', detachably secured thereto, and having the depending brackets, the rock-shafts journaled in said brackets, and having the ratchet-wheels and the rock-arms, the plow-beams pivotally bolted to the lower ends of the rock-arms, the double-ended pawl or detent to engage said ratchet-wheels and having the operating-lever, and the lever secured to one of the rock-shafts, substantially as described.



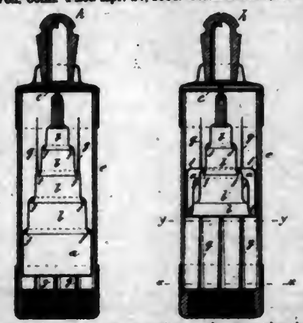
401,046. CAR-COUPLING. CHARLES A. MCDOUGALL, Alameda, Cal. Filed Oct. 20, 1888. Serial No. 288,704. (No model.)

Claim.—1. The vertically-fulcrumed leaves or gates B, fitted within the chamber of the draw-head, and springs by which they are closed, so as to retain the head of the draw-bar, in combination with the double-acting cam fixed upon the vertical shaft between the hinged gates, the vertical shaft K, and the intermediate crank-arms, whereby the cam-shaft is turned, substantially as herein described.

2. The chambered draw-head having the vertically-fulcrumed and spring-actuated leaves or gates fitted within it, the double cam



401,046.

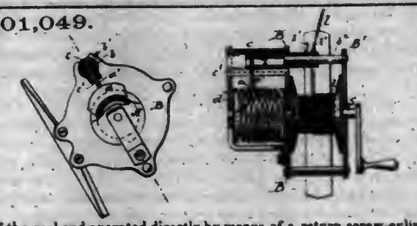


fixed to the shaft between the leaves, the shaft K, having crank-arms connecting with a similar arm from the cam-shaft, and a second crank-arm, P, fixed to the shaft K and connected by a rod with a hand-lever, N, substantially as herein described.

401,047. SPRING-MOTOR. ADAM MEAHL, Cairo, Ky. Filed June 21, 1888. Serial No. 277,766. (No model.)

Claim.—In a spring-motor, the combination of the spring C, the mechanism for winding the same, the gearing for conveying motion to the spindle *b*, the flanged collar *b'*, movably attached to said spindle, the arms *c c*, attached to its outer edge, the cross-piece *d*, attached to the top of the spindle and having the arms *c c* passing through its ends, and the spring between the cross-piece and flanged collar, all arranged substantially as set forth.

401,048. GAS-PRESSURE REGULATOR. WILLIAM H. METCALF, New Haven, Conn. Filed Apr. 27, 1888. Serial No. 272,026. (No model.)

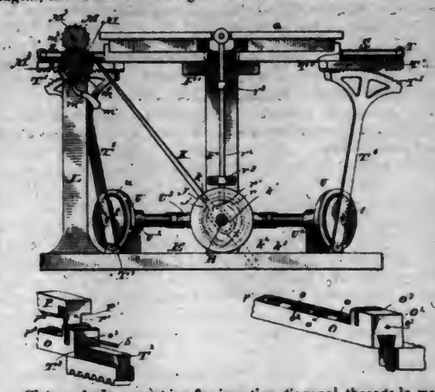


Claim.—In a gas-pressure regulator, the combination, with the valve case or shell having diminishing area upwardly, of the graduated valve, consisting of the cup, and a series of short telescopic tubes fitted to suspend one by the other and connected by the upper tube with a support, substantially as described.

401,049. LINE-GUIDE FOR FISHING-REELS. CHRISTIAN E. MOLLER, Hoboken, N. J., and CHARLES RAETTIG, New York, N. Y. Filed Oct. 20, 1888. Serial No. 289,447. (No model.)

Claim.—1. In a fishing-reel, the combination of a tubular line-guide, *b*, having a follower, *a*, and pins *b' b'*, protruding through the left side of the reel-frame B and guided at one end by the upper stay-rod, b^3, over which it passes, and at the other by a slotted tube, *c*, supported by a bracket or casing, *d'*, mounted upon the outer left side

401,049.



of the reel and operated directly by means of a return screw-cylinder, A, mounted on the spool-shaft *a*, with the fishing-line *l*, as and for the purposes herein shown and set forth.

2. In a fishing-reel, the combination, of a tubular line-guide, *b*, having a follower, *a*, and pins *b' b'*, protruding through the left side of the reel-frame B and guided at one end by the upper stay-rod, b^3, over which it passes, and at the other by a slotted tube, *c*, supported by a bracket or casing, *d'*, mounted upon the outer left side of the reel and operated by the aid of a return screw-cylinder, A, arranged at the left side of the reel with the line *l*, as and for the purposes herein shown and described.

401,050. MACHINE FOR INSERTING DIAGONAL STRIPS IN WEAVING CANE-WORK, &c. HENRY B. MORRIS, Hornellsville, assignor to the Morris Weaving Company, Geneva, N. Y. Filed Nov. 22, 1888. Serial No. 291,655. (No model.)

Brief.—The objects of the invention are to provide improved means for separating the threads in the woven fabric, so that diagonal threads may be inserted, means for inserting the diagonal threads, means for holding the ends of said threads during the return of the inserting-needle, means for cutting the diagonal threads to the proper lengths, and means for feeding the fabric to the separators.

Claim.—1. In a machine for inserting diagonal threads in warp fabrics, the combination, substantially as hereinbefore set forth, of the separators for opening a diagonal passage in the fabric, means for actuating the separators, the needle which carries the diagonal thread through said passage, and means for actuating the needle.

2. In a machine for inserting diagonal threads in warp fabrics, the combination, substantially as hereinbefore set forth, of the separators for opening a diagonal passage in the fabric between the warp and weft threads, means for actuating the separators, the needle which carries the diagonal thread through said passage, means for actuating the needle, and devices for holding the end of the diagonal thread during the backward movement of the needle.

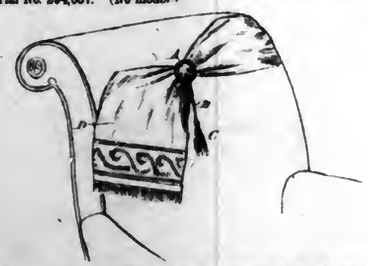
3. In a machine for inserting diagonal threads in warp fabrics, the combination, substantially as hereinbefore set forth, of the separators for opening a diagonal passage in the fabric between the warp and weft threads, means for actuating the separators, the needle which carries the diagonal thread through said passage, means for actuating the needle, and devices for severing the diagonal thread inserted from the thread carried by the needle.

4. The combination, substantially as hereinbefore set forth, of the separators for opening a diagonal passage in the fabric between the warp and weft threads, means for actuating the separators, the needle which carries the diagonal thread through said passage, means for actuating the needle, the feed-rollers for carrying the fabric through the machine, and means for actuating them.

5. The combination, substantially as hereinbefore set forth, of the upper and lower dies formed with a longitudinal groove or race, means for raising and lowering the upper die relatively to the lower die, the feed-rollers for carrying the fabric through the dies, the needle, and means for reciprocating the needle in the longitudinal groove or race.

6. The combination, substantially as hereinbefore set forth, of the main frame, the upper and lower feed-rollers geared to revolve synchronously and formed with projecting pins and recesses corresponding with the interstices in the fabric, and means for actuating the feed-rollers.

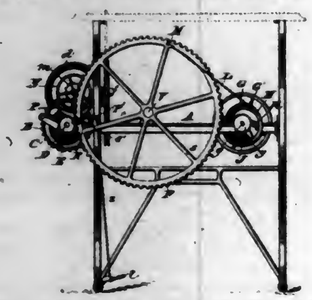
7. The combination, substantially as hereinbefore set forth, of the main frame, the upper and lower dies, the main driving-shaft, connections between the driving-shaft and the upper dies, whereby they are raised and lowered relatively to the lower dies, the feed-rollers, connections between the main driving-shaft and the feed-rollers for actuating them, the needle, the needle-carrying frame, and connections between the needle-carrying frame and the main driving-shaft.



8. The combination, substantially as hereinbefore set forth, of the main frame, the upper and lower dies, the main driving-shaft, the frame to which the upper dies are secured, the vertical rods secured to the die-supporting frame, the cams on the driving-shaft with which the vertical rods engage, the upper and lower feed-rollers geared to revolve synchronously, the feed-roll-actuating rod, and the cam on the driving-shaft with which said rod engages.

9. The combination, substantially as hereinbefore set forth, of the lower die formed with alternate projections and recesses and longitudinal grooves, the upper die formed with alternate projections and longitudinal grooves, the recessed block on the outer end of the lower die, and the blade or plate on the upper die adapted to enter said recess, said block and plate being perforated for the purpose specified.

10. The combination, substantially as hereinbefore set forth, of the lower die, the upper die, the needle-carrying-frame, the needle, the bell-crank lever pivoted to the lower die and projecting beneath it, a clamping device on the lower front portion of the lever, and a lug or projection on the front end of the lever engaging with a lug or projection on the upper die, for the purpose specified.



11. The combination, substantially as hereinbefore set forth, of the separators, the clamping devices, and the needle formed with a horizontal central opening, and tapered, split, and provided with forwardly-projecting teeth at its front end.

401,051. LOOP-TIE FOR DECORATIVE SCARFS OR SIMILAR ARTICLES. JOSEPHINE MÜLLER, New York, N. Y. Filed Dec. 26, 1888. Serial No. 294,657. (No model.)

Claim.—As an article of manufacture, the tie for decorative scarfs, consisting of the broad ornamental loop A and the relatively-long cord B, attached thereto at one end, and having the ornamental appendage C attached to its free end, as shown and described.

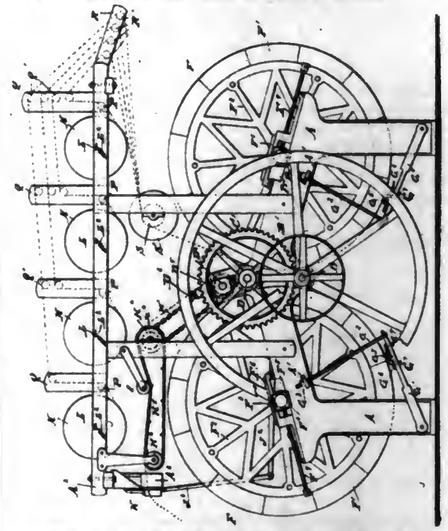
401,052. SPRING-MOTOR. CHARLES NICHOLSON, Philadelphia, Pa., assignor to the Nicholson Storage Power and Spring Motor Company, Washington, D. C. Filed Feb. 4, 1887. Serial No. 226,497. (No model.)

Claim.—1. In a spring-motor, the combination of a motor-spring and an equalizing-spring with a wheel connected to the motor-spring and a chain and cam connecting the equalizing-spring with the rim of the wheel, substantially as described.

2. In a spring-motor, the combination of a volute motor-spring connected with a gear-wheel and a volute equalizing-spring, a cam of suitable pitch connected with the equalizing-spring, and a chain connecting the cam with the rim of the wheel, substantially as described.

3. In a spring-motor, the combination of a volute motor-spring and a similar equalizing-spring with a driving-wheel connected to the motor-spring, and a chain and cam connecting the equalizing-spring with a stud in the radius of the wheel, which radius in the revolution of the wheel crosses the line of the chain, whereby the equalizing-spring will alternately oppose and assist the motor-spring, substantially as described.

4. In a spring-motor, the combination of a friction-wheel and a friction brake-shoe with a wheel driven by a motor, and spurs upon said wheel for actuating the brake-shoe automatically when the motor arrives at the limits of its run in storing and yielding power, substantially as described.



401,053. LACE-PIN FASTENING. MILTON E. OPPENHEIMER, New York, N. Y. Filed Jan. 31, 1888. Serial No. 262,532. (No model.)

Claim.—1. In a lace-pin, the combination, with a sleeve provided with a longitudinal slot and a transverse slot at the end of the said longitudinal slot, of a longitudinally-slotted tube fitting in the sleeve and provided with a stop at the end of the slot, a collar abutting against the sleeve, and a handle projecting from the collar, substantially as described.

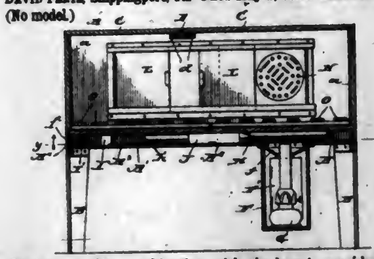
2. In a lace-pin, the combination, with the body A and the sleeve E, secured to the body and provided with the longitudinal slot F and the transverse slot K, of the tube G, provided with the slot J, the stop L, the shoulder H, and the handle I, substantially as described.

401,054. LACE-PAPER MACHINE. GIUSEPPE PAGI, New York, N. Y. Filed Dec. 3, 1886. Serial No. 220,978. (No model.)

Claim.—1. In a lace-paper machine, the combination of a pattern-wheel with two wheels having wooden rims, means, as described, for holding the said wheels in frictional contact with the said pattern-wheel, and a roller having an elastic rim and held on top of the said pattern-wheel, substantially as shown and described.

2. In a lace-paper machine, the combination, with the gearing of the pattern-wheel, of an endless belt driven from said gearing, a paper-cutting device located at the end of the said endless belt, and means, as described, for operating the said cutting device from the said gearing, substantially as set forth.

3. In a lace-paper machine, the combination, with the pattern-wheel D and wheel F, having a wooden periphery and working in contact with said pattern wheel, of a scraper having a series of blades arranged obliquely to the axis of said wheel F, as and for the purpose specified.



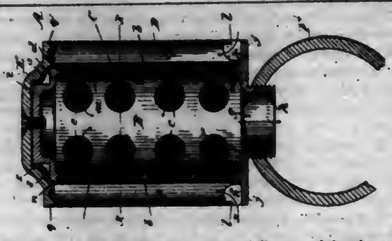
4. In a lace-paper machine, the combination, with the wheels F, having wooden rims, of the files or scrapers G^3, held in contact with the periphery of the said wooden rims, the pivoted box G^4, supporting the said scrapers or files G^3, the hinged frame G', supporting the said box G^4, the screw-rod G^5, supporting the free end of the said hinged frame G', and the nuts G^6, for adjusting the said rods G^5, substantially as shown and described.

5. In a lace-paper machine, the combination, with the pattern-wheel D', of the wheel F, having a wooden rim, the shaft F^2, supporting the said wheel F, the box F^3, in which the said shaft F^2 is mounted, the main frame A, forming, in connection with the hinged covers F^4, inclined slots F^5, the said covers F^4, hinged on the said frame A, and the screw-rods F^7, screwing in the said hinged covers F^4 and against the boxes F^3, so as to adjust the said wheel F in relation to the pattern-wheel D', substantially as shown and described.

6. In a lace-paper machine, the combination, with the wheel F, having a wooden rim, of the scrapers G^3, acting on the periphery of the said wooden rim, the box G^4, supporting the said scrapers G^3, and the set-screws G^4, for adjusting the said scrapers vertically in the said box G^4, substantially as shown and described.

7. In a lace-paper machine, the combination, with a wheel, F, having a wooden rim, of the scrapers G^3, acting on the periphery of the said wooden rim, the box G^4, supporting the said scrapers G^3, the set-screws G^4, for adjusting the said scrapers G^3 in the said box G^4, the pivoted frame G', supporting the said box G^4, the set-screws G^7, for adjusting the said box G^4 on said frame G', the rods G^5, connected with the said frame G', and the nuts G^6, for adjusting the said rods G^5 on the main frame in relation to the wooden rim of the said wheel, substantially as shown and described.

401,055. COMBINED BREAD-RAISER AND KITCHEN-SAFE. DAVID PEFFER, Shippingport, Pa. Filed May 2, 1888. Serial No. 272,569. (No model.)



Claim.—1. The combination, with the box A, provided with a double hollow bottom, of a lamp-chamber in communication with said hollow bottom, a plate, as H, united to one member of said hollow bottom, forming a chamber open at one end and formed with an opening for the admission of heat from the lamp-chamber, and baffle-pieces located between the chamber formed by the plate H and the heat-escape opening, substantially as shown and described.

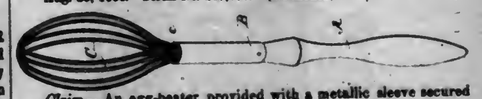
2. The combination, with the box A, formed with a double hollow bottom, of a lamp-chamber, F, in communication with said hollow bottom, the plate H, having apertures h, and secured to one member of said bottom, forming a heat-distributing chamber, baffles I I I', and support J, located between the forked end A" of the plate H, substantially as shown and described.

401,056. PROCESS OF EXTRACTING COPPER FROM COPPER PYRITES. JOSEF PERINO, Charlottenburg, near Berlin, Germany. Filed Mar. 3, 1888. Serial No. 266,054. (No model.) Patented in Germany Jan. 28, 1888, No. 44,498; in Norway Feb. 10, 1888, No. 794; in Sweden Feb. 10, 1888, No. 1,496; in England Feb. 10, 1888, No. 2,019; in Luxemburg Feb. 10, 1888, No. 367; in France Feb. 13, 1888, No. 188,606; in Belgium Feb. 13, 1888, No. 80,635; in Italy Mar. 31, 1888, No. 23,074 and No. 398; in Portugal Apr. 12, 1888, No. 1,237; in Spain May 14, 1888, No. 7,901, and in Austria-Hungary Oct. 20, 1888, No. 18,314 and No. 32,839.

Claim.—The herein-described process of obtaining copper from copper pyrites, consisting in heating the copper pyrites mixed with nitric salts of iron to a temperature of about 200° centigrade, whereby sulphate is produced, lixiviating the mass with water, and finally precipitating the copper, as set forth.

401,057. FILTERING APPARATUS. BENJAMIN F. PERKINS, Holyoke, Mass. Filed Nov. 20, 1888. Serial No. 291,400. (No model.)

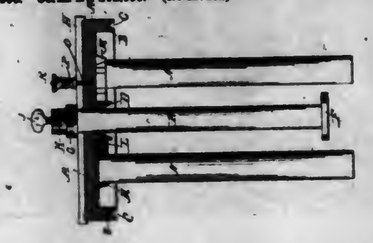
Claim.—1. In a filter, in combination, a body comprising open-work sides formed by intersecting ribs, a closed top and an opening through its bottom, a strainer-shell fitting upon and surrounding the open-work sides of said body, a casing of larger diameter than said strainer-shell resting on said lugs, whereby a chamber is formed between the said casing and shell, an opening at the lower edge of said shell leading to said chamber, and means for closing the top of said chamber, substantially as described.



2. In a filter, in combination, a body comprising open-work sides formed by intersecting ribs, a closed top, an opening through its bottom, and the outlying ledge *j*, provided with the lugs *k*, a strainer-shell fitting upon and surrounding the open-work sides of said body, a casing of larger diameter than said strainer-shell resting on said lugs, whereby a chamber is formed between the said casing and shell, an opening at the lower edge of said shell leading to said chamber, and means for closing the top of said chamber, substantially as and for the purpose described.

3. In a filter, in combination, a body comprising open-work sides formed by intersecting ribs, a closed top, an opening through its bottom, and the outlying ledge *j*, provided with the lugs *k*, a strainer-shell fitting upon and surrounding the open-work sides of said body, a casing of larger diameter than said strainer-shell resting on said lugs, and a cover bearing against the upper ends of said strainer-shell and casing for confining same in their positions and closing the top of the chamber which is formed between the casing and strainer-shell, substantially as and for the purpose described.

4. In a filter, in combination, a body comprising open-work sides formed by intersecting ribs, a closed top externally provided with a polygonal projection, an opening through its bottom surrounded by an externally-screw-threaded boss and having the outlying stepped lugs *k*, a strainer-shell fitting upon and surrounding the open-work sides of said body, a casing of larger diameter than said strainer-shell resting on said lugs, a cover bearing against the upper ends of said strainer-shell and casing for confining same in place for covering the chamber which is formed between the casing and strainer-shell and covering the top of said body, and a screw passing through the said cover and into the top of said body.



5. In a filtering apparatus, the combination, with a filter-tank provided with a supplemental box, G, having an outlet-opening, and a series of pipes, F, in said tank leading and open to said box G, of a series of strainer-filters each comprising a body having open-work sides, a closed top and an opening through its bottom leading to the passage of its carrying-pipe F, a strainer-shell fitting upon and surrounding said open-work sides of the body, a casing of larger diameter than said strainer-shell supported to surround same, forming the chamber *p*, and the lower opening leading thereto, and a lid for closing the top of said chamber, and a body of granulated filtering material or materials in said tank enveloping said series of filters, substantially as and for the purpose described.

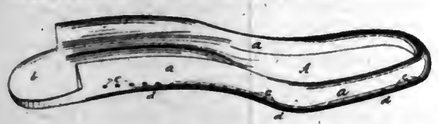
401,058. EGG-BEATER. CHRISTIAN F. PFAU, Quincy, Ill. Filed Aug. 25, 1888. Serial No. 283,750. (No model.)

Claim.—An egg-beater provided with a metallic sleeve secured to a suitable handle, a thimble having longitudinal peripheral grooves, and the wires bent into loops and their ends secured between the sleeve and thimble in the grooves of the latter, the wires at their apices bearing from within outward on the adjacent ones and being free to move on each other, substantially as described.

401,059. GALVANIC BATTERY. JAMES H. PHALAN, New Haven, assignor to the Electrical Supply Company, Ansonia, Conn. Filed Dec. 7, 1888. Serial No. 292,953. (No model.)

Claim.—1. In a battery, the combination of a jar-cover with contractible element-securing devices and means whereby such devices are both contracted to secure the elements and secured to the cover.

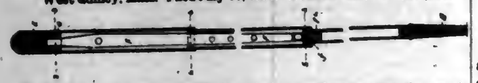
2. In a battery, the combination of a jar-cover with contractible element-securing clamps and devices whereby such clamps are simultaneously contracted to secure the elements and themselves secured to the cover.



3. In a battery, the combination of a series of element-clamps, each provided with a lateral elongation, and a series of staples to straddle such elongations, and whereby such clamps are both contracted and secured to the cover.

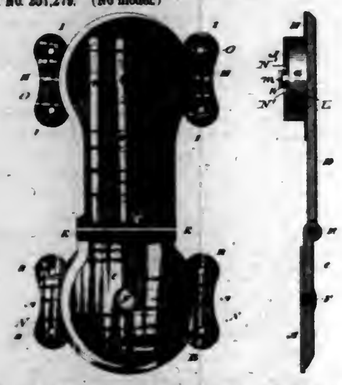
4. In a battery, the combination of a jar-cover with a series of element-clamps arranged in a circle upon such cover, each clamp having a lateral elongation, and a series of staples which straddle such elongations, and are then driven into the cover so as to simultaneously contract such clamps and secure the whole system to the cover.

5. In a battery, the combination of a series of connected element-clamps, each provided with a lateral projection and with a body of substantially the same diameter as the element, and a series of staples which straddle the projections, and when driven contract the clamps, and thus secure the element.



6. In a battery, the combination of a jar-cover with a series of element-securing devices, each having a continuous outline consisting of a body substantially the diameter of the element and a contractible lateral projection.

401,060. BOOT OR SHOE. BENJAMIN A. PILLOW, Richmond, Va. Filed Mar. 21, 1888. Serial No. 268,026. (No model.)



Claim.—A boot or shoe composed of an upper, outer sole, an insole and lining, and a molded middle sole secured between the inner and outer sole and upper and lining, and composed of a blank cut approximately to the size and shape of the sole of the foot of the wearer, but slightly larger than the same, except at the heel, which is cut away, and having the extended edges beveled and turned up and molded to the shape of the foot, as described, for the purposes specified.

401,061. WALKING-STICK. PAUL PILOW and JOSEPH PLOUDRE, West Quincy, Mass. Filed July 16, 1888. Serial No. 280,116. (No model.)

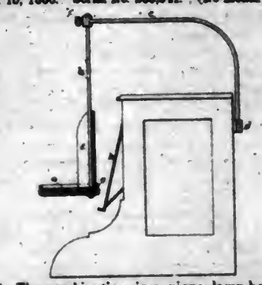
Claim.—A walking-stick in tubular sections telescoping each other, in combination with a fife inserted in and crossing the joints of said sections, and with rests E F² of the sections for the opposite ends of the fife, substantially as described, for the purpose specified.

401,062. TRUNK-LOCK. HENRY B. PLUMB, Terryville, Conn., assignor to the Eagle Lock Company, same place. Filed Oct. 3, 1887. Serial No. 251,279. (No model.)

Claim.—In a trunk-lock, the combination, with a carrying-plate having two ears extending horizontally from opposite points on its edge and perforated for its attachment to a trunk, of a hasp consisting of a hinged and a pivoted part, the latter being pivoted to the center of the carrying-plate and shaped to bear solely upon the central portion thereof, whereby the pivoted part of the hasp does not touch the ears of the rivets by which the carrying-plate is secured to the trunk, a cylindrical case inclosing locking mechanism carried by the free end of the hinged part of the hasp, and a keeper having a recess to receive the said case and horizontally-extending ears for its attachment to the trunk, substantially as set forth.

401,063. FLUX-FEEDING APPARATUS FOR BLAST-FURNACES. NATHANIEL A. PRATT, Atlanta, Ga., assignor to the Pratt Steel Company, Birmingham, Ala. Filed June 2, 1888. Serial No. 275,940. (No model.)

Claim.—1. The combination, with a furnace having tuyeres, of a blower-cylinder, a blast-main, a bustle-pipe provided with nozzles, a flux-feeding apparatus for discharging pulverized flux into said blast-main, and an air-engine connected to and operated by compressed air from said blower-cylinder and operating to drive said flux-feeding apparatus, substantially as described.

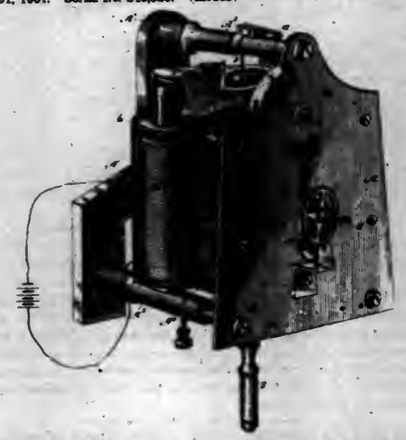


2. The combination, with a furnace having tuyeres, of a blower-cylinder, a blast-main, a bustle-pipe provided with nozzles, a flux-hopper, a discharge-valve and its casing beneath said hopper and communicating with said blast-main, and an air-engine operated by compressed air from said blower-cylinder and operating said valve, substantially as described.

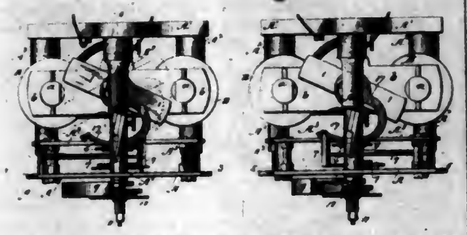
3. The combination, with a furnace having tuyeres, of a blower-cylinder, a blast-main, a bustle-pipe provided with nozzles, a flux-hopper, a discharge-valve beneath said hopper and communicating with said blast-main, an air-engine, a piston within the same connected to said valve, and pipes which connect said engine with said blower-cylinder, substantially as described.

4. The combination, with a furnace having tuyeres, of a blower-cylinder, a blast-main, a bustle-pipe provided with nozzles, a flux-hopper formed with an outlet-port, a valve-casing below said outlet-port, feed-channels which open into said blast-main, a reciprocating valve within said casing having ports or recesses which alternately register with said outlet-port and with said feed-channels, an air-engine, a piston within the same having its rod connected to said reciprocating valve, and pipes which connect said engine and blower-cylinder, substantially as described.

5. The combination, with the furnace 1, having tuyeres 2, of the blower-cylinder 5, provided with the air-inlet valves 10 and the piston 6, the vertical chamber 7, having inlet-valves 9, the curved pipes 8, the blast-main 4, the annular blast or bustle pipe 3, provided with nozzles 3ª, the flux-hopper 11, provided with the outlet-port 12, the valve-casing 13, the feed-channels 14, the valve 15, formed with ports or recesses 16, the air-engine 19, the piston 18, connected to said valve 15 by the rod 17, and the pipes 21, provided with stop-cocks 22 and connected with said engine 19 and blower-cylinder 5, substantially as described.



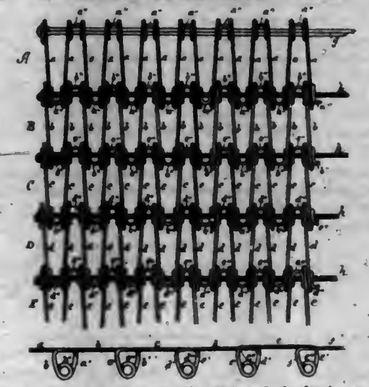
401,064. PIANO LAMP-HOLDER. LEWIS PRAY, Portland, Me. Filed Sept. 15, 1888. Serial No. 285,541. (No model.)



Claim.—1. The combination, in a piano lamp-holder, of a disk, *a*, having a rim around the top and a groove inside of said rim, with a shade, *c*, inserted in said groove, all substantially as set forth.

2. The combination, in a piano lamp-holder, of the disk *a*, rod *b*, secured to one side of the disk *a*, a set-screw coupling, *f*, through which the rod passes, a curved rod, *e*, attached to said coupling *f*, and a socket, *d*, fastened to the back of piano, and serving as a bearing for the rod *e*, all substantially as set forth.

401,065. ELECTRIC WINDING FOR TORSION-PENDULUM CLOCKS. HEINRICH RABE, Hanau, Germany, assignor to the Hanauer Electrische Uhren Fabrik Steinheuer Rabe, same place. Filed Aug. 31, 1887. Serial No. 248,329. (Model.)

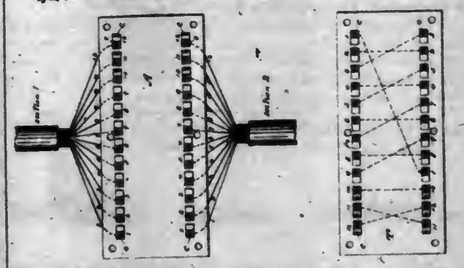


Claim.—1. In an electrical clock-winding apparatus, the combination, with the dial-work shaft, of electro-magnets forming part of an electric circuit, a pivoted swinging spring-retracted armature, an arm attached to and moving with the latter, a pivoted lever connected with the aforesaid shaft, and one part of which has a non-conducting portion and projects into the path traversed by the armature-arm, a weight connected with the pivoted lever, and conductors connecting the winding mechanism and magnetic coils with a battery, substantially as shown and described, whereby when the weight shall have run down the projecting portion of the lever comes in contact with the armature-arm, thus completing the electrical circuit, so that the armature turns and carries the lever back to its starting position, and also raises the weight, as specified.

2. In an electrical clock-winding apparatus, the combination, substantially as shown and described, with a swinging arm forming part of an electro-magnetic circuit, of a pivoted vibrating lever having a conducting and non-conducting portion which engages the aforesaid arm and alternately makes and breaks the circuit at the limits of movement of said lever, a weight, and a clock-work mechanism, with both of which said lever is connected, whereby the said weight is raised when the lever is returned to its starting position, as specified.

3. In an electrical clock-winding apparatus, the combination, with the electro-magnets forming part of an electrical circuit, a spring-retracted armature pivoted between their poles and having an arm attached, the segmental rack-lever and a weight, both fixed on the same rotatable axis, and said lever having a laterally-projecting portion, to which a non-conducting piece is secured, the dial-work shaft, and a pinion mounted loose on the same and meshing with the aforesaid lever, escape mechanism, the pendulum, and a piece connecting said escape mechanism with the pendulum-rod, substantially as shown and described, whereby the pendulum is vibrated until the weight has descended, when an electric circuit is formed by contact of the rack-lever and armature-arm, thus causing the armature to swing and carry the lever and weight back to their starting-place and break the circuit, so that the armature resumes its normal position and the weight begins to fall again, as specified.

4. In an electrical clock-winding apparatus, the combination, with the two electro-magnets arranged vertically parallel and forming part of an electric circuit, of a bar-armature fixed horizontally on a vertical shaft between their poles, a retracting-spring coiled about the said shaft and serving to hold the armature normally out of alignment with the magnetic poles, the vertically-swinging segmental rack-lever, and a weight fixed on the same horizontal axis, the said lever having a lateral portion provided with a non-conducting piece, an escape mechanism, a pendulum, dial-shaft, means for connecting the shaft and pendulum with the lever, and a curved arm attached to the armature and extending normally around the pendulum-rod, so that its free end is in position to engage the lateral portion of the rack-lever when thrown over by the weight reaching the limit of its downward movement, substantially as shown and described.



401,066. METALLIC MAT. ABBOTT M. REEVES, Indianapolis, Ind. Filed Dec. 3, 1888. Serial No. 292,490. (No model.)

Claim.—1. A mat composed of strips of wire having each horizontal portions, downward extensions, and bends or coils, as set forth.

2. A mat composed of strips of wire having each horizontal portions, downward extensions, and bends or coils, and rods securing the strips together by passing through the coils, as set forth.

401,067. CIRCUIT-CONNECTING DEVICE. JOHN C. REILLY, Brooklyn, N. Y. Filed Feb. 13, 1889. Serial No. 299,783. (No model.)

Claim.—1. A connecting device for multiplex circuits, consisting of a plate fitted with two groups of contacts forming the terminals of the respective circuits to be connected, in combination with a second plate removably attached thereto and similarly fitted with two groups of contacts registering with the contacts of the first plate and

having circuit-connections between the contacts of one row and those of the other row.

2. A connecting device for multiplex circuits, consisting of two plates adapted to be adjustably clamped together, each of their adjacent faces being fitted with corresponding contacts in two groups, one plate having permanent terminals for the circuits to be connected and the other plate having the required connections.

3. In a connecting device for multiplex circuits, a plate having two groups of contacts constituting the terminals of the circuits to be connected, both groups arranged in regular order, in combination with a circuit-transposing plate having two groups of registering contacts and wires or strips constituting the connections for said circuits and arranged in irregular order, in accordance with the scheme of transposition required, and means for bringing the corresponding contacts of the two plates together.

401,068. SAFETY-GUARD FOR RAILWAY-CARS. GEORGE W. REMINGTON, Exeter, R. I., assignor of one-half to Thomas G. Hunt, same place. Filed Aug. 21, 1888. Serial No. 283,326. (No model.)

Claim.—1. The safety-guard hereinbefore described, consisting of hangers or supports secured to the car, the guard *a*, journaled in said hangers, and the spring-actuated catch arranged to hold the guard in a vertical or normal position.

2. The combination, with a car, of the pivotally-mounted guard *a* and the spring-connected latches *b*, adapted to retain the guard in position, all constructed, arranged, and operating substantially as shown and described, and for the purpose set forth.

3. In a safety attachment of the class hereinbefore described, the combination therewith of the pivotally-mounted guard *a*, having its upper portion cut away, as at a^4, substantially as shown and described, and for the purpose set forth.

4. The combination, with a railroad-car, of the pivotally-mounted spring-locking guard *a*, mounted in front of the car-wheels, and a flexible guard, a^3, attached to the forward end of the car, substantially as shown and described.

401,069. HEEL-PROTECTOR. FRANCIS H. RICHARDS, Hartford, Conn., assignor to the American Heel Protector Company, Newark, N. J. Filed July 11, 1887. Renewed Sept. 25, 1888. Serial No. 286,387. (No model.)

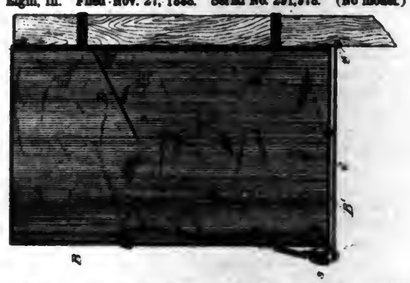
Claim.—1. The improved heel-protector herein described, it consisting of a bar having the cross-sectional form of an inverted arch or channel-bar and provided on its under side with wear-plugs and on one edge with placing-braces, substantially as described.

2. The improved heel-protector herein described, it consisting of a curved bar having the cross-sectional form of an inverted arch or channel-bar, said bar being provided with wear-plugs and having openings therein between said plugs, substantially as described.

3. The improved heel-protector herein described, it consisting of the curved bar B, of a cross-sectional form, substantially as described, said bar being connected at its ends by a bar, 6, and provided with wear-plugs and placing-braces, substantially as described.

4. The improved heel-protector herein described, it consisting of the bar B, having the cross-sectional form of an inverted arch or channel-bar and the hollow wear-plugs 4, depending from the under side of said bar, the openings through said plugs connecting with the interior of said bar, all substantially as described.

401,070. GLOVE-FASTENING. WILLIAM S. RICHARDSON, Boston, Mass. Filed July 30, 1888. Serial No. 281,467. (No model.)

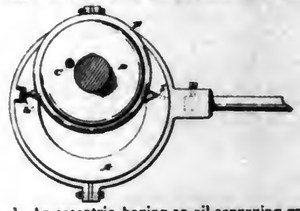


Claim.—1. In the herein-described fastening for gloves and other articles, the ball member, comprising a ball, post, or stud, having, or having attached to it, a conical base, a collet and cap, within which said base is contained, and a flanged eyelet adapted to fasten the capped ball to the material by turning its flange upon the conical base of the ball, substantially as described.

2. In a fastening for gloves and other articles, the socket member having the tubular sleeve *f*, the shoulder f', integral therewith, and the curved sides f^3, having the opening f^4 and the slit or slits f^5, substantially as described.

3. The combination, in a fastening device for gloves and other articles, of the ball *b*, base *c*, collet *d*, cap *e*, and an eyelet, with the socket member of the fastening having the opening of less diameter than the greatest diameter of the ball and flaring or enlarged sides of less diameter than the bore of the eyelet, substantially as described.

4. In the herein-described fastening for gloves and other articles, the combination of the collet, the cap, the conical base, and the ball member held at the apex of the conical base, substantially as described.



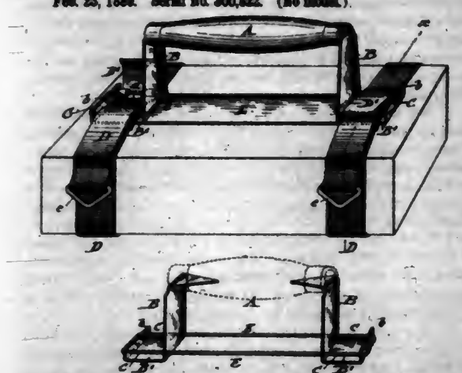
401,071. RECEPTACLE FOR BUNDLES. LEONARD M. ROSE, Elgin, Ill. Filed Nov. 27, 1888. Serial No. 291,978. (No model.)

Claim.—1. In combination, a laundry-receptacle, A, containing a downwardly-inclined guard, D, extending from the rear thereof part way across the receptacle, separating the latter into an upper and a lower compartment and affording a passage between them toward the front side of the receptacle, an opening in the front side of the receptacle above the said passage, a self-closing door, B, hinged at the lower side of the opening to open inward and thereby close the passage, a door, B', in the lower part of the receptacle, and means, substantially as described, for locking the door B', substantially as and for the purpose set forth.

2. In combination, a laundry-receptacle, A, containing a downwardly-inclined guard, D, extending from the rear thereof part way across the receptacle, separating the latter into an upper and a lower compartment and affording a passage between them toward the front side of the receptacle, an opening in the front side of the receptacle above the said passage, a door, B, hinged at the lower side of the opening to open inward and thereby close the said passage, a spring, C, maintaining the said door normally in the position of closing the opening, and a door, B', in the lower part of the receptacle, and means, substantially as described, for locking the door B', substantially as and for the purpose set forth.

401,072. ECCENTRIC-OILER. JOSEPH ROSBONG and ISAIAH ROSBONG, Canton, Ohio, assignors of one-third to John J. Rosbong, same place. Filed Oct. 22, 1888. Serial No. 288,857. (No model.)

Claim.—1. An eccentric having an oil-conveying groove on one side and provided with oilways leading therefrom through said eccentric to its periphery, substantially as described.



2. The combination, with an eccentric having oilways, of a disk having an annular oil-conveying groove, substantially as described.

3. The combination, with an eccentric having oilways leading to its periphery, of a disk having an oil-groove upon its inner face located against the face of the eccentric having the oilways, substantially as described.

4. The combination, with an oil-conveying disk, of an eccentric having oilways communicating with an oil-groove in the disk and with the periphery of the eccentric, said disk being mounted centrally on the power-shaft, substantially as described.

5. The combination, with the eccentric A, having oilways *b'*, of the oil-conveying disk B, connected by said oilways with the periphery *a* of the eccentric, a non-rotatable plate, D, located in the disk, and the oil-supply pipe C, substantially as described.

401,073. SHAWL-STRAP. MAX RUBER, New York, N. Y. Filed Feb. 23, 1888. Serial No. 300,822. (No model.)

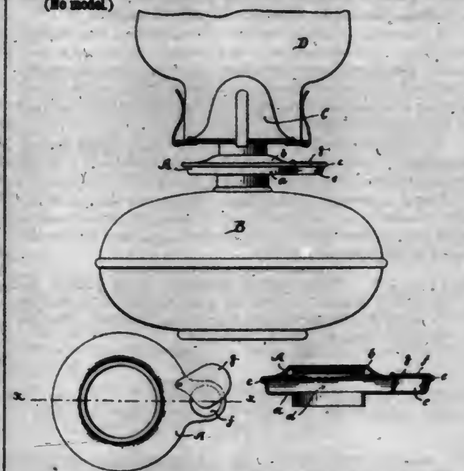
Claim.—1. The combination, in a shawl-strap, of upright stays, a handle connecting said stays, outwardly bent and flanged parts at the lower ends of the stays, wire links connecting the flanges and stays, straps attached to one side of the wire links, and clamping-levers hinged to the other side of the wire links, substantially as set forth.

2. In a shawl-strap, the combination of upright shanks or stays, a handle connecting said stays, outwardly-bent parts at the lower ends of the stays, having flanges at the outer ends, wire links connecting said stays and flanges, a longitudinal bar connecting said stays, straps attached to one side of the wire link, and clamping-levers pivoted to the other side of the wire links, substantially as set forth.

3. The combination of upright shanks or stays having outwardly bent and flanged parts at their lower ends, a handle connecting the upper end of said stays, wire links connecting the stays and flanges, clamping-levers hinged to one side of said wire links, and straps attached to the other side of the wire links, and provided with stop devices at the outer ends for preventing the straps from being withdrawn from the clamping devices, substantially as set forth.

401,074. STEM WINDING AND SETTING WATCH. EDWARD SMITH, Peoria, Ill. Filed July 17, 1888. Serial No. 280,170. (No model.)

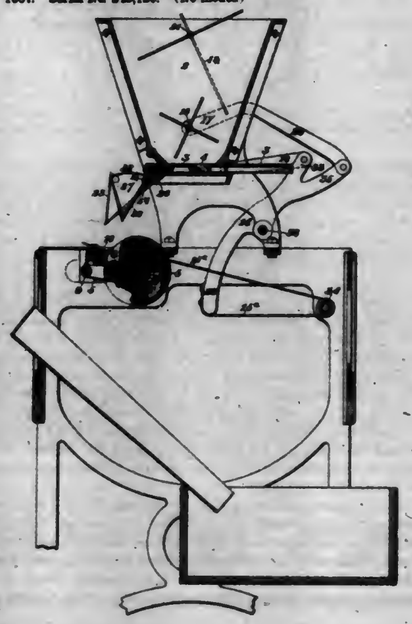
Claim.—1. In stem winding and setting mechanism, the stem consisting of the part W, having at its inner end the lateral V-shaped notches, and the part *c*, having corresponding spring-catches with V-shaped ends adapted to automatically engage said notches when the parts are pressed together end to end and to automatically disengage when the parts are forcibly drawn apart, whereby a strong pull upon the crown leaves the movement with a portion of the stem mounted therein free from the parts within the pendant.



2. The combination, with the pendant, of the sleeve F, fixed therein and having the inward projection *m* at its own outer end, the stem-bearing K, having a limited sliding movement in said sleeve, the divergently-curved springs J, formed integrally with said bearing and engaging said projection, and the stem rotating without sliding in said bearing, substantially as and for the purpose set forth.

3. In stem winding and setting mechanism, the combination, with the watch-pendant, of a sleeve fixed therein and internally contracted at its upper or outer end, a sliding stem-bearing closely fitting said sleeve, provided at its upper end with opposite divergent springs whose free ends fall within and without said contracted sleeve end as the bearing slides back and forth in the sleeve, and a stem having a rotary but not a sliding motion in said bearing.

4. In stem winding and setting mechanism, the combination, with the pivoted yoke and the winding and hands-setting train mounted thereon, of a spring fixed at each end and at its middle engaging an arm of said yoke, and a detachable portion of the stem sliding in the movement and engaging the middle of said spring at all times, whereby the sliding of the stem in either direction may impart positive motion to said yoke, substantially as set forth.



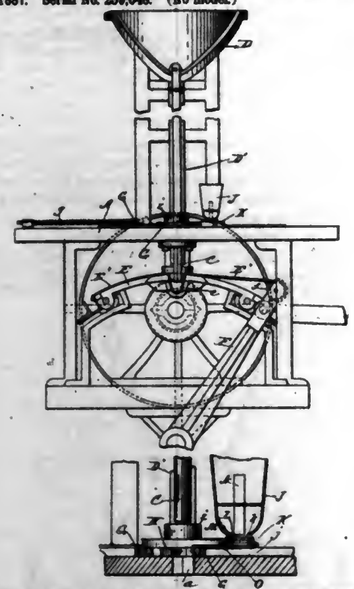
5. The combination of the stem c C, the slide-bearing K, surrounding and sliding with said stem, the sleeve F, inclosing said bearing and secured in the pendant, the internal annular projection, *m*, upon said sleeve, the divergent springs J, projecting from said bearing and resisting its sliding in said sleeve, the collar *e g*, fixed to the stem c C, and the spring S, engaging an arm of the yoke N and engaged by said collar, substantially as set forth.

401,075. ATTACHMENT AND OIL-FILLER FOR LAMPS. JOHN G. DELEKER, Boston, Mass. Filed Mar. 23, 1888. Serial No. 268,279. (No model.)

Claim.—A combined safety attachment and oil-filler for lamps, consisting of a shallow hollow casing having its lower end formed to fit into the body of the lamp and its upper end formed to receive the burner, and provided with a lip or trough and cover, substantially as shown, and for the purposes described.

401,076. CIGAR-BUNCHING MACHINE. STEPHEN A. SHEPARD, Allegheny, assignor to Lang & Shepard, Pittsburg, Pa. Filed July 1, 1887. Serial No. 243,139. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of a hopper, a discharge mechanism therefor, a bunching-cylinder, a bunching-apron, a rock-lever for actuating the discharge device, and straps which connect the cylinder and lever and are reversely wrapped around the cylinder, substantially as and for the purposes specified.



2. In a cigar-bunching machine, the combination of a hopper, a discharge mechanism therefor, a rock-lever connected to and actuating the discharge mechanism, a chute having a delivery-gate and means for actuating the same from the discharge mechanism, and a bunching-cylinder connected with and actuated from the rock-lever, substantially as and for the purposes specified.

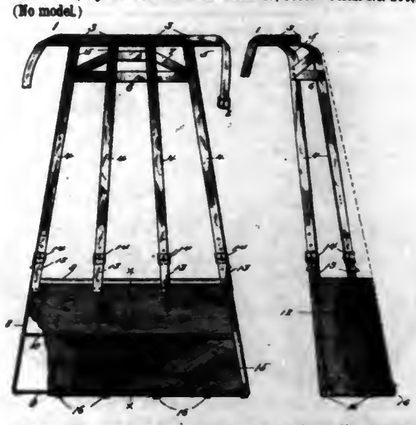
3. In a cigar-bunching machine, the combination, with the hopper having a reciprocating discharge-bottom, a rock-lever connected to and actuating the same, two reversely-moving agitators arranged above the bottom and operated by said lever, and a chute having a delivery-gate and means for actuating the same from the reciprocating bottom, substantially as and for the purposes specified.

4. In a cigar-bunching machine, the combination, with the hopper having a discharge-bottom, of two reversely-moving agitators or shafts in said hopper, a chute or receptacle into which the tobacco is delivered in measured quantities, a valve or gate in said chute, and a pivoted lever actuated by the discharge-bottom, substantially as and for the purposes specified.

5. In a cigar-bunching machine, the combination, with the hopper having reversely-moving agitators located therein and a moving discharge-bottom, of a chute or receptacle into which the tobacco is discharged in measured quantities, a valve in said chute, a pivoted lever actuated by the moving bottom of the hopper, and a bunching-apron located beneath the discharge end of said chute, substantially as and for the purposes specified.

401,077. CIGAR-MAKING MACHINE. JAMES R. SMITH, New York, N. Y., assignor, by direct and mesne assignments, of two-thirds to Adolph Moceeis and Benjamin Lichtenstein, same place. Filed Dec. 27, 1887. Serial No. 259,048. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of a main table having a vertical opening therein, a rolling-table located below the main table and provided with a cavity in line with said vertical opening, a hopper fixed to the main table at one side of the opening therein and elevated a short distance above the same, a reciprocating carriage provided with a cut-off operating on the main table and having an open mold adapted to slide beneath said hopper, and a vertically-reciprocating plunger adapted to pass through said open mold and the opening in the main table to carry the contents of the mold to the cavity in the rolling-table, substantially as and for the purpose described.



2. In a cigar-bunching machine, the combination of a main table having an opening therein, a cigar-rolling table located below said main table and having a cavity in the same vertical line with the opening in said main table, an apron connected to the rolling table, a hopper fixed to the main table at one side of the opening therein, a reciprocating carriage on the main table provided with a cut-off, and an open mold fixed to said carriage and adapted to alternately align with the discharge-orifice of the hopper and the opening in the main table, adjustable valves located in the bottom of said hopper for varying the area of the discharge-orifice thereof, a vertically-reciprocating plunger adapted to pass through said vertical opening and the open mold, and a rocking arm carrying the bunching-roller, substantially as described.

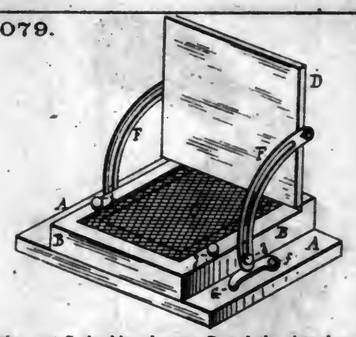
3. In a cigar-bunching machine, the combination of a main table having an opening therein, a cigar-rolling table having a cavity therein, an apron connected to said rolling-table, a rocking-arm carrying the bunching-roller and adapted to take the filler and bight in the apron out of the cavity in said rolling-table, a hopper fixed to the main table at one side of the vertical opening therein, a reciprocating carriage operating on the main table having a cut-off and an open mold secured thereto, regulating-valves located in the bottom of the hopper for varying the area of the discharge-orifice thereof, an agitator operating in the hopper above its discharge-orifice, and a reciprocating plunger adapted to pass through the opening in the table and the open mold, substantially as and for the purpose described.

4. In a cigar-bunching machine, the combination of a main table having an opening therein, a cigar-rolling table located below the same and having a cavity therein, a hopper fixed to the main table at one side of the vertical opening in said table, the endwise-adjustable valves located in the bottom of the hopper across the discharge-orifice therein and adapted to vary the area of the same, a reciprocating carriage having a cut-off and operating on the main table, an open mold fixed to the carriage, and a reciprocating plunger operating through the opening and the mold, substantially as and for the purpose described.

5. In a cigar-bunching machine, the combination of the main table having an opening therein, a cigar-rolling table having a cavity therein, a hopper fixed to the main table at one side of the vertical opening therein, endwise-adjustable valves located in the bottom of the hopper, a laterally-adjustable valve located above the endwise-movable valve and adapted to be moved transversely across the discharge-orifice in the hopper to vary the width thereof, a reciprocating carriage having a cut-off, an open mold fixed to said carriage, and a vertically-reciprocating plunger operating in the mold and vertical opening, substantially as and for the purpose described.

401,078. SKIRT-PROTECTOR. WILLIAM F. SMITH and ALBERT B. CATTERALL, Syracuse, N. Y. Filed Jan. 15, 1889. Serial No. 296,440. (No model.)

Claim.—The combination, with a series of depending tapes, of a protector-frame formed of steel ribs and bent to conform to the shape of the dress and having an outer covering of cambric and an inner facing of rubber, the lower end of the frame being provided with a series of dress receiving and securing clamps, and the upper end of the protector being provided with a series of short tapes having buckles for connection with the depending tapes, substantially as specified.



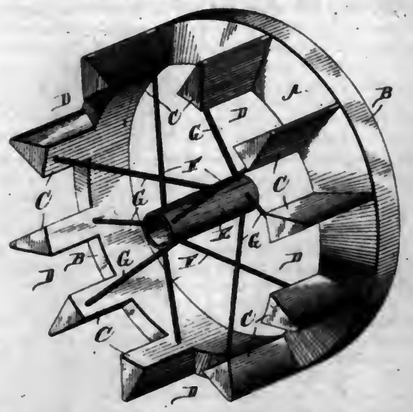
401,079. WAGON-SEAT. ROSCOE G. STONE, Warwick, R. I., assignor of one-half to Maynard L. Stone, same place. Filed Jan. 12, 1889. Serial No. 296,153. (No model.)

Claim.—1. A wagon-seat having a cover hinged thereto and provided with slotted guide-bars of quadrant shape movable on side pins of the seat-frame, so that said cover may be used interchangeably as a seat and a seat-back, substantially as described.

2. The combination of a wagon-seat, a cover hinged thereto and provided with quadrant-shaped slotted guide-bars which are movable on side pins of the seat-frame, and a spring adapted to automatically close said covers, substantially as shown.

3. The combination of the seat-frame B, having the pins *b*, the

401,079.



wire-netting seat C, the hinged cover D, and the slotted quadrant-shaped guide-bars fastened to said cover D, substantially as specified.

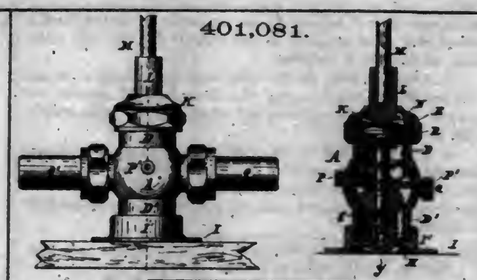
4. The combination of the seat-frame B, having the pins *b*, the wire-netting seat C, the hinged cover D, the spring *d*, and the slotted quadrant-shaped guide-bars F, fastened to said cover D, substantially as specified.

5. The combination of a wagon-seat, a back hinged thereto and having curved slotted guide-bars movable on side pins of the seat-frame, a slotted base-board, and a movable stop adapted to swing under the foot of the guide-bar to support the seat-back, substantially as described.

6. A wagon-seat consisting of a frame, B, a wire-netting, C, stretched thereon, and a cover, D, hinged to said frame, substantially as shown.

401,080. WHEEL. WILEY H. STROUD, Waxahachie, Tex. Filed Dec. 11, 1888. Serial No. 293,234. (No model.)

Claim.—1. In a wheel for the purpose named, the combination of the rim provided with a peripheral outwardly-tapered rib, B, and the lateral independent wedge-shaped ears or projections arranged on the side of the said rib with their outer edges flush with the outer edge of the rib, substantially as specified.



2. In a wheel for the purpose named, the combination of the rim provided with a tapered peripheral rib having laterally-extending wedge-shaped ears or projections C C, the hub, and the outer and inner series of spokes extending from the hub, respectively, to opposite ends of the said ears or projections, substantially as specified.

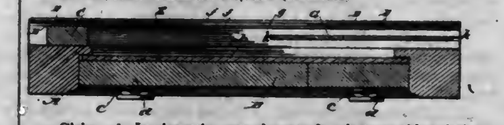
3. In a wheel for the purpose named, the combination, with the rim provided with laterally-extending independent ears or projections, of the hub and the outer and inner series of spokes, F and G, inclined in opposite directions and attached at their outer ends to alternate ears or projections, substantially as specified.

401,081. HOPPER-VALVE. CHRISTIAN STURM, Buffalo, N. Y. Filed Dec. 14, 1888. Serial No. 293,542. (No model.)

Claim.—As an improved article of manufacture, a hopper-valve consisting, essentially, of a body having cylinders D D', a valve-seat located centrally in said body, a cap and a bottom piece to close said cylinders, the former having a passage for the push-button L, and a valve consisting of a stem having a curved top, E, a cup-shaped piston secured underneath said head by a nut, and an elastic valve proper located in the egress side of the cylinders, whereby the initial pressure of the liquid passing through the valve acting upon said piston will close the valve proper, as and for the purpose set forth.

401,081.

401,082. LAWN-TENNIS NET. FREDERICK W. TAYLOR, Philadelphia, Pa. Filed Dec. 20, 1887. Serial No. 258,486. (No model.)

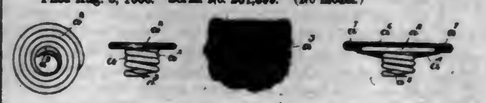


Claim.—1. In a lawn-tennis net, the combination, with a reticulated body having an upper sight-tape, of a centrally re-enforced portion joined to said sight-tape, substantially as set forth.

2. In a lawn-tennis net, the combination, with a reticulated body having upper and lower sight-tapes, of a centrally re-enforced portion joined to said sight-tapes, substantially as set forth.

3. In a lawn-tennis net, the combination of a reticulated body having its upper, middle, and lower portions of greater strength than the adjacent portions, and two sight-strips, one of which is attached to the upper and the other to the lower extremity of the body, substantially as set forth.

401,083. VIGNETTING ATTACHMENT FOR PHOTOGRAPHIC-PRINTING FRAMES. JOSEPH R. TEWKESBURY, Fort Madison, Iowa. Filed Nov. 27, 1888. Serial No. 291,965. (No model.)



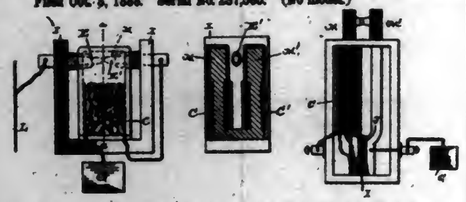
Claim.—1. In vignetting attachments for photographic-printing frames, the combination, with the printing-frame A, of the attached mask-carrying frame C, closed on its sides over the printing-frame, but provided with opposite side slots, *h h*, at its lower end, substantially as specified.

2. In vignetting attachments for printing-frames, the combination, with the printing-frames A, of the attached mask-carrying frame C, closed on its sides over the printing-frame, but provided with opposite side slots, *h h*, at its lower end, and the adjustable and flexible vignetting-mask G, having opposite arm-like projections, *i i*, on its sides adapted to slide within said slots as guides and to provide for the adjustment of the mask G in various directions, essentially as described.

3. In vignetting attachments for photographic-printing frames, the combination, with the printing-frame, of the attached frame C, the masks D D, of card-board or other suitable thin material, secured to said frame C, and having enlarged openings *f* in them, and the loose mask E, adjustable in various directions between the masks D D, and provided with a suitably-shaped smaller aperture, *g*, substantially as specified.

4. In vignetting attachments for photographic-printing frames, the combination, with the printing-frame, of the attached frame C, the masks D D, secured to said frame C, and having enlarged openings *f* in them, the loose mask E, adjustable in various directions between the masks D D, and provided with a suitably-shaped smaller aperture, *g*, and the adjustable and flexible cut-off vignetting-mask G, all of said masks being constructed of card-board or other suitable thin material and being arranged in relation to each other and to the printing-frame, essentially as shown and described.

401,084. BUTTON. GEORGE H. THOMAS, Chicopee Falls, Mass. Filed Aug. 3, 1888. Serial No. 281,899. (No model.)



Claim.—1. As an improved article of manufacture, a button

having the head a^3, formed of wire, the worm or tubular shank a, formed by a close spiral coil of wire integral with the wire of the head, substantially as described.

2. A button having the flat coiled head a^3 and shank a, the said head and shank being formed of wire in one piece, as specified, and a cap or covering secured to the flat coiled head by a collet, substantially as described.

3. A button having the flat coiled head a^3 and shank a, the said head and shank being formed of wire in one piece, the end a^5 of the wire being pointed and bent to a position in line with the axis of the shank, but slightly removed from the last coil thereof, substantially as described.

401,085. LIGHTNING-ARRESTER. ELIHU THOMSON, Lynn, Mass. Filed Oct. 9, 1888. Serial No. 287,565. (No model.)

Claim.—1. In an arc-rupturing device, a shield of insulating material located between the surfaces of the electrodes and adjacent conducting-surfaces of the device by which the arc is disrupted, as and for the purpose described.

2. An arc-rupturing device having its exposed surfaces adjacent to surfaces of the arcing electrodes or bodies shielded with insulating material.

3. The combination, with electrodes liable to abnormal arcing, of an arc-dispelling magnet and a shield of insulating material between opposed surfaces of the magnet and electrodes, as and for the purpose described.

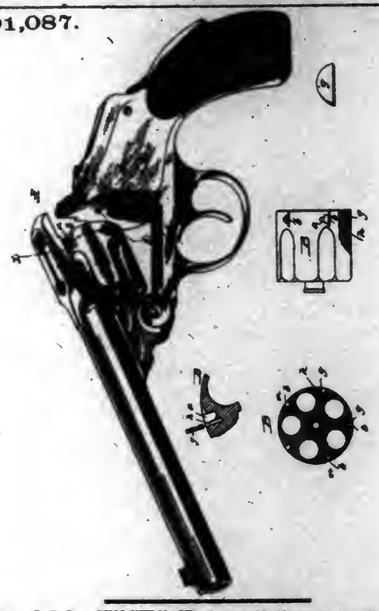
4. In an arc-rupturing device, a magnet whose poles are covered with insulating-shields.

5. In an arc-rupturing device, an intercepting-shield of solid insulator between the poles of an arc-rupturing magnet and the arcing-electrodes.

6. In an arc-rupturing device, magnet portions shielded by an insulating-covering, in combination with shielded electrodes having an exposed metal portion wholly within the space between the magnet-poles.

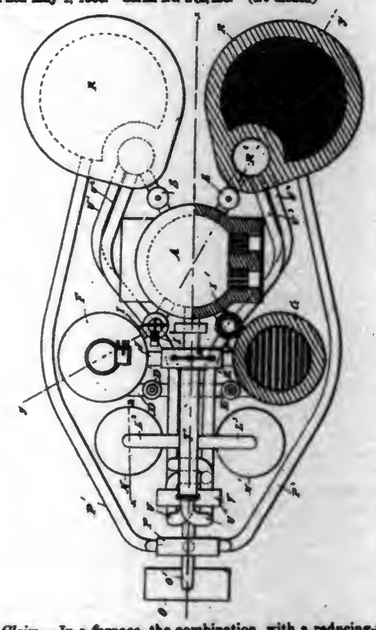
7. In an arc-rupturing device, a divided magnet whose portions are electrically insulated, but free for the passage of magnetism from one to the other, the poles of which magnet each bear one of a pair of electrodes connected, respectively, to the parts of an electric circuit, substantially as described.

401,086. HINGE. JAMES A. TURNER, Evanston, Ill. Filed Dec. 9, 1887. Serial No. 257,204. (Model.)



Claim.—The herein-described hinge, consisting of the leaves B C, adapted for attachment to the parts to be joined, knuckles *b c*, formed on said leaves, pivots passing through said knuckles, a link, as D, connecting the two leaves, said link being bent at right angles near its ends to form flat faces or shoulders located in position to rest in contact with the adjacent flat faces of the leaves when the leaves are folded together or parallel with each other, and having knuckles formed upon the ends of the bent portions of the link to engage the pivots E E', substantially as described.

401,087. REVOLVING FIRE-ARM. DANIEL B. WESSON, Springfield, Mass. Filed Jan. 31, 1889. Serial No. 298,277. (No model.)

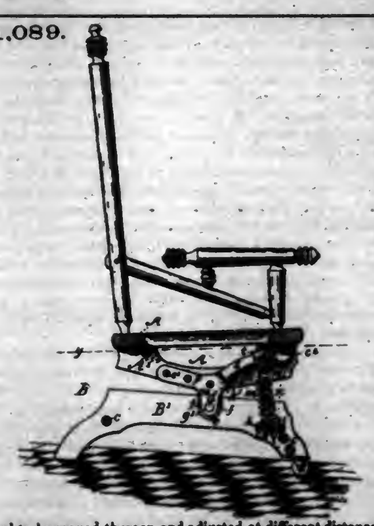


Claim.—1. A cylinder for revolving fire-arms, provided with peripheral catch-notches having the abutment-wall of each thereof formed of a block of suitable material harder than that from which the cylinder proper is formed and let into a recess therein and there rigidly secured, substantially as and for the purpose described.

2. In a revolving fire-arm, the combination, with the stock or frame provided with a cylinder-catch, of the cylinder provided with peripheral catch-notches having the abutment-wall of each thereof formed of a block of suitable material harder than that from which the cylinder proper is formed and let into a recess therein and there rigidly secured, substantially as and for the purpose described.

401,087.

401,088. ZINC-FURNACE. GUSTAF M. WESTMAN, New York, N. Y. Filed May 1, 1888. Serial No. 272,428. (No model.)



Claim.—In a furnace, the combination, with a reducing-furnace, of regenerators connected alternately with the reducing-furnace, condensers, each connected by two or more pipes with the said reducing-furnace, coolers connected with the said condensers, and a blast-engine connected with the said coolers and the said regenerators, substantially as shown and described.

401,089. OSCILLATING CHAIR. CHARLES R. WHITTLESEY, New Haven, assignor of one-half to Charles Lee, Bridgeport, Conn. Filed Nov. 15, 1888. Serial No. 290,972. (No model.)

Claim.—1. The combination, with the stationary and tilting parts of an oscillating chair, of a spring pivotally attached to one of the parts, a guide, track, or lever-arm attached to the other part in a line the points of which are at different distances from the center of oscillation, and an attachment for connecting the spring to the lever-bar,

401,089.

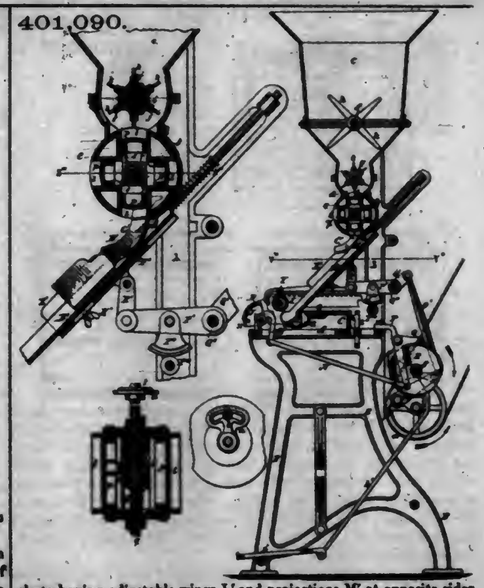
adapted to be moved thereon and adjusted at different distances from the center to vary the force of the action of the spring.

2. The combination, with the stationary and tilting parts of an oscillating chair, of a spring pivotally attached or hinged to one of the parts, a curved lever-arm attached to the other part arranged in a line the points of which are at different distances from the center of oscillation, and having its curve formed in the arc of a circle approximately concentric to the pivotal center of the spring when the chair is in normal position, and a sliding part fitted upon the lever-bar and connected to the spring and adapted to be moved along the arm to vary the leverage of the action of the spring on the chair.

3. The combination, with the stationary and tilting parts of an oscillating chair, of a spring pivotally attached or hinged to the base thereof, a lever-arm attached to the tilting part and arranged in a line the points of which are at different distances from the center of oscillation, an attachment fitting upon the lever-arm and adapted to slide thereon and having the spring connected to it, and means for securing the sliding attachment to the arm at different distances from the center of oscillation to vary the leverage of the action of the springs on the oscillation of the chair.

4. The combination, with the stationary and tilting parts of an oscillating chair, of a spiral spring pivotally connected or hinged at one end to the base of the chair, a curved arm attached to the tilting part as a lever from the center of oscillation, a part fitted upon the arm and adapted to slide thereon and connected with the upper end of the spring, and a set-screw for securing the said part to the arm at different distances from the center of oscillation, as specified.

5. The combination of the base B, having the side frames B', the tilting part A, having the side frames A', each hinged to the side frames of the base, with the axis below the surface of the frames of the base, the lever-arms S, attached to the side frames of the tilting part, the springs *m*, pivotally attached to the base at the lower ends, the sliding attachments *t*, fitted to slide upon the lever-arms, with the upper ends of the springs connected to them, and set-screws for securing the sliding attachments upon the lever-arms at different distances from the center of oscillation, substantially in the manner and for the purpose specified.



401,090. CIGAR-BUNCHING MACHINE. JOHN R. WILLIAMS, Newark, N. J., assignor to the John R. Williams Company, New York, N. Y. Filed July 19, 1888. Serial No. 280,409. (No model.)

Claim.—1. In a cigar-bunching machine, the inclined chute secured to a casting or frame, inclined guide-rods for controlling the movement of the chute, and mechanism for moving the said chute and frame on said rods from the driving-shaft, combined with a rolling-table, apron, and reciprocating roller, the elevated hopper for scrap-tobacco, and feed mechanism, substantially as and for the purposes set forth.

2. In a cigar-bunching machine, the chute having adjustable wings at its lower end and connected with the frame or casting, the inclined guide-rods for said frame, and mechanism, substantially as described, for imparting an inclined sliding movement to the chute, combined with the rolling-table, apron, reciprocating roller, and hopper for scrap-tobacco, substantially as and for the purposes set forth.

3. The rolling-table having at its front end a recess and plate, G, combined with the reciprocating roller and the chute secured to a frame and having an inclined sliding movement, the lower end of the

401,090.

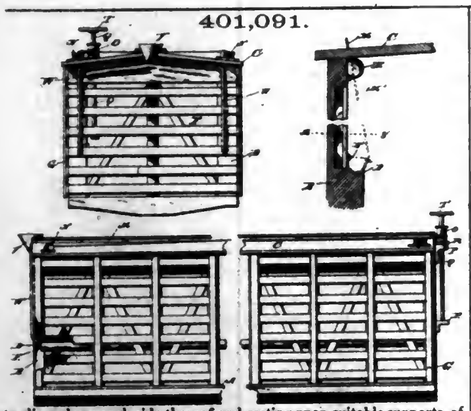
chute having adjustable wings L' and projections M' at opposite sides extending below the chute, substantially as and for the purposes set forth.

4. In a cigar-bunching machine, the rotary cylinder *c*, containing the recesses *l*, the confining-plate *z* for said cylinder, and the hinged door A', which when open operates as a chute for the tobacco, combined with the chute B', for conveying the charges of tobacco measured in said recesses to the rolling-table, the elevated hopper for containing the tobacco in bulk, and mechanism for rotating the said cylinder and for opening and closing said door, substantially as shown and described.

5. In a cigar-bunching machine, the cylinder *c*, containing recesses *l*, the platens *p*, having racks *s*, pinion *r*, meshing with said racks, shaft *q*, and confining-plate *z*, having door A', combined with the chute for conveying the tobacco from said recesses to the rolling-table, an elevated hopper for the tobacco in bulk, and mechanism for rotating the said cylinder and for opening and closing said door, substantially as set forth.

6. In a cigar-bunching machine, the cylinder *c*, containing recesses and platens *p*, the confining-plate *z*, and the pivoted door A', operating in conjunction therewith and provided with lateral projections D', combined with the sliding chute and frame connected therewith, the sides of said frame forming cams for opening and closing door A', and an elevated hopper for feeding charges of tobacco to said recesses, substantially as set forth.

7. In a cigar-bunching machine, the cylinder *c*, containing recesses *l*, the platens *p*, having racks *s*, pinion *r*, meshing with said racks, shaft *q*, having index-finger *t*, and index-plate *u*, combined with the confining-plate *z*, provided with a pivoted door, A', the chute for conveying the charges of tobacco to the rolling-apron, and the elevated hopper for feeding the tobacco to said recesses, substantially as set forth.

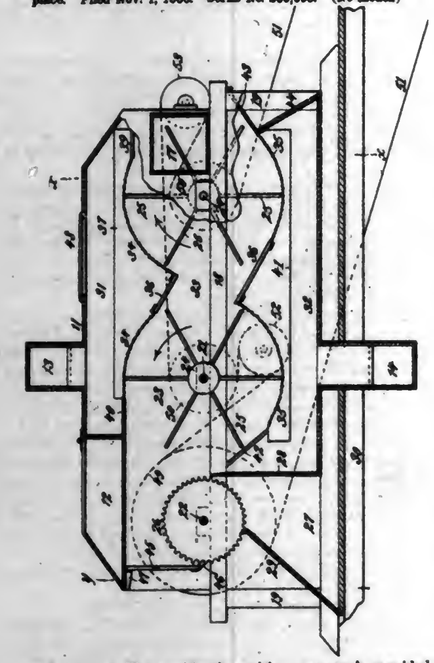


8. In a cigar-bunching machine, the elevated hopper for the tobacco in bulk, a charge-receptacle below said hopper, a door connected with said receptacle to confine or permit the escape of the charges of tobacco therefrom, mechanism, substantially as described, for opening and closing said door, and the bunch-rolling mechanism, combined with the chute leading from the charge-receptacle to the rolling mechanism, and the blades J' J', secured at the upper end of the chute, said blades converging toward each other at their outer ends and constituting walls to direct or distribute the charges of tobacco on said chute, substantially as and for the purposes specified.

9. In a cigar-bunching machine, the elevated hopper having a reduced lower end, combined with the horizontal shaft *g* in said lower end and having the collar *i*, provided with the recesses *j*, and radial blades *k*, of flexible material, the receptacle below said hopper for measuring the charges of tobacco, and having a hinged door, A', mechanism, substantially as described, for operating said door, and a chute for conveying the charges of tobacco from said receptacle to the rolling mechanism, substantially as set forth.

401,091. STOCK-CAR. JOHN R. WILSON, Farmville, Va. Filed Oct. 17, 1888. Serial No. 288,277. (No model.)

Claim.—1. The combination, with the car and the troughs ex-



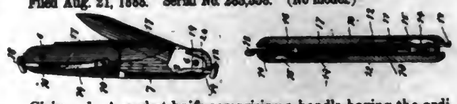
401,091.

tending along each side thereof and resting upon suitable supports, of guides hinged to the outer edges of the troughs, respectively, and sliding in ways in the car-walls, a funnel fixed without the car above the plane of the troughs, pipes leading from said funnel to points slightly above the ends of the troughs and terminating in open ends substantially parallel to the troughs, respectively, cords secured to the inner edges of the troughs and passing vertically through the car-roof, and means for drawing all said cords simultaneously upward, substantially as set forth.

2. The combination, in a stock-car, of the trough E, the grooved posts B, the rollers H, working in the grooves in the posts, the links I, connecting the rollers and the outer edge of the trough, the cords M, and means for drawing the cords upward simultaneously, whereby the trough may be raised to the top of the car and be at the same time partially inverted.

401,092. SEED-COTTON CLEANER. WILLIAM M. WILSON, Friar's Point, Miss., assignor of one-half to William Henry Dickerson, same place. Filed Nov. 1, 1888. Serial No. 289,695. (No model.)

Claim.—1. The combination, with a receptacle provided with longitudinal spaced screens dividing the receptacle into three compartments, a supply-tube entering the central compartment near the front end thereof, and exhaust-tubes connecting with the upper and lower compartments, of a series of rotary beaters in the central compartment, and a delivery-cylinder adjacent to the discharge end of said compartment, substantially as shown and described.



2. The combination, with a receptacle provided with longitudinal spaced screens dividing the receptacle into three compartments, a supply-tube entering the central compartment near the front end thereof at a right angle, and exhaust-tubes connected with the upper and lower compartments, of shafts within the central compartment, provided with beaters, said shafts capable of revolving in opposite directions, means, substantially as shown, for revolving said shafts, as described, and a delivery-cylinder having a roughened periphery journaled in the main frame and adjacent to the discharge end of the central compartment, all combined to operate substantially as shown and described.

3. The combination, with a receptacle provided with longitudinal spaced screens dividing the same into three compartments, a supply-tube entering the central compartment near the front end thereof, and exhaust-tubes connected with the lower and upper compartments, of a series of beaters journaled in the central compartment, a delivery-cylinder journaled in the main frame at the rear or discharge end of the central compartment, and a gravity air-valve pivoted at the rear of the cylinder in the outlet of the receptacle, substantially as shown and described.

4. The combination, with a receptacle provided with longitudinal spaced screens dividing the receptacle into three compartments, a supply-tube entering the central compartment near the front end thereof at a right angle thereto, and exhaust-tubes connecting with the upper and lower compartments, of shafts provided with arms journaled in the central compartment, capable of revolving in opposite directions, means, substantially as shown, for revolving said shafts, a corrugated delivery-cylinder journaled in the main frame at the discharge end of said compartment, and a gravity air-valve pivoted at the rear of the cylinder in the outlet of the receptacle, substantially as shown and described.

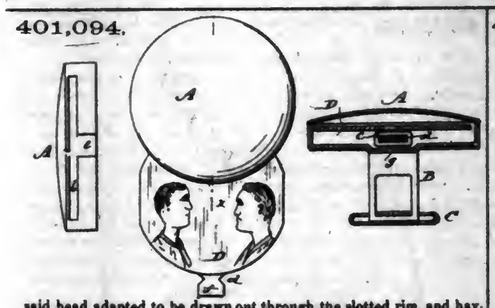
5. The combination, with a receptacle provided with longitudinal spaced screens dividing the receptacle into three compartments, a supply-tube entering the central compartment near the front end thereof, and exhaust tubes connected with the upper and lower compartments, of oppositely-revolving shafts journaled transversely in the central compartment, hubs attached to said shafts, and beater-arms projecting from the hubs, alternately flaring in opposite directions, means for operating said shafts, as described, a roughened delivery-cylinder journaled in the main frame at the discharge end of the said compartment, and a gravity air-valve pivoted at the rear of the cylinder and in the outlet of the receptacle, all combined substantially as shown and described.

401,093. POCKET-KNIFE. ARTHUR WILSIN, New York, N. Y. Filed Aug. 21, 1888. Serial No. 283,358. (No model.)

Claim.—1. A pocket-knife comprising a handle having the ordinary back-spring, a blade normally held partially projected or open by said spring, and having the usual shouldered heel to engage the spring when the blade is fully opened and be locked thereby, and a lock or catch to engage the blade when fully closed, substantially as set forth.

2. The combination, with the knife-handle and the ordinary back-spring held therein, of a blade having a projection on the inner edge of its pivotal portion in front of the pivot and bearing against the said spring when the blade is closed, and a lock or catch to hold the blade fully closed, as set forth.

3. A pocket-knife constructed with a blade having its pivotal portion formed with a projection bearing against the knife-spring, in combination with a spring-actuated locking device mounted on the knife-handle and extending between and clamped by the knife-spring and the butt of the pivotal portion of the blade, substantially as shown and described.



4. A pocket-knife constructed with a blade having its pivotal portion formed with a projection bearing against the knife-spring, in combination with a locking device mounted on the knife-handle and extending between and clamped by the knife-spring and the butt of the pivotal portion of the blade, substantially as shown and described.

5. A pocket-knife constructed with blade 2, having its pivotal portion 1 formed with a projection, 3, bearing against knife-spring 7, a receding part, 4, adjacent thereto, with a heel, 5, in combination with spring-arm 9, laterally movable in a recess, 11, in the knife-handle, having at its outer end the tip 13, and a pin, 8, extending through opening 8' in the plate 10, and between knife-spring 7 and receding part 4 of the pivotal portion 1 of knife-blade, substantially as shown and described.

401,094. CAMPAIGN-BUTTON. LEON WESTERDORF and AUGUST REYNOUD, New York, N. Y. Filed Aug. 1, 1888. Serial No. 281,629. (No model.)

Claim.—1. The campaign-button herein described, consisting of a hollow head having a slotted rim, and with a portrait-slide within

401,094.

said head adapted to be drawn out through the slotted rim, and having a spring operating to draw the slide within the button, substantially as shown and described.

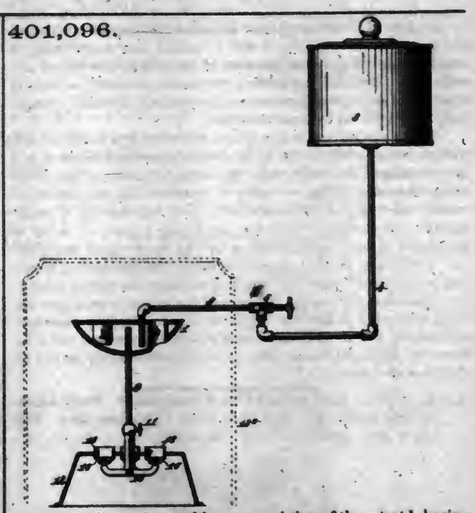
2. The combination of the hollow button or button-head A, having a slot in its rim, the portrait-slide D, arranged to pass in and out of said button through said slot, the draw-bar or pull-piece *d*, attached to said slide and projecting beyond the rim of the button, and a spring closing the slide within the button, essentially as shown and described.

401,095. LIGHTNING-CONDUCTOR FOR WIRE FENCES. FREMONT E. WOOD, Yucca, Ariz. Filed Nov. 23, 1888. Serial No. 292,058. (No model.)

Claim.—1. In a lightning-conductor for wire fences, the combination of a sectional conductor and clamping-sockets formed of two sections, each section being provided with a longitudinal groove and an aperture at right angles to the groove, substantially as described.

2. In a lightning-conductor, the combination of the sectional conductor, sectional sockets in which the ends of the sectional conductor are secured, and a connecting or binding wire for connecting the ends of the sectional conductor with the strands of a wire fence, substantially as described.

3. A sectional socket consisting of a socket-section, 10, formed with a central groove and ribs 12 and 12ª, and a socket-section, 13, formed with ribs 15 and 15ª, and a means, substantially as described, for connecting the sockets, as and for the purpose stated.



4. In a lightning-conductor, the combination, with rods 20, of socket-sections 10 and 13, screws 2, a binding-wire, 21, and set-screws, as 22 and 23, substantially as described.

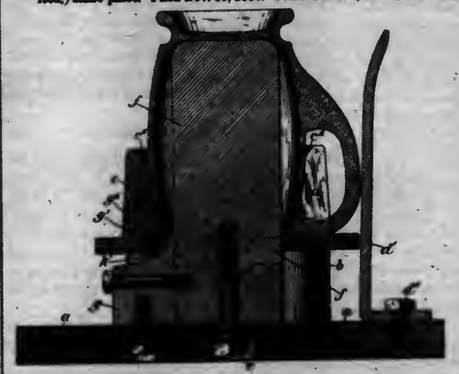
401,096. HEATER FOR STOVES AND OTHER PURPOSES. SAMUEL H. ALTICE, HENRY P. ROBERTS, and CUNNINGHAM REED, Jamestown, N. Y.; said Roberts assignor to said Altice and Reed. Filed May 3, 1888. Serial No. 272,662. (No model.)

Claim.—1. The open air-supply pan 12, having a perforated top wall and adapted to set within a stove, and the air-chamber 13, open at the top, supported by and rising above said top wall, and in communication at its base with the interior of the air-supply pan, in combination with the burner projecting into the air-chamber, the retort, the vapor-conducting tube, and the oil-supply pipe, substantially as described.

2. An oil vaporizer and burner consisting of the retort 1, having flues 2 extending entirely through it, the oil-supply tube 4, the vapor-conducting tube 9, communicating with the retort, descending therefrom, and provided with a burner at its lower end, the open air-supply pan 12, adapted to set within a stove and having a perforated top wall, and the air-chamber 13, open at the top, supported by and rising above said top wall surrounding the burner, and in communication at its base with the interior of the air-supply pan, substantially as described.

401,096.

3. An oil vaporizer and burner consisting of the retort 1, having flues 2 extending therethrough, the oil-supply pipe 4, the vapor-conducting tube 9, leading down from the retort and provided at its lower end with a series of burner-tips, the air-supply pan 12, adapted to set within a stove and having a series of openings in its top wall, and a series of air-chambers, 13, supported in said openings and each one rising above the top wall surrounding a burner and provided with openings 15 at its lower end, placing it in communication with the interior of the air-supply pan, substantially as described.



401,097. BRICKS, &c., INCRUSTED WITH METAL. JAMES C. ANDERSON, Highland Park, Ill. Filed Nov. 30, 1888. Serial No. 292,309. (Specimens.)

Claim.—As a new article of manufacture, a brick or tile having a metallic incrustation formed integral with the same without an intermediate vitrifiable material.

401,098. METHOD OF INCRUSTING BRICK. JAMES C. ANDERSON, Highland Park, Ill. Filed Nov. 30, 1888. Serial No. 292,308. (No specimens.)

Claim.—An improvement in the art of manufacturing bricks, blocks, and tiles, which consists in applying finely divided or comminuted metals to the bricks, blocks, or tiles while the same are in a green or unburned state, and in then burning said articles to the pottery point to fuse the metal and cause it to form an incrustation or envelope of metal integral with the main body of the article.

401,099. APPARATUS FOR SHAPING GLASSWARE. JOSEPH ANDERSON, Pittsburg, Pa., assignor to the O'Hara Glass Company, (Limited,) same place. Filed Nov. 19, 1887. Serial No. 255,581. (No model.)

Claim.—1. A former for shaping glass articles, which consists in a central guide die or post and an outer matrix into the cavity of which the article is inserted, said matrix being of less width than the original diameter of the article to be shaped and being contracted in diameter from the outside inwardly, whereby a compressing and shaping action on the article is obtained, substantially as and for the purposes described.

2. A former for shaping glass articles, which consists in a matrix into the cavity of which the article is inserted, said matrix being of less width than the original diameter of the article to be shaped and being contracted in diameter from the outside inwardly, whereby a compressing and shaping action on the article is obtained, substantially as and for the purposes described.

3. In a former for shaping glass articles having a handle or projection, a matrix into the cavity of which the article is inserted, said matrix being of less width than the original diameter of the article to be shaped and being contracted in diameter from the outside inwardly, the cavity of the matrix being slotted at the side to permit passage of the handle or projection and having a guide, *d'*, situate at the rear of the slot, substantially as and for the purposes described.

4. A former for shaping glass articles, which consists in a matrix into the cavity of which the article is inserted, said matrix being of less width than the original diameter of the article to be shaped and being contracted in diameter from the outside inwardly, whereby a compressing and shaping action on the article is obtained, and a lip-former or die at the base of the said matrix, substantially as and for the purposes described.

401,100. CORNER-IRON FOR WAGON-BOXES. PETER ANDERSEN, Fort Wayne, Ind., assignor to Henry G. Olds, same place. Filed July 6, 1888. Serial No. 279,189. (No model.)

Claim.—1. An iron wagon-box corner combining in one piece an exterior rib constituting the outer corner of the box, a single thin connecting septum or web, and diverging interior flanges fitting the interior corner of the box and forming by these three parts mitered recesses for receiving and holding the wooden side and end of the box, substantially as shown and described.

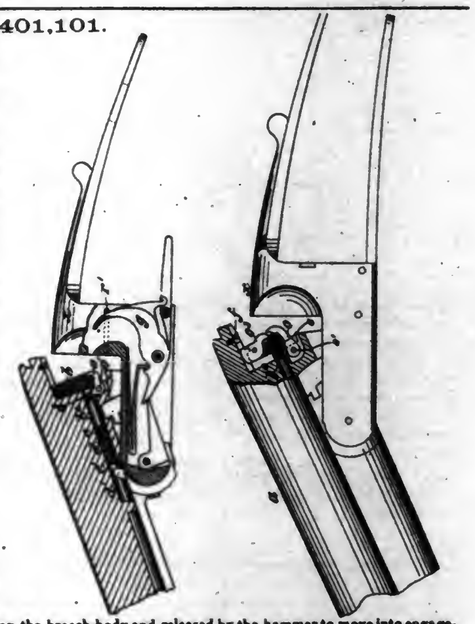
2. A set of corner-irons for a solid wagon-box corner, comprising an upright corner of iron having an exterior rib forming the outer corner of the box, a connecting septum or web, and diverging interior flanges fitting the inner corner of the box and forming by these three parts mitered recesses for receiving and holding the wooden side and end of the box, and a top piece fitting the upper and inner edge of the box and bolted thereto, substantially as described.

3. A set of corner-irons for a solid wagon-box corner, comprising, in combination, the upright corner-iron I and the top piece, T, constructed and combined substantially as described.

4. A corner-iron for the rear end of a wagon-box having a hinged end-gate, combining in one piece an exterior rib forming the outer corner of the box, a recess to receive the end of the wooden side of the box, a catch to hold the latch of the end-gate, and an inner flange fitting against and fastened to the rear corner-post of the box, substantially as described.

5. The corner-iron I', substantially as described.

6. A corner-iron for a wagon or buggy seat, combining in one piece an exterior rib forming the outer corner of the seat, a single thin connecting septum or web, and diverging interior flanges fitting the interior corner of the seat and forming by these three parts mitered recesses for receiving the ends of the back and side of the seat, the said parts being combined in planes and angles corresponding to the planes and angles of the back, sides, and bottom of the seat, substantially as described.



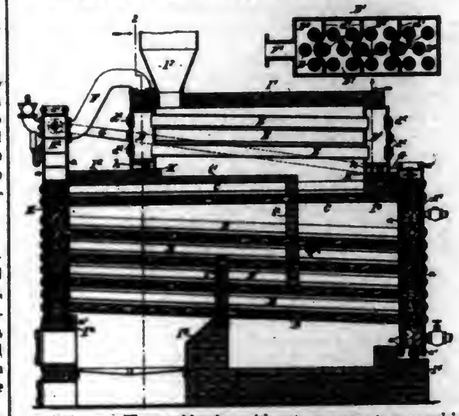
401,101. BREECH-LOADING FIRE-ARM. WILLIAM ARMOS, Birmingham, County of Warwick, England. Filed Aug. 3, 1888. Serial No. 282,195. (No model.) Patented in England Dec. 9, 1886, No. 16,138.

Claim.—1. The combination, with a drop-down barrel, a breech-body, and a lift for the ejecting mechanism, of an extractor-ejector, a retaining-catch therefor on the breech end of the barrel, a rod moved lengthwise of the extractor-ejector by the lift, and a spring acting on the extractor-ejector and compressed when the rod is moved by the lift, substantially as described.

2. The combination, with a drop-down barrel, a breech-body, and a lift for the ejecting mechanism, of an extractor-ejector comprising a head and a tubular shank or sleeve extending therefrom, a lengthwise-movable rod located in the shank and having a head at its inner end to be acted on by the lift, a spring between the shank and the head of the rod, and a retaining-catch pivoted on the breech end of the barrel, substantially as described.

3. The combination, with a drop-down barrel, a breech-body, and an extractor-ejector, of a movable dog on the extractor-ejector to engage and hold an unfired cartridge, a hammer and a plunger arranged

401,101.

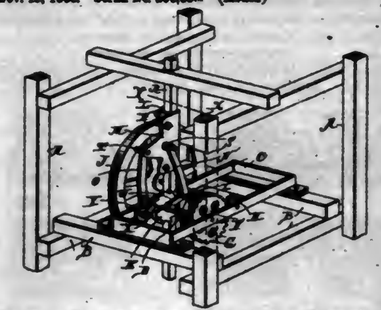


on the breech-body and released by the hammer to move into engagement with the dog for disengaging the latter from the cartridge when the barrel is dropped, substantially as described.

4. The combination, with a drop-down barrel, a breech-body, and an extractor-ejector, of a dog pivoted on the extractor-ejector to engage and hold an unfired cartridge, a plunger on the breech-body, and a hammer which holds the plunger retracted while cocked and releases such plunger when uncocked and permits the latter to advance and engage the dog, substantially as described.

5. The combination of a drop-down barrel, a breech-body, and an extractor-ejector, of a dog pivoted on the extractor-ejector and having a lip to engage and hold an unfired cartridge, a plunger on the breech-body having a lateral leg, a spring for advancing the plunger to engage the dog, and a hammer which holds the plunger retracted when cocked, substantially as described.

401,102. STEAM-GENERATOR. MICHAEL C. ARMOUR, Chicago, Ill. Filed May 7, 1888. Serial No. 273,011. (No model.)



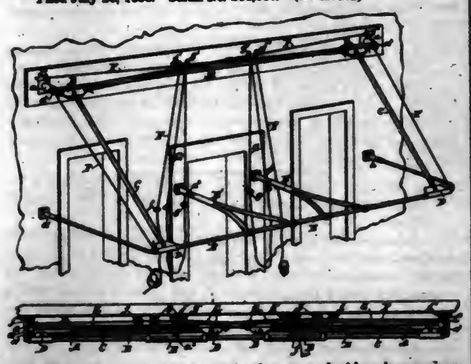
Claim.—1. The combination, with a steam-generator comprising two water-heads arranged at opposite ends of the generator and extending the full width of the same, a series of inclined water-tubes located between and connected at their opposite ends to said water-heads, and a second series of horizontal water-tubes located above the same, one of said water-heads being extended above the horizontal water-tubes to form a separating-chamber, of a plurality of separate steam-headers arranged at opposite ends of the boiler, and steam-heating pipes connecting said headers with each other and one of said headers with the top of said separating-chamber, one of said

headers being provided with an opening forming the steam-exit of the boiler, substantially as described.

2. The combination, with a steam-generator provided with a steam-space or separating-chamber, of steam-headers D D', divided into a series of chambers or compartments by transverse partitions, steam pipes or tubes E E E, connecting said headers, and a pipe or passage connecting one of the headers with the steam-space of the generator, substantially as described.

3. The combination, with a steam-generator comprising two water-heads and intermediate water-tubes connected therewith, two steam-headers, D and D', and a plurality of steam-heating pipes, E E E, communicating with the said headers, and a pipe connecting said headers and steam-heating pipes with the steam-generator, of transverse girders located over the water-tubes of the boiler and sustaining said steam-headers D and D', substantially as described.

401,103. DEVICE FOR CONVERTING MOTION. CHARLES R. ARMSTRONG, Nevada, Iowa, assignor to Jay A. King, same place. Filed Nov. 15, 1888. Serial No. 290,890. (Model.)

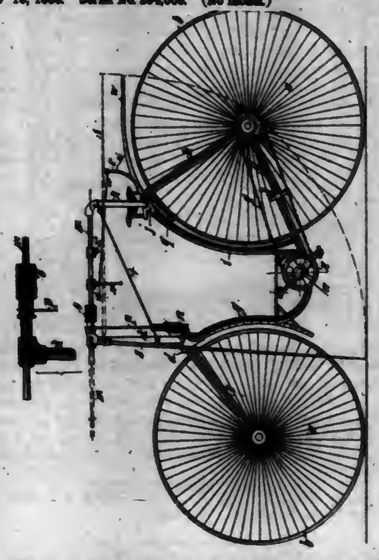


Claim.—1. The combination of the main shaft, the ratchet-wheel mounted thereon, the plates W, extending from said shaft and having notches in their edges, the pawls pivoted to said plates and engaging the ratchet-wheels, and the springs having one end bearing upon the pawls and the other end engaging one of the notches in the plates W, as set forth.

2. The combination, with the reciprocating rod, of the L-shaped clamping-plates fitting around the same and provided with perforated ears, the securing-bolts passed through said ears, the pitmen pivoted to one of said clamping-plates, the main shaft, the ratchet-wheel on the said shaft, and the pawls operated by the pitmen and engaging said ratchet-wheel, as set forth.

3. The combination of the reciprocating rod, the main shaft, the ratchet-wheel mounted thereon, the clamping-plates L M, fitting around the reciprocating rod, the plate L, having the pairs of ears P, and the plate M, having the perforated ears Q and the projection R, the securing-bolts passed through the ears P Q to bind the clamping-plates around the reciprocating rod, the stud S, projecting laterally from the end of the projection R, the stud T, projecting from the plate M in a direction opposite to the stud S, the pitmen pivoted to said studs, and the pawls operated by said pitmen and engaging the ratchet-wheel, as set forth.

401,104. AWNING-FRAME. CHARLES M. ASHBY, De Smet, Dak. Filed July 26, 1888. Serial No. 281,117. (No model.)



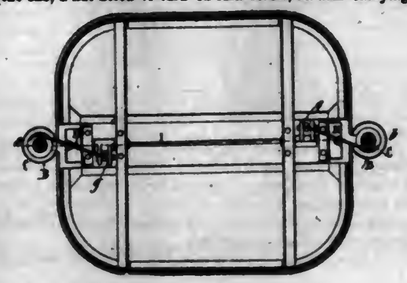
Claim.—1. An awning-frame having on each side a brace pivotally secured at one end to its pivoted or hinged bow or projecting part and at the other end to a runner or sleeve movable on the rear or guide rod, and having suitable cords to operate it, whereby it can be let down and locked in position or raised and folded, substantially as described.

2. The awning-frame composed of the guide-rod A, secured upon projecting standards, the bow or projecting part E, hinged to like standards, and the brace-rods C, one on each side, pivoted at one end to the bow and at the other to runners on the rod A, substantially as and for the purposes set forth.

3. The guide-rod A, secured at a distance from the face of the building, the bow E, hinged to standards, the brace-rods C, pivoted at one end to the bow and at the other movable on the rod A, and the cords F and G, the whole combined and operating in the manner set forth.

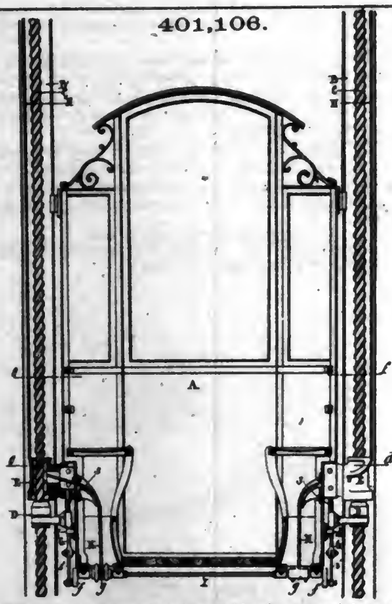
401,105. BICYCLE. DÉSIRÉ A. BAZE, Paris, France. Filed Dec. 18, 1888. Serial No. 294,006. (No model.)

Claim.—1. The combination, in a bicycle, of an upper frame, *k*, having on one side a slide, *m*, to provide for opening it, a cross-head, *d*, and a lower frame, *g h i*, connected in front with the cross-head *d*, and connected with the upper frame, *m*, at the rear thereof, substantially as and for the purpose herein set forth.



2. The combination, with a frame, *k*, and the cross-head *d*, of the fork *c*, provided with a rod or pivot passing through it, the pulley *n* on the upper end of the said rod or pivot, the collars *o* on the sides of the frame *k*, and the cords *p*, connecting said collars with the said pulley, all substantially as herein set forth.

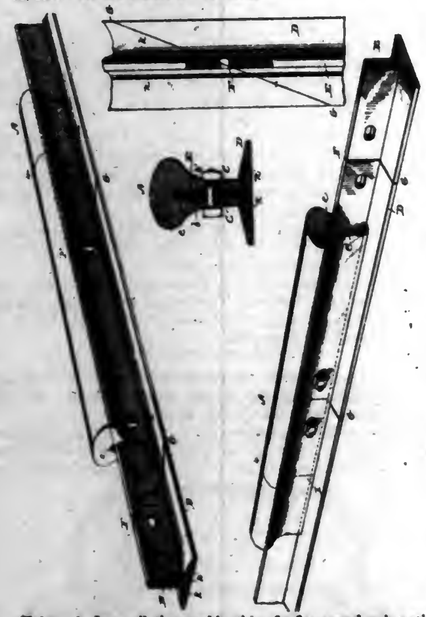
3. The combination, with an upper frame, *k*, of the tail-bar *w*, arranged over the hind wheel and provided with pegs *w'*, for hanging of baggage, substantially as herein specified.



4. The combination, with the frame *m*, of the supporting-legs *z*, pivoted to said frame near the front thereof, and a spring, *t*, adapted to spring said legs out into a horizontal position at the sides of the frame, substantially as specified.

401,106. SAFETY DEVICE FOR ELEVATORS. PIER G. RACKNAM, Paris, France. Filed Feb. 14, 1888. Serial No. 263,903. (No model.) Patented in France May 18, 1883, No. 160,662.

Claim.—The combination, with an elevator-cab and a hoisting-rope therefor, of a stationary upright screw, a socket secured fixedly to the cab, a nut fitted to turn on said screw, an arm carrying said

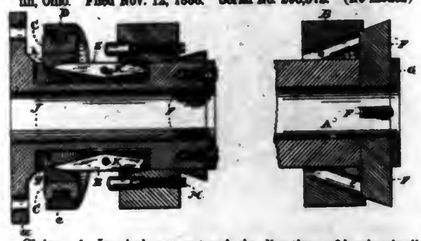


401,106.

nut and attached to the cab to be capable of an up-and-down movement thereon, a friction-brake one member of which is on said socket and the other on said nut, a horizontal shaft carried by the cab, a lever-arm on said shaft connected with the hoisting-rope, a crank on said shaft, and a rod connecting said crank with the said arm which carries the nut, substantially as described, whereby the nut is prevented from descending on the screw on the breaking of the hoisting-rope, as herein set forth.

401,107. RAIL. RICHARD DE S. BAGOT, Columbia, S. C. Filed Dec. 15, 1888. Serial No. 293,678. (No model.)

Claim.—1. In a rail, the combination of a flange and web section constituting the base and a grooved ball fitted thereto by means of webs integral with the ball and concave in the wake of the bolts projecting from each side of the ball clamping the base-section, and having a space, *c*, between the top of the web-section and the bottom of the groove, substantially as described.



2. In a rail, the combination of a flange and web section constituting a base having diagonally-cut ends for forming the joints, and a grooved ball with projecting webs or jaws fitting over the base-section, whereby, when a joint is formed, the sections are secured together and an unbroken base-section is provided for the support of the ball.

3. In a rail, the combination of a flange and web section constituting a base having a groove on each side of the web and a grooved ball fitting over the base, and having webs or jaws concave in the wake of the bolts, the extremities of which fit into the grooves on each side of the base-section, and having a space, *c*, between the top of the base-section and the bottom of the groove in the ball, as described.

4. As a new article of manufacture, a ball for a rail having a central groove and two downwardly-projecting webs or jaws integral with the ball, concave in the wake of the bolts, and adapted to be fitted over the web of a flange and web section, the groove being of sufficient depth to leave a space, *c*, when applied to the base-section, substantially as described.

5. In a rail, the combination of a flange and web section constituting the base and a grooved ball fitted thereto by means of webs integral with the ball, concave in the wake of the bolt projecting from each side of the ball and clamping the base-section.

401,108. SCREW-CUTTING DIE-HEAD. WILLIAM J. BAKER, Tiffin, Ohio. Filed Nov. 12, 1888. Serial No. 290,572. (No model.)

Claim.—1. In a bolt-cutter head, the dies thereof having inclined circular enlargements opposite their thread-cutting ends in co-operative engagement with the grooved ring B, movably fitted and arranged to encircle the barrel of said cutter-head, substantially as and for the purpose set forth.

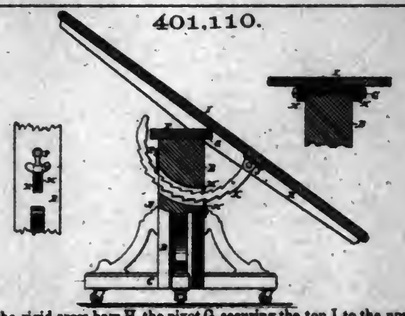
2. The combination, with a bolt-cutter head and the ring B, having inclined grooves with enlarged circular terminals fitting to correspondingly-shaped dies or cutters movable therein, of a sleeve, C, with a shifter, D, for moving said ring upon the barrel of the head, and the levers E E, pivotally arranged within cavities of said barrel for locking said ring, substantially in the manner and for the purpose described.

3. The combination, with the locking mechanism of a bolt-cutter head, the barrel A, provided with cavities, and pivoted levers E E, swinging therein, of the springs J, arranged for conjoint action in connection with the sleeve C and die-ring B, in the manner and for the purpose substantially as set forth.

4. In a bolt-cutter head, the arrangement of the barrel A, ring B, and levers E E, in combination with the springs J and N, the adjusting-screws M, connecting-screws I, and set-screws O, constructed substantially in the manner described, for the purpose set forth.

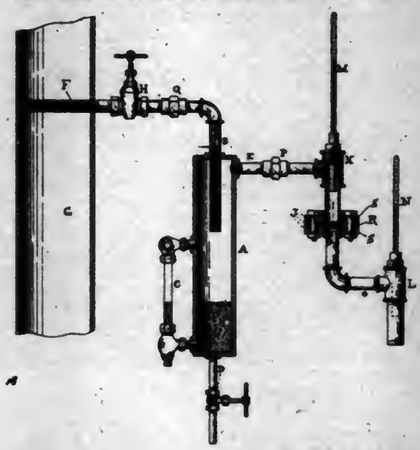
5. In a bolt-cutter head, the sleeve C, having in connection a wedge, *h*, for raising the levers E, located between the said sleeve and the die-ring B, arranged to encircle the barrel A and slide thereon, constructed and arranged in the manner and for the purpose substantially as described.

401,109. PRESERVING FRUIT. WILLIAM R. BAKER, Pasadena, Cal. Filed July 28, 1888. Serial No. 281,305. (Specimens.)



Claim.—The process of curing or drying fruit, consisting in first subjecting it in a confined space to the fumes of the herein-described mixture, composed of sulphur, willow charcoal, saltpeter, allspice, coffee, and alum, and then exposing the same to the action of a drying agent, substantially as specified.

401,110. TABLE OR STAND FOR EXHIBITING CLOAKS, &c. WILLIAM BARDSLEY, Kearney, N. J. Filed May 14, 1887. Serial No. 238,206. (No model.)



Claim.—1. The table hereinbefore described, consisting of the stand and the top I, the latter being pivotally secured to the upper end of the former and being provided with the loosely-pivoted segmental rack having teeth on its lower and upper edges and passing through the slot M in the stand, combined with the rigid plate N at one end of said slot and below said rack and the swinging dog P at the other end of said slot and above said rack, the teeth on the opposite sides of the segmental rack having their inclined or longer faces parallel with each other, substantially as for the purposes set forth.

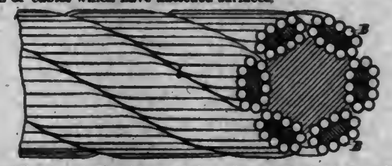
2. The table hereinbefore described, consisting of the post B and base C, extending laterally therefrom, combined with the top I, having the rigid cross-bars H, the pivot G, securing the top I to the upper end of the said post and passing through said cross-bars, the loosely-swinging segmental rack K, secured to the under side of the top and having teeth upon its upper and lower edges, said teeth being reversely inclined, the slot M, cut in the post B, the supplemental plate N, secured to the face of said post in position to engage the rack, and the locking-dog P, pivotally secured to the opposite face of said post and adapted to swing freely in either direction transversely to the path of the rack and to engage the upper edge of said segmental rack, substantially as and for the purposes set forth.

401,110.

401,111. STEAM-CALORIMETER. GEORGE H. BARRUS, Reading, Mass. Filed Nov. 30, 1888. Serial No. 292,264. (No model.)

Claim.—1. In a steam-calorimeter, a drip-chamber for the deposit and measurement of most of the entrained water contained in the wet steam tested, combined with a heat-measurer in which the balance of the moisture is measured, in the manner and for the purposes set forth.

2. In a steam-calorimeter, the combination of two thermometer-chambers with their respective thermometers, one subjected to the steam of initial pressure, the other to the escaping steam of atmospheric pressure, the second chamber being open to the atmosphere, and means for wire-drawing the steam interposed between the two thermometer-chambers, in the manner and for the purposes set forth.

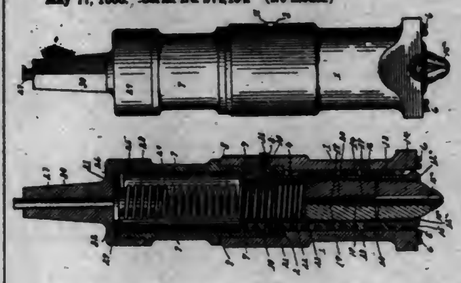


3. In a steam-calorimeter, the combination of two thermometer-chambers with their respective thermometers, one subjected to the steam of initial pressure, the other to the escaping steam of atmospheric pressure, the second chamber being open to the atmosphere, means for wire-drawing the steam interposed between the two thermometer chambers, and an insulating device for intercepting the transfer of heat along the walls of the pipe to the wire-drawn steam, in the manner and for the purposes set forth.

4. In a steam-calorimeter, the combination of means for wire-drawing the steam and a thermometer-chamber (which is open to the atmosphere) with its thermometer for showing the temperature of the escaping steam, in the manner and for the purposes set forth.

5. In a steam-calorimeter, the combination of means for wire-drawing the steam, a thermometer-chamber (which is open to the atmosphere) with its thermometer for showing the temperature of the escaping steam, and an insulating device for intercepting the transfer of heat along the walls of the pipe to the wire-drawn steam, in the manner and for the purposes set forth.

401,112. WIRE CABLE. TELFORD C. BATCHELOR, 8 Barons Court Road, West Kensington, County of Middlesex, and ARTHUR LATCH, Biddick Hall, South Shields, County of Durham, England. Filed Nov. 26, 1888. Serial No. 292,093. (Specimens.) Patented in England Aug. 25, 1888, No. 12,285; in France Sept. 1, 1888, No. 192,723, and in Belgium Sept. 3, 1888, No. 83,110.



Brief.—The object of the invention is to improve the construction of cables which have flattened surfaces.

Claim.—1. A cable consisting of a series of substantially flattened strands laid together and each strand comprising a single-wire core, A, formed with substantially flat sides, and a series of wires, B, covering the wire core.

2. In wire-cable strands, the combination of an inner wire of shape other than round and of ordinary wires on the outside, which substantially conform to the contour of the inner wire and constitute a strand having one or more substantially flattened sides, substantially as described.

401,113. NAIL-EXTRACTOR. LEOPOLD BAUMEISTER, Bridgeport, Conn., assignor of one-half to David F. Crofut and George H. Crofut. Filed May 17, 1888. Serial No. 274,134. (No model.)

Claim.—1. A nail-extractor consisting, essentially, of a shell, a sliding jaw-carrier within the shell, jaws within the carrier projecting below the same, and provided at their extremities with inwardly-turned edges adapted to undercut the head of the nail, a spring acting to throw said jaws downward, a spring acting to open the jaws when raised, and means for turning the jaw-carrier and jaws backward to cut away the wood from under the head of a nail and for raising them straight outward to draw the nail.

2. In combination, the shell, the sliding jaw-carrier, jaws within the carrier projecting below the same, and provided at their extremities with inwardly-turned edges adapted to undercut the head of the nail, a spring acting to throw the jaws downward, a spring acting to open the jaws when raised, and means whereby the jaw-carrier and jaws may be rotated to cut the wood from under the head of a nail.

3. In combination, the shell, the sliding jaw-carrier, pivoted and oscillating jaws within the carrier, a spring acting to throw the jaws downward, a spring acting to oscillate upon their pivots and to open the jaws when raised, a rotatory barrel having a screw-thread engagement with the jaw-carrier, whereby the jaw-carrier and jaws may be raised to extract a nail, and a spring connecting and adapted to relatively rotate said carrier and barrel.

4. The combination, with the shell and the barrel adapted to rotate independently thereof, of the sliding jaw-carrier provided with projecting cutting ends, jaws pivoted within but separately from said carrier, provided with projecting cutting ends and having longitudinal movement independently thereof, springs 17 and 22, for respectively protruding the jaws and for opening them, and means for rotating and for raising the jaw-carrier and jaws.

5. The combination, with the shell, the barrel rotating independently thereof, the jaws, and the jaw-carrier having slot 20 in one side thereof, of screw-pin 18, engaging the jaws and lying in said slot, springs 17 and 22, and means, substantially as described, for rotating the jaw-carrier and jaws and for raising them straight upward in the shell, as and for the purpose set forth.

6. The combination, with the shell, the barrel rotating independently thereof, and the jaw-carrier having incline 12ª, of the jaws projecting below said carrier, provided at their extremities with inwardly-turned edges adapted to undercut the head of the nail and having inclines 10ª, engaging the incline on the jaw-carrier, spring 22, act-

ing to force said jaws downward, so that they are closed by the inclines, and spring 17, acting to open the jaws when pressed upward.

7. The shell having lug 4, and the jaw-carrier having threads 13 and groove 14, engaging said lug, in combination with the jaws within the carrier projecting below the same, and provided at their extremities with inwardly-turned edges adapted to undercut the head of the nail, springs to hold said jaws downward and to open them when raised, and the barrel having threads 9, engaging the threads upon the jaw-carrier, as and for the purpose set forth.

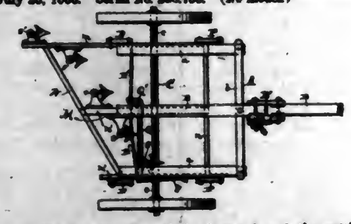
8. The shell having lugs 4 and 5, and the jaw-carrier having grooves 14 and 15, engaging said lugs, and screw-threads 13, in combination with the jaws, springs 17 and 22, and the barrel having screw-threads engaging the threads upon the jaw-carrier, as and for the purpose set forth.

9. The shell having opening 3 and lug 4, and the jaw-carrier having groove 14, engaging said lug, and screw-threads 13, in combination with the barrel having screw-threads engaging the threads upon the jaw-carrier, spring 24, connecting and adapted to relatively rotate the barrel and jaw-carrier, a groove, 10, and a key engaging opening 3 and groove 10, whereby the barrel and shell are locked together, leaving the barrel free to rotate.

10. The shell having lug 4, and the jaw-carrier having a groove, 14, engaging said lug, screw-threads 13, and incline 12^b, in combination with the jaws projecting below said carrier, provided at their extremities with inwardly-turned edges adapted to undercut the head of the nail, and having inclines 10^b, engaging incline 12^b, spring 22, acting to force the jaws downward, so that they are closed by said inclines, spring 17, acting to open the jaws when raised away from the incline, and the barrel having threads engaging the threads upon the jaw-carrier, whereby the jaw-carrier and jaws are raised together when the barrel is rotated forward.

11. The shell having lugs 4 and 5, the jaw-carrier having grooves 14 and 15, engaging said lugs, screw-threads 13, and inclines 10^b, in combination with the jaws having inclines engaging the jaw-carrier, springs 17 and 22, and the barrel having threads engaging threads upon the jaw-carrier, whereby, when the barrel is rotated in one direction, the shell, jaw-carrier, and jaws are carried with it, and when rotated in the opposite direction the jaw-carrier and jaws are drawn upward into the shell and barrel.

12. The combination, with the shell, jaws, and jaw-carrier having screw-threads 13, of the barrel having threads engaging threads 13, cap 29, spring 22, acting to force the jaws downward in the jaw-carrier, and spring 24, connected to the jaw-carrier and to the cap, whereby, when the barrel is rotated to raise the jaw-carrier, spring 24 is twisted, and when the barrel is released said spring will act to throw the jaw-carrier outward to its normal position.



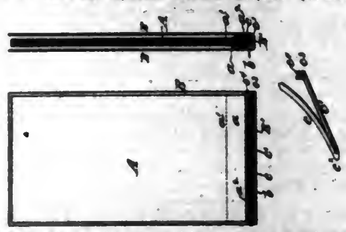
13. The combination, with the shell, the jaw-carrier having threads 13, the barrel having threads engaging threads 13, and the cap, of spring 24, connected to the cap and to the jaw-carrier, whereby, when said barrel is rotated to raise the jaw-carrier, said spring is twisted, and when the barrel is released the spring will act to throw the jaw-carrier downward.

14. The shell, jaw-carrier, barrel, and cap threaded to engage the barrel and having a pin, 32, in combination with plate 26, having a rod projecting upward through the cap and notches engaging said pin, and spring 24, connected to said cap and to the jaw-carrier, whereby, when said rod is pressed inward, the plate is disengaged from the pin and the cap may be turned downward to place without twisting the spring.

15. The combination, with the shell, jaw-carrier, and jaws, of the barrel, cap 29, springs 22 and 24, and pin 21, passing through the jaw-carrier, against which said springs bear, substantially as described.

16. The combination, in a nail-extractor, of the shell 1, the sliding jaw-carrier in the same, the rotatory barrel 7, having a screw engagement with the jaw-carrier, spring 24, connecting and adapted to relatively rotate the barrel and carrier, and the grasping-jaws within the latter, substantially as described.

401,114. CULTIVATOR. BENJAMIN F. BERGER, South Bend, Ind. Filed July 23, 1888. Serial No. 280,753. (No model.)

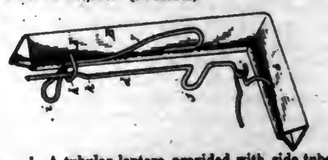


Claim.—1. The combination of the frame A and the cultivator-gang suspended therefrom by links, substantially as described, with a sectional tongue and the lock-hinge joint thereof, composed of plates R H, and J, and bolts *f* and G, all substantially as set forth.

2. The combination, in a cultivator of the character described, of the rectangular carrying-frame A, having tongue-section B, and the tongue-section D, adjustably connected to part B by an adjusting locking-hinge, with the frame M and the cultivator-gang attached to said frame, the chain R', crank-rod Q, lever *g*, and cranked axle C, all substantially as and for the purpose specified.

3. The herein-described locking-hinge joint, consisting of the plate E, the opposite plate, H, having racks I I on its outer face and the spring-plate J, having racks L L, the bolt *f* and bolt G, and hand-nut *g*, all constructed and adapted to operate substantially as described.

401,115. MEMORANDUM-BOOK. MARCELLUS F. BERRY, Brooklyn, N. Y. Filed Jan. 16, 1888. Serial No. 260,823. (No model.)



Claim.—1. The combination, with a book-cover and a needle or strip of metal extending parallel with the line of fold of the cover and within the same, of a book having extending lengthwise at the back of the leaves and outside thereof a pocket or loop receiving the needle or strip, whereby the book is detachably secured in its cover, substantially as herein described.

2. The combination, with a book-cover, of a strip of metal folded upon itself and having one member or leg forming a needle, and the other member or leg being permanently secured in the back of the cover and having a catch or fastening for the engagement of the free end of the needle, and a book having at the back and outside of its leaves a pocket or loop receiving the needle, whereby the book is detachably secured in its cover, substantially as herein described.

3. The combination, with a book-cover and a book having at the back of the leaves outside thereof a pocket or loop, as a^3, of the device for securing the book in the cover, consisting of a needle, as *c*, entering said pocket or loop, and a base-piece or stock, as *c'*, from one end of which the needle springs, and having at the opposite end a fastening or catch for the free end of the needle, and a strip of fabric, *b*, attached to the back of the cover, and serving to secure and conceal the base-piece or stock *c'* in the cover, substantially as herein described.

401,116. TUBULAR LANTERN. LEWIS F. BEITH, New York, N. Y., assignor of two-thirds to The R. E. Dietz Company, same place, and the Steam Gauge and Lantern Company, Rochester, N. Y. Filed Aug. 4, 1887. Serial No. 246,108. (No model.)

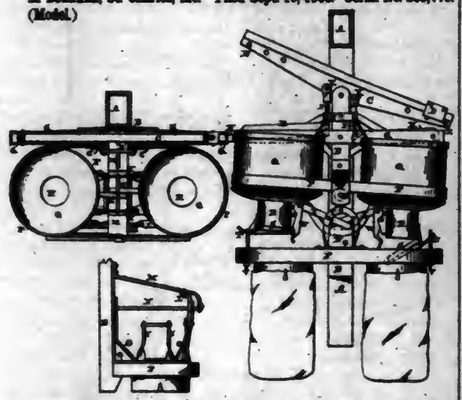
Claim.—1. A tubular lantern provided with side tubes of triangular cross-section, each arranged with its flat back outwardly and with one edge toward the burner, substantially as set forth.

2. The combination, with the tubular-lantern frame having its side tubes provided with guide-loops *h*, of a lifting globe-frame provided with side wires, *d*, passing through said loops, and having a thumb-piece, *j*, formed on one of said side wires below the guide-loop, through which it passes, substantially as set forth.

3. The combination, with the tubular-lantern frame provided with a guide-loop, *h*, of a lifting globe-frame provided with a side wire, *d*, passing through said loop, and having a thumb-piece, *j*, below said loop, and a spring-catch, I, arranged in said loop, and provided above the latter with a thumb-piece, *i*, substantially as set forth.

401,117. HARVESTER-CUTTER. JOHN A. BLAIR, Philadelphia, Pa. Filed Sept. 8, 1888. Serial No. 284,856. (No model.)

Claim.—1. A cutter-bar with lugs and tongues thereon, knives with recesses, the walls of which embrace the lugs, and a locking bar or cap with slots to engage the tongues, each knife having a flange at its back, and the locking-bar having a series of faces at its back,



401,117.

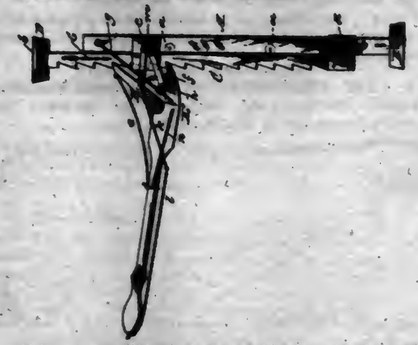
said series of flanges and faces being in parallel vertical planes inclined to the edges of the cutter-bar, said parts being combined substantially as described.

2. A cutter-bar in combination with knives, and a locking-bar for said knives, each knife having a vertical flange, and the said locking-bar having on its back a series of faces, said flanges and faces being parallel with each other and inclined to the edges of the cutter-bar, substantially as described.

401,118. AUTOMATIC GRAIN-WEIGHING MACHINE. HENRY H. BOSSERT, St. Charles, Mo. Filed Sept. 19, 1888. Serial No. 285,770. (Model.)

Claim.—1. In an automatic weighing-machine, the combination of a suitable supporting-frame, a frame pivoted at its center to the supporting-frame, hoppers secured to its ends, a scale-beam pivoted at its center, connecting-rods which connect the frame and the beam upon opposite sides of their centers, and a rolling or sliding weight placed upon the scale-beam, whereby, when the beam is tilted by the weight of the grain in one of the hoppers, the weight will slide to that end of the beam, and vice versa when tilted by the grain in the opposite hopper, substantially as described.

2. The combination of the supporting-frame, the pivoted frame having a hopper at each end, a scale-beam pivoted at its center, a rolling or sliding weight placed thereon, two levers pivoted to the supporting-frame at their outer ends, and their inner ends to the scale-beam at opposite sides of its center, and the pivoted frame connected to the centers of the levers at opposite sides of its center, all combined to operate in the manner substantially as set forth.



3. The combination of the supporting-frame, the pivoted frame provided with hoppers at each end, the levers pivoted at their outer ends to the supporting-frame, connecting-rods which connect the pivoted frame at opposite sides of its center to the levers, connecting-rods which connect the inner ends of the levers with the scale-beam upon opposite sides of its center, the scale-beam pivoted at its center above the pivoted frame, and the sliding weight, the beam being provided with a device for limiting the movement of the weight, for the purpose specified.

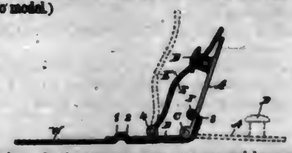
4. The combination of the supporting-frame, a frame pivoted at its center to the supporting-frame, hoppers secured to opposite ends of the pivoted frame, a pivoted scale-beam connected therewith, a weight placed thereon, doors pivoted to the outer edges of the lower ends of the hoppers, outwardly-extending arms secured to the doors, the horizontal base secured to the supporting-frame, and upwardly-extending connections secured to the base and engaging the outer ends of the arms that are secured to the doors, all combined to operate in the manner substantially as described.

5. The combination of the scale-beam, a weight placed thereon, the pivoted frame connected to the beam, the hoppers having an opening in their bottoms, the doors hinged thereto and having an arm connected to the base, vertical latches pivoted to the lower ends of the hoppers, levers pivoted at their outer ends to the upper ends of the latches and at their inner ends pivoted upon the base, whereby, when the beam is raised, the doors are closed and the latches made to engage therewith and lock them in a closed position, and which, when the beam is lowered by the weight of the grain, allow the doors to open, substantially as described.

6. The combination of the scale-beam having a weight, the pivoted frame having an arm extending downward below its pivotal point, the base, a vertical lever pivoted to the base at its lower end, and a bifurcated rod pivoted at its outer end to the upper end of the lever, the bifurcated ends of the rod engaging a wheel of the register, and the register, whereby, when the frame is tilted, the register is operated, substantially as shown.

401,119. LIFTING-JACK. JAMES A. BOUK, Nevada, Mo. Filed Dec. 22, 1888. Serial No. 294,944. (No model.)

Claim.—1. In a lifting-jack, the combination, with the standard A, having guide-yoke *c* and pivoted support B, of the toothed rack-bar C, having guide-yoke *d* and pivoted support D, and the lever E for operating the rack-bar C, substantially as and for the purpose set forth.



2. The standard A, rack-bar C, and lever E, with pawl F, in combination with the pivoted arms *h i*, rods *g k*, and the cords or chains *e l*, substantially as and for the purpose described.

401,120. MANUFACTURE OF INCANDESCENT-LAMP FILAMENTS. THEREE D. BOTTOME, Newark, N. J., assignor to John B. Tibbits, Hoosick, N. Y. Filed Sept. 30, 1887. Serial No. 251,057. (No specimens.)

Claim.—1. The process of manufacturing filaments, consisting in saturating a carbon filament with a tungsten compound and reducing such compound to metal tungsten, substantially as herein described.

2. An incandescent filament composed of metallic tungsten and carbon in varying proportions, for the purpose as herein described.

401,121. GARMENT-SUPPORTER. PETER J. BOYLE, Boston, and GEORGE H. GATES, Athol, Mass. Filed Oct. 27, 1888. Serial No. 289,333. (No model.)

Claim.—1. A garment-supporter comprising a pair of metal plates hinged together, a headed stud upon the lower plate, and a loop hinged at one end to the other plate to engage the stud, said loop provided with an enlarged opening for the passage of the head of the stud, having its lower end contracted and of less breadth than the head of the stud, for the purpose set forth.

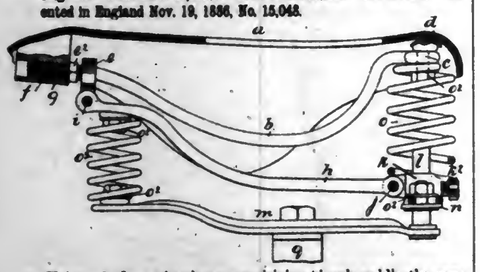
2. A garment-supporter comprising a pair of plates hinged together, a stud and a loop on the plates to grasp the garment to be held, and an elastic webbing secured to and stretched between the plates, substantially as described.

3. A garment-supporter comprising a pair of plates hinged together, a headed stud on one plate, a loop hinged to the other plate, having an enlarged opening to receive the head of the stud, the lower end of said opening being of less breadth than the head of the stud, and an elastic webbing secured to both plates to yieldingly hold the stud in the contracted end of the loop, for the purpose set forth.

4. A garment-supporter comprising an elastic webbing to support the same, a pair of plates hinged together and each provided with one or more transverse slots, the webbing passing through and confined in the slot of the upper plate and along the under sides of the plates to the slot in the lower plate, through which its looped end extends, a pin or the like inserted in said looped end on the outer side of the plate, whereby the webbing is secured in the slot, and a stud on the lower plate and a loop to engage the stud hinged to the upper plate, substantially as described.

5. In a garment-supporter, a plate having a transverse slot, in combination with an elastic webbing secured to the plate, the end por-

tion of the webbing being doubled and passed through the slot, with the extremity of the webbing between the body of the same and the plate, and a length of wire shorter than the width of webbing located in the loop on the outer side of the plate, the combined diameter of the wire and thickness of the two lengths of webbing being greater than the width of the slot, whereby the webbing is removably and securely fastened to the plate in the manner substantially as described.



401,122. WHITEWASH. DAVIS BRIBOLARI, Madisonville, Tex.

Filed Jan. 3, 1889. Serial No. 295,310. (No specimens.)

Claim.—A whitewash-paint composed of the cactus-plant, lime, eggs, and water thoroughly intermingled and in about the quantities substantially as described.

401,123. VELOCIPEDE-SADDLE. JOHN B. BROOKS, Birmingham, England.

Filed Dec. 20, 1887. Serial No. 258,510. (No model.) Patented in England Nov. 19, 1886, No. 15,048.

Claim.—1. In a tricycle or rear-driving bicycle saddle, the combination, with the seat of a saddle, of three coiled springs, *o o*^{3}, and two curved framing or extension bars, *b*, which latter proceed from front to rear of the under side of the seat of a saddle, with their back ends separated and connected to the under side of the saddle-seat by hanging pins, while their fore parts, which are screwed for tensioning, pass through and take within brackets *e g*, respectively, secured on the front under side of the saddle-seat, substantially as described and set forth.

2. The combination, with the seat of a tricycle or rear-driving bicycle-saddle and base-plate *m*, of an adjustable bracket, *k*, fixed pillar *l*, and bracket-affixing screw *k*^{2}, for the purpose substantially as set forth.

3. The combination, with a bicycle-saddle, *a*, extension-bars *b b*, bracket-plate *n*, and clip *l*, of two rear-disposed coiled springs, *o*, substantially as set forth.

4. The combination, with the back supporting-springs of velocipede-saddles, of an adjustable bracket-plate, *n*, working upon a pillar or upright, *l*, substantially as set forth.

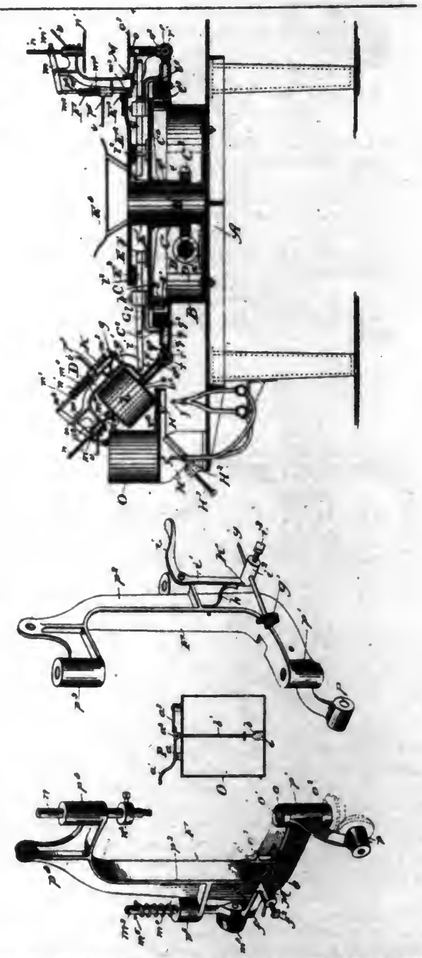
5. The combination, with an adjustable bracket, *k*, with fixed peg *l*, of a bracket-plate, *n*, substantially as set forth.

6. The combination, with the seat of a saddle, *a*, extension-bars *b*, coiled springs *o*, and base-plate *m*, with adjusting means *k l*, of a stay, *h*, jointedly connected at its ends to brackets *k* and *e*, respectively, as set forth.

401,124. BRUSH-CYLINDER FOR COTTON-GINS. ISRAEL F BROWN, New London, Conn.

Filed June 7, 1888. Serial No. 276,306. (No model.)

Claim.—1. The combination, with a bristle-holder for cotton-gins, consisting of a long piece of wood having a flange or lip, B, made integral with it and extending outward from one of its outer edges, of bristles arranged to lie directly against such flange or lip from their inner ends to a point near their outer ends and normally supported and stiffened by it, substantially as set forth.



2. The combination, with a bristle-holder for cotton-gins, consisting of a long strip of wood having a flange or lip, B, made integral with it extending outward from one of its outer edges and having its inner edge beveled and laterally grooved, of bristles located in the lateral grooves in the flange or lip of the holder and supported from their inner ends to a point near their outer ends, substantially as set forth.

401,125. CAN-SOLDERING MACHINE. KATIE BROWN, Chicago, Ill., administratrix of James Brown, deceased, assignor to the said Katie Brown, (in her personal capacity.)

Filed Nov. 27, 1888. Serial No. 291,946. (No model.)

Claim.—1. In a can-soldering machine, the combination, with a stationary support, of an annular rack, *t*^{4}, cam E^3, and rotatory support C upon the stationary support, pivotal can-carriers F upon the rotatory

401,125

support, having revoluble supports *o*^{3} for the cans and pinions *q*^{3}, connected with the supports *o*^{3} and in mesh with the rack *t*^{4}, sustaining-rods G, pivotally secured toward one end to the carriers and toward the opposite end permanently engaging the cam E^3, means, substantially as described, for revolving the support C, whereby the cam E^3 shall cause the rods G to reciprocate and thereby oscillate the can-carriers, and the rack *t*^{4} shall cause the pinions *q*^{3} to rotate and thereby revolve the supports *o*^{3}, clamps upon the frames F, operating to hold the cans upon the supports *o*^{3}, and a solder-trough, H, in the path of the carriers F, near the limit of their outward oscillation, substantially as and for the purpose set forth.

2. In a can-soldering machine, the combination, with a stationary support, of an annular rack, *t*^{4}, cam E^3, and rotatory support C upon the stationary support, brackets *c*^{3} upon the support C, carrying rotatory shafts *q*', each having toward one end a pinion, *q*^{3}, in mesh with the rack *t*^{4}, and toward its opposite end a miter gear-wheel, *q*^{2}, and rotatory shafts *r*, having miter gear-wheels *r*', in mesh with the wheels *q*^{2}, can-carriers F, pivotally supported on the shafts *r* and provided with sleeves *p*', containing rotatory shafts, each carrying toward one end a miter gear-wheel, *o*^{2}, in mesh with the wheel *r*', and at its opposite end a can-support, *o*^{3}, sustaining-rods G, pivotally secured toward one end to the carrier-frame and toward the opposite end permanently engaging the cam E^3, means, substantially as described, for revolving the support C, whereby the cam E^3 shall cause the rods G to reciprocate and thereby oscillate the can-carriers, and the rack *t*^{4} shall cause the support *o*^{3} to rotate, clamps upon the carriers F, operating to hold the cans upon the supports *o*^{3}, and a solder-trough, H, in the path of the carriers F, near the limit of their outward oscillation, substantially as and for the purpose set forth.

3. In a can-soldering machine, the combination, with a stationary support, rotatory support, can-carriers, and solder-trough, of a solder-reservoir having a normally-closed discharge valve automatically

opened at intervals by the revolving parts of the machine, substantially as described.

4. In a can-soldering machine, the combination, with a stationary support, rotatory support, can-carriers, and solder-trough, of a gage, I, substantially as and for the purpose set forth.

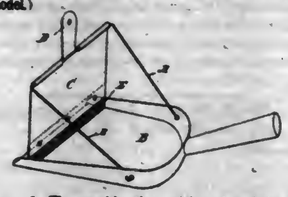
5. In a can-soldering machine, the combination, with a stationary support, of a rotatory support, C, pivotal can-carriers F upon the support C, provided with revoluble supports *o*^{3} for the cans, means, substantially as described, for rotating the support C, a rack, *t*^{4}, and cam E^3 on the stationary support, reciprocal sustaining-rods G upon the rotatory support, pivotally secured toward one end to the can-carriers and toward the other end engaging with the cam E^3, pinions *q*^{3} upon the support C, connected with the supports *o*^{3} and in mesh with the rack *t*^{4}, whereby when the support C is rotated the carriers F are caused to oscillate and the supports *o*^{3} to revolve, a solder-trough in the path of the carriers F near the limit of their outward oscillation, and a horizontal curved perforated pipe, L, communicating with an air-supply and adjacent to the path of the carriers F, near the limit of their inward oscillation, substantially as and for the purpose set forth.

6. In a can-soldering machine, the combination, with a stationary support, solder-trough, and rotatory support, of can-carriers F, each provided with a wiper, *g*', substantially as and for the purpose set forth.

7. In a can-soldering machine in which the cans to be soldered are carried by a revolving support, *o*^{3}, on an oscillatory frame, F, whereby they are revolved and oscillated into and out of a solder bath, the combination, with the frame F, of reciprocating wiping mechanism K upon said frame, substantially as and for the purpose set forth.

8. In a can-soldering machine, the combination, with a stationary support, rotatory support C upon the stationary support, oscillatory can-carriers F upon the support C, provided with revoluble supports *o*^{3} for the cans, and clamps operating to hold the cans on the supports *o*^{3} to revolve with the latter, and the mechanism for actuating the support C, carriers F, and supports *o*^{3}, of wiping mechanism K, secured upon each can-carrier, having a projecting part, *i*, and a part, *i*', supporting a wiper, *g*', and a cam, E^4, upon the stationary support, in the path of the projecting part *i*, whereby, when the support C is rotated, the engagement of the projecting part *i* with the cam E^4 advances the wiper *g*', substantially as and for the purpose set forth.

9. In a can-soldering machine, the combination, with a stationary support, solder-trough, and rotatory support C, of can-carriers F upon the support C, each comprising a frame provided with a sleeve, *p*^{3}, and a support, *p*', a revoluble holder, *o*^{3}, on the support *p*', a holder, *n*', upon a rod, *n*, extending through the sleeve *p*^{3}, a lever, *m*, fulcrumed upon the frame and pivotally secured toward one end to the rod *n* and toward its opposite end to a rod, *m*^{3}, carrying a projection, *m*^{2}, a cam, E^2, upon the stationary support in the path of the projection *m*^{2}, spring mechanism tending to force the holder *n*' downward, and loosening mechanism M, fulcrumed upon the can-carrier frame and extending toward one end underneath the rod *m*^{3} and at its opposite end toward the holder *o*^{3}, whereby, when the support C is rotated, the engagement of the projections *m*^{2} with the cam E^2 forces each projection *m*^{2}, rod *m*^{3}, and adjacent end of the loosening mechanism M down and raises the opposite end of the loosening mechanism and raises the holder *n*' against the resistance of the spring, the resilience of which latter forces the holder *n*' down when the projection *m*^{2} is freed from engagement with the cam E^2, substantially as and for the purpose set forth.



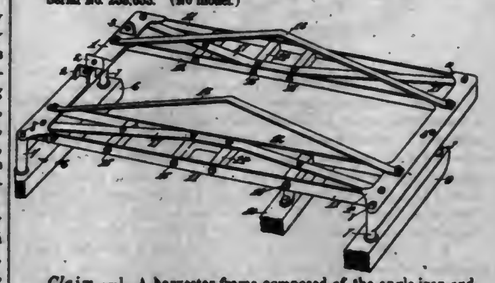
10. In a can-soldering machine, the combination, with a stationary support, solder-trough, and rotatory support C, of can-carriers F and one or more projections, *v*, upon the support C, and a solder-reservoir, O, having a discharge-valve, *b*, normally closed and connected with an arm, *a*^{2}, of a pivotal lever, an arm, *a*', of which latter extends into the path of the projection *v*, whereby, as the support C rotates, the engagement of the projections *v* with the arm *a*' temporarily opens the valve *b*, substantially as and for the purpose set forth.

11. In a can-soldering machine, the combination, with a stationary support, solder-trough, and rotatory support C, of can-carriers F upon the support C, having one or more projections, *v*, and a solder-reservoir, O, having a discharge-valve, *b*, rod *b*', connected with the valve *b* and projecting above the solder-reservoir, a pivotal lever, P, having an arm, *a*^{4}, pivotally connected with the rod *b*', and an arm, *a*', extending into the path of the projection *v*, and spring mechanism retaining the valve *b* normally closed, whereby, as the support C rotates, the engagement of the projections *v* with the arm *a*' temporarily opens the valves *b*, substantially as and for the purpose set forth.

12. In a can-soldering machine, the combination, with a stationary support, solder-trough, rotatory support, and pivotal can-carriers F, of a cam, E^2, on the stationary support and reciprocal sustaining-rods G upon the rotatory support, pivotally secured toward one end to the can-carriers and provided with projections P, engaging with the cam E^2, whereby, when the support C rotates, the cam E^2 causes the rods G to reciprocate and thereby to oscillate the can-carriers, substantially as and for the purpose set forth.

401,126. COMBINED SINK SHOVEL AND CLEANER. PHILIP C. BROWN, Brooklyn, N. Y.

Filed May 18, 1888. Serial No. 274,337. (No model.)

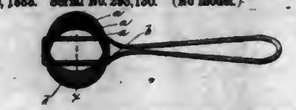


Claim.—1. The combination, with a shovel, (or scoop,) of arms hinged to the rear part of the flange thereof and allowed a vertical swinging movement, and a cleaner pivoted on the outer ends of said arms above the shovel and adapted to swing thereon, substantially as described.

2. The combination, with a shovel, (or scoop,) of arms, as A, hinged to the rear sides of the shovel and united at their outer ends, a cleaner, as C, pivoted to the connecting-piece of said arms, and a thumb-piece, as D, and scraper, as E, secured on the upper and lower edges, respectively, of said cleaner, substantially as described.

401,127. HARVESTER-FRAME. ROBERT BROWN, Miamisburg, Ohio, assignor to Hoover & Gamble, same place.

Filed Apr. 4, 1887. Serial No. 233,633. (No model.)



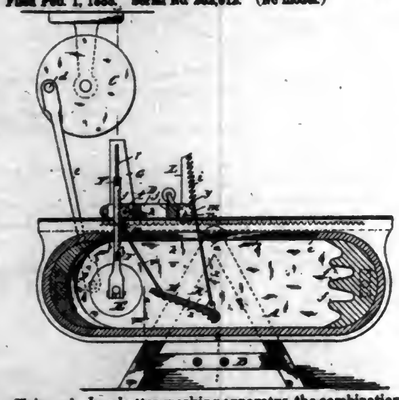
Claim.—1. A harvester-frame composed of the angle-iron end plates, 1 and 5, having their horizontal flanges turned inward, the compound side rails consisting of parallel members braced and united by sleeves 14 and bolts 15, the ends of said side rails underlying the horizontal and abutting against the vertical flanges of the end rails, the arched braces 16, and the lateral braces 17, substantially as described.

2. The combination, with a harvester-frame having gear-segments 19 centrally mounted thereon, of pinions on the axle meshing with said segments, an arm, 22, having a hook embracing the lower side of a sleeve surrounding the axle, said arm having a projection, 23, connected by a rod, 24, to the frame, a crank-shaft having bearing in the arm 32, and a spring-actuated sleeve, 43, on the end of the arm 32, extending from said arm 22, a miter-gear, 33, carried by said crank-shaft, a miter-gear, 34, rigid with a pinion, 36, both journaled on the arm 22, with the gear 36 meshing with the crest of a gear, 37, on the axle, and the gear 34, meshing with miter-gear 33, the spring-actuated locking-sleeve 43 being provided with a bayonet-slot with which a pin on the crank-shaft engages, substantially as described.

3. The combination, with the crank-arm 32, having lug 44, of the shaft 28, the lock-sleeve 43, having bayonet-slot 46 and notches engaging with lugs 44, the stop-pin 47 on shaft 28, and the spring 45, substantially as described.

401,128. SEEDER. JOSEPH W. CALEF, North Easton, assignor, by mesne assignments, to Allen G. Lovell, trustee, Boston, Mass.

Filed Dec. 10, 1888. Serial No. 293,130. (No model.)

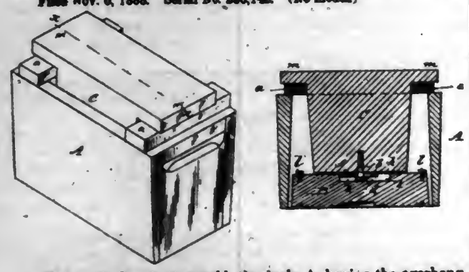


Claim.—1. A raisin-seeder composed of a handle or holder and a series of elastic ribs secured to said holder and adapted to yield laterally, said ribs being separated by spaces which permit the ribs to separate, but are of less width than the thickness of a raisin-seed, whereby the ribs are adapted to first yield or open and permit the passage of a seed between them and to then close and prevent the withdrawal of the seed, as set forth.

2. A raisin-seeder composed of a spirally bent or coiled wire and a handle or holder secured to said wire and formed to inclose portions of the coils, the remaining portions projecting from said holder and constituting elastic convex ribs, which are separated by spaces narrower than the thickness of a raisin-seed, as set forth.

3. In a raisin-seeder, the combination of the spiral wire, the handle formed to receive said wire, and the curved plate *d*, secured to said handle and covering portions of the coils of the wire, the remaining portions of said coils projecting from the plate *d* and constituting elastic convex ribs, as set forth.

401,129. BUTTER-WORKER. HENRY I. CARVER, Ludlow, Mass. Filed Feb. 1, 1888. Serial No. 262,612. (No model.)



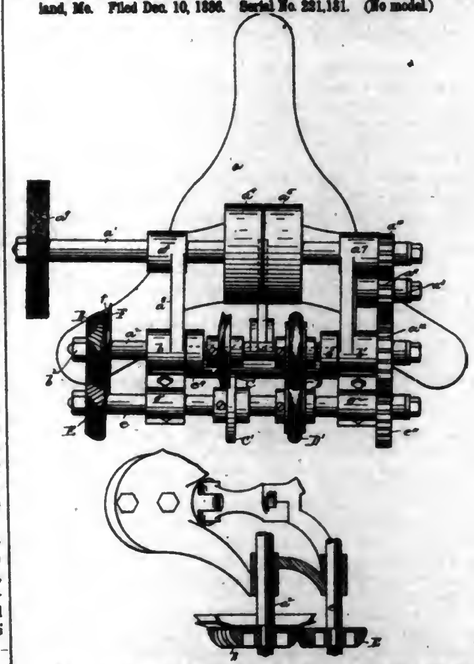
Claim.—1. In a butter-working apparatus, the combination, with a receptacle or body, A, provided with intermediately-disposed trunnions *a a*, by which it is hung in bearings of a suitable support, and provided at its opposite inner ends with the horizontally and vertically arranged series of ribs *f f* and *g g*, of a revolving crank-pin, *d*, carried by a suitably-arranged shaft, and a connecting-rod extending between and secured to said crank-pin and one end portion of said receptacle-body, substantially as and for the purpose described.

2. The combination, with a body or receptacle provided with a longitudinally-arranged rack-bar, of a horizontal sliding frame, D, having mounted therein a pinion meshing with said rack, the vertical frame F, vertically movable and guided on and supported by said sliding frame, and a horizontal roller, E, carried by said vertical frame, substantially as and for the purpose described.

3. The combination, with a body or receptacle provided with a longitudinally-arranged rack-bar, of a sliding frame, D, having mounted thereon a pinion, *m*, meshing with said rack-bar and provided with a pinion, *t*, the vertical frame F, supported and guided in said sliding frame D, provided with the rack-teeth *s*, and a horizontal roller, E, carried by said vertical frame F, substantially as and for the purpose described.

4. The combination, with a body or receptacle provided with a longitudinally-arranged rack-bar, of a sliding frame, D, provided with the hooked standard L, and having mounted thereon a pinion, *m*, meshing with said rack-bar, and a frame, K, comprising the transversely ribbed or serrated board H, the supporting-arms *v v*, pivoted to said sliding frame, and the bail *x*, adapted to engage the hooks *i* of said standards, substantially as and for the purpose described.

401,130. BUTTER-MOLD. HENRY I. CARVER, Ludlow, Mass. Filed Nov. 6, 1888. Serial No. 290,142. (No model.)



Claim.—1. In a butter-mold, the body A, having the overhanging cleats *a a*, combined with the print-block B and the forcing-block C, swiveled the one to the other, said forcing-block having at its inner end a length greater than the width of the mold-chamber, substantially as and for the purpose described.

2. In a butter-mold, the body having the overhanging cleats *a a*, combined with the print-block B, having the adjustable stops *l* at its top end portions in the lines of said overhanging cleats, and the forcing-block C, provided with the screw-pin *b*, perpendicularly adjustable on the inner end of said forcing-block and having a swiveling engagement with the said print-block, substantially as and for the purpose described.

3. In a butter-mold, the body having the overhanging cleats *a a* and the print-block having the channel and bifurcated metal plate lying over and having its legs terminating at a short distance from one end of said channel, combined with the forcing-block having the headed stud on its under side and capable of a detachable engagement with the said print-block, all substantially as shown, and for the purpose described.

4. In a butter-mold, the body A, having the overhanging cleats *a a*, combined with the print-block B, having the adjustable stops *l*, and provided with the channel and bifurcated metal plate lying over and having its legs terminating at a short distance from one end of said channel, the forcing-block C, having at its inner end a length greater than the width of the mold-chamber and having the headed and perpendicularly-adjustable screw-pin and capable of a detachable engagement with the said print-block, all substantially as shown and described.

401,131. HEEL-BURNISHING MACHINE. JAMES W. CARVER, Lynn, Mass., assignor to the National Heeling Machine Company, Portland, Me. Filed Dec. 10, 1886. Serial No. 221,131. (No model.)

Claim.—1. In a burnishing-machine, the combination, with the shafts a^9 and *e* and their connecting-gears a^{10} a^{11}, of the burnishing-roll B, secured to the said shaft a^9 and provided with the rest F, and the burnishing-roll E, secured to the said shaft *e*, and being below and in advance of the said burnishing-roll B, and thereby adapted to serve as a roll-rest as well as a burnisher, substantially as set forth.

2. The combination, in a burnishing-machine, of the burnishing-roll B, having ribs or projections *f'* extending diagonally across the same in one direction, and the rest-roll E, having the ribs or projections f^5 extending across the same in a direction opposite to that of the ribs or projections *f'* of the roll B, substantially as described.

3. In a burnishing-machine, the combination, with the rotary burnishing-roll B, having a burnishing-surface shaped transversely to approximate the shape of the surface of a trimmed heel, of the rotary burnishing-roll E, adapted to serve as a roll-rest, and having a transverse burnishing-surface struck upon a smaller arc than that of the transverse surface of the roll B, substantially as set forth.

4. In a burnishing-machine, the combination, with the shaft a^9, having the burnishing-roll B and the beading-roll C, of the shaft *e*, having the burnishing rest-roll E and the rotary rest C', to co-operate with the said beading-roll, substantially as set forth.

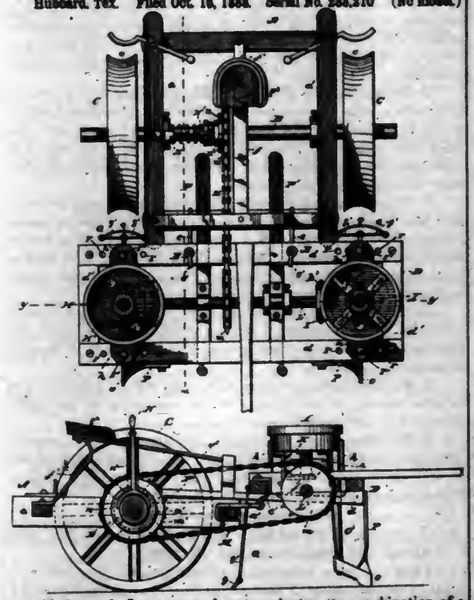
5. In a burnishing-machine, the combination, with the shaft a^9, having the burnishing-roll B and the wax-roll D, of the shaft *e*, having the burnishing rest-roll E and the rotary heel-rest D', to co-operate with the said wax-roll D, substantially as set forth.

6. In a burnishing-machine, the combination, with the shaft a^9, having the burnishing-roll B, and provided also with a wax-holding device, consisting of the sleeve or hub d^2 d^4, having the flange or collar d', the flange or collar d^3, and nut d^2, of the shaft *e*, having the burnishing rest-roll E and the roll-rest D', substantially as set forth.

7. In a burnishing-machine, the combination, with the shaft a^9, having the burnishing-roll B, and provided also with a wax-holding device, consisting of two collars, d^7 d^8, one of which is adjustable or movable relative to the other, and both of which are provided with inwardly-extending pins or projections d^6, of the shaft *e*, having the burnishing rest-roll E and the roll-rest D', to co-operate with the wax-roll, substantially as set forth.

8. In a burnishing-machine, the combination, with the shaft a^9 and the burnishing-roll B, carried thereby, of the shaft *e*, having the burnishing rest-roll E, and the adjustable hanger e^3, in which the said shaft *e* is journaled, substantially as set forth.

9. The combination of the head *a*, supporting the shaft a^9, the burnisher-roll B, carried thereby, the hanger e^3, suspended from the shaft a^9, the shaft *e*, carried thereby, the slotted link e^4, and the clamping-nut e^{13}, substantially as described.



10. In a burnishing-machine, the combination, with the shaft a^9, provided with the burnishing-roll B and the beading-roll C, of the shaft *e*, provided with the burnishing-roll E and roll-rest C', and the adjustable hanger e^3, in which the said shaft *e* is journaled, substantially as set forth.

11. In a burnishing-machine, the combination, with the shaft a^9, provided with the burnishing-roll B and the wax-roll D, of the shaft *e*, having the burnishing-roll E and the rest D', and the adjustable hanger e^3, in which the said shaft *e* is journaled, substantially as set forth.

12. The combination, in a burnishing-machine, of the head *a*, the pulley-shaft *a'*, having the gear a^{10}, the shaft a^9, connected with the gear a^{10} by the intermediate gear, a^{11}, and supporting the burnishing-wheel B, the beading-roll C, and waxing-roll D, with the shaft *e*, connected with the gear-wheel a^{12} by the gear e^{11}, and the rests E C' D', carried thereby, substantially as and for the purposes described.

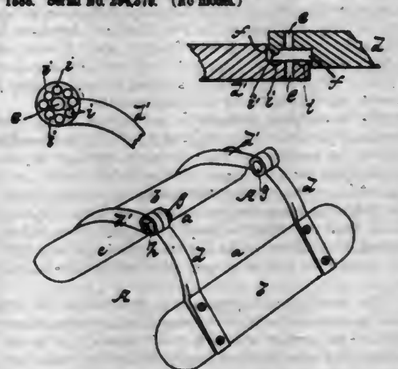
13. The combination, in a burnishing-machine, of the shaft *a'*, supporting the brush a^8, the shafts a^9 *e*, arranged to run at a slower rate of speed than the shaft *a'*, and supporting, respectively, the burnishing-roll B and rest-roll E, with said burnishing-roll and rest-roll, substantially as described.

401,132. CORN AND COTTON PLANTER. THOMAS J. CATHEY, Hubbard, Tex. Filed Oct. 16, 1888. Serial No. 288,210. (No model.)

Claim.—1. In a corn and cotton planter, the combination of a main carrying-frame in which the axle is journaled, an adjustable frame hinged thereto and carrying two hoppers or receptacles, levers for elevating the adjustable frame, a rotary disk located in one of said hoppers, a rotary sweep located in the other hopper, vertical shafts to which said sweep and disk are secured, an endwise-movable shaft common to both of said vertical shafts and adapted to be geared at will with either of the same, and a sprocket-chain passing over sprocket-wheels fixed on the axle and the shaft for rotating the latter, substantially as described.

2. In a corn and cotton planter, the combination of the two hoppers, one having a rotary planting-disk and the other a rotary sweep, the depending straps secured to the hoppers and each having a step or bearing, the vertical shafts stepped in said bearings and having the disk and sweep secured thereto, and the shaft adapted to be geared with either of said vertical shafts, substantially as described.

3. In a corn and cotton planter, the combination of a main carrying-frame having the axle journaled therein, an adjustable frame jointed thereto, the two hoppers each mounted on standards which are bolted to said adjustable frame to detachably secure said hoppers to the adjustable frame and adapt them to be adjusted laterally thereon, the depending straps secured to said hoppers, the vertical shafts mounted in the straps and hoppers and one having a rotary planting-disk and the other a rotary sweep, a shaft having bevel gear-wheels keyed thereto and adapted to mesh with similar wheels on the vertical shafts, the seed-tubes secured to the hoppers and having braces bolted to the adjustable frames, the drags suspended from said adjustable frame, and mechanism intermediate of the axle and the shaft for rotating the latter, substantially as described.

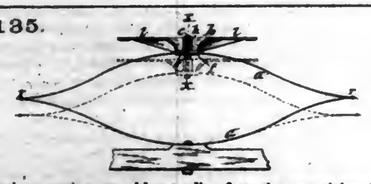


401,133. GUARD FOR BARBED-WIRE FENCES. MERRITT R. CHAPPELL, Battle Creek, Iowa. Filed July 3, 1888. Serial No. 278,367 (No model.)

Claim.—1. A guard T-shaped in transverse section and adapted to be suspended from the fence-wire, substantially as described.

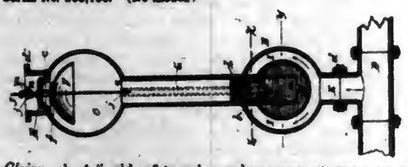
2. The guard comprising the slat B, the slat C, secured to the lower edge thereof and projecting beyond opposite sides of the same, and the link pivotally connected to the guard and adapted to be engaged with the fence-wire, substantially as described.

401,134. HARNESS-SADDLE. JOHN W. CLARK, Jackson, Miss., assignor of one-half to Lynn H. Kirkland, same place. Filed Dec. 22, 1888. Serial No. 294,379. (No model.)



Claim.—In a harness-saddle, the arms *a a'*, provided with the pads *b b'* and central perforations, *c c*, and depressions *i* on the inner face thereof, the arms *d d*, having a corresponding central opening and provided with the pin adapted to engage one of the depressions, whereby the twin sections are held in position, and the bolt *g* and nut *h*, for securing the meeting ends of the arms together, as shown and described.

401,135. VEHICLE-SPRING. EDWARD CLUTT, Nyack, N. Y. Filed Dec. 3, 1888. Serial No. 292,994. (No model.)



Claim.—The combination of the graduated elliptic spring, consisting of the leaves *a a*, having their end portions curved reverse from the central portion and lying contiguous to each other and rigidly united thereat, and the saddle *b*, formed with the spring-bearing *c*, longitudinal flanges *f f* on said bearing, the eye *h* at the center,

401,135.

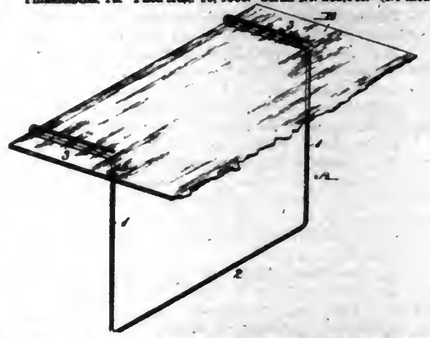
longitudinal supporting-arms *l l*, extending from the central bearing, *c*, and the bolt or rivet *c*, passing through said eye and spring, substantially as described and shown.

401,136. LIQUID SAFETY-VALVE FOR GAS-DISTRIBUTING PIPES. JAMES C. CONROY, Pittsburg, Pa., assignor of one-half to the Union Water Meter Company, Worcester, Mass. Filed Jan. 2, 1889. Serial No. 295,153. (No model.)

Claim.—1. A liquid safety-valve and escapement apparatus comprising the tubular standard provided at its lower end with a chambered bulb having an inlet and gas passages and forming a liquid-containing pocket about the end of the tube, and having at its upper end a chambered bulb or enlargment joining flush with said tube and furnished with an exit-passage, and provided with attaching flanges or bosses at the inlet and exit for connecting said apparatus with a main and a discharge pipe, substantially as and for the purpose set forth.

2. The combination, with the tubular standard provided with the lower chambered bulb having inlet and gas passages arranged to form a pocket for liquid for sealing the end of the tube, and the upper chambered bulb having an exit-passage, of the shield disposed within said upper chamber above the tube, substantially as and for the purpose set forth.

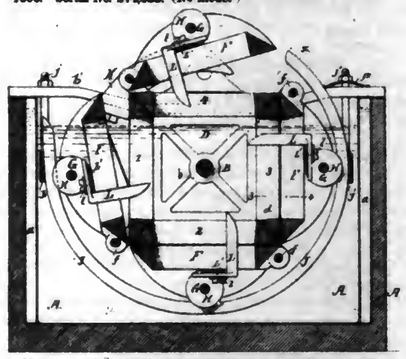
3. The combination, substantially as described, of the tubular standard provided with upper and lower chambered bulbs, gas inlet and exit passages, and liquid seal for the lower end of said tube, a gage-glass for denoting the level of liquid within the tube, and the inverted-cup-shaped shield suspended within the upper chamber, for the purposes set forth.



4. The combination, substantially as described, of the tubular standard provided with the lower chambered bulb having inlet and gas passages adapted for containing a liquid to form a seal or liquid-valve at the lower extremity of the tube, the upper chambered bulb provided with the exit or escapement passage, and a movable shield suspended within said upper chamber over the tube and having at its top a disk or surface filled at its top to close or partially close said exit-passage, substantially as and for the purpose set forth.

5. The combination, substantially as described, of the tubular standard provided with a lower chambered bulb or enlargement, having inlet and gas passages and fitted for containing liquid to seal the lower end of the tube, the upper chambered bulb having an exit-passage with a valve-seat about said passage, a movable shield suspended within said upper chamber over the end of the tube and having its top fitted for closing outward to said valve-seat, and an adjusting-stop, *m*, for arresting the upward movement of said shield at a given position in relation to said valve-seat, for the purpose set forth.

6. The combination, substantially as described, of the tubular standard provided with a lower chambered bulb or enlargement having inlet and gas passages and fitted for containing liquid to seal the lower end of the tube, the upper chambered bulb having an exit-passage with a valve-seat about said passage, a puppet-valve closing inward against said seat, a movable shield connected with said valve and suspended within said upper chamber over the end of the tube and fitted for closing outward to said valve-seat, and an adjusting-stop for arresting the upward movement of said puppet-valve and shield at a given position in relation to the seat, for the purpose set forth.



7. The combination, with a gas-distributing pipe or main, of the tubular standard provided with the lower chambered bulb having inlet-passages disposed for maintaining a liquid seal at the lower end of the tube, a chamber at the upper end of said tube, into and from which said sealing-liquid can flow, an escapement or exit opening at the top of said upper chamber, a shield disposed within, between the tube and escapement-opening, and an indicator or gage-gears fixed on the side of said tubular standard, all arranged for operation, substantially as and for the purpose set forth.

401,137. LIGHT-HOLDER FOR HOT-BEDS. WILLIAM DE CAUX, Philadelphia, Pa. Filed Aug. 16, 1888. Serial No. 282,840. (No model.)

Claim.—A glass or light holder consisting of the legs 1, foot 2, and loops 3, said foot being connected with the base of the legs and said loops with the top thereof, substantially as described.

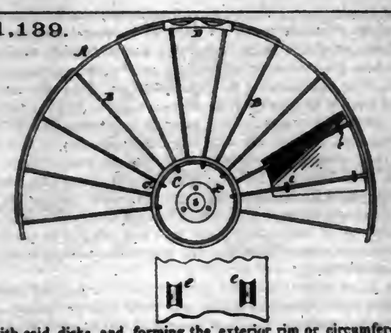
401,138. APPARATUS FOR HARDENING SAW OR OTHER STEEL BLADES. THOMAS S. DIBSTON, Philadelphia, Pa. Filed May 18, 1888. Serial No. 274,322. (No model.)

Claim.—1. The combination of the tank containing hardening-liquid, a drum provided with stationary and movable grids, with cams encircling a portion of the drum and acting to clamp the movable grids to the drum while said grids are in the hardening-liquid, and cams for raising the movable grids when they emerge from the liquid, substantially as described.

2. The combination of the tank, the drum formed of a series of grids with a series of grids pivoted thereto, cams encircling a portion of the drum and acting to close the jaws formed by said grids, and fixed cams with which projections on the pivoted grids engage to open said jaws when they reach a position above the liquid in the tank, all substantially as specified.

3. The combination of the drum and means for rotating the same, said drum having a series of grids forming jaws adapted to be opened and closed automatically, with a cleaning-block and a treadle connected thereto to raise said block, so that a hardened blade may be passed from the grids under the cleaning-block when the jaws release said blade, substantially as and for the purpose set forth.

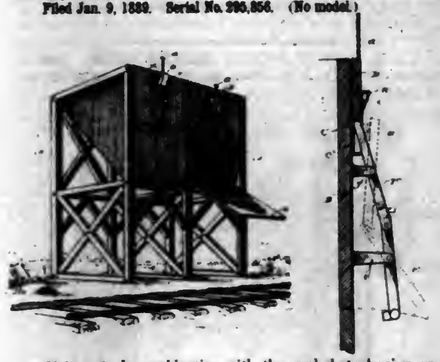
4. The combination of the tank and a drum carrying a series of jaws with a cam encircling a portion of said drum for closing the jaws, said cam having a yielding support at one or both of its ends, substantially as specified.



5. The combination of the movable grids with an adjustable stop or stops secured to one of said grids for supporting the saw-blade, substantially as described.

6. The combination of the tank, a drum composed of a series of grids, a series of grids or frames pivoted thereto, with rollers carried by each movable grid, and an annular cam acting upon said rollers to clamp the grids together, substantially as described.

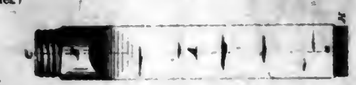
401,139. WIND-WHEEL. WILLIAM BOKER, Newark, N. J. Filed Mar. 30, 1887. Serial No. 233,000. (No model.)



Claim.—1. In a wheel such as described, the combination of disks C, having a series of perforations near their peripheries, spoke-wires inserted through said perforations and bent up and over the peripheries of said disks, and metallic bands or rings, as C', fitting over the ends of the spoke-wires and the peripheries of the disks in line with said disks and forming the exterior rim or circumference thereof when in place, as set forth.

401,139.

2. In a wheel such as described, the combination of disks C and spoke-wires B, a screw-shaft on which the disks are mounted, a nut or nuts on the shaft for adjusting one of said disks, and a fixed collar against which the other disk is held, as set forth.

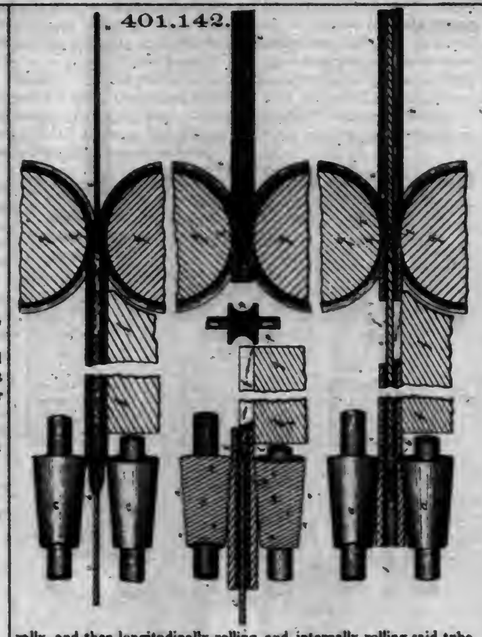


401,140. COAL-CHUTE INDICATOR. JOSEPH ELDER, Peoria, Ill. Filed Jan. 9, 1889. Serial No. 296,856. (No model.)

Claim.—1. In combination with the coal-chute having an outwardly-opening door, an indicator comprising a stationary signal, a gravitating shutter to cover the same, and trip devices, substantially as shown, arranged at one end in the path of the ordinary door and acting at the opposite end to sustain the door.

2. In combination with the coal-chute having the outwardly-opening door, the indicator-frame C, the gravitating shutter D, provided with the incline *d*, and the connected levers E F, arranged the former in position to be acted upon by the opening door and the latter in position to engage the shutter.

401,141. ENVELOPE AND STAMP MOISTENER. ABRAHAM J. ELIAS, Buffalo, N. Y. Filed Jan. 2, 1889. Serial No. 295,147. (No model.)



Claim.—As an improved article of manufacture, an envelope and stamp moistener consisting, essentially, of a flat thin tube, A, having on its upper end a circular enlargement, B, provided with a screw-cap, C, said tube having on its lower end an inwardly-projecting neck or stricture, *a*, and being fitted with a flat wick of woven fabric reaching to within a short distance of the circular enlargement, the whole being constructed and combined in the manner as and for the purpose set forth.

401,142. METHOD OF MAKING METAL TUBING. JOHN H. FLAGLER, New York, N. Y. Filed Dec. 17, 1887. Serial No. 258,161. (No model.)

Claim.—1. The method of making tubing which consists in spirally rolling and reducing a hollow ingot or blank to draw out the metal into a tube and arrange the fibers of the same spirally, and then longitudinally rolling said tube over a mandrel to further decrease the thickness of the walls of the same, substantially as and for the purposes set forth.

2. The method herein described of making tubing, which consists in spirally rolling and reducing a hollow ingot or blank to draw out the metal into a tube and arrange the exterior fibers thereof spirally, and then longitudinally rolling and internally rolling said tube to further draw out the metal and to arrange the interior fibers thereof spirally, substantially as and for the purposes set forth.

401,142.

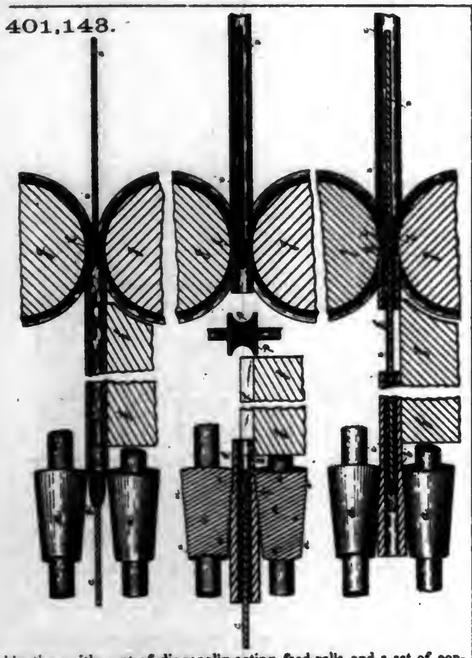
3. The method of making tubes which consists in spirally rolling a hollow ingot or blank to draw it out into a tube and arrange the fibers of the same spirally, and then rolling said tube longitudinally over a rotating mandrel to decrease the thickness of walls of said tube and give the desired finish to the same, substantially as and for the purpose set forth.

4. The method of making tubes which consists in spirally rolling a hollow ingot or blank to draw it out into a tube, and then rolling said tube longitudinally over a rotating conical mandrel of larger diameter than that of the interior of said tube to increase the diameter of the same and decrease the thickness of its walls, substantially as and for the purpose set forth.

5. The method of making tubes which consists in spirally rolling a hollow ingot or blank, and thereby drawing it out and forming spiral ribs on the surface thereof, and then rolling said tube longitudinally over a mandrel, and thereby smoothing and elongating said tube, substantially as and for the purpose set forth.

401,143. APPARATUS FOR THE MANUFACTURE OF METAL TUBING. JOHN H. FLAGLER, New York, N. Y. Filed Dec. 17, 1887. Serial No. 258,162. (No model.)

Claim.—1. In apparatus for the manufacture of metal tubing, a set of diagonally-acting converging rolls with an interposed mandrel, in combination with a set of direct-acting concave rolls and an interposed rotating mandrel, said second set being in line with said first set and adapted to receive the blank therefrom, substantially as and for the purposes set forth.

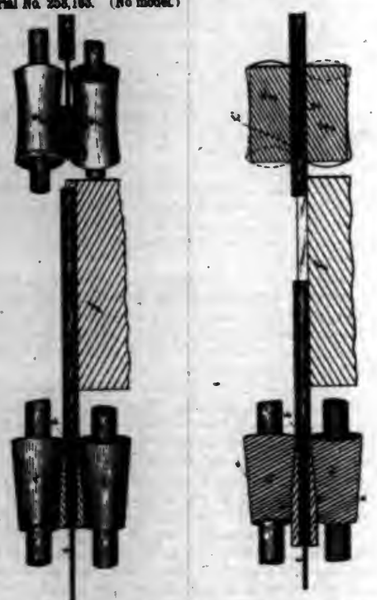


2. In apparatus for the manufacture of metal tubing, the combination, with a set of diagonally-acting spirally-grooved converging rolls having an interposed mandrel, of a set of direct-acting concave rolls having an interposed rotating mandrel, said second set being in line with said first set and adapted to receive the blank therefrom, substantially as and for the purposes set forth.

3. In apparatus for the manufacture of metal tubing, the combination of a set of diagonally-acting converging rolls provided with an interposed mandrel, a set of direct-acting concave rolls in line therewith, and a rotating mandrel interposed between said second set and of larger cross-section than the internal diameter of the tube fed thereto and having a tapering forward end slightly concave in longitudinal section, substantially as and for the purposes set forth.

4. In apparatus for the manufacture of metal tubing, the combination, with a set of diagonally-acting converging rolls and a set of direct-acting concave rolls having an interposed mandrel, of a pair of concave feed-rolls in the line of feed between said sets of rolls and adapted to feed the blank to said concave rolls, substantially as and for the purposes set forth.

5. In apparatus for the manufacture of metal tubing, the com-



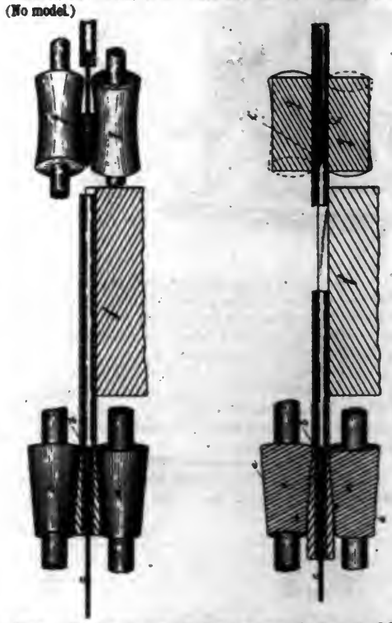
401,143.

bination, with a set of diagonally-acting feed-rolls and a set of concave rolls having an interposed mandrel, of a pair of feed-rolls, said feed-rolls being transversely adjustable, so as to engage with the blank and feed it into the concave rolls, substantially as and for the purposes set forth.

6. In continuous rolling-mills for the manufacture of tubing, the combination, with a pair of concave drawing-rolls, of a pair of feeding-rolls mounted in line therewith, a transversely-moving slide or slides carrying one or both said feed-rolls, and lever mechanism to draw said rolls together, substantially as and for the purposes set forth.

401,144. APPARATUS FOR THE MANUFACTURE OF METAL TUBING. JOHN H. FLAGLER, New York, N. Y. Filed Dec. 17, 1887. Serial No. 258,163. (No model.)

Claim.—1. In an apparatus for the manufacture of tubing, the combination of a set of diagonally-acting converging rolls, with a set of concave cross-rolls having an interposed mandrel between them, said latter set of rolls being in line with and adapted to receive the blank from the first set, substantially as and for the purpose set forth.



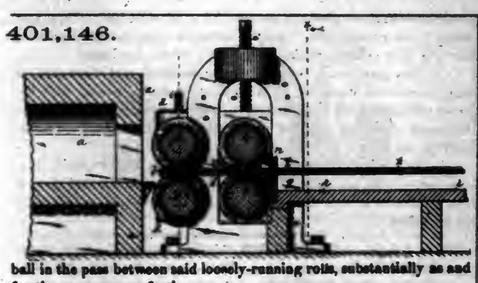
2. In an apparatus for the manufacture of tubing, the combination of a set of diagonally-acting converging rolls, with a set of concave cross-rolls having a rotating mandrel interposed between them, said latter set being in line with and adapted to receive the blank from the first set, substantially as and for the purpose set forth.

3. In an apparatus for the manufacture of tubing, the combination of a set of diagonally-acting converging rolls, with a set of concave cross-rolls having a portion of its pass gradually reducing in area, the latter set of rolls being in line with and adapted to receive the blank or tube coming from the first set, substantially as and for the purposes set forth.

4. In an apparatus for the manufacture of tubing, the combination of a set of diagonally-acting rolls, with a set of concave cross-rolls having a mandrel interposed between them and having the space between the surface of the mandrel and the working-faces of the rolls gradually decreasing in size, the second set of rolls being in line with and adapted to receive the blank coming from the first set, substantially as and for the purpose set forth.

5. In an apparatus for the manufacture of tubing, the combination of two or more concave cross-rolls, the pass formed by which gradually decreases in area throughout a portion thereof and remains constant during the remaining portion, substantially as and for the purpose set forth.

401,145. ART OF FORMING SEAMLESS TUBING. JOHN H. FLAGLER, New York, N. Y. Filed Dec. 17, 1887. Serial No. 258,164. (No model.)



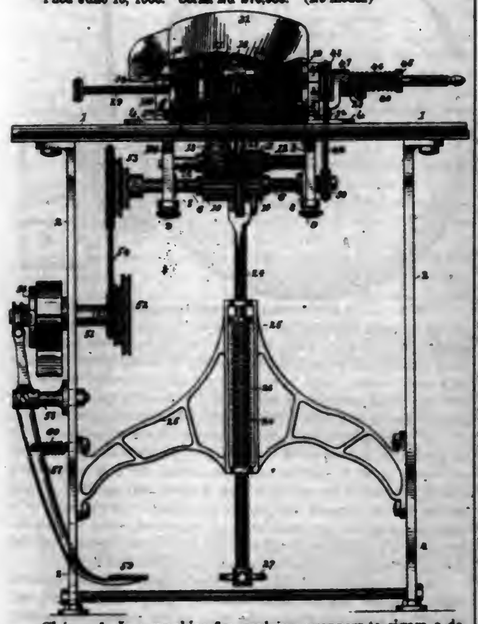
Claim.—The herein-described improvement in the art of forming seamless metal tubing, consisting in first spirally rolling and reducing a hollow ingot or blank to draw out the metal into a tube and arrange the fibers thereof spirally, and then cross-rolling said tube over a mandrel to further draw out the metal of the same, preserve the exterior spiral fibers, and arrange the interior fibers spirally, and also imparting a true cylindrical form to the tube, and straighten the same, substantially as and for the purpose set forth.

401,146. APPARATUS FOR WELDING TUBING. JOHN H. FLAGLER, New York, N. Y. Filed July 6, 1888. Serial No. 279,161. (No model.)

Claim.—1. In tube-welding apparatus, the combination, with the welding-furnace and power-driven tube-welding rolls, of a set of concave forming and lapping rolls mounted loosely in bearings between the furnace and the welding-rolls, and adapted to form the tube and lap the edges to be welded prior to its entrance into the welding-rolls, substantially as and for the purposes set forth.

2. In tube-welding apparatus, the combination, with a welding-furnace and power-driven tube-welding rolls, of a set of loosely-running rolls between the furnace and welding-rolls, and a mandrel or

401,146.



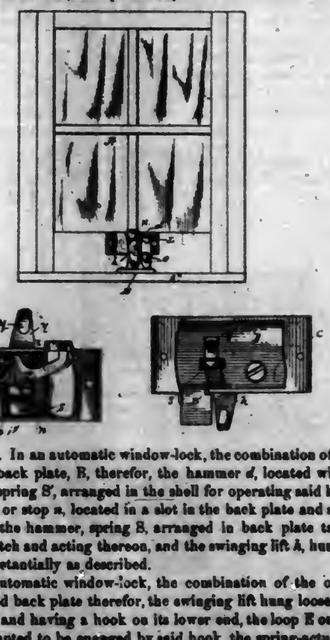
ball in the pass between said loosely-running rolls, substantially as and for the purposes set forth.

3. In tube-welding apparatus, the combination, with a welding-furnace and power-driven tube-welding rolls, of loosely-mounted rolls located between the furnace and welding-rolls, and springs governing the pressure of said loosely-running rolls, substantially as and for the purposes set forth.

4. In tube-welding apparatus, the combination, with tube-welding rolls, of a sizing or finishing ball located back of the same and in the line of the passage of the tube from said welding-rolls, substantially as and for the purposes set forth.

5. In apparatus for welding tubes, the combination, with the tube-welding rolls c c, of the bracket *p* and the sizing or finishing ball *n*, supported by said bracket, substantially as and for the purposes set forth.

401,147. MACHINE FOR WRAPPING CIGARS. SIMON J. FLATOW, New York, N. Y., assignor of one-half to Louis Sieber, same place. Filed June 13, 1888. Serial No. 276,939. (No model.)



Claim.—1. In a machine for applying wrappers to cigars, a device for forming the head portion of the cigar, constructed as herein shown and described—that is, comprising a plate or surface having a longitudinal concavity open at its top throughout its entire length and running to a point, the latter being cut away or open at one side, as described, to permit the tip or "ball" of the operator's finger to be inserted laterally into the point of the concavity, for the object herein stated.

2. In a machine for wrapping cigars, the combination of the longitudinally-adjustable carriages, each comprising parallel side plates and rollers fitted between the same, of the narrow endless belt passing over said rollers between the side plates of the carriages, and the stationary guideways or rods upon which the carriages can slide, substantially as herein set forth.

3. In a machine for applying wrappers to cigar-bunches, the combination of the inclined longitudinally-arched plate, the inclined end plate having a concave depression and a tip-forming plate or surface having a concave tapering cavity made open at the top and end, and the ledge at the end of said cavity with the endless traveling apron, and the operating and guide rollers, substantially as herein set forth.

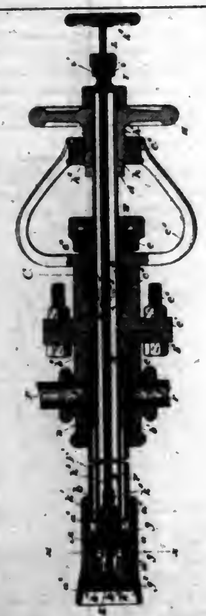
4. In a machine for applying wrappers to cigar-bunches, the combination of the longitudinally-adjustable carriages having guide-rollers and the endless belt passing over the same, with the fixed and pivoted frames having guideways for said adjustable carriages, and the screw-shafts on said fixed and pivoted frames for moving the carriages, as and for the purpose set forth.

401,148. COMBINATION ALARM-LOCK FOR WINDOWS. JAMES B. FINCH, Newark, N. J., assignor of one-half, by mesne assignments, to Thomas W. Harris, Henry R. Kilmly, and Hugo S. Mack. Filed Feb. 23, 1888. Serial No. 265,042. (No model.)

Claim.—1. In an automatic window-lock, the combination of the outer shell, C, back plate, B, therefor, the hammer *d*, located within said shell, flat spring S', arranged in the shell for operating said hammer, the catch or stop *n*, located in a slot in the back plate and serving to support the hammer, spring S, arranged in back plate transverse to the catch and acting thereon, and the swinging lift A, hung in the shell C, substantially as described.

2. In an automatic window-lock, the combination of the outer shell, the slotted back plate therefor, the swinging lift hung loosely in the outer shell and having a hook on its lower end, the loop E on the window-sill adapted to be engaged by said hook, the spring-actuated hammer located within the outer shell, and the catch or stop in the slotted back plate for temporarily supporting said hammer, substantially as described.

3. The combination of the outer shell, C, having projection B', formed to receive a percussion-cap, O, the slotted back plate, B, of the shell, the oscillating lift A, having hook *h*", lugs U U, on which it hangs in shell C, and projection 2, the hammer *d*, located within the shell, so as to be capable of falling upon cap O, its actuating-spring likewise situated within shell C, the stop *n* in the slotted back plate having shoulder V, and the spring S, fixed in the back plate transverse to said stop and acting thereon, substantially as described.

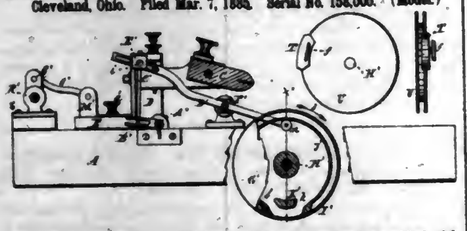


4. The combination of the outer shell, C, the spring-actuated hammer within the same, the stop or catch *n* for supporting said hammer, the spring S, transverse to the catch and serving to keep it in place, the swinging lift A, hung in the outer shell, and the loop E on the window-sill, substantially as described.

401,149. HYDROCARBON-BURNER. WILLIAM L. FISHER, Flint, Mich., assignor to the Fisher Oil Burner Company, same place. Filed May 16, 1888. Serial No. 274,085. (No model.)

Claim.—In a vapor-burner, the combination, with an outer casing having a portion of its inner wall inclined outwardly to form a valve-seat and a portion outside of said valve-seat at a different angle forming a dash, of a steam-valve and an oil-valve within said casing and within the dash, one of said valves adapted to engage the valve-seat of said casing, the oil and steam passages adjacent to the point of discharge both inclining outwardly, and the inner passage having a greater angle of inclination, whereby the two passages are made to approach each other.

401,149.



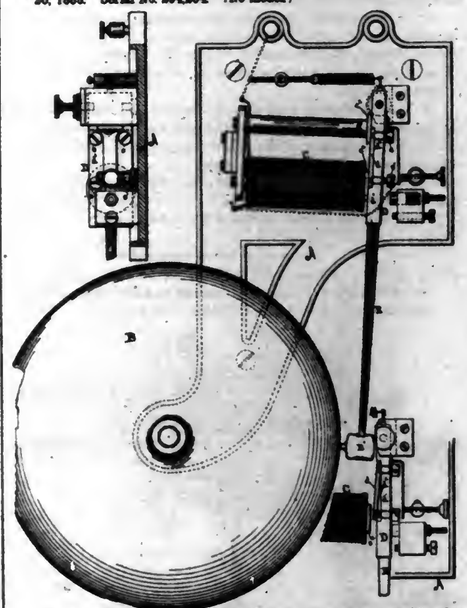
401,150. TACKLE-BLOCK. GEORGE A. FORD, Cleveland, Ohio. Filed June 21, 1888. Serial No. 277,718. (No model.)

Claim.—1. A sheet-metal casing for tackle-blocks, consisting of two sections, approximately halves, joined together rigidly in a plane lengthwise the sheave-axle and approximately lengthwise the tackle-block, each having a flanged slot for the sheave, substantially as set forth.

2. In a tackle-block, the combination, with a sheet-metal casing made up of two sections, approximately halves, joined together on a plane lengthwise the sheave-axle and lengthwise or approximately lengthwise the tackle-block, of an internal metallic strap extending around the inner wall of the casing and riveted to sections of the casing, substantially as set forth.

401,151. PAPER-RULING MACHINE. JONATHAN C. FORMAN, Cleveland, Ohio. Filed Mar. 7, 1888. Serial No. 156,005. (Model.)

Claim.—1. In a paper-ruling machine, the rocker I, provided with an arm in which is secured a face-plate, S, arranged in relation to and in combination with the drum U and cams thereon, and spring for operating said rocker, pen-beam C, and arms L and K, substantially as described, and for the purpose set forth.



2. In a paper-ruling machine, the combination of a rock-shaft arranged in the rear of the pen-beam and having at each end thereof an arm whereby the ends of the shaft are attached by suitable connecting rods or links to the sliding standards of the pen-beam, respectively, for moving simultaneously and oppositely both ends of the pen-beam, for the purpose specified, and the pen-beam *c*, substantially as hereinbefore set forth.

3. The combination of the rocker I, the arms K and L, and pen-beam C, the conical core P, and its set-screw *c*, for the adjustment of the arm K in relation to the lifting-arm L of the pen-beam.

4. In a paper-ruling machine, the combination, with the pen-beam and its movable standards, of the transverse shaft provided with devices, substantially as described, at its ends connected with and simultaneously imparting opposite movements to said standards, substantially as set forth.

5. In a paper-ruling machine, the closed cam G' and lever D', having one end thereof adapted to run on the course of the said cam, in combination with the connecting-rod and the gate A", substantially as described.

401,152. ARMATURE FOR ELECTRO-MAGNETS. JOHN GEARY, Philadelphia, Pa., assignor to J. Elliott Shaw, same place. Filed Dec. 20, 1888. Serial No. 294,204. (No model.)

Claim.—1. In an armature for electro-magnets, the combination of one or more light sections and a heavy section held in operative relation by a hinge or other device in such manner that portions of each section will be opposite the surface of attraction of the poles of a single magnet, said light sections being influenced before the heavier section, traveling in advance of and drawing the said heavier section into the field of attraction, substantially as shown and described.

2. In an armature for electro-magnets, the combination of one or more light sections and a heavy section, each of said sections being set loosely in the face of its contiguous section, and held in operative relation therewith by screws in such manner that portions of each section will be opposite the surface of attraction of the poles of a single magnet, said light sections being influenced before the heavier section, and traveling in advance of and drawing said section into the field of attraction, substantially as shown and described.

3. An armature for electro-magnets, composed of two or more sections secured together in such manner that portions of each section will be opposite the same poles of an electro-magnet, each section being successively influenced by the magnetic attraction and drawing its attached section into the field of attraction, for the purpose described.

4. In an armature for electro-magnets, the combination of light section *d*, set loosely in recess d^2 in the face of heavy section d', said light section being first influenced by the magnetic attraction, traveling in advance of the heavier section, and operating to draw said heavier section into the field of attraction of a single magnet, C, through the medium of diamagnetic screws *c c'*, substantially as shown and described.

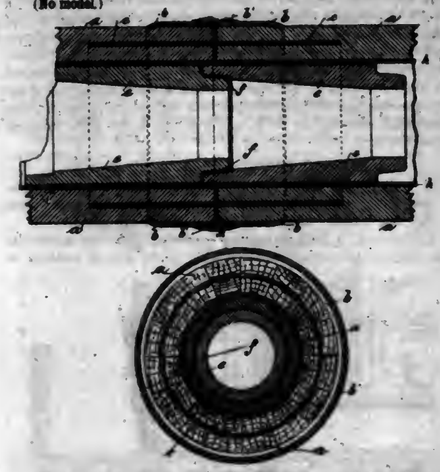
401,153. ELECTRIC GAS-LIGHTING BURNER. JOHN GEARY, Philadelphia, Pa., assignor to J. Elliott Shaw, same place. Filed Feb. 5, 1889. Serial No. 298,721. (No model.)

Claim.—1. In an electric gas-lighting burner, the combination, with the magnets thereof, of an armature pivoted thereon two cam-levers riding on shoulders and operating to impart rotary motion to the gas-cock, as and for the purpose set forth.

401,153.

2. In an electric gas-lighting burner, the combination, with the magnets thereof, of an armature pivoted at its center, and having pivoted on one of its edges two cam-levers riding on the ends of adjusting-screws in the bed-plate and imparting rotary motion to the gas-cock, as and for the purpose set forth.

3. In an electric gas-lighting burner, the combination, with the magnets, the movable electrode, and the gas-cock thereof, of an armature pivoted below the plane of its lower surface, in order to secure a movement of the same in the direction of a radial curve, as and for the purpose set forth.



4. In an electric gas-lighting burner, the combination, with the movable electrode-rod D, sliding in the flange b^3 on the burner-tube B, of the adjustable slide d', sliding on said tube and secured to said rod by screw d^3, preventing the same from turning, and serving to admit of changing the tension of the spiral spring *d*, encircling rod D, and sustained between said flange and slide, as and for the purpose set forth.

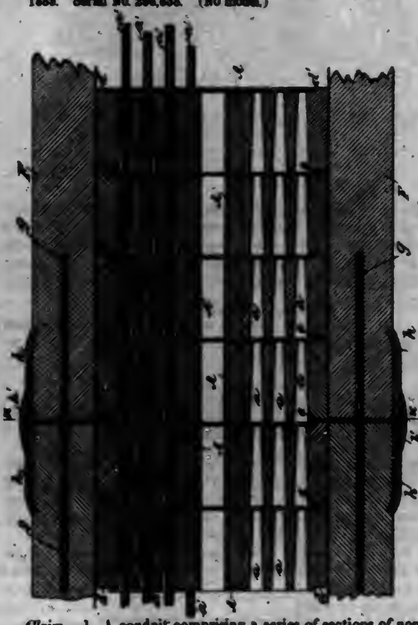
5. In an electric gas-lighting burner, the combination, with the magnets thereof, of an armature, E, provided with trunnions *e e'* below the plane of its lower surface, said trunnions being secured on the screw e^2, and bolt e^3, passing into the burner-tube, as and for the purpose set forth.

6. In an electric gas-lighting burner, the combination, with the magnets thereof, of an armature, E, having pivoted on the edge thereof on screws *f f'* the cam-levers F F', provided with the cam portions f^2 f^2 in their under edges, and the rounded ends f^4 f^4, engaging with the gas-cock, said levers at their cam portions resting and riding on the ends of the adjusting-screws *g g'* in the bed-plate G when the armature is actuated and communicating rotary motion to said gas-cock, as and for the purpose set forth.

7. In an electric gas-lighting burner, the combination, with the magnets thereof, of the armature E, having the trunnions *e e'*, pivoted on the screw and bolt e^2 e^3 below the plane of the lower edge of said armature, the latter having pivoted on its edge on screws *f f'* the cam-levers F F', provided with the cam portions or notches f^2 f^2, for engagement with the ends of the adjusting-screws *g g'* in the bed-plate G, the outer ends, f^4 f^4, of said levers engaging with the gas-cock H in the burner-tube and transmitting rotary motion to said gas-cock, as and for the purpose set forth.

401,154. TUBE OR CONDUIT. GEORGE H. GILLETTE and KING C. GILLETTE, New York, N. Y. Filed Jan. 17, 1889. Serial No. 296,637. (No model.)

Claim.—1. A tube or casing for a conduit, consisting of a series of sections formed of compressed wooden strips having grooved or slitted ends, as described, suitable retaining-bands, and connecting-sleeves, said section being disposed end to end and the said sleeves extending into the adjoining slits or grooves of the several connecting sections.



2. A tube or conduit consisting of a series of sections formed of compressed wooden strips, as described, suitable retaining-bands, and an inner tube or core, said sections being disposed end to end and united one to another.

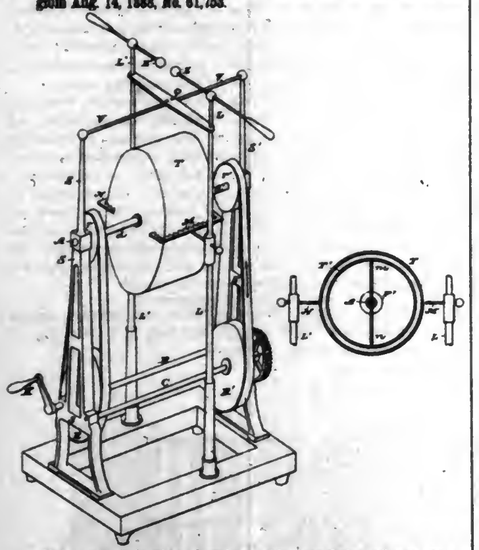
3. A tube or conduit consisting of a series of sections formed of compressed wooden strips having grooved or slitted ends, as described, suitable retaining-bands, connecting-sleeves, and an inner tube or core, said sections being disposed end to end and said sleeves extended into the adjoining slits or grooves of the several connecting sections.

4. A tube or conduit consisting of a series of sections formed of compressed wooden strips, as described, suitable retaining-bands, and an inner core composed of a series of short cylinders of insulating material, as glass, provided with connecting longitudinal openings, said sections being disposed end to end and united one to another.

5. A tube or conduit consisting of a series of sections formed of compressed wooden strips, as described, suitable retaining-bands, an inner core composed of short cylinders of insulating material, as glass, provided with one or more connecting longitudinal openings, and washers or packings interposed between said cylinders, said sections being disposed end to end and united one to another.

401,155. CONDUIT FOR ELECTRICAL CONDUCTORS. GEORGE H. GILLETTE and KING C. GILLETTE, New York, N. Y. Filed Jan. 17, 1889. Serial No. 296,638. (No model.)

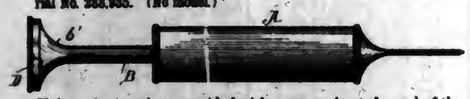
Claim.—1. A conduit comprising a series of sections of non-conducting material, as glass, provided with contracting longitudinal openings, said sections being arranged and secured one after another with the corresponding openings in line, whereby one or more continuous ducts with bearings at intervals are formed, substantially as set forth.



2. A conduit comprising a series of sections of non-conducting material, as glass, provided with tapering longitudinal openings, said sections being arranged and secured one after another with the larger ends of the opening in the succeeding sections adjacent to the smaller ends of the openings in the immediately preceding sections, substantially as and for the purposes set forth.

3. A conduit comprising a series of sections of non-conducting material, as glass, and intermediary washers or packings, said sections being provided with contracting longitudinal openings and secured one after another with the corresponding openings in line, substantially as and for the purposes set forth.

4. A conduit comprising a series of inner sections of non-conducting material, as glass, and an outer covering or casing, said sections being provided with contracting longitudinal openings arranged one after another with the corresponding openings in line, substantially as and for the purposes set forth.



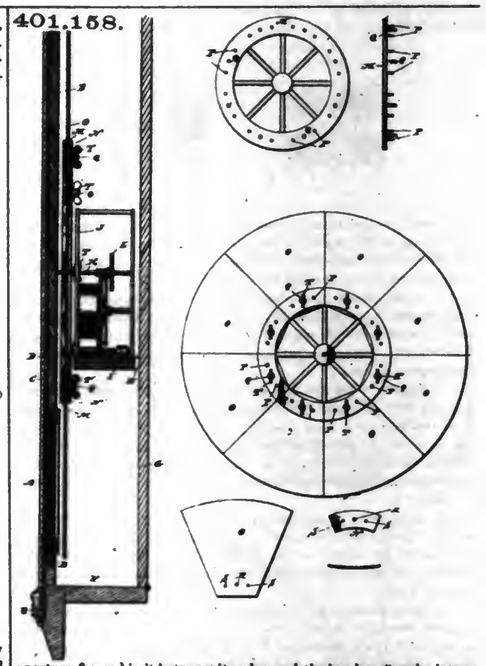
5. A conduit consisting of a series of sections of non-conducting material, as glass, intermediary packings or washers, and a compressed outer wooden casing, said sections being provided with contracted longitudinal openings and secured within said casing with the corresponding openings in line, substantially as described.

401,156. STATIC-INDUCTION MACHINE. HERMANN GLASER, Vienna, Austria-Hungary. Filed Dec. 28, 1887. Serial No. 259,271. (No model.) Patented in England Aug. 29, 1887, No. 11,718; in Austria-Hungary Jan. 15, 1888, No. 317,118 and No. 64,906; and in Belgium Aug. 14, 1888, No. 81,753.

Claim.—An induction electric machine consisting of two rotary drums of idioelectrical material arranged one within the other and hermetically closed against the entrance of air without frictional materials or brushes, the two drums rotating in opposite directions, substantially as herein described, and shown on the accompanying drawings.

401,157. SYRINGE. JAMES H. GLASCOCK, Sherman, Tex., assignor of one-half to John C. May, Lexington, Ky. Filed Oct. 23, 1888. Serial No. 288,935. (No model.)

Claim.—1. A syringe provided with a reservoir at the end of the piston-rod outside of the syringe-barrel, said reservoir communicating through the piston-rod with a fibrous piston-head and adapted to contain a suitable liquid, whereby said piston-head is kept continually moistened, substantially as and for the purpose described.

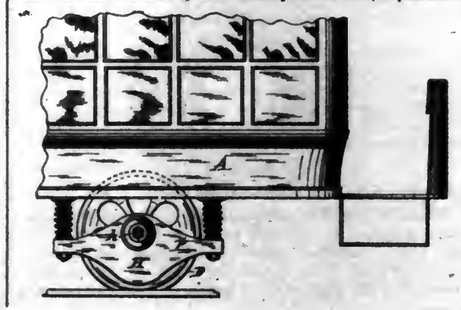


2. A syringe provided with a piston-rod having its inner end perforated and its outer end enlarged and provided with a cap, and a fibrous piston-head surrounding the perforations of the piston-rod, substantially as described.

401,158. ADVERTISING DEVICE. CHARLES D. GOODWIN and WILLIAM M. CHASE, New Haven, Conn. Filed Aug. 13, 1888. Serial No. 282,596. (No model.)

Claim.—1. In an advertising device, the combination, with a flat panel displaying a picture upon its outer face and having a single

401,158.



aperture formed in it between its edge and the border of such picture, of a frame of molding for such panel, a case located behind the frame, which is adapted to be supported in an upright position, a clock-movement located in the case, and a single imperforate flat or disk-shaped wheel for displaying the advertisements interposed between the back of the panel and the said movement, an arbor of the strike-train whereof is forwardly extended for the purpose of supporting and intermittently rotating the said wheel, substantially as set forth.

2. In an advertising device, the combination, with a panel having an aperture in it, of a clock-movement located behind the panel, and a flat or disk-shaped card-wheel located directly back of the panel connected with the clock-movement, so as to be supported and intermittently rotated thereby, and composed of a wheel-plate, sector-shaped cards having their inner and narrower ends applied to the rim of such plate, and retaining-segments placed upon such ends of the cards and secured to the plate, substantially as set forth.

3. In an advertising device, the combination, with a panel having an aperture in it, of a clock-movement located behind the panel, and a flat or disk-shaped card-wheel located directly behind the panel connected with such clock-movement, so as to be supported and intermittently actuated thereby, and composed of a wheel-plate, sector-shaped cards having their inner and narrower ends applied to the rim of the plate, retaining-segments placed upon such ends of the cards, and pins and studs for securing the cards and segments to the plate, substantially as set forth.

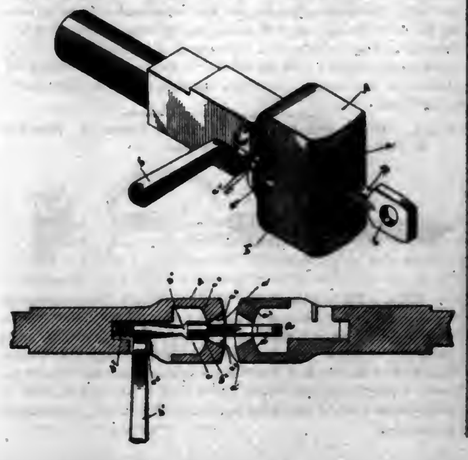
401,159. BEARING FOR STREET-CARS. DAVID G. GRANT, Syracuse, N. Y., assignor of one-half to Marion A. Andrews, same place. Filed Jan. 7, 1889. Serial No. 295,654. (No model.)

Claim.—1. A car-axle bearing consisting of a vertical annular track carried eccentrically and rotatably on the axle, a pedestal se-

401,159.

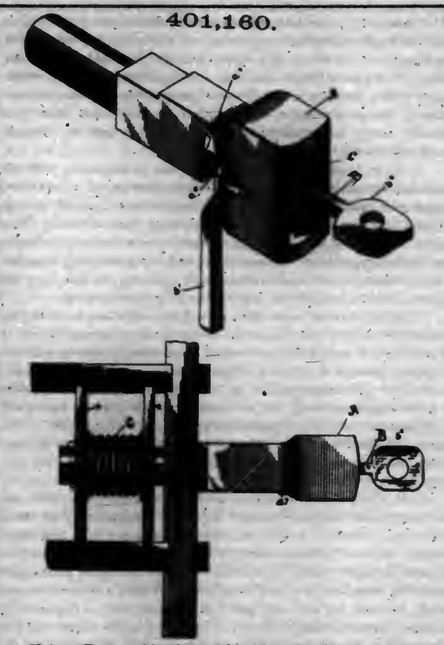
cured to the car-body and provided with an endless track, and a plurality of anti-friction rollers provided with bearings traveling on the two tracks, substantially as set forth and shown.

2. A car-axle bearing consisting of a vertical annular track carried eccentrically and rotatably on the axle, a pedestal secured to the car-body and carrying an endless track a portion whereof is concentric with the lower portion of the aforesaid annular track, and anti-friction rollers provided with bearings on the endless track of the pedestal and mounted on the lower portion of the annular track carried on the axle, as aforesaid.



3. A car-axle bearing consisting of a ring suspended vertically from the axle and riding eccentrically and rotatably thereon, a pedestal secured to the car-body and having affixed to it an endless track a portion whereof is concentric with the lower portion of the suspended ring, and the remainder of said track being eccentric in relation to the aforesaid ring, and rollers adapted to travel independently of each other and provided with bearings in the aforesaid track and upon the inner side of the lower portion of the suspended ring, substantially as set forth.

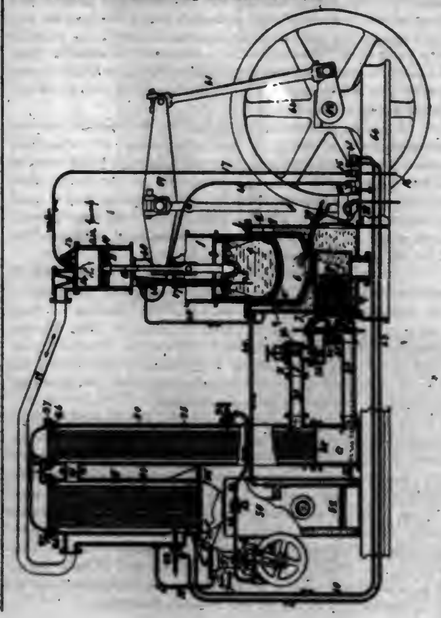
4. A car-axle bearing consisting of a ring suspended vertically from the axle and riding eccentrically and rotatably thereon, a pedestal secured to the car-body and formed with a housing inclosing the aforesaid ring, endless tracks on the inner sides of the said housing and having their main portions concentric with the lower portion of the ring, and the remainder of the said tracks of the form of arches beneath the axle, and rollers adapted to travel independently of each other, and provided with bearings in the aforesaid tracks and on the inner side of the lower portion of the ring, substantially as described and shown.



5. In an anti-friction axle-bearing, the combination, with the stationary track and movable track parallel therewith and rollers interposed between said tracks and adapted to rotate independently of each other, of supplemental rollers of larger diameters than the aforesaid rollers and pivoted to the ends thereof and concentric therewith, substantially as and for the purpose set forth.

6. The combination, with the car-body and axle, of the ring *r*, hung on the axle, the pedestal P, connected to the car-body and formed with the housing H, inclosing the aforesaid ring, and formed also with segmental tracks *a a*, concentric with the lower portion of the ring, and with the arching tracks *a' a'* beneath the axle, the journals *c c c*, traveling in the tracks *a a'*, the rollers *b b b*, mounted on the central portions of said journals and traveling on the inner side of the lower portion of the ring *r*, the supplemental rollers *c c c*, mounted on the aforesaid journals at opposite ends of the rollers *b b b* and of greater diameter than the latter rollers, and the set-screw *k*, passing through the housing H from the outer side thereof and in line with the axle, substantially as described and shown.

401,160. CAR-COUPLING. ROBERT I. HAMPTON, Athens, Ga. Filed July 25, 1888. Serial No. 281,013. (No model.)



401,160.

Claim.—The combination, with a draw-head having an oblong mouth with inclined sides leading into a larger interior opening provided with the lug or shoulder forming a seat, of the coupling-link provided with the weighted lever designed to rest against the lug or shoulder when in an uncoupled position, and to drop and turn the coupling-link to bring it to the position of coupling, substantially as described.

401,161. INTERNAL-COMBUSTION THERMO-DYNAMIC MOTOR. JAMES HARGREAVES, Farnworth, County of Lancaster, England. Filed Mar. 20, 1888. Serial No. 268,294. (No model.) Patented in England July 26, 1882, No. 3,540, and Apr. 15, 1887, No. 5,485; in France Feb. 6, 1883, No. 153,536, and Dec. 5, 1887, No. 187,491; in Belgium Feb. 7, 1883, No. 60,385, and Dec. 6, 1887, No. 79,287; in Italy Mar. 31, 1883, No. 15,195, and Nov. 30, 1887, No. 22,711; in Spain Apr. 12, 1888, No. 12,296, and in Canada Aug. 23, 1888, No. 29,736.

Claim.—1. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, a heating-chamber with which the supply-passage communicates, an air pump, 10, communicating with the heating-chamber, and a water-supply which discharges into the working-cylinder, of the air-pump, whereby the air is mingled with water or aqueous vapor prior to its delivery to the heating-chamber, substantially as and for the purposes described.

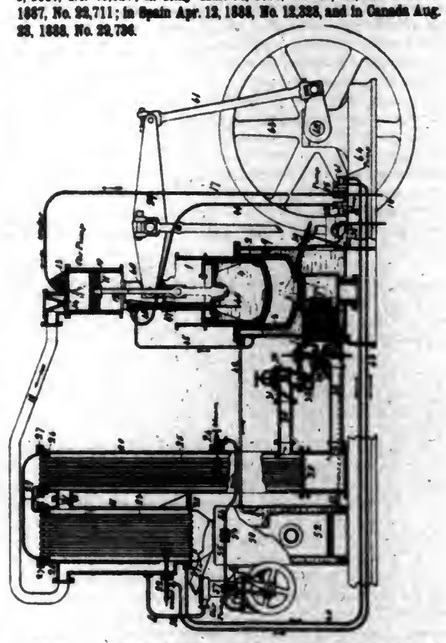
2. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a saturating chamber or vessel communicating with the air-supply passage, through which chamber or vessel the air-supply passes, said saturating chamber or vessel being provided with a steam or water supply, whereby the air is charged with aqueous vapor, and a superheating-chamber through which the air and aqueous vapor pass and wherein they are superheated, substantially as and for the purposes described.

3. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage having the valves 34 and 26, of a saturating chamber or vessel communicating with the air-supply passage, through which chamber or vessel the air-supply passes, said saturating chamber or vessel being provided with a steam or water supply, whereby the air is charged with aqueous vapor, and a regenerator-chamber communicating with the exhaust-port of the engine and also interposed in the air-supply passage between the saturator and the combustion-chamber, substantially as and for the purposes described.

4. In an internal-combustion motor, the combination, with the main piston, an air-pump operated therefrom, and an air-duct and a combustion-chamber having an air-supply passage, of a saturating chamber or vessel communicating with the air-supply passage and the air-duct, through which chamber or vessel the air-supply passes, said saturating chamber or vessel being provided with a steam or water supply, whereby the air is charged with aqueous vapor, a regenerator-chamber communicating with the exhaust-port of the engine and also interposed in the air-supply passage between the saturator and the combustion-chamber, and valves controlling the passage from the saturator to the generator, and also controlling the passage from the regenerator to the delivery end of the exhaust.

5. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a saturating chamber or vessel communicating with the air-supply passage, through which chamber or vessel the air-supply passes, said saturating chamber or vessel being provided with a steam or water supply, whereby the air is charged with aqueous vapor, and a flue or flues extending through the saturating-chamber and forming a passage-way for the exhaust from the motor-cylinder, whereby the exhaust is used for heating the said saturating-chamber, substantially as and for the purposes described.

6. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a saturating chamber or vessel communicating with the air-supply passage, and through which chamber or vessel separately pass the air and the products of combustion, said saturating chamber or vessel being provided with a water-supply, whereby the air is charged with aqueous vapor, and a pump, 41, connected with the water-supply and adapted to spray the water into and saturate the air in the saturating chamber or vessel, substantially as described.



7. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a saturating chamber or vessel communicating therewith, through which chamber or vessel the air-supply passes, a water-jacket for the motor, which water-jacket is connected with the saturating-chamber, and a pump also connected therewith, whereby a circulation of the water through the jacket and the saturating-chamber is maintained, substantially as and for the purposes described.

8. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a chamber or vessel communicating therewith, through which chamber or vessel the air-supply passes, a water-jacket for the motor, a boiler, 50, communicating with the water-jacket and with the said chamber or vessel, and an air-pump whose engine is connected with the boiler, the delivery-pipe of said air-pump communicating with the air-supply, substantially as and for the purposes described.

9. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a saturating-chamber, 18, communicating with the said air-supply passage, through which chamber the air-supply passes, said saturating-chamber being provided with a water-supply, whereby the air is charged with aqueous vapor, a second saturating-chamber, 20, interposed between the chamber 18 and the air-supply passage and provided with a steam-supply pipe, and a passage leading from the exhaust of the said combustion-chamber through said saturating-chambers, whereby the air and aqueous vapor passing through the saturating-chambers are heated, substantially as and for the purposes described.

10. In an internal-combustion motor, the combination, with the combustion-chamber having an air-supply passage, of a saturating chamber or vessel, 18, communicating therewith, through which chamber or vessel the air-supply passes, and a water-supply pump having its inlet and discharge ports communicating with said saturating-chamber, whereby a continuous circulation of water into and from said saturating-chamber is maintained, substantially as and for the purposes described.

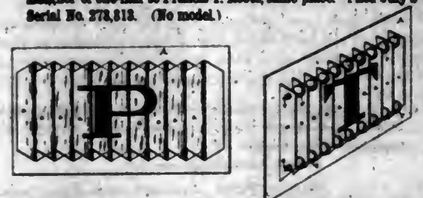
401,162. PROCESS OF OBTAINING MOTION FROM HEAT PRODUCED BY LIQUID OR GASEOUS FUEL. JAMES HARGREAVES, Farnworth, County of Lancaster, England. Filed Apr. 4, 1888. Serial No. 269,532. (No model.) Patented in England July 26, 1883, No. 3,540, and Apr. 15, 1887, No. 5,485; in France Feb. 6, 1883, No. 153,536, and Dec. 5, 1887, No. 187,401; in Belgium Feb. 7, 1883, No. 60,335, and Dec. 6, 1887, No. 79,827; in Italy Mar. 31, 1883, No. 15,185, and Nov. 30, 1887, No. 22,711; in Spain Apr. 12, 1884, No. 12,328, and in Canada Aug. 23, 1888, No. 23,736.

Claim.—1. The method hereinbefore described of treating the air which is supplied to the combustion-chamber of an internal-combustion motor, which consists in mingling aqueous vapor with the air, heating the same until the air is saturated with aqueous vapor, then mingling the saturated air with steam and superheating the same preparatory to bringing the air into contact with the liquid or gaseous fuel in the combustion-chamber, substantially as and for the purposes described.

2. The method hereinbefore described of treating the air which is supplied to the combustion-chamber of an internal-combustion motor, which consists in saturating air with water under pressure, mixing the thus saturated air with steam, superheating the resulting product and raising the same to a high degree of heat prior to bringing the same into contact with the other fuel, and thereafter utilizing the products of combustion for heating the water and air, substantially as described.

401,163. SHEARS. WALTER P. HATCH, Pullman, Ill. Filed Nov. 30, 1888. Serial No. 292,310. (No model.)

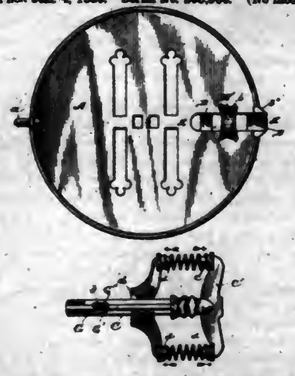
Claim.—The combination of the blades A and B, the blade B being countersunk adjacent its pivot-hole, a single screw-bolt, C, for pivotally connecting said blades, the nut E upon said screw-bolt, and a washer, D, of rubber, said washer D being located within the countersunk seat of the blade B and bearing against the inner face of the nut E, whereby the screw-bolt C and the nut E are held in fixed relation to the blade B during the operation of the shears, substantially as described.



401,164. METHOD OF PREPARING DESIGNS FOR ADVERTISING-CARDS. THEODORE P. HEINEMANN, Connersville, Ind., assignor of one-half to Francis T. Roots, same place. Filed July 2, 1888. Serial No. 278,812. (No model.)

Claim.—1. The hereinbefore-described method of forming variable signs, which consists in first crimping the strip or blank to the form of the proposed sign, then folding the outwardly-projecting ribs down, first upon one side, then upon the other, and while so folded forming upon each side of the slats the design.

2. The method of forming designs for signs, consisting of the following steps: first crimping the strip or blank to the form of the proposed sign; second, folding the outwardly-projecting ribs down first in one direction and then in the other, and while so folded forming the designs upon them, and, third, folding the ribs to the reverse side and forming the third character upon the spaces between the ribs, substantially as hereinbefore set forth.



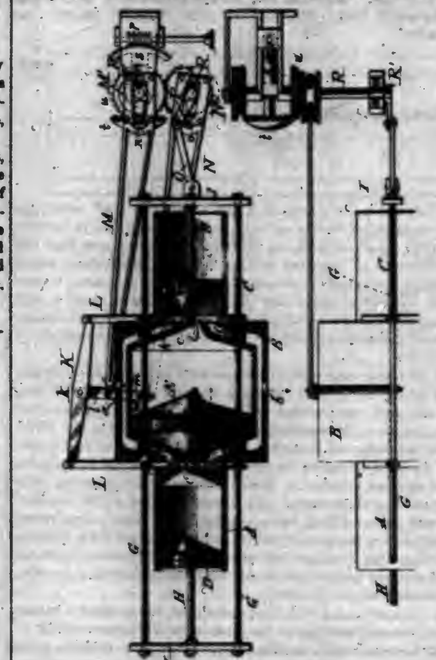
401,165. METHOD OF PRODUCING VARIABLE SIGNS AND ADVERTISING-CARDS. THEODORE P. HEINEMANN, Connersville, Ind. assignor of one-half to Francis T. Roots, same place. Filed July 2, 1888. Serial No. 278,813. (No model.)

Claim.—1. The method of preparing slatted variable signs by first in so forming the required designs or characters upon both sides of a strip or sheet of metal or other suitable material that the character will appear regular when the slats are turned at a right angle, then severing or partially severing the said sheet to form slats.

2. The method of preparing slatted fronts for variable signs, which consists of the following steps: first, in forming one of the required designs or characters regularly upon one side of a plate of sheet metal or other suitable material; second, in so forming the second designs or characters required upon the opposite side of the plate that they will appear regular when said plate is severed into slats and the slats turned at a right angle; third, in partially severing the said plate to form slats and turning said slats at a right angle to the plate, substantially as shown and described.

401,166. STOVE-PIPE DAMPER. FREDERICK W. HOSMER, Freeport, Ill. Filed Jan. 4, 1889. Serial No. 295,396. (No model.)

Claim.—1. The combination, with a damper-blade provided with a socket having an internal lug, *b*, of a shank adapted to enter said socket, and having a suitable head or enlargement, a slide moving on said shank, and a spring interposed between said slide and the head or enlargement of the shank, and adapted to press the slide away from said head or enlargement, the end of the shank opposite said head or enlargement being formed with a longitudinal groove or depression extending inward from the end of the shank, but having its inner end closed and turned outward toward the end of the shank, said groove throughout its entire length being adapted to permit the passage of the internal lug, *b*, of the socket in the blade, substantially as and for the purpose set forth.



2. The combination, with a damper-blade having an outwardly-conical boss at one point in its margin, of a shank adapted to pass axially through said cone and provided with means for engagement of the blade, a slide moving on said shank and having an internally-conical surface corresponding with the external cone on the boss of the blade, and a spring interposed between said slide and a suitable head or enlargement on the shank, and adapted to press said slide toward the boss on the blade, substantially as and for the purpose set forth.

3. The combination, with the damper-blade and a shank adapted to engage therewith and provided with a suitable head or enlargement, of a slide moving on said shank and provided with arms extending in opposite directions therefrom, and a spring interposed between the end of each of said arms and the head or enlargement on the shank, and adapted to press said slide away from said enlargement, and at the same time to form a non-heating surface to be grasped in operating the damper, substantially as and for the purpose set forth.

4. The combination, with the blade A and the shank C, adapted to engage said blade, and provided with a head, C', of the slide D, moving on the shank, and the springs S S, interposed between the ends of the arms of the slide and the corresponding ends of the arms of the head, and adapted to press the slide away from the head, and at the same time to form non-heating surfaces adapted to be grasped in operating the damper, substantially as and for the purpose set forth.

5. The combination, with the blade A and shank C, adapted to engage therewith, and having a head, C', provided with bosses *c*, of the slide D, provided with the bosses *d*, and the springs S, interposed between the slide and head, and held in place by the bosses *c d*, substantially as and for the purpose set forth.

401,167. COMPOUND STEAM-ENGINE. CARLOS HOLLY, Lockport, N. Y. Filed Dec. 10, 1885. Serial No. 185,310. (No model.)

Claim.—1. As a compound steam-engine, a double-acting cylinder, in combination with two single-acting cylinders arranged on the ends of the double-acting cylinder and provided with simultaneously-moving pistons which are connected by means of piston-rods joined at their ends by cross-pieces, said piston-rods passing through the double-acting but outside of the single-acting cylinders, the middle piston being secured to the rods and the end pistons being connected by rods with said cross-pieces, substantially as described.

2. In a compound steam-engine, the combination of a low-pressure cylinder, two high-pressure cylinders placed on the ends of the low-pressure cylinder, the adjacent heads of said cylinders having each a steam-port and ingress and exhaust passages, arranged substantially as shown, and all of said cylinders being provided with simultaneously-moving pistons which are connected by means of piston-rods joined at their ends by cross-pieces, and passing through the double-acting

but outside the single-acting cylinders, the middle piston being secured to the rods and the end pistons connected with the cross-pieces, and valves situated between the heads of the cylinders, each of said valves having two openings, and arranged to operate substantially as specified and shown.

3. In a compound steam-engine, a double-acting cylinder, in combination with two single-acting cylinders arranged on the ends of the double-acting cylinder, a piston within each cylinder, and a frame for enabling the pistons to have a simultaneous movement without the use of a piston-rod common to the three pistons, said frame consisting of a cross-piece at the outer end of each single-acting cylinder and rods connecting the pistons with said cross-pieces, substantially as described.

4. In a compound steam-engine, the combination of a low-pressure cylinder, two high-pressure cylinders placed on the ends of the low-pressure, the adjacent heads of said cylinders having each a single port, and being likewise provided with ingress and exhaust passages, and valves situated between the heads of the cylinders, each of said valves having two openings, one to admit steam to the high-pressure cylinders and the other for allowing steam to pass from the high-pressure to the low-pressure cylinders, and also from the low-pressure to the exhaust, all arranged and operated substantially as described.

5. In a compound steam-engine, a central low-pressure double-acting cylinder, in combination with two contiguous single-acting high-pressure cylinders, said cylinders being provided with pistons having port-closing projections, and all connected together and having a simultaneous movement in the same direction, as and for the purpose specified.

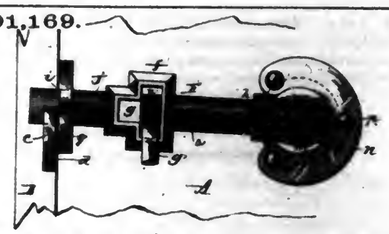
6. The combination of cylinder B, its piston E, cylinders A and C, their pistons D and F, the piston-rods G G and H H, and the cross-pieces I I, substantially as set forth.

401,168. MACHINE FOR IMPARTING MOTION. JOHN J. ITEN, Davenport, Iowa. Filed Sept. 18, 1888. Serial No. 285,754. (No model.)

Claim.—1. In combination with a journaled shaft carrying a fixed ratchet-wheel having one or more notches in its side, two crank-arms hung upon said shaft, one provided with an engaging pawl and the other with an engaging arm for imparting intermittent partial rotation to said wheel, an actuating-rod connected at one end to each of said crank-arms, one of said connections riding in a slot in said rod, and the opposite end of said rod attached to driving mechanism for imparting to the opposite end reciprocal motion, substantially as described.

2. In combination with a journaled shaft carrying a fixed ratchet-wheel having one or more notches in its side, two crank-arms hung upon said shaft, one provided with an engaging-pawl and the other an engaging arm for imparting intermittent movements to said wheel, and an actuating-rod connected at one end to each of said crank-arms, one of said connections riding in a slot in said rod, the opposite end of said rod attached to driving mechanism for imparting to its other end to-and-fro motion, and a sprocket-wheel rigidly attached upon said shaft, a sliding frame carrying two or more pulleys seated in a slideway in the main frame, an endless sprocket-chain with one or more catches upon its outer surface surrounding said pulleys and sprocket-wheel, and mechanism for adjusting said frame in its slideway, substantially as described.

3. In combination with a journaled shaft, mechanism for imparting to it intermittent partial rotations, a sprocket-wheel rigidly attached upon said shaft, a sliding frame seated in a slideway in the main frame, carrying two or more pulleys, an endless sprocket-chain, with one or more catches in its outer surface surrounding said pulleys and sprocket-wheel, and mechanism for adjusting said frame in its slideway, substantially as described.



401,169. LATCH. ORIEN A. JEFFERS, Lansing, Mich. Filed Dec. 27, 1888. Serial No. 294,791. (No model.)

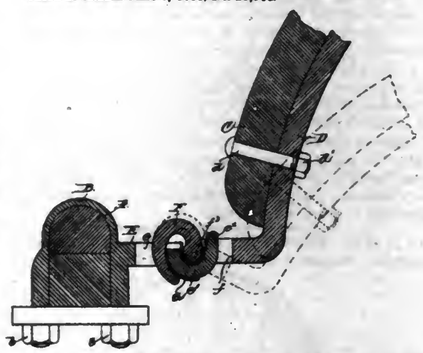
Claim.—1. In a latch, the combination, with a turning plate having a socket therein, of a sliding latch-bolt, one end of which rests loosely within said socket, substantially as set forth.

2. In a latch, the combination, with a turning plate having a socket therein, of a sliding latch-bolt, one end of which rests loosely within said socket, and means for operating and locking the bolt, substantially as set forth.

3. In a latch, the combination, with a turning plate having a socket therein, of a latch-bolt loosely mounted in the socket of the

401,169.

turning plate, and a lever, the said bolt having a shoulder adapted when the latch-bolt is in one position to rest over and in a position to be engaged by the lever, substantially as set forth.



4. In a latch, the combination, with a turning socket and rim to hold the latter in place, and a slide-bolt, the latter having a rib thereon, of a keeper having a notch therein adapted to receive said rib in order to lock the latch, substantially as set forth.

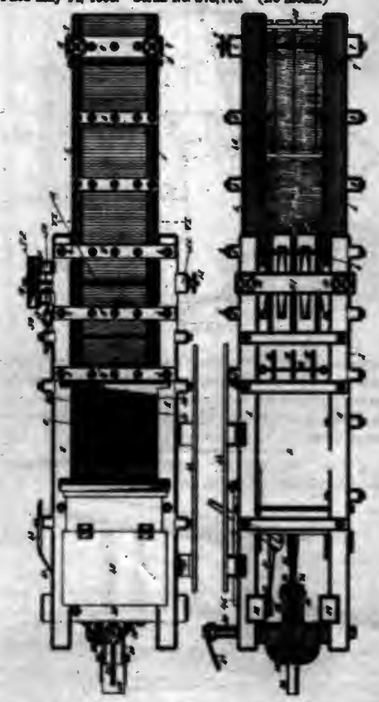
5. In a latch, the combination, with a turning socket and a rim to hold the latter in place, of a bolt having a T-shaped slot and a rib, a keeper having a notch to receive the rib, and a thumb-lever for operating the latch-bolt, substantially as set forth.

6. In a latch, the combination, with a turning socket having an offset thereon, and a rim having a corresponding offset to receive said turning socket, of a latch-bolt adapted to slide in the socket, said bolt having a T-shaped slot, a rib, and a flattened end, a keeper having a notch to receive the rib, a thumb-lever, and a slotted handle, substantially as set forth.

7. In a latch, the combination, with a longitudinally-sliding latch-bolt having a T-shaped slot therein, of a lever passing through said slot, substantially as set forth.

401,170. THILL-COUPLING. CHARLES R. JOHNS, Hatley, Quebec, Canada. Filed Aug. 3, 1888. Serial No. 281,861. (No model.) Patented in Canada June 9, 1888, No. 29,311.

Claim.—1. A thill-coupling composed, essentially, of a coupling-iron provided with an upward, backward, and downwardly curved hook, substantially as specified, and a second coupling-iron having a bar and slot or opening to permit the said curved hook to pass in front of and over the bar, through the slot, and under said bar to lock the couplings, in the manner and for the purpose specified.



2. A thill-coupling composed, essentially, of a primary loop portion having a bar, a slot or opening, and a forward and upwardly turned lip, and a thill-iron provided with a secondary loop portion having a slot or opening and a backward and downwardly curved hook, substantially as and for the purpose described.

3. The combination, with the primary loop portion having the slot or opening and bar, as specified, of a thill-iron provided with a backward and downwardly curved hook, and a washer provided with the wings g, the main portion g', and the lip g^2, the said lip passing over the bar, substantially as and for the purpose set forth.

4. The combination, with the primary loop portion having a slot, a bar, and the upturned lip, substantially as specified, and the thill-iron provided with the secondary loop portion having the slot and curved hook, as specified, of the shaped and hardened washer G, having the wings g, the main body portion g', and the lip g^2, substantially as and for the purpose specified.

5. A thill-coupling composed, essentially, of a thill-iron provided with a backward and downwardly curved hook, and a bar adapted to be secured to an axle and to permit the hook to pass over and under the same and to prevent lateral movement of said hook when engaged therewith.

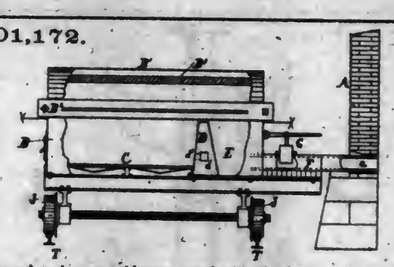
401,171. BALING-PRESS. WILLIAM J. H. KAPPE, Quincy, Ill. Filed May 14, 1888. Serial No. 273,773. (No model.)

Claim.—1. A baling-press having a traverser provided with guide-plates, and guide-strips for said plates in the compression-chamber extended into the receiving-chamber, the part extended into the receiving-chamber being beveled, substantially as and for the purpose described.

2. The combination, in a baling-press, of a traverser, a connecting-rod secured to said traverser and pivoted in slotted links, a cam-lever pivoted to said slotted links, a shaft upon which said cam-lever is pivoted, a crank swiveled to said shaft and embracing the cam-lever, and a horse-power arm connected with said crank.

3. The combination, in a baling-press, as hereinbefore set forth, of the vertical shaft 30, attached to the fore part of the press, a double crank, 35, swiveled to said shaft and having shoulders, as described, a cam-lever, 33, also swiveled to said shaft, having projecting shoulders 37 39 and embraced by said double crank, a horse-power arm, 36, secured to said double crank, a slotted link, 34, pivotally affixed to said cam-lever, a connecting-rod, 24, pivoted in a slot in said link, and a traverser, as 19, connected with said rod.

4. The combination, in a baling-press, of slotted links, a connecting-rod, as 24, pivoted in the slot of said links, a traverser, as 19, secured to said connecting-rod, a power-supply connection pivotally secured to said links, and anti-friction rollers mounted upon the outer end of said connecting-rod.



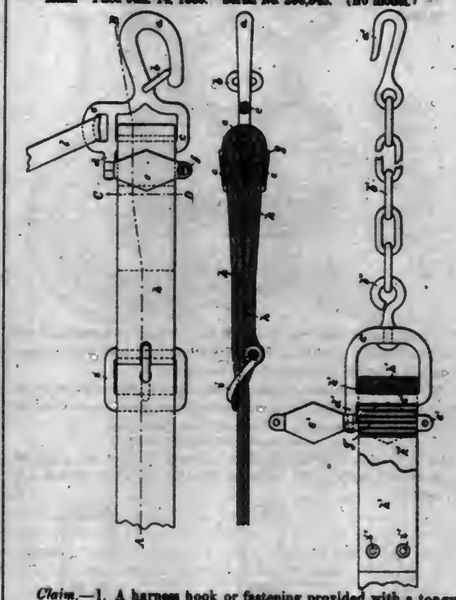
5. The combination, in a baling-press, of a traverser, a connecting-rod for said traverser pivotally secured in slotted links 34, as described, a double cam-lever pivotally secured to said slotted links, power-connections for actuating said double cam-lever, and anti-friction rollers mounted upon the outer end of said connecting-rod, for the purpose described.

6. The combination, in a baling-press, as hereinbefore set forth, of the vertical shaft 30, attached to the end of the press, a crank swiveled to said shaft and having shoulders, as described, a cam-lever, also swiveled to said shaft, having projecting shoulders 37 39 and embraced by said crank, a link pivotally affixed to said cam-lever, a connecting-rod, 24, pivoted in said link, a traverser, 19, secured to said connecting-rod, and anti-friction rollers 48, mounted upon the outer end of said connecting-rod, for the purpose described.

401,172. FURNACE FOR BRICK-KILNS. CHARLES M. KEEP, Erie, Pa. Filed Aug. 31, 1888. Serial No. 284,224. (No model.)

Claim.—1. A brick-kiln plant comprising a number of kilns having each a series of flues opening through its walls, and a portable furnace having a series of flues corresponding with the kiln-flues and

401,172.



arranged to be separably connected with the latter, substantially as and for the purpose described.

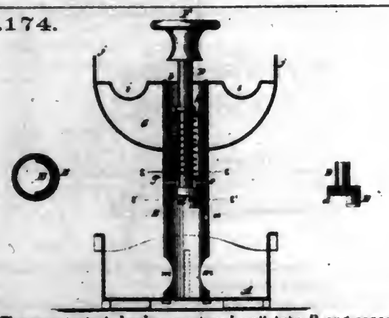
2. An improved portable furnace for brick-kilns of the kind herein described, provided with a hollow bridge-wall opening into the fire-chamber, an air-chamber above the fire-chamber, and with pipes connecting the air-chamber with the bridge-wall, whereby the air is heated and then fed directly into the fire-chamber of the furnace, substantially as and for the purpose set forth.

3. In a furnace substantially as shown, the combination, with the arched roof B, of the fixed base-plate B^2, the movable base-plates b', and the springs b between said plates.

401,173. HOOK FOR HARNESS. DANIEL E. KENDRICK, Boston, Mass. Filed Jan. 14, 1889. Serial No. 296,343. (No model.)

Claim.—1. A harness hook or fastening provided with a tongue adapted to lie between the two parts of the chafing-leather and harness-strap, substantially as described, combined with two clamps pivotally connected to each other and to said harness hook or fastening and adapted to clasp the bight or loop of said strap, and means for drawing and holding said clamps together, for the purpose herein specified and set forth.

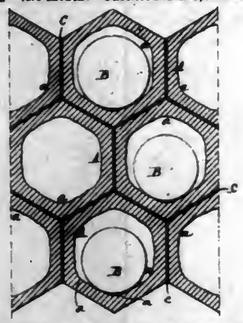
2. The harness hook or fastening, substantially as herein described, having a tongue, and two pivoted clamps pivoted to said hook, and a clamp-tightening screw, in combination with the harness-strap and its chafing-leather, substantially as set forth.



3. The herein-described harness hook or fastening, consisting of the hook a, dog b, frame c, pivot d, clamps $c\,c$, screw f, and tongue g, all constructed and arranged to operate substantially as specified.

4. A harness hook or fastening of the class herein described, combined with the two clamps $c\,c$, pivoted thereto, and the pressure-adjusting screw f, all substantially as and for the purpose specified.

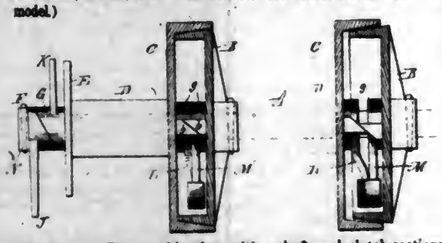
401,174. CIGAR CUTTER AND SUPPORT. PHILIP KERN, Yonkers, N. Y. Filed June 1, 1888. Serial No. 275,714. (No model.)



Claim.—1. The single tube B, having opening m at its lower end, a cutter within said tube, rod D, carrying said cutter, and knob F on said rod, combined with the head G, carried at the upper end of said tube and having cigar-recesses i, the head G serving to limit the movement of the knob F, substantially as described.

401,174.

2. The receptacle A, having apertured wall, tube B, and concave cutter E within said tube, rod D, carrying the cutter E, and knob F on said rod, combined with the cigar-rest G on the tube B, and the apertured lug *f* on said head, said lug being above the aperture in the wall of the receptacle A, the head G serving to limit the movement of the knob F, substantially as described.



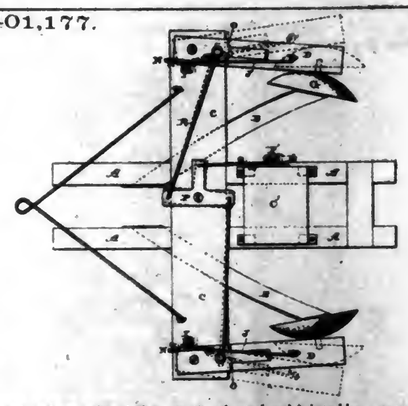
401,175. WINE-BIN. GEORGE KING, East Haddon, County of Northampton, assignor of two-thirds to William Arthur Smith, Weedon, and George King, Jr., East Haddon, England. Filed Jan. 19, 1888. Serial No. 261,244. (No model.) Patented in England Nov. 23, 1886, No. 15,296.

Claim.—1. A wine-bin consisting of a number of hexagonal cells of brick or other suitable material piled together, such cells adapted to contain a bottle, substantially as described.

2. A hexagonal cell adapted to contain a bottle and having its interior surface provided with slightly-hollowed grooves *a* in line with each angle of the hexagon, substantially as described.

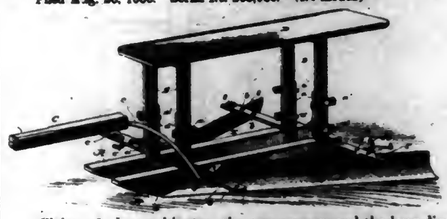
401,176. FRICTION-CLUTCH. GEORGE W. KING and HENRY M. BARNHART, Marion, Ohio. Filed Dec. 24, 1888. Serial No. 294,482. (No model.)

Claim.—1. The combination, with a shaft and clutch-sections thereon, of hubs located between the sections and carrying gravity-weights and inclines for separating said sections, substantially as set forth.



2. In a clutch, the combination, with a shaft and clutch-sections thereon, of hubs located on said shaft and carrying inclines and weights for forcing the clutch-sections apart, and cams for forcing the clutch-sections together, substantially as set forth.

3. In a clutch, the combination, with a shaft, a clutch-section fixed thereon, a clutch-section loosely mounted thereon, and a drum secured to the loose section, of hubs loosely mounted on the shaft between the clutch-sections and carrying inclines and weights for separating the clutch-sections, and cams for holding the clutch-sections together, substantially as set forth.



401,177. CULTIVATOR FOR LISTED CORN. HARLIN R. KING, Jackson, Kans. Filed Oct. 18, 1888. Serial No. 288,511. (No model.)

Claim.—In a corn-cultivator, the combination of the runners, the board or frame placed thereon, the pivoted and jointed bars connected to opposite ends of the board, the disks connected to the bars, levers for operating the bars and disks vertically, levers for moving the bars and disks laterally, and cutters which extend from opposite sides of the runners, substantially as shown.

401,177.

401,178. CULTIVATOR. FRANK W. KIRKBRIDE, Stratton, Nebr. Filed Aug. 28, 1888. Serial No. 283,980. (No model.)

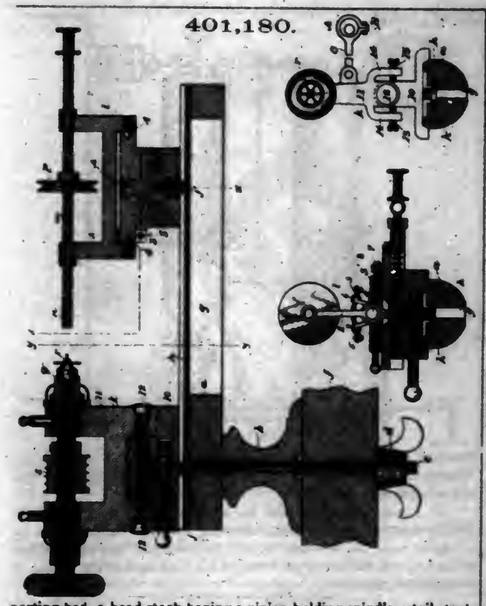
Claim.—1. In a cultivator, the two runners and the long divergent blades or scrapers located outside of the respective runners, in combination with the blades G, secured to and extending below the runners to prevent lateral movement of the machine.

2. In a cultivator, the arched cross-bars B, having the outwardly-turned ends, the runners secured to said bars and adjustable vertically in relation thereto, and the oblique scrapers secured to the ends of the cross-bars, as shown.

3. The arched cross-bars with the outwardly-turned ends and the oblique scrapers rigidly attached thereto, in combination with the two runners having the upright arms, the clip-bolts securing said arms to the cross-bars, and the blades G, secured to and adjustable vertically upon the runners.

4. In a cultivator, the two runners, the arched cross-bars connecting said runners and extended upward at their ends, and the oblique blades or scrapers bolted to said extended ends and adapted for transposition, as described, whereby they may be caused to throw the earth inward or outward, as occasion may require.

401,179. SEAT FOR VEHICLES. JAMES LEA, Fernleigh, New Road, Bromsgrove, County of Worcester, England. Filed Aug. 8, 1888. Serial No. 282,294. (No model.) Patented in England May 15, 1888, No. 7,202.



Claim.—As a new article of manufacture, a foot stool or seat consisting of the base-plate H, the secondary plate K, and the top plate, N, all of substantially uniform dimensions and arranged horizontally one above the other, a series of springs secured to and distributed about the under side of the base-plate adjacent to the edges or corners thereof, and two series of springs located, respectively, between and secured to and distributed about the edges or corners of the base and secondary plates, and the secondary and top plates, substantially as and for the purposes described.

401,180. PINION-FACING MACHINE. WILLIAM B. LEARNED and LEONIDAS MURRAY, Boston, Mass., assignors of one-half to The E. Howard Watch and Clock Company, same place. Filed May 6, 1887. Serial No. 237,396. (No model.)

Claim.—1. In a pinion-facing machine, the combination of a supporting-bed, a head-stock having a pinion-holding spindle, a tail-stock having a laterally-movable portion, a spindle journaled in said movable portion, and thereby adapted to reciprocate laterally, and a facing-shell supported by said spindle and having an independent rocking movement thereon, as set forth.

401,180.

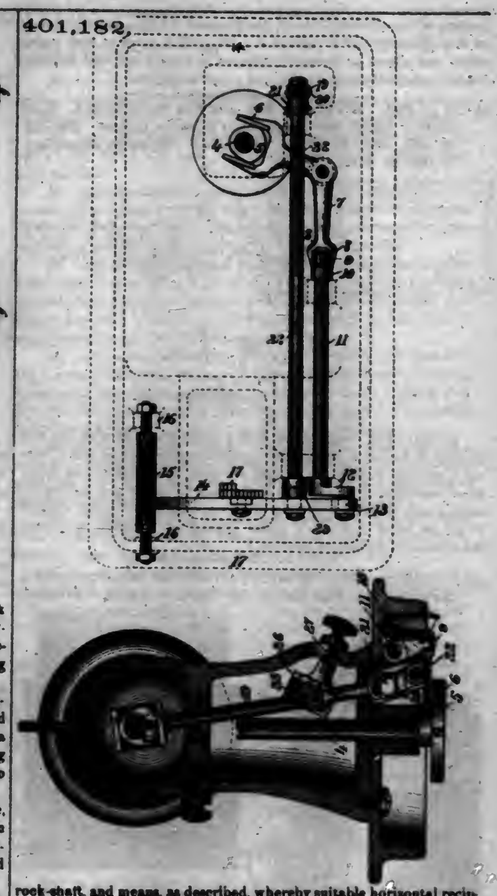
2. In a pinion-facing machine, the combination of a supporting-bed, a tail-stock having a spindle, a facing-shell supported by said spindle and having a rocking or oscillating motion thereon, and a head-stock having a laterally-movable portion, and a pinion-holding spindle journaled in said movable portion, and thereby adapted to reciprocate laterally, as set forth.

3. A lathe-stock composed of a base, a frame pivoted to said base, and a spindle journaled in said frame, combined with power-driven devices, as an eccentric, A, and connecting-rod C, whereby a continuous rapid rocking or oscillating motion may be automatically imparted to said frame and spindle, as set forth.

4. In a pinion-facing machine, the combination of a spindle having a grooved pulley, a facing-shell supported by said spindle and adapted to rock, a cord engaged with said pulley, and power-driven devices, as a crank-wheel, *w*, and rod *v*, for reciprocating said cord and jarring or rocking the facing-shell, as set forth.

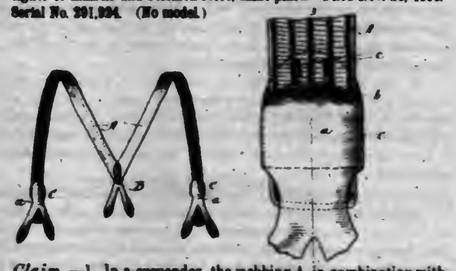
401,181. HANDLE FOR TABLE-CUTLERY. WILLIAM W. LEE, Northampton, Mass. Filed Sept. 7, 1888. Serial No. 284,834. (No model.)

Claim.—The compound handle above described, made up of the shells *a* and *b*, the inner shell, *a*, being of metal and connected to the tang of the instrument, and the outer shell, *b*, being of plastic material and molded upon the inner shell, *a*, all as and for the purpose specified.



401,182. FEEDING MECHANISM FOR SEWING-MACHINES. FRANCIS T. LEILICH, Bridgeport, Conn. Filed Jan. 25, 1889. Serial No. 297,547. (No model.)

Claim.—1. In a feeding mechanism for sewing-machines, the combination, with the feed-bar slotted and forked at one end, as shown, of a link fulcrumed to the bed and upon which the other end of said bar is supported, a horizontally-extended and cranked rock-shaft engaging the forked end of the bar, whereby the appropriate vertical movement is imparted thereto, the feed-driving rock-shaft engaging the slot in the bar, the cam-actuated bell-crank lever, whereby the feed-lifting rock-shaft is actuated, and the vibratory lever connected to the main shaft, whereby the feed-driving shaft is operated, substantially as set forth.

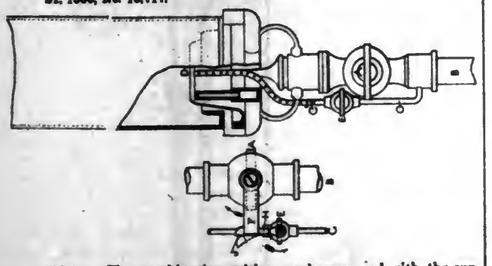


2. In a feeding mechanism for sewing-machines, the combination, with the vertical shaft and the cam secured thereon, of the horizontally-vibrating bell-cranked lever actuated as to one end by said cam, the feed-lifting rock-shaft engaged and actuated by the outer end of said bell-crank lever, the feed-bar operated vertically by said lifting rock-shaft, and means, as described, whereby suitable horizontal reciprocation is imparted to said feed-bar, substantially as and for the purpose specified.

3. In a feeding mechanism for sewing-machines, the combination, with the main shaft and the cam arranged thereon, of the reciprocating connection whose upper end embraces the cam, and whose lower end is forked and engages the wrist of the crank on the feed-driving rock-shaft, a slide-block on the connection, and a grooved block in which the slide-block travels, the slotted arm of the machine, and an adjustable binding device, as a screw, whereby said block may be held in adjusted position, substantially as set forth.

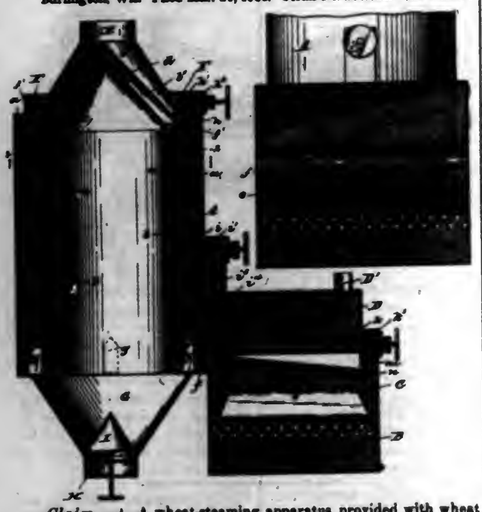
401,182.

401,183. SUSPENDERS. HYMAN LIEBENTHAL, Chicago, Ill., assignor to himself and Solomon Price, same place. Filed Nov. 26, 1888. Serial No. 291,934. (No model.)



Claim.—1. In a suspender, the webbing A, in combination with straps C, each strap C consisting of a piece, *a*, and a piece, *b*, sewed together at their edges, and a fastener or hook, *c*, secured to the inner face of one of the pieces *a* or *b* near its upper edge, substantially as specified.

2. In a suspender, the webbing A, in combination with straps C, each strap C consisting of a piece, *a*, which is made from a single piece of material, and a piece, *b*, corresponding in form to the upper



portion of the piece *a*, the two pieces *a* and *b* being sewed together at their side edges and capable of being pulled apart at their upper edges, and a hook or fastener, *c*, adapted to engage and hold the webbing A, substantially as and for the purpose specified.

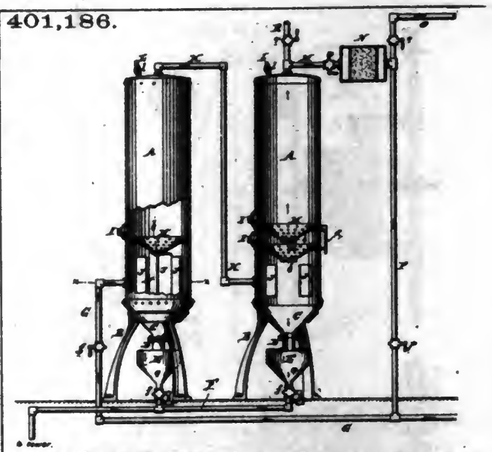
401,184. APPARATUS FOR LIGHTING GAS-BURNERS. ALEXANDER A. LISTER, Camberwell, County of Surrey, England. Filed Jan 12, 1888. Serial No. 260,516. (No model.) Patented in England Aug. 21, 1886, No. 10,717.

Claim.—The combination, with a gas-burner and with the supply-pipe B, having a tap, A, of the supplementary igniting-pipe C, having a separate cock or tap, E, and provided with interlocking mechanism consisting of the arm H on the plug of tap E, and having the catch J and the arm F on plug of tap A, said arm F being adapted to rest on top of arm H, and under catch J, as described, to prevent the premature turning of the tap A.

401,185. WHEAT-STEAMING APPARATUS. GEORGE LITTLEFIELD, Burlington, Wis. Filed Mar. 29, 1888. Serial No. 268,892. (No model.)

Claim.—1. A wheat-steaming apparatus provided with wheat and steam chambers, combined with a boiler and a water-tank, the latter being in communication with one of the said steam-chambers to enable the water therein to be heated prior to being supplied to the said boiler, substantially as set forth.

2. The combination, with the receptacle A, having the steam-chambers *a* and *b*, the interposed wheat-chamber *c*, and the steam pipe or chamber F, of the boiler C, the water-tank D, communicating with said boiler and with one of said steam-chambers, and the valve *i'*, for controlling admission of steam to said water-tank, substantially as set forth.



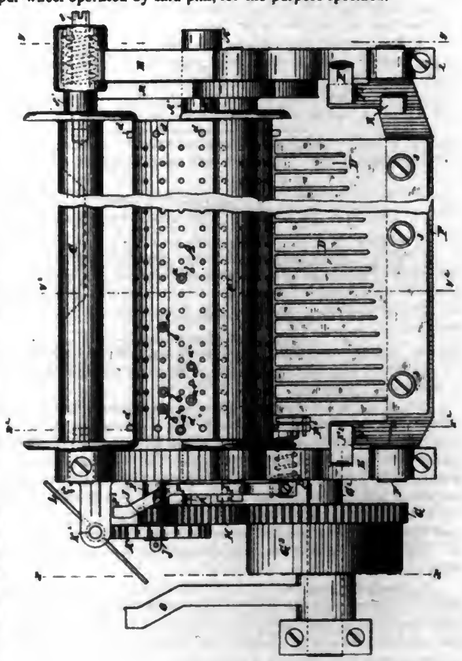
401,186. WATER-PURIFYING APPARATUS. JOHN B. LOVE, Philadelphia, Pa. Filed May 1, 1888. Serial No. 272,433. (No model.)

Claim.—1. In combination, a water-supply main, settling-purifiers having conical bottoms, collecting-chambers below said purifiers communicating with said purifiers by tubular necks, perforated diaphragms, pipe-connection between the supply-main and purifier below the diaphragms, and a valved blow-off pipe from the dirt-collecting chamber.

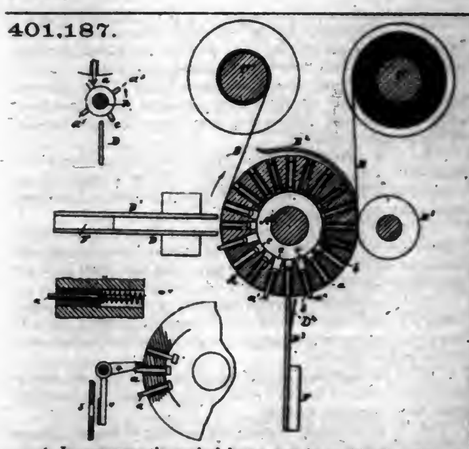
2. The combination of a street water-main, settling-purifiers having conical bottoms, collecting-chambers below said purifiers communicating with said purifiers by a tubular neck, a filter proper, pipe-connections for causing water to pass successively through the purifiers and filter to the house, and an auxiliary valved pipe leading directly from the purifiers to the house to convey water which does not pass through the filter.

3. A water-settling purifier having a conical bottom, and a collecting-chamber below it communicating with its conical bottom by a tubular neck, and in which the collecting-chamber also has a conical bottom, in combination with a valved blow-off pipe at the bottom of the collecting-chamber.

401,186.



401,187. AUTOMATIC MUSICAL INSTRUMENT. THOMAS A. MACAULAY, New York, N. Y. Filed July 24, 1886. Serial No. 208,915. (No model.)



Claim.—1. In an automatic musical instrument controlled by a perforated sheet, a cylinder having movable pins, said pins being held in operative position by gravity alone to operate a sounding device, for the purpose specified.

2. In an automatic musical instrument controlled by a perforated sheet, a cylinder having movable pins, said pins being held in operative position by gravity alone, in combination with means, as A, to operate sounding devices, for the purpose specified.

3. In an automatic musical instrument, in combination, the cylinder having movable pins controlled by a perforated sheet and a spur-wheel operated by said pins, for the purpose specified.

401,187.

4. In an automatic musical instrument, in combination, the cylinder having pins controlled by a perforated sheet and a device having multiple projections adapted to be operated by said pins, for the purpose specified.

5. In combination, the cylinder having pins and the spur-wheels C, operated by said pins, for the purpose specified.

6. In combination, the cylinder having pins and a device having multiple projections adapted to be operated by said pins, for the purpose specified.

7. In an automatic musical instrument, a movable perforated sheet, suitable devices for moving said sheet, and a device having multiple projections operated by devices controlled by said sheet, said multiple projections adapted to operate sounding devices.

8. In an automatic musical instrument controlled by a perforated sheet, a cylinder having holes, adjustable bushes fitted into said holes and provided with pins adapted to move outward and inward in said bushes, whereby the extent of movement of the pins is varied, for the purpose specified.

9. In an automatic musical instrument, a cylinder having holes, bushes open at both ends fitted into said holes, and pins having heads or collars loosely fitted in said bushes, for the purpose specified.

10. In an automatic musical instrument controlled by a perforated sheet, a cylinder having holes, bushes fitted into said holes and provided with pins adapted to move outward and inward in the respective bushes, and having heads or collars playing between the bushes and the inner ends of the holes of the cylinder to limit the movement of the pins, for the purpose specified.

11. In an automatic musical instrument, in combination with a cylinder having movable pins controlled by a perforated sheet, a spur-wheel operated by said pins and a sounding device operated by said spur-wheel, for the purpose specified.

12. In an automatic musical instrument, the combination of movable pins in a cylinder controlled by a perforated sheet, a sounding device, as D, and an intermediate rotary device for operating said sounding device.

13. In an automatic musical instrument, the combination of movable pins in a cylinder controlled by a perforated sheet, a sounding device, and an intermediate device for operating said sounding device.

14. In an automatic musical instrument, the combination of a cylinder having pins, a sounding device, and an intermediate rotary device, as A, having projections for operating said sounding device, for the purpose specified.

15. In an automatic musical instrument, the combination of a cylinder having pins, a sounding device, and an intermediate device, as A, having projections, as a^3, for operating said sounding device, for the purpose specified.

16. In an automatic musical instrument, the following elements in combination: a sounding device, as D, a spur-wheel for operating said sounding device, and an automatic device, as A, provided with means to operate said spur-wheel, for the purpose specified.

17. In an automatic musical instrument, the following elements in combination: a sounding device, a rotary device having means to operate said sounding device, and an automatic rotating device, as A, provided with projections adapted to operate said rotary device, for the purpose specified.

18. In an automatic musical instrument, the following elements in combination: a sounding device, as D, a rotary device, as A, having projections, as a^4, adapted to operate said sounding device, and a rotary device having projections for operating said rotary device A, for the purpose specified.

19. In an automatic musical instrument, a movable pin-cylinder having lines of holes arranged in quincuncial order, for the purpose specified.

20. In an automatic musical instrument, a movable pin-cylinder having lines of holes arranged in quincuncial order and a perforated sheet adapted for use with said cylinder, for the purpose specified.

21. In an automatic musical instrument, the combination of the clip P^4, the spring, the lever P^7, and the operating-pin, for the purpose specified.

22. In an automatic musical instrument, the combination of a movable pin-cylinder provided with a stop-pin, a perforated sheet provided with holes registering with said stop-pin for releasing the same, and means, as a lever, for stopping the instrument thereby.

23. In an automatic musical instrument, in combination, a perforated sheet having holes, a cylinder having movable pins controlled by said sheet and a lever or equivalent device operated by said pins, and a fan-wheel or other similar device controlled by said lever to stop the instrument, for the purpose specified.

24. In an automatic musical instrument, a perforated sheet having a line of holes, as *c*, adapted to engage feeding devices, a hole or holes, as c^6, intermediate between said holes, and one or more stop-pins, the feed-engaging holes being adapted to permit the passage over them of the said pin or pins to stop the instrument.

25. In an automatic musical instrument, the combination of a cylinder provided with fixed registering pins, one or more movable stop-pins, and a perforated sheet provided with sets of perforations adapted to the several sets of pins, for the purpose specified.

26. A perforated sheet for automatic musical instruments having one or more holes registering with a stop device and adapted to release the same, whereby the instrument is caused to stop.

27. In an automatic musical instrument, the combination of a perforated flexible sheet, a cylinder having fixed pins registering with said perforations, a wheel, as M, deriving its movement from said cylinder, and a take-up roller, as C, for taking up the flexible sheet.

28. In an automatic musical instrument, in combination with a pin-cylinder, a comb-plate movable away from its operative position, for the purpose specified.

29. In an automatic musical instrument, the combination of the arm R with the comb-plate F, the arm F^2, and the lug F^3, for the purpose specified.

30. In an automatic musical instrument, the combination of the comb-plate F, the arm F^2, and the lug F^3, for the purpose specified.

31. In an automatic musical instrument, in combination with a pin-cylinder two or more comb-plates placed one over the other and provided with corresponding teeth tuned in unison, whereby two or more sounds of the same pitch are produced in succession to represent one note and prolong the same.

32. In an automatic musical instrument, a comb-plate fixed in bearings and adapted to be brought out of and into operative position, for the purpose specified.

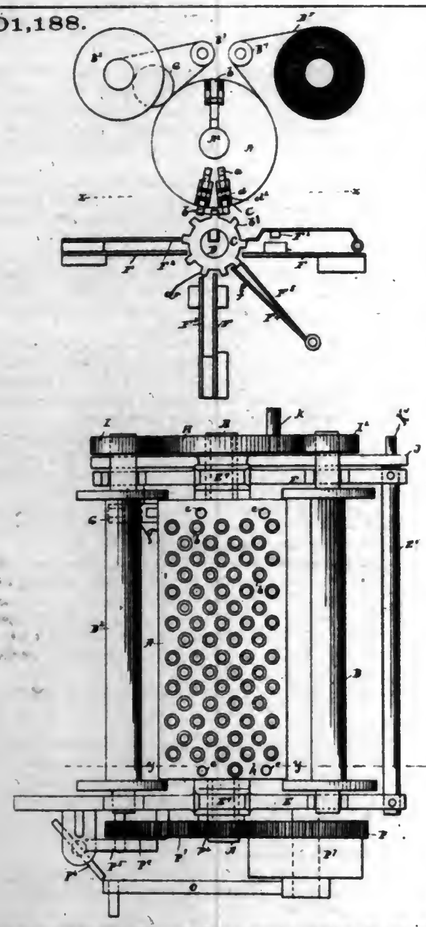
33. In an automatic musical instrument, a cylinder having movable pins, a perforated sheet, two or more rows of sounding devices placed one above the other, and devices to operate said sounding devices controlled by said perforated sheet, for the purpose specified.

34. In an automatic musical instrument, a perforated sheet, a cylinder having pins adapted to engage in said perforations, and a roller pressing said sheet against said cylinder, for the purpose specified.

35. In an automatic musical instrument, a cylinder having pins and a guard placed over said cylinder, for the purpose specified.

36. In an automatic musical instrument, a pin-cylinder having a guard fixed in an inclined position over said cylinder, for the purpose specified.

37. A perforated sheet for automatic musical instruments having two lines of equidistant holes and a series of lines of holes unequally distant located between said lines of equidistant holes, for the purpose specified.



401,188. AUTOMATIC MUSICAL INSTRUMENT. THOMAS A. MACAULAY, New York, N. Y. Filed Dec. 20, 1887. Serial No. 258,460. (No model.)

Claim.—1. In a musical instrument, a picking device and means to operate the same, said picking device provided with multiple projections moving in substantially the same planes and adapted to be brought in simultaneous or nearly simultaneous engagement with two or more sounding devices and set them in vibration.

2. In a musical instrument, a device, as C, and means to operate the same, said device provided with means, as c^5 c^5, moving in substantially the same plane, adapted to be brought into simultaneous or or nearly simultaneous engagement with two or more sounding devices to set them in vibration.

3. In a musical instrument, a spur-wheel, as C, and means to operate the same, having devices, as c^5 c^5, moving in substantially the same plane, adapted to be brought in simultaneous or nearly simul-

401,188.

taneous engagement with two or more sound-producing devices and set them in vibration.

4. In an automatic musical instrument, in combination, movable pins in a cylinder controlled by a perforated sheet, a device, as C, operated by said pins, having means, as c^3 c^3, adapted to be brought in simultaneous or nearly simultaneous engagement with two or more sounding devices, for the purpose specified.

5. In a musical instrument, the combination of a spur-wheel, as C, and means to operate the same, and two or more sounding devices arranged in different radial lines in relation to the axis of the spur-wheel, the different projections of the said spur-wheel being adapted to actuate the said sounding devices simultaneously, or nearly so, for the purpose specified.

6. In an automatic musical instrument, a movable perforated sheet, operating devices controlled by said sheet, and a picker having multiple projections operated by said sheet-controlled devices, and two or more sounding devices operated by said multiple projections, for the purpose specified.

7. In an automatic musical instrument having a flexible sheet, a sheet-roller, and take-up roller provided with pulleys, adjustable bearings for said rollers, a wheel for operating said roller-pulleys, and a device adapted to disengage either of said pulleys from said wheel, for the purpose specified.

8. In an automatic musical instrument having a perforated flexible sheet, sheet-roller, and a take-up roller having pulleys, slotted bearing-brackets containing said rollers, a driving-wheel for operating said roller-pulleys, and a lever arranged to disengage either of said rollers from said driving-wheel, for the purpose specified.

9. In an automatic musical instrument, the combination of the driving-wheel H, the pulleys I I^3, the slotted brackets, and the levers J, for the purpose specified.

10. In an automatic musical instrument controlled by a perforated sheet, a pin-cylinder supported in movable bearings and adapted to be raised out of operative position, for the purpose specified.

11. In an automatic musical instrument, a pin-cylinder, a hinged frame supporting said cylinder, and a stopping device, as E^7, for limiting the position of said frame, for the purpose specified.

12. In an automatic musical instrument controlled by a perforated sheet, a pin-cylinder and sheet-rollers supported in a hinged frame adapted to raise said cylinder and rollers out of operative position, for the purpose specified.

13. In an automatic musical instrument, a pin-cylinder, a spur-wheel shaft, a hinged frame in which said cylinder is supported, and a device to fix the operative positions of said cylinder and said spur-wheel shaft, for the purpose specified.

14. In an automatic musical instrument, in combination, a pin-cylinder and spur-wheel shaft, one being movable from the other, and devices by which the relative positions of said spur-wheel shaft and pin-cylinder are fixed when brought into operative position.

15. In an automatic musical instrument, a pin-cylinder, a motor-wheel, a hinged frame in which said cylinder is supported, and a device to fix the operative position of said cylinder and motor-wheel, for the purpose specified.

16. In an automatic musical instrument, a movable pin-cylinder having pin-holes and an axle having a hole connecting with said pin-holes, for the purpose specified.

17. In an automatic musical instrument, a sliding pin-cylinder having an axle provided with a hole through its entire length, for the purpose specified.

18. In an automatic musical instrument, a sheet-roller having two perforated sheets, two pin-cylinders controlled by said sheets of perforations, and two take-up rollers for taking up said sheets, for the purpose specified.

19. In an automatic musical instrument, two perforated sheets containing parts of the same piece of music, pins in two cylinders controlled by said sheets, and devices operated by said pins adapted to operate sounding devices, for the purpose specified.

20. In a musical instrument, the combination of the shaft D, the spur-wheels C, the washers D^2, the screw D^4, and the nuts D^5, for the purpose specified.

21. In a musical instrument, the combination of the shaft D, the spur-wheels C, the washers D^2, and means to secure said spur-wheels and washers on said shaft, for the purpose specified.

22. In an automatic musical instrument, in combination, the shaft D, the washers D^2, and a picking device, and means to secure said picking device and washers on said shaft, for the purpose specified.

23. In a musical instrument, a shaft, as D, having a series of spur-wheels, as C, a comb-plate, as F, and adjusting-bushes, as D^4 D^5, to adjust the positions of said spur-wheels to said comb-plate, for the purpose specified.

24. In a musical instrument, in combination, a shaft having a groove, a series of spur-wheels adapted to rotate on said shaft, and a series of washers having projections adapted to enter the grooves in said shaft.

25. In a musical instrument, in combination, a shaft having a series of rotating spur-wheels, a series of fixed washers alternating with said spur-wheels, and a series of cloth or other similar washers interposed between said spur-wheels and said washers, for the purpose specified.

26. In a musical instrument, in combination, a shaft having a series of spur-wheels and an alternating series of non-rotary separating devices, for the purpose specified.

27. In a musical instrument, a pin-cylinder, a shaft having spur-wheels, as C, and adjustable devices whereby said spur-wheels are adjusted to said pin-cylinder, for the purpose specified.

28. In a musical instrument, a shaft having spur-wheels, a comb-plate operated by said spur-wheels, and devices by which said spur-wheels are adjusted to said comb-plate, for the purpose specified.

29. In an automatic musical instrument, a pin-cylinder having an adjustable bush, said bush being split longitudinally, for the purpose specified.

30. In an automatic musical instrument, a sliding pin having a head or collar, a stopping device for said pin, and a sound-deadening washer, for the purpose specified.

31. In a musical instrument, in combination, the comb-tooth F^2, with the comb-tooth F, the spur-wheel C, and means to operate the same, for the purpose specified.

32. In a musical instrument, in combination, the comb-tooth F^2, arranged to escape action of the picking device C, and the comb F, arranged to be set in vibration by the said picking device, for the purpose specified.

33. In a musical instrument, a comb-tooth, as F^2, arranged to escape the action of its picking device, and the comb-tooth F, arranged to be set in vibration by said picking device, for the purpose specified.

34. In an automatic musical instrument, the combination of a pin-cylinder, a perforated sheet, a spur-wheel, as C, a lever, as F^4, and a spring, as F^5, and a stop-pin, as *f*, for the purpose specified.

35. In a musical instrument controlled by a perforated sheet, the combination of the spur-wheel C, the lever F^4, the spring F^5, and the stop-pin *f*, for the purpose specified.

36. In an automatic musical instrument, a spur-wheel and means to operate it, controlled by a perforated sheet, and a damper operated by a projection on said spur-wheel, said damper held from contact with the sounding device by said projection, for the purpose specified.

37. In an automatic musical instrument, a cylinder having pins, a spur-wheel, as C, operated by said pins, and a damper operated by said spur-wheel, for the purpose specified.

38. In an automatic musical instrument, a comb-tooth-picking device operated by a rotating device having pins, and a damper operated by said picking device, for the purpose specified.

39. In an automatic musical instrument, a spur-wheel and means to operate it, a damper consisting of a lever operated by a projection on said spur-wheel, and a sounding device controlled by said damper, for the purpose specified.

40. In an automatic musical instrument, a flexible sheet having perforations, a cylinder having pins engaging said perforations, an elastic roller pressing said sheet against said cylinder, and a take-up roller, for the purpose specified.

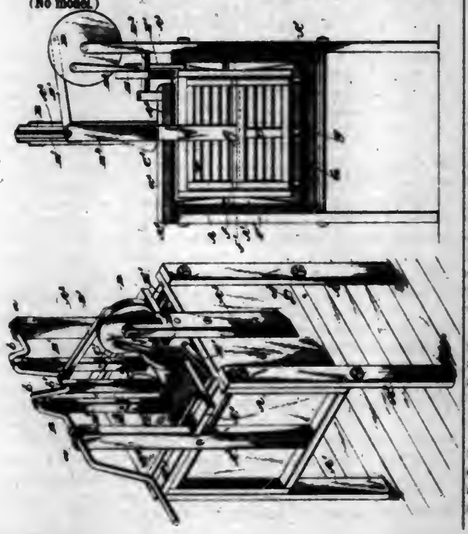
41. In an automatic musical instrument, a flexible sheet having perforations, a cylinder provided with pins engaging said perforations, a roller pressing said sheet against said cylinder, and a take-up roller, said pressure-roller located between said cylinder and said take-up roller, for the purpose specified.

42. In an automatic musical instrument, in combination, a roller having a perforated sheet, a guide-roller, as B^3, one or more, a cylinder having pins engaging in said perforations, and a take-up roller for taking up said sheet, for the purpose specified.

43. In an automatic musical instrument, a flexible sheet having perforations, a cylinder provided with pins engaging said perforations, a roller pressing said sheet against said cylinder, and a take-up roller, for the purpose specified.

44. In a musical instrument, a series of spur-wheels, a shaft and frictional devices, and means to adjust the same, said frictional devices applied to the faces of said spur-wheels, for the purpose specified.

45. A perforated sheet for automatic musical instruments, having lines of holes along its edges, and a blank space at one or both ends of said sheet for some distance between said lines of holes, for the purpose specified.



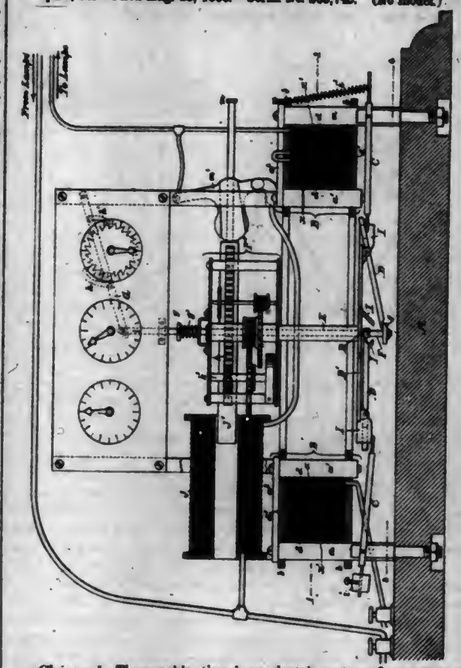
46. A music-sheet roller having two perforated sheets containing different parts of the same piece of music adapted for simultaneous use in automatic musical instruments, for the purpose specified.

47. A duplex perforated sheet adapted for simultaneous use in automatic musical instruments having different parts of the same piece of music on each sheet, for the purpose specified.

401,189. MEDICATED FELT. ANTHONY F. MACHOLD, Philadelphia, Pa. Filed Oct. 25, 1888. Serial No. 289,068. (No specimens.)

Claim.—The herein-described composition of matter, consisting of lamb's wool, dog's hair, and oil of the juniper-berry, in the proportions specified.

401,190. WASHING-MACHINE. SOLOMON MANTLE, JOHN MANTLE, and CHARLES MANTLE, Penfield, Ill. Filed Oct. 4, 1888. Serial No. 287,141. (No model.)



Claim.—1. In a washing-machine, the combination of the washing-box having uprights, the crank-shaft, the vertically-reciprocating pounders attached to the crank-shaft, the semi-rotary disk-wheels connected to the crank-shaft and to each other by pitmen, and the side oscillating rubbers connected to one of said disk-wheels by pitmen, substantially as described.

2. In a washing-machine, the combination, with the pounders and rubbers, of the crank-shaft and disk-wheels, one of which is mounted at right angles to the other, and pitmen connecting the crank-shaft to the upper disk, the disks to each other, and the rubbers to the lower disk, substantially as described.

3. In a washing-machine, the combination of a washing-box having uprights, the crank-shaft having depending pitmen with mortised ends, vertically-reciprocating pounders having posts with upper-tenoned ends adapted to fit into the mortised ends of the depending pitman and forming a hinged joint therewith, the reversely-situated semi-rotary disk-wheels connected to the crank-shaft and to each other by pitmen, the oscillating ribbed rubbers having gudgeons working in curved slots in stripe mounted in the washing-box, and the pitmen connecting said rubbers with one of the disk-wheels, substantially as described.

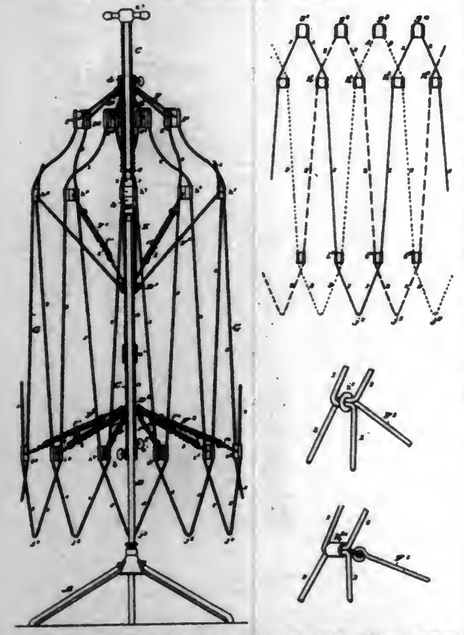
401,191. ELECTRIC METER. ALBERT H. MARWARDS, Philadelphia, Pa. Filed Aug. 25, 1888. Serial No. 283,745. (No model.)

Claim.—1. The combination, in an electric meter, of a compound magnet energized by the main or lighting current, and a series of register-operating armatures controlled by said magnet and offering a graduated resistance to the attracting power thereof, the retracting device of each armature being independent of those of the other armatures, substantially as specified.

2. The combination, in an electric meter, of a compound magnet energized by the main or lighting current, a series of armatures controlled by said magnet and offering a graduated resistance to the attracting power thereof, and a moving disk or plate carrying elements of the registering apparatus, whereby said elements are carried past the successive armatures, so as to be acted upon by those armatures which are attracted by the magnet, substantially as specified.

3. The combination, in an electric meter, of a compound magnet energized by the main or lighting current, a series of register-operating armatures controlled by said magnet and offering a graduated resistance to the attracting power thereof, and a traversing tripper for acting upon the armatures in succession and moving them away from the attracting-pole of the magnet, all substantially as specified.

4. The combination, in an electric meter, of a compound magnet energized by the main or lighting current, a series of armatures controlled by said magnet and offering a graduated resistance to the attracting power thereof, and a traversing carrier forming part of the registering mechanism and having elements which coact with the



armatures and are so arranged in respect thereto that each of said elements will be acted upon in succession before the first is again acted upon, all substantially as specified.

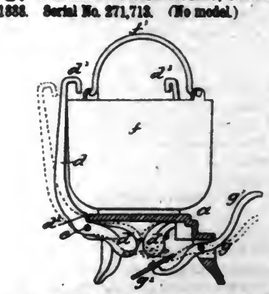
5. The combination of a compound magnet energized by the main or lighting current, a series of armatures controlled by said magnet and offering a graduated resistance to the attracting power thereof, the ratchet-lever of a registering device, a rod connected to said lever, one or more actuating-levers acted on by the armatures and acting upon said rod to operate the register, a spring for restoring the rod, and a rotated carrier for the actuating-levers, all substantially as specified.

6. The combination of a compound magnet, a series of register-operating armatures governed thereby and offering a graduated resistance to the attracting power thereof, and a double-coil wrapping for said magnet interposed in the main or lighting circuit, whereby the coils may be used either in series or multiple arc, all substantially as specified.

7. The combination of the clock-work mechanism of an electric meter, a solenoid-coil having a core geared to the spring-shaft of said clock-work mechanism, and a switch whereby the coil is thrown into and out of circuit by the movement of the core, all substantially as specified.

401,192. DRESS-FORM. ALBERT McDOWELL, New York, N. Y. Filed Aug. 1, 1887. Serial No. 245,585. (No model.)

Claim.—1. In a dress-form, the combination, with a support therefor, of the expansible rib structure formed of three overlapping zigzag structures of wire or the like connected together at their points of crossing and connected to the distending braces of said support at said crossing-points.



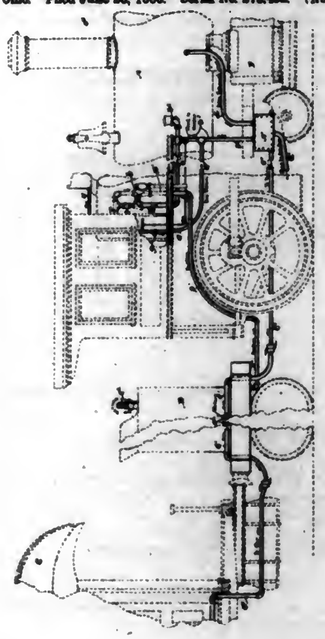
2. The combination, with a standard, a runner, and a rib structure of a dress-form, of an extensible brace composed of two members having eyes or loops formed at their ends, through which the bodies of said members pass, respectively, and one or both of said members corrugated laterally, as and for the purposes set forth.

3. In a dress-form, the combination of the expansible rib structure G, the standard C, provided with right and left screws *c c*, the nut-runners D' D^2 on said screws, the braces F' F^2, connecting said runners, respectively, with the rib structure at the points described, the runner D, the braces F, connecting said runner with the rib structure at the waist, the set-collar over the runner D, and the spring E under runner D, substantially as set forth.

4. In a dress-form, the combination, with a standard and runners thereon, of an expansible rib structure composed of three sets of wires, 1 2 3, which cross each other, and which have laterally-bent portions that lie side by side at the points $1'$ 1^2 1^3 1^4, where said wires cross, and wire expanding-braces hinged to said rib structure at said crossing-points and connecting it with said runners, as set forth.

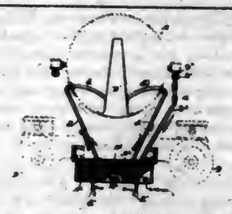
5. In a dress-form, the combination, with the rib structure, the braces F' and F^2, the runner-nuts D' and D^2, all connected and arranged substantially as set forth, of the upright B, the set-collar *b* thereon, and the tubular standard C, constructed of two parts, provided with right and left screws, as described, and said parts joined together end to end by a sleeve, c^x, as set forth.

401,198. POT-REST. JOSEPH McLEAN, Rockville, Conn. Filed Apr. 24, 1888. Serial No. 271,713. (No model.)



Claim.—1. In combination with a pot-supporting base, the upright arms pivoted to the base on several sides, and having the inturned hooked upper ends and the inward-extending lower ends overlying the inner end of the trip-lever, and the trip-lever with one end located outside the base and the other underlying the inner ends of the several hooked arms, all substantially as described.

2. In a pot-holder, in combination with the base *a*, the plural number of hooked arms *d*, pivoted to the base on several sides, with the inturned lower ends weighted and bent or curved inward, whereby the hooked ends are held normally inward, and the trip-lever *g*, pivoted to the base, with one end extending beyond the base and the other underlying the inner ends of the several arms *d*, all substantially as described.



3. In a pot rest or support, in combination with a base, *a*, having suitable feet, *b*, the upright arms *d*, pivoted thereto, each arm having a stop, d^3, and inturned hook d^5 on its upper end, and an inward-extending weighted end, d', and a lever, *g*, pivoted to the base, and with its inner end adapted to engage the lower ends of the arms, all substantially as described.

4. In a pot rest or support, in combination with a base, *a*, the upright hooked arms *d*, pivoted to the base and having inward-extending lower ends, and the lever *g*, pivoted to the base and bearing on its inner end the loose disk g^4, underlying the ends of the arms, all substantially as described.

401,194. CAR-HEATER. JOHN T. MEAD and JOHN THOMSON, Cleveland, Ohio. Filed June 23, 1888. Serial No. 278,402. (No model.)

401,194.

Claim.—1. In car-heater, the combination, with motor for supplying feed-water to the boiler, of heater arranged to receive the overflow feed-water, pipes for conducting the water from the heater through the train and returning the water to the supply-tank of the tender, and pipes connecting the heater with the exhaust of the engine, substantially as set forth.

2. The combination, with heater located under the boiler, such heater having a heating-coil and two steam-compartments, of pipes connecting the said compartments of the heater, respectively, with the exhaust and with the ash-pan of the engine, the said heating-coil being connected in the train-pipe, substantially as set forth.

401,195. PRINTER'S PRESS-POINT. JACOB W. MEISE, Harrisburg, Pa. Filed July 17, 1888. Serial No. 280,187. (No model.)

Claim.—In combination with a piece of press-furniture having a recess in its upper face and a vertical opening leading from the bottom of said recess, a metal socket seated in said opening and provided with a head and internal threads, a press-point having a pointed upper end, a threaded lower end to engage the threads of the socket, and an intermediate angular nut or collar adapted to rest upon the bottom of the recess when the point is level with the face of the type, in the form substantially as described.

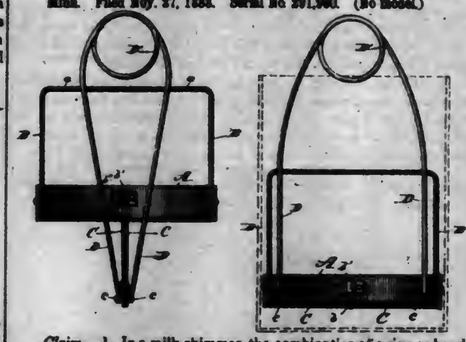
401,196. MAIL-POUCH. CHARLES W. MILLER, Clifton, Ariz., assignor of one-half to Charles Royce, same place. Filed July 21, 1888. Serial No. 280,595. (No model.)

Claim.—1. In a mail-pouch, the combination of a plate secured at one side of the mouth for a portion of the length of the plate, and provided with a series of locking-lugs, with a locking-plate mounted at the opposite side of said pouch and secured thereto for a portion of its length, and adapted to receive said lugs, substantially as specified.

2. In a mail-pouch, the combination of a locking-plate secured at one side of the mouth of the pouch for a portion of the length of the plate, and provided with lugs, with a locking-plate secured to the opposite side of the pouch for a portion of its length, and provided with spring-actuated locking-bolt having openings adapted to receive said lugs, substantially as specified.

3. In a mail-pouch, the combination of a plate having inwardly-projecting locking-lugs with a spring-pressed slotted guard-plate secured to the pouch under the lugs, substantially as specified.

4. In a mail-pouch, a plate having locking-lugs connected for a portion of its length to the pouch, in combination with a locking-plate secured for a portion of its length to the opposite side of the pouch, and provided with a locking-bolt for the reception of lugs, and an interposed hinge, the ends of which are connected to said plate, substantially as specified.



5. In a mail-pouch, the combination of opposite plates adapted to lock and secured to the pouch for a portion of their length with an interposed spring-hinge adapted to spring the plates apart when said plates are not locked, substantially as specified.

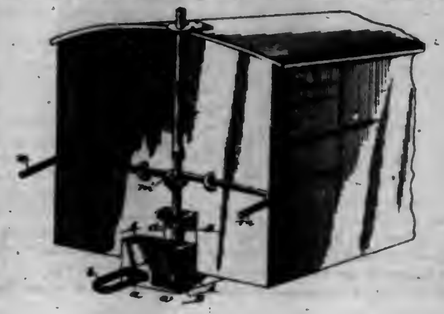
6. In a mail-pouch, the combination of two opposite plates adapted to lock with a spring-hinge secured to and mounted intermediate said plates, and formed with a central coil adapted to take into recesses formed in the ends of said plates when the same are closed and locked, substantially as specified.

7. The combination, with the pouch 1, of the plate 2, having the lugs 5 and connected to the pouch for a portion of its length, and of the plate 3, having the openings 13 and 15, the interposed inwardly-folding hinges 19, and the bolt-plate 11, perforated, as at 12, and having the interposed spring 14, substantially as specified.

8. The combination, with the pouch 1, having openings 8, of the plate 2, having the end recesses, 4, and the lugs 5, and of the locking-plate 3, having the openings 13, and locking-bolt 11, having openings 12, the spring 14, for actuating said bolt-plate, and of the spring-hinges 19, having the coils 20 and 21, and the stiffening-plate 24, perforated, as at 25, substantially as specified.

401,197. MILK-SKIMMER. ALBERT T. MILLS, Lac Qui Parle, Minn. Filed Nov. 27, 1888. Serial No. 291,960. (No model.)

Claim.—1. In a milk-skimmer, the combination of a ring or band, A, a transverse rod, *b*, extended across the bottom of this band and provided with upturned ends *b'*, clips *b''*, for securing or clamping these upturned ends *b'* against the interior of the said band, semicircular bottom plates, C C, pivoted upon the transverse rod *b*, the curved edges of these plates being adapted to fit within the said band A, and operating-rods pivoted to the said hinged bottom plates, substantially as and for the purpose herein set forth.



2. The combination of a rim or band provided with a suitable bail, a transverse rod secured to this rim, two semicircular bottom plates, C C, pivoted upon this rod, and the spring-actuating operating-rods, the normal tendency of these rods being to press inward, substantially as described.

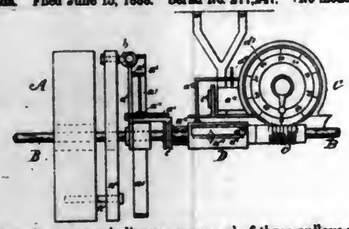
3. The combination of a circular rim or band, a bail, B, secured to the rim and provided with slots *a a*, a stationary rod, *b*, secured to the said rim, two semicircular bottom plates pivoted upon this rod, spring-actuated rods D, attached to the said bottom plates and passing through the slots *a a* in the bail, and a spring connected to these rods to press their lower ends inwardly, substantially as described.

4. In a milk-skimmer, the combination of a ring or band, a pivotal rod attached thereto, bottom plates pivotally attached to this rod, vertical operating-rods pivotally attached to these bottom plates, and a spring interposed between the upper ends of the said operating-rods and formed integral with the same, substantially as described.

401,198. CAR-COUPLING. JOEL I. MOSHEIMER, Fowlton, Kans. Filed Sept. 26, 1888. Serial No. 286,423. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-bar and the coupling-pin, of the impact-block, the vertical lever C, pivoted at its upper end and engaging with the said impact-block at its lower end, and the pin-supporting bar adapted to be engaged by

401,198.

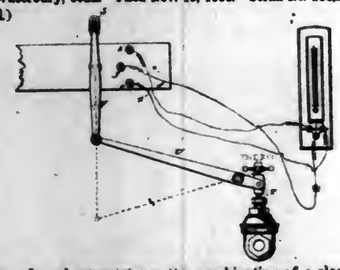


the said lever C, and having its front end extended and adapted to engage directly with the said coupling-pin, substantially as and for the purpose described.

2. In a car-coupling, the combination, with the draw-bar, the impact-block, and the lever C, of the bar F, the spring G, the bar H, arranged parallel with the bar F and adapted to be engaged by the lever C, and the spring J, substantially as described.

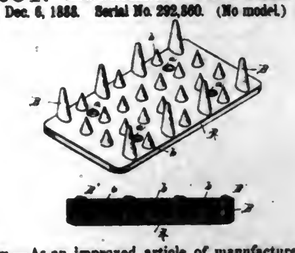
3. In a car-coupling, the combination, with the draw-bar, the impact-block, the lever C, and the spring G, of the bar H, having its front end reduced and provided with the projection A^2, the spring K, having its front end extended within the path of the lever C, and the spring J, substantially as and for the purpose described.

4. In a car-coupling, the combination of the draw-bar having the chamber D, the partition E, dividing the chamber into two compartments, the bar F and the spring G in one compartment, the bar H and the spring J in the other compartment, the spring K on bar H, the impact-block, and the lever C, substantially as described.



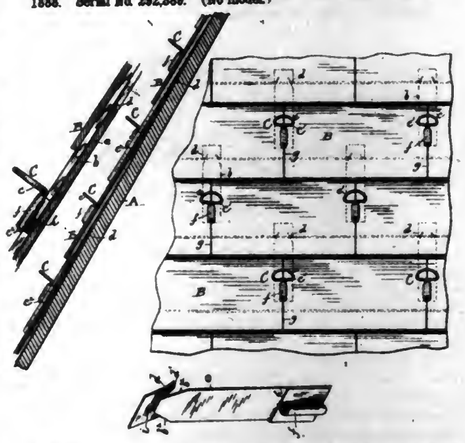
401,199. POWER-INDICATOR. EMERY NIXON, Toronto, Ontario, Canada. Filed June 15, 1888. Serial No. 277,247. (No model.)

Claim.—1. A power-indicator composed of three pulleys of about equal diameter, the first pulley, A, being the driven pulley from the factory-pulley and being loose on the shaft B, and the second pulley, a^3, having two driving-bolts, one of them, a', projecting sidewise and between two arms of the first pulley, from which it receives its motion, the other bolt, b, projecting from the other side, and going behind the outer end of an arm, a^4, journaled on the hub of the third pulley, a^2, the outer end of said arm bearing upon the rear end of a compression-spring, a^5, secured on the circumference of the third pulley, which is rigidly secured on the shaft B, the vibrations of which compression-spring are utilized to operate a rack, a^7, pinion a^8, spindle a^9, lower pinion, a^{10}, and rack with tongue a^{11}, which racks and pinions aforesaid operate a pointer, a^{14}, denoting upon a graduated scale the pressure in pounds on the surface of the first driven pulley, substantially as shown and described.



2. In a power-indicator composed of three pulleys of about equal diameter, the pulleys A and a^3, loose on the shaft B, the pulley a^2, rigidly secured on the said shaft, the driving-bolts a' and b in pulley a^3, the arm a^4, journaled in the hub of pulley a^2, and compression-spring a^5, secured on the circumference of pulley a^2, the rack a^7, pinion a^8, spindle a^9, lower pinion, a^{10}, and rack with tongue a^{11}, all combined and operating as set forth.

401,200. ELECTRIC VALVE-CONTROLLER. WILLIAM E. NORRIS, Waterbury, Conn. Filed Nov. 19, 1888. Serial No. 291,269. (No model.)

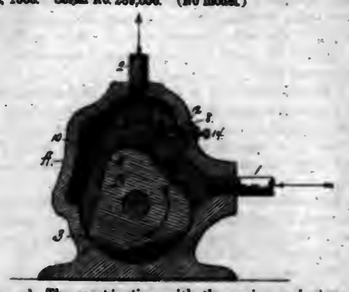


Claim.—In a heat-regulator, the combination of a clock-work, an arm revolved thereby, connections from the said arm to the valve or damper of the heating apparatus, a magnet, a lever one arm of which forms the armature for said magnet, the other arm provided with a dog, and the rapidly-revolving part of the clock-work provided with a finger revolving in a path corresponding to the said dog of the armature-lever and adapted to engage therewith when the circuit is broken or disengage therefrom when the circuit is closed, a wheel in connection with said clock-work and adapted to revolve therewith, the said wheel constructed with notches in its periphery at opposite points, the said points corresponding to the extreme positions of the said arm, and the armature-lever constructed with a finger adapted to engage said notches when the circuit is open, but adapted to ride upon the periphery of said wheel between the said notches, two spring-contacts in connection with one line of the electric circuit, but arranged upon opposite sides of a revolving arbor in said clock-work, the said revolving arbor carrying an arm which is adapted to engage said contacts at predetermined points in its revolution and make connection with the magnet through the frame at either of said points, as the case may be, the said magnet having one end of its wire in connection with the frame of the clock-work and the other end in connection with the other line of the electric circuit, substantially as described.

401,201. BELT-FASTENER. JOHN B. NORTON, Philadelphia, Pa. Filed Dec. 6, 1888. Serial No. 292,860. (No model.)

Claim.—As an improved article of manufacture, the herein-described belt-fastener, consisting of a rectangular metallic plate having rivet-apertures a, arranged as described, and provided on opposite sides with a row of flattened clinchable teeth separated from one another by short conical non-clinchable teeth, and with intermediate rows of short conical non-clinchable teeth intersecting or breaking joints with the side rows of alternate long and short teeth, substantially as and for the purpose set forth.

401,202. SNOW-GUARD. THOMAS O'GARA, Worcester, Mass., assignor of one-half to Orlando W. Norcross, same place. Filed Dec. 1, 1888. Serial No. 292,389. (No model.)



Claim.—1. A snow-guard consisting of a strip of sheet metal having holding-ears at its upper end projecting back of its under surface, adapted to catch and hold over the upper edge of the bottom slate, and also provided with a suitable bracket or snow-stop at its lower end, the sheet-metal strip being adapted to be passed up under the edges of two abutting slates, with the aforesaid snow-stop projecting up through the joint between them above the surface thereof, substantially as set forth.

2. A snow-guard comprising, in combination, the sheet-metal strip b, having its upper end cut to produce the ears d d, projecting back to form hooks adapted to catch and hold over the upper edge of the bottom slate, and said upper end of the main strip bent forward for the purpose specified, said strip also being provided at its lower end with a longitudinal socket, and the wire part c bent to form a holding-loop or snow-stop, and straight ends at about right angles thereto adapted to be inserted into the aforesaid socket to hold said wire part in position, substantially as set forth.

3. The sheet-metal strip b, having the ears d d, projecting back from its upper end, and a longitudinal holding-socket upon the face of its lower end, in combination with the wire part c, bent in such manner as to form a snow-stop and to be inserted into the holding-socket aforesaid, substantially as and for the purpose set forth.

401,203. ROTARY PUMP. JAMES H. PARKER, Utica, N. Y. Filed Oct. 24, 1888. Serial No. 289,056. (No model.)

Claim.—1. The combination, with the casing and piston of a rotary pump, of the abutment C, pivotally mounted in the casing over the piston, and formed with an arm terminating in a head to set with its end face against the casing, and a downward-extending part to rest on the piston, and an arm, 10, formed to rest on the piston opposite to the abutment-head, substantially as described, and for the purpose specified.

2. The combination, with the casing formed with an abutment bearing-surface having a packing-seat and provided with an adjustable packing arranged in said seat, and the rotary piston, of an abutment, C, pivotally mounted in the casing over the piston, and formed with a head arranged to set with its face end against the abutment bearing-surface of the casing, and said head having a downward-extending arm, 9, and having an arm, 10, to rest on the surface of the piston, substantially as described, and for the purpose specified.

3. In a rotary pump, an abutment pivotally mounted in the casing over the piston, and formed with an arm terminating in a head arranged to bear with its end surface against the surface of the casing and to rest with its lower end on the surface of the piston, and an arm formed to bear on the piston, said arm having its end extended to project partly across the water-course, substantially as described, and for the purpose set forth.

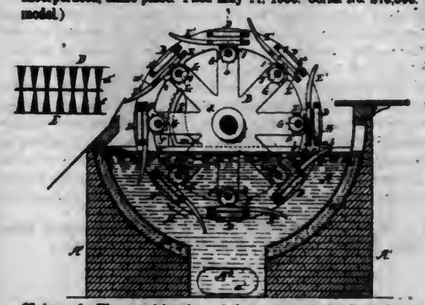
401,204. IGNITING APPARATUS FOR GAS-ENGINES. LEWIS C. PARKER and BEAUMONT PARKER, Kansas City, Mo. Filed Dec. 3, 1888. Serial No. 292,505. (No model.)

Claim.—1. As an improvement in gas-engines, the combination with the inlet pipe or chamber, of the exhaust-chamber and its valve, the ignition-chamber applied to one side of the inlet pipe or chamber, around and outside the inlet-arm of which is applied a plate or disk, and between which and a second plate is interposed asbestus covering, together with means for fastening in place the same, substantially as set forth.

2. As an improvement in gas-engines, the combination, with the valved inlet pipe or chamber having connection with an exhaust-chamber connected to the power-cylinder, of the ignition-chamber applied to one side of the inlet pipe or chamber, and having a valve provided with a port, the apertured shield overhanging the ignition-tube, and the heating medium disposed below the ignition-tube and having its flame within said shield, substantially as set forth.

3. The combination, with the inlet pipe or chamber, of the plate or disk secured thereto, the interposed asbestus, the arm or shield having an asbestus covering, and the securing-bolts, substantially as described.

401,205. HEATING STREET-CARS. WILLIAM H. PATTON, Pueblo, Colo. Filed Nov. 12, 1887. Renewed Mar. 5, 1889. Serial No. 302,018. (No model.)

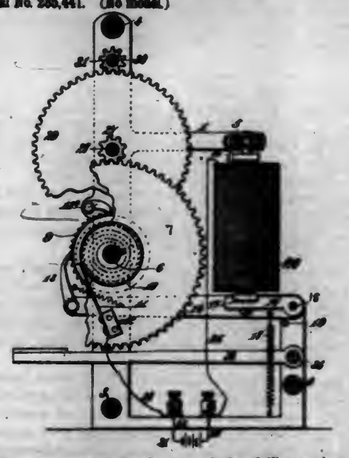


Claim.—The combination, with a gas-engine mounted upon a wheeled frame and having a surrounding water-jacket, of the pipe

401,205.

E, leading from said water-jacket to and through the cars to be heated, a tank, C', into which the returning end of said pipe discharges, a second tank above the gas-machine, into which the water from the tank C' is forced, and a pipe leading from said second tank into the surrounding water-jacket, whereby a continuous circulation is effected, substantially as herein described.

401,206. HARDENING APPARATUS FOR SAW-BLADES, &c. SAMUEL T. PAUL, Philadelphia, Pa., assignor to Henry Disston & Sons, Incorporated, same place. Filed May 11, 1888. Serial No. 273,506. (No model.)



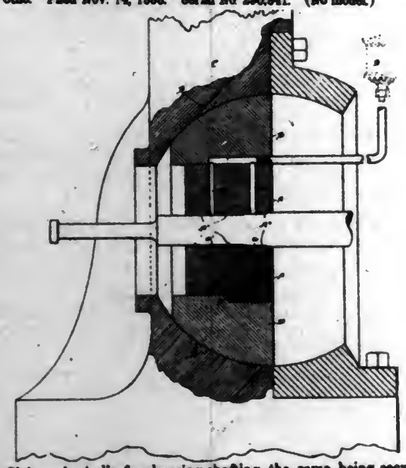
Claim.—1. The combination of the tank and the drum having a series of grids with movable frames, with devices acting upon said movable frames to clamp the saw-blank or other blade between the grid and frame, substantially as described.

2. The combination of the tank, the rotatable drum mounted in bearings thereon and having a series of grids, with movable frames opposite said grids, and cams adapted to clamp said movable frames to the grids, substantially as described.

3. The combination of the drum formed of a series of grids, a series of frames opposite the series of grids, and a cam-shaft with cams thereon, with pinions on the end of each cam-shaft, and racks with which the pinions engage to move the frames toward or from the grids, substantially as and for the purpose described.

401,207. COMBINED MECHANICAL AND ELECTRO-MAGNETIC MOTOR. CHARLES A. RANDALL, London, England. Filed Sept. 15, 1888. Serial No. 285,441. (No model.)

Claim.—1. A motor for driving a lathe, drill, or other machine, consisting of a train of gearing having a drive-wheel to connect with and operate the lathe or other machine, a motive power for supplying the force to actuate the train of gearing, a ratchet-wheel for rewinding the motive power, a pawl-carrier having its pawl arranged to



engage the ratchet-wheel, an electro-magnet, an armature-lever, an electric circuit, a revolving circuit-closing wheel having an annular row of alternating make-and-break contact-points, and a contact-finger in the circuit alternately acting on said annular row of alternating make-and-break contact-points to vitalize the electro-magnet at intervals, substantially as described.

2. A motor for driving a lathe, drill, or other machine, consisting of a train of wheels, one of which is provided with a lateral stud, a drive-wheel revolved by said train and having means to connect with and operate the lathe or other machine, a motive power for actuating the train of wheels, electro-magnetic mechanism, substantially as described, operating at intervals to rewind the motive power, a governor for controlling the speed of the drive-wheel, and a lever operating the governor and having a pin to engage and hold the aforesaid lateral stud, substantially as described.

3. A motor for driving a lathe, drill, or other machine, consisting of a train of gearing having a drive-wheel to connect with and operate the lathe or other machine, a motive power for actuating the train of gearing, an electric circuit, an electro-magnet in the circuit, pawl-and-ratchet mechanism, an armature-lever, a revolving circuit-closing wheel having an annular row of alternating make-and-break contact-points, and a contact-finger in the circuit acting alternately on said annular row of make-and-break points to vitalize the magnet at intervals and rewind the motive power the extent to which it unwound while the circuit was broken, substantially as described.

4. The combination, in a motor, of a train of gearing, a motive power for actuating the same, the ratchet-wheels, the pawl-carrier, the armature-lever, the electro-magnet, the circuit, the revolving circuit-closing wheel having an annular row of alternating make-and-break contact-points, and the contact-finger acting alternately on the said annular row of make-and-break points to energize the magnet at intervals and rewind the motive power, substantially as described.

401,208. DIE FOR DRAWING SHAFTING. JOSEPH RAPP, Akron, Ohio. Filed Nov. 14, 1888. Serial No. 290,841. (No model.)

Claim.—1. A die for drawing shafting, the same being secured to a ring having a spherical bearing in the housing, substantially as shown, whereby the die may turn universally to bring itself in alignment with the engaging shafting, substantially as set forth.

2. The combination, with the die for drawing shafting, of a band or ring embracing such die, the periphery of the band or ring being spherical and engaging a corresponding spherical seat in the supporting-housing, substantially as set forth.

3. A die for drawing shafting, the same being loosely mounted, whereby it may turn universally to bring itself in alignment with the engaging shafting, and provided with receiving and finishing bores of unequal diameter, with an annular groove separating these bores, and with suitable holes connecting such annular groove with the lubricating device, substantially as set forth.

4. A die secured to a ring having a ball-and-socket bearing and provided with receiving and finishing bores of unequal diameter, an annular recess between the bores for lubricating, an annular groove midway of the finishing-bore for lubricating, and with suitable holes connecting such recess and groove with an oiler, substantially as set forth.

401,209. SLIDE-VALVE. HARRY C. REAGAN, Philadelphia, Pa. Filed Jan. 26, 1888. Serial No. 297,635. (No model.)

Claim.—1. The combination, in a slide-valve, of the main steam-inlet passages and supplemental inlet-passages, and the exhaust-chamber, with a valve for controlling said supplementary inlet-passages, substantially as described.

2. The combination, in a slide-valve, of the passages F F', supplemental passages *f f'*, and a passage, *e*, with a valve, G, having on its stem a pinion meshing with a stationary rack, so that on the reciprocation of the main valve said valve G will be oscillated to open one or other of the ports *f f'* to the steam, substantially as and for the purpose set forth.

3. The combination, in a steam-valve, of the exhaust-chamber *f'* and a steam-passage with a pipe connecting said exhaust and steam passages, and a check-valve in said pipe to allow for the escape of steam from the exhaust to the steam-passage, but check any escape of steam from the steam-passage into the exhaust, substantially as set forth.

4. The combination of the slide-valve and its steam-passages with the valve-seat having grooves so situated as to be uncovered by one or other of the steam-passages, whereby the lubricant in said grooves will be atomized, as and for the purpose set forth.

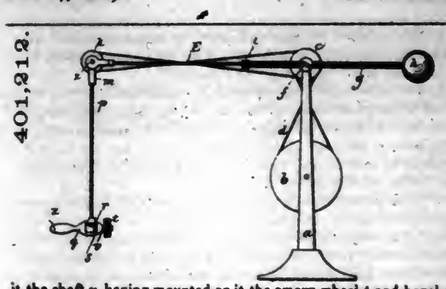
5. The combination, in a slide-valve, of the reservoirs J J, outlets *j j'*, and grooves J' J', substantially as described.

6. The combination, in a slide-valve, of the valve G, having an indicator-hand, *i*, with a dial on the said slide-valve, substantially as and for the purpose described.

401,210. BOOK AND BOOK-COVER. ISABELLA REED, New York, N. Y. Filed Aug. 17, 1887. Serial No. 247,151. (No model.)

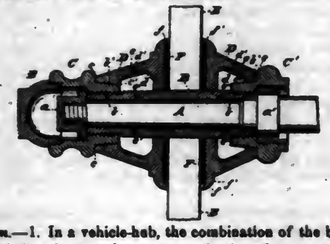
Claim.—A book-cover having designated spaces for an address, postage, or other indicated purpose, with words of direction and information placed thereon, said cover being permanently bound with a book and serving also as a mailing-cover instead of a wrapper, substantially as described.

401,211. SHEET-METAL VESSEL. HENRY S. REYNOLDS, Brooklyn, N. Y. Filed July 9, 1888. Serial No. 279,474. (No model.)



Claim.—The body A, having the flange *i*, foot B, having the flange *o*, and the bottom C, having the dished bottom *c*, the sides *p*, rising therefrom, and the outturned flange *r* at the upper edge of the sides, and the flange *e* beneath the flanges of the body and foot, the said flanges *r* and *o* embracing the flanges of the body and foot above the dished bottom, and thus uniting the body and foot and securing the bottom in place, substantially as described.

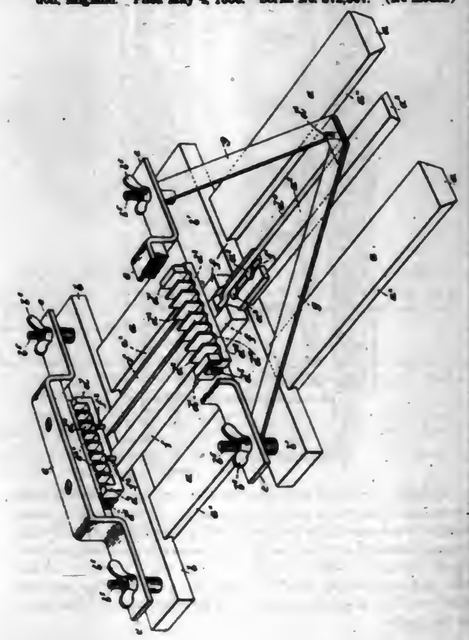
401,212. GRINDING-MACHINE. WILLIAM S. ROBBINS, New Bedford, Mass. Filed July 20, 1888. Serial No. 280,878. (No model.)



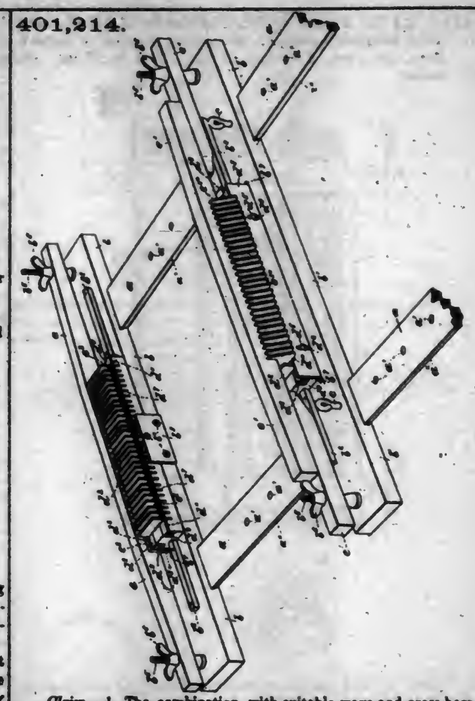
Claim.—In a grinding-machine, the combination of the standard *a*, band-wheels *b* and *c*, pivoted tube *g*, rod *e*, provided with fork *x*, the shaft *n*, provided with band-wheel *k*, and bevel-gear meshing with bevel-gear on rod *p* and pivoting the fork *x* and yoke *m* together, the rod *p*, journaled in yoke *m* and box *q* and provided with bevel-gears *o* and *r*, the box *q*, provided with handle *z*, having journaled in

it the shaft *v*, having mounted on it the emery-wheel *t*, and bevel-gear *s*, all as shown and described.

401,213. WHEEL-HUB. EDWARD C. ROBERTS, Abingdon, Va. Filed July 28, 1888. Serial No. 281,396. (No model.)



Claim.—1. In a vehicle-hub, the combination of the box having the threaded ends, the clamping-nuts having the transversely-beveled portion, the bearing-rings, and the washer, substantially as specified.

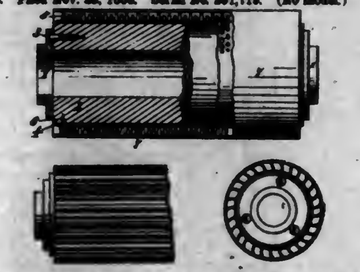


2. In a vehicle-hub, the combination, with the box threaded at its ends, of the clamping-nut C, having the beveled portion, the shoulder *c*, and the rearwardly-projecting portion, the nut C, having the beveled portion, the annular shoulder, and the threaded outer end, the cap E, the bearing-rings having the oil-chamber, the flared opening and the flange, and the rubber washers, substantially as specified.

3. A wheel-hub consisting of the box threaded at its ends, the clamping-nuts having the threaded and beveled inwardly-projecting portion, the cap E, engaging a threaded portion of the nut C, the bearing-rings having the annular recess *d*, the flared opening and the flange, and the rubber washer, substantially as specified.

401,214. PLAITING APPARATUS. CORNELIS F. A. ROELL, London, England. Filed May 4, 1888. Serial No. 272,867. (No model.)

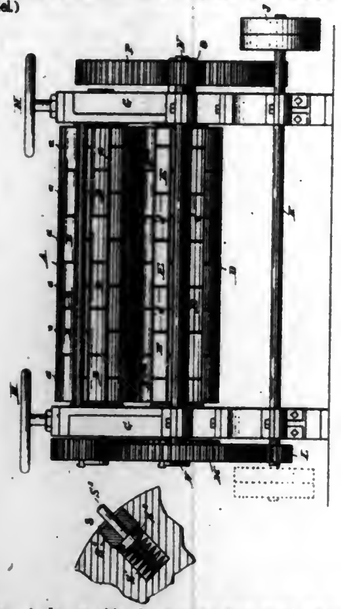
401,214.



Claim.—1. The combination, with suitable ways and cross-bars, of the lower comb-bars, each lower comb-bar having a series of comb-plates, and the upper comb-bars, each upper comb-bar having a series of comb-plates, substantially as described.

2. The combination, with suitable ways, of the cross-bars sliding thereon, the lower comb-bars secured to the cross-bars, the uprights secured to the ends of the cross-bars, the upper comb-bars through which the uprights project, and the fly-nuts by which the upper comb-bars are secured, substantially as described.

3. The combination, with suitable ways and cross-bars, of the lower comb-bars, each lower comb-bar having a series of comb-plates, the adjustable plates for regulating the depth of work between the comb-plates, and the upper comb-bars, each upper comb-bar having a series of comb-plates, substantially as described.

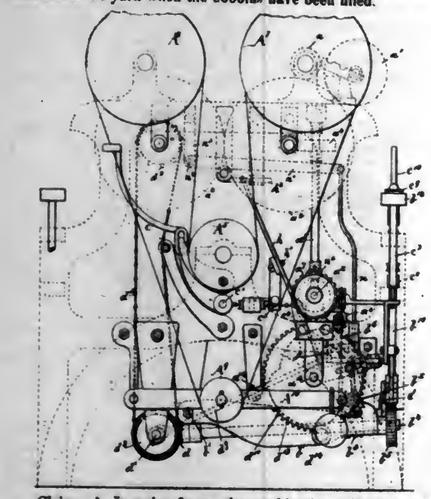


4. The combination, with suitable ways and cross-bars, of the lower comb-bars, each lower comb-bar having a series of comb-plates, the guide-bars, the upper comb-bars, each upper comb-bar having comb-plates, the links connected to the traversing cross-bar, and the rod connected to the lower traversing comb-bar and to the links, substantially as described.

401,215. SAND-PAPER DEVICE. SIMON ROSS, Jr., Linwood, Ohio. Filed Nov. 22, 1888. Serial No. 291,719. (No model.)

Claim.—As an improved article of manufacture, the herein-described sandpapering device, consisting of a drum provided with a tubular covering-band fixed thereto and formed integral with a series of inherently-elastic soft-rubber projections extending radially from the surface of the band, separated to provide intervening air-circulating spaces and yieldingly holding and driving a sand-paper band by frictional contact therewith to permit the free circulation of air between the adjacent surfaces of the soft-rubber projections and the sand-paper band, substantially as described.

401,216. ROLLER-DIE FOR STAMPING SHEET METAL. LOSELEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Harlan P. Lloyd, same place. Filed June 15, 1888. Serial No. 277,251. (No model.)



Claim.—1. In a machine for stamping sheet metal, the two roller-dies adapted to mesh, and journaled in suitable sliding blocks in the end frames, in combination with the gears I, keyed to the spindles of said dies, and the spring-gages S in one of said roller-dies, and suitable mechanism for rotating said dies, substantially as set forth.

2. In a machine for stamping sheet metal, having two roller-dies, the spring-gages located in one of said dies and consisting of the spring S', pin S^2, having the flanged head S^3, and stop S^4, substantially as set forth.

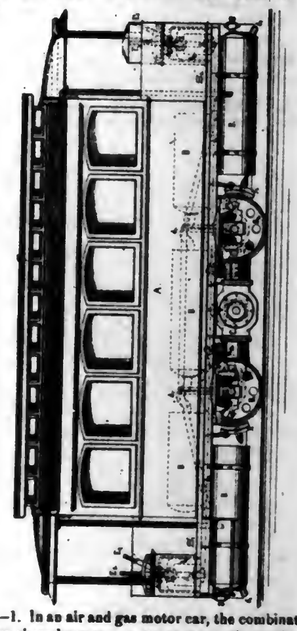
401,217. RING-SPINNING FRAME. WILLIAM H. SALTMARSH and CHARLES A. BOSARDUS, Chicopee Falls, Mass. Filed Sept. 14, 1888. Serial No. 285,415. (No model.)

Brief.—The object of the invention is to provide a ring-frame with means whereby the ring-rail may be automatically lowered to wind down the yarn when the bobbins have been filled.

Claim.—1. In a ring-frame, the combination, with the building-lever, chain-hub, and pick-shaft, of the reversing-shaft, connecting gearing between the reversing-shaft and pick-shaft and between the pick-shaft and chain-hub, and with means to actuate the said reversing-shaft to operate the pick-shaft, substantially as described.

2. The builder-lever, the pick-shaft, its attached ratchet and pawl p, combined with the lever d^9, and the connection between the said lever and pawl, substantially as described.

3. The belt-shipper rod, the lever to engage and hold the said rod, the leg-lever n, connected thereto and having a projection, 3, and the lever d^9, having the finger or projection 4, combined with the locking-lever f, and with means to move it to release the lever d^9, and means to actuate said lever at the completion of the winding-down motion, substantially as described.



4. The builder-lever, the pick-shaft, the reversing-shaft, the gearing between it and the pick-shaft, means to rotate the reversing-shaft, the lever d^9, a spring to effect the engagement of the said gearing, a latch to hold the said lever d^9, and a tripping device, as c', for the said latch, combined with the ring-rail, lifting-rod, and with means between the builder-lever and lifting-rod to lift the lifting-rod, whereby as the lifting-rod makes its greatest upstroke the said latch is actuated to release the said lever and cause the reversing-shaft to rotate the pick-shaft, substantially as described.

5. The builder-lever, the pick-shaft, the sliding reversing-shaft, its actuating-spring, the gear between the said shafts, and means to rotate the said reversing-shaft, combined with the lever d^9 and the latch e to hold the said lever in position to disengage the gears between the reversing and pick shafts, substantially as described.

6. The builder-lever, the pick-shaft, the sliding reversing-shaft, its engaging spring, the gear between the said shafts, and means to rotate the said reversing-shaft, combined with the lever d^9 and with the locking device f to engage the said lever and lock it in position to keep the gears between the reversing and pick shafts in engagement while the reversing-shaft actuates the pick-shaft, substantially as described.

7. The builder-lever, means to move it, the pick-shaft having the worm and the beveled gear, the chain-hub having the worm-gear, the chain, the rock-shaft to which it is connected, and the lifting-rod and ring-rail, and the ratchet-wheel and pawl to move the pick-shaft intermittingly, combined with the reversing-shaft, its gear d^8, and means to rotate the said shaft, and means to automatically stop the rotation of the spindles as soon as the ring-rail reaches its lowest position after starting to wind the yarn down over the yarn load preparatory to doffing the bobbins, substantially as described.

401,218. AIR AND GAS LOCOMOTIVE. ALBERT SCHMID, ROBERT SIEGFRIED, and JOHN C. BECKFELD, Allegheny, Pa., said Siegfried assignor to said Schmid. Filed Dec. 14, 1888. Serial No. 293,569. (No model.)

Claim.—1. In an air and gas motor car, the combination of tanks for containing air under pressure, one or more other tanks for containing gas under pressure, a combustion-chamber with which said tanks communicate and in which the air and gas burn continuously, an interposed mixing-chamber, an engine driven by the products of combustion, and a controlling-lever upon each end of the car for governing the flow of the products of combustion from the combustion-chamber to the engine.

2. In an air and gas motor car, the combination of a double-compound single-acting reversible engine, tanks for containing air and gas under pressure, a combustion-chamber in which the mingled air and gas are consumed, pipes leading from the combustion-chamber to the respective ends of the car, and levers for controlling the flow of the products of combustion through said pipes to the engine located on the car.

3. In an air and gas motor car, the combination of a double-compound single-acting engine, tanks for containing air and gas under pressure, a combustion-chamber in wich the mingled air and gas are consumed, pipes leading from the combustion-chamber to the respective ends of the car, levers for controlling the flow of the products of combustion through said pipes to the engine located on the car, brakes applied to the wheels of the car, cylinders having their pistons connected with the brake-levers, pipes communicating with the combustion-chamber and leading from the respective platforms to said brake-cylinders, and levers located upon the respective platforms for controlling the flow of the products of combustion from said combustion-chamber through said pipes.

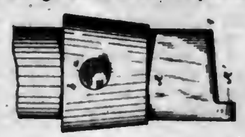
4. In an air and gas motor car, the combination of a double-compound single-acting engine, tanks for containing air and gas under pressure, a combustion-chamber in which the mingled air and gas are consumed, pipes leading from the combustion-chamber to the respective ends of the car, levers for controlling the flow of the products of combustion through said pipes to the engine located on the car, a reversing-gear on the engine, and levers located upon the respective platforms for operating the reversing-gear.

5. In an air and gas motor car, the combination of an engine, tanks for containing air and gas under pressure, a combustion chamber in which the mingled air and gas are consumed, pipes leading from the combustion-chamber to the respective ends of the car, and levers for controlling the flow of the products of combustion through said pipes to the engine located on the car.

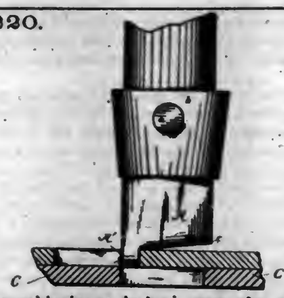
6. In a double-compound single-acting engine, two high-pressure cylinders and two low-pressure cylinders located upon opposite sides of the driven crank-shaft, in combination with a vehicle carrying the engine and apparatus for supplying the products of combustion to said engine.

7. In a double-compound single-acting engine, two high-pressure cylinders and two low-pressure cylinders located upon opposite sides of the driven crank-shaft, in combination with a vehicle carrying the engine and apparatus for supplying the products of combustion to said engine, and valves intervening between the high-pressure and low-pressure cylinders, whereby the latter are used automatically as high-pressure cylinders in case the valves of the small cylinder are in such a position as not to admit gases to their respective cylinders.

401,219. POCKET-BOOK. ERNST SCHNUPP, East New York, assignor to Well & Livingston, New York, N. Y. Filed Feb. 28, 1889. Serial No. 301,454. (No model.)



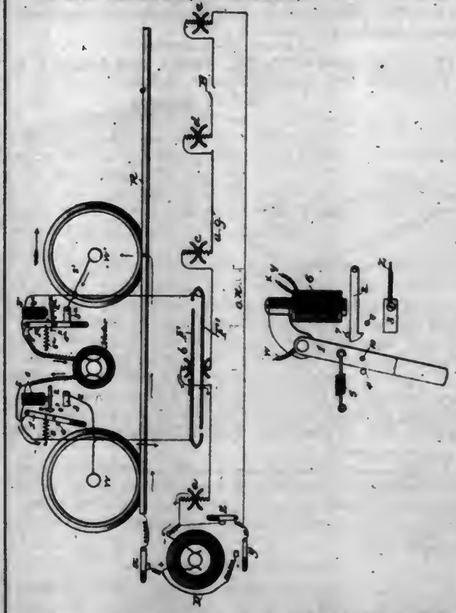
Claim.—The combination, with the jaws, of a bag or body secured below the jaws and gussets or flaps extending above said jaws when the bag is open and folding between the same when the jaws are closed, substantially as described.



401,220. PUNCH. FREDERICK H. SKIDEL, Easton, Pa., assignor of one-half to Henry C. Barnet and Frank Traumbiter, same place. Filed Jan. 2, 1888. Serial No. 295,167. (No model.)

Claim.—1. The punch having at lower corner edge of its inclined shear cutting-edge a, combined guide projection and cutter having a central beveled and pointed cutting-edge, substantially as shown and described, and for the purposes set forth.

2. The punch having a central beveled and pointed inclined shear



401,220.

cutting-edge, and having at the lower corner edge of said cutter a combined guide projection and cutter having a central beveled and pointed cutting-edge, substantially as set forth.

401,221. ELECTRIC RAILWAY. SIDNEY H. SHORT, Denver, Colo., assignor to the United States Electric Company, same place. Filed Feb. 17, 1887. Serial No. 227,960. (No model.)

Claim.—1. In combination with the main and return conductor of a series electric railway, a generator therefor, and a current-collector, movable connections from the terminals of the generator to connect one of the said terminals with the main and return conductors of the railway, and the other terminal of the generator with a rail, as R, connections from said rail to the motor, and interposed switches on the car between said rail and motor, with connections between said switches and the motor on the car, and between said switches and the current-collector, substantially as described.

2. In combination with a car and electric motor carried thereby, connections between said motor and the rail and between said motor and the current-collector, with interposed switches on the car between the rail and the motor, a generator, a rail in connection therewith, and conductors arranged in parallel, substantially as described.

3. In combination with the car, a motor carried thereby, connections from said motor to the rail and to the current-collector, an interposed switch, a main conductor in connection with one terminal of the generator, a return-wire, O H, switches y z, for changing the connection of the said return-wire from one terminal to the other of said generator, and a switch, x, for connecting the rail with the generator, substantially as described.

4. In combination with a generator, the conductors x g O H in connection with one terminal, a rail, R, in connection with the other terminal, a motor on the car, a connection between the rail and the motor and a connection between the motor and the current-collector, a spring-actuated switch on the car between one terminal of the motor and the rail, an electro-magnet adapted to release said switch, and thus automatically short-circuit the motor, a second switch between

the other terminal of the motor and the rail, and connections from said rail to said motor through the said switch, and connections from the other terminal of said motor to the current-collector, substantially as described.

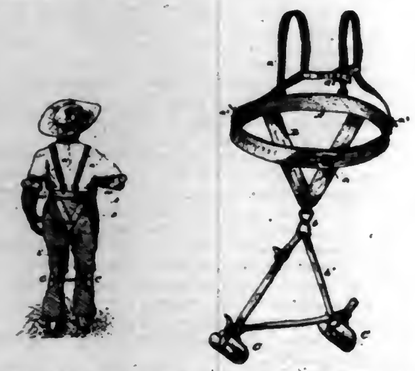
5. In combination with the generator, conductors arranged in parallel in connection with one terminal, a rail in connection with the other terminal, electrical connections from the rail to the motor on the car, an interposed switch-blade for making or breaking this connection, a connection between the motor and the current-collector, an electro-magnet interposed, and an armature automatically operated by the passage of the current through the electric magnet to break the connection from the rail to the motor, substantially as described.

6. In combination with the system of electrical railway described, a switch consisting of an electro-magnet interposed between the motor and the current-collector, a pivoted lever, 1, a contact-block, 3, electrically connected to the rail, and the pivoted armature 2, adapted to engage with the lever 1, substantially as described.

7. In combination with the main and return conductor of a series electric railway, a generator therefor, and a current-collector, movable connections from the terminals of the generator to connect one of said terminals with the main and return conductor of the railway and the other terminal of the generator with a rail, as R, and connections from the rail to the motor and from the motor to the current-collector, substantially as described.

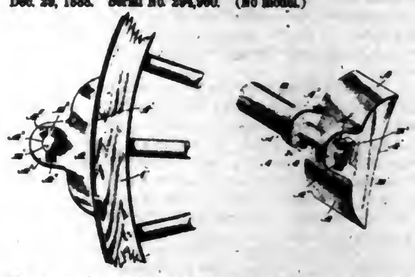
401,222. GAME APPARATUS. HENRY L. SMITH, Brooklyn, N. Y.

Filed July 28, 1888. Serial No. 281,299. (No model.)



Claim.—1. In a game apparatus, the combination, with a board or table laid out to represent a ball-field and provided with raised sides, of an elastic cushion having a curved outer surface and representing a batter and a number of pins or pegs representing fielders.

2. A game apparatus comprising a board or table laid out to represent a ball-field and provided with raised sides an elastic cushion representing the batter, and projections extending laterally from the sides of the field and toward the "diamond," substantially as and for the purpose specified.

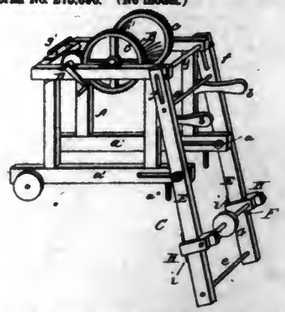


3. A game apparatus comprising a board or table laid out to represent a ball-field and provided with raised sides, an elastic cushion representing the batter, and a bridge provided with arches extending across the rear portion of the field, substantially as and for the purpose specified.

401,223. BRACE FOR BACK AND LEGS. JOSEPH H. SMITH, Kaufman, Tex. Filed Jan. 22, 1889. Serial No. 297,122. (No model.)

Claim.—In a back and leg brace, the combination of the belt A, the straps *a' a'*, secured to the belt A, the straps B B, secured to the belt A and extending downward V-shaped, the links at the lower ends of the straps B B, the strap *b'*, the pads C, attached to the lower ends of the strap *b'*, and the necessary buckles to secure and adjust the device to the body of the wearer, substantially as described and shown.

401,224. BRAKE FOR VEHICLES. THOMAS S. SMITH, Washington, D. C., assignor of one-half to Henry Copperthite, same place. Filed Dec. 29, 1888. Serial No. 294,960. (No model.)



Claim.—1. In combination with the brake-bar having a suitable shank or stem, the brake-block having an opening to receive such stem, and a lug on the stem engaging a portion of the block, so as to hold it in place on the stem, substantially as and for the purpose specified.

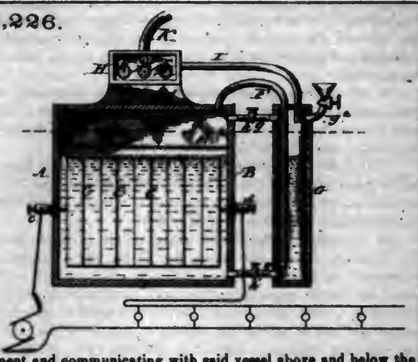
2. In combination with the brake-block having the opening for reception of a supporting-stem, the brake-bar having a stem extending through such opening, and a shoulder and lug at opposite ends of the opening to hold the block in place on the stem, substantially as and for the purpose shown.

3. In combination with the brake-block having the shank-receiving opening with an offset at one side, the brake-bar having a stem or shank to enter the opening in the brake-block, and having the shoulder and the lug to engage the block at opposite ends of the opening, with the lug so situated as to be out of line with the offset from the opening when the block is in operative position, substantially as and for the purpose set forth.

4. In combination with the brake-bar having the brake-block-supporting shank and the shoulder and lug at opposite ends of such shank, the brake-block having the shank-receiving opening with an offset so situated as to be out of line with the lug on the shank when the block is in operative position, and a lug or shoulder on the block to engage the lug on the stem, so as to limit the rotation or tilting of the block, substantially as and for the purpose described.

401,225. APPARATUS FOR LAYING ELECTRICAL CONDUCTORS. WALTER F. SMITH, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed June 1, 1888. Serial No. 275,696. (No model.)

Claim.—1. The combination, with the portable winch or windlass frame A, having elongated longitudinally-slotted base-bars *a'*, of the supplementary detachable and adjustable frame E, carrying the pulley G, and secured to said base-bars by bolts a^3, substantially as described.



2. The combination, with the portable winch or windlass frame A, of the supplementary adjustable and detachable frame E E, the adjustable stirrups H, secured to the frame E E, the pulley G, and the pulley-shaft F, mounted in said stirrups, substantially as set forth.

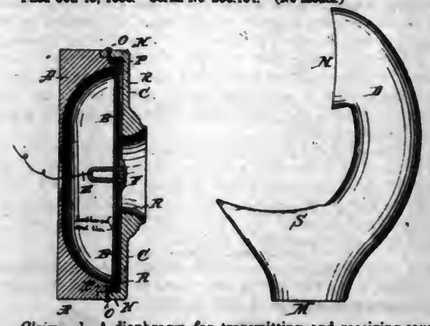
3. The combination, with the horizontal winch or windlass frame having longitudinally-slotted base-bars and transverse tie-bar *g*, of the supplementary pulley-frame C and bolts a^2 a^3, substantially as set forth.

401,226. ELECTRIC METER. WALTER F. SMITH, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed Aug. 22, 1888. Serial No. 283,431. (No model.)

Claim.—1. In an electric meter, the combination, with a vessel adapted to contain a fluid-conductor, electrodes contained in said vessel, and a gas-measuring instrument in communication therewith, of an auxiliary receptacle interposed between said vessel and measuring-

401,226.

instrument and communicating with said vessel above and below the fluid-level thereof, substantially as and for the purpose described.



2. In an electric meter, the combination of a closed vessel containing electrodes and adapted to contain a fluid-conductor, a foraminated partition arranged in said vessel above the fluid-level, and a gas-measuring instrument in communication with said vessel by a pipe opening into the vessel above said partition, substantially as described.

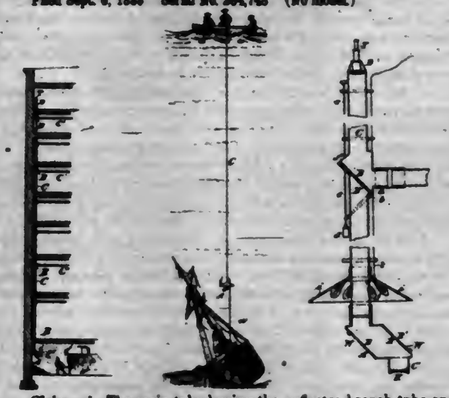
3. In an electric meter, the combination, with a vessel containing electrodes composed of sections of iron nickel-coated and a solution of caustic potash, of a gas-measuring instrument in communication with said vessel, substantially as described.

4. In an electric meter, the combination, with a vessel adapted to contain a fluid-conductor, of electrodes contained in said vessel and composed of sections of iron coated with nickel and a gas-measuring instrument in communication with said vessel, substantially as described.

5. In an electric meter, the combination, with a vessel containing electrodes composed of sections of iron and a solution of caustic potash, of a gas-measuring instrument in communication with said vessel, substantially as described.

401,227. MECHANICAL TELEPHONE. GEORGE THOMAS, New York, N. Y., assignor of one-third to Joseph H. Simpson, same place. Filed Oct. 15, 1888. Serial No. 288,137. (No model.)

Claim.—1. A diaphragm for transmitting and receiving sound, composed of leatheroid and tin, substantially as described.

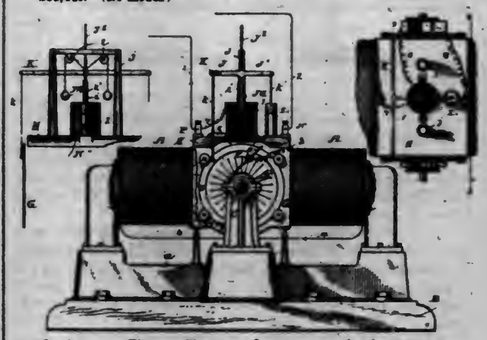


2. A combined mouth and ear attachment made rigid in one piece and adapted to be detachably attached to a telephone, and consisting of two communicating chambers, the opening of one of which, when in use, is applied to the mouth simultaneously with placing the ear at the opening of the other, substantially as described.

401,228. WASHING-MACHINE. FREDRICH W. TIEMANN, Fort Wayne, Ind. Filed Mar. 27, 1888. Serial No. 268,606. (No model.)

Claim.—In a washing-machine, the combination, with a supporting-frame having seats or bearings, of a rectangular frame having journals engaging therewith, and a barrel pivotally mounted within said frame and provided with bolts projecting through curved slots formed in half-disks mounted on said rectangular frame, thumb-nuts being turned upon the bolts to lock the barrel, substantially as described.

401,229. OPTICAL DEVICE FOR THE OBSERVATION OF LOCALITIES BY REFLECTION. HOWARD A. TRAFF, Brooklyn, N. Y. Filed Sept. 6, 1888. Serial No. 284,748. (No model.)



Claim.—1. The main tube having the reflector branch tube and reducing-lens at one end and a telescope at the other, combined with means for producing illumination adjacent to said reflector, substantially as set forth.

2. The main tube having an eye-piece at one end and the reflector at the other end, combined with a branch leading from said reflector, provided with a double-concave lens, substantially as set forth.

3. The main tube having a telescope at one end and the reflector at the other end, combined with a branch leading from said reflector and having a double-concave lens, substantially as set forth.

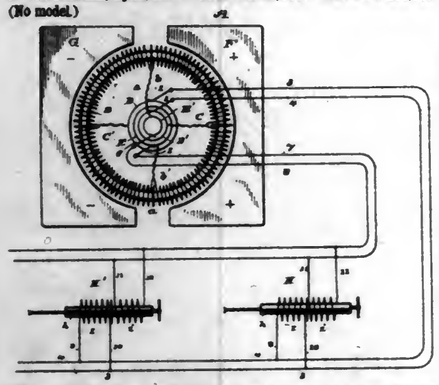
4. The main tube having a branch tube extending therefrom, combined with the weighted movable reflector at the union of the tubes, the reflector being at equal angles with the axial lines of the tubes, substantially as set forth.

401,230. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Aug. 22, 1888. Serial No. 283,446. (No model.)

Claim.—1. The combination of a generator having two armatures within its field of force, one supplying the main working-circuit, the other being in circuit with and supplying current to the field-magnet coils of the generator, and a motor for automatically adjusting the commutator-brushes of both armatures and arranged to raise or lower said commutator-brushes, and thereby increase or diminish the output of the armature supplying the field-magnet circuit, according to the rise or fall of potential in the main circuit, and prevent sparking in the brushes of the main armature, substantially as described.

2. The combination of a generator having two armatures, one of which is included in the main working-circuit, the other in circuit with the field-magnets of the generator, and a motor for adjusting the commutator-brushes of both armatures, comprising a solenoid included in the main circuit and arranged to lower or raise the said commutator-brushes, according to the rise or fall of potential arising from increased or diminished demand for current in the main circuit, substantially as described.

3. In combination with the field-magnets of an electric generator, two armatures, one in the main circuit and the other acting as an



exciter and in circuit with the field-magnets of the generator, and a motor for adjusting the brushes of both armatures, comprising a solenoid or solenoids included in the main circuit and a plunger or plungers influenced thereby and arranged to lower or raise the commutator-brushes according to the flow of current in the main circuit, substantially as described.

4. The combination, with the field-magnets of an electric generator, of two armatures, the mumutator-brushes of both of which are rotatively mounted, and a motor actuated by the main current and arranged to shift all the brushes at once, according to the flow of current in the main circuit, substantially as described.

5. In an electric generator, the combination, with suitable supports thereon, of movable commutator-brush-carrying frames, a solenoid included in the main circuit, an iron plunger for said solenoid, a frame secured to and extending from said plunger and connected to the brush-carrying frame, a guiding-frame extending over the plunger, and counter-weights suspended from said guiding-frame and arranged to raise the plunger and its connections when less than the predetermined current is passing in the solenoid, substantially as described.

6. In an electric generator, the combination, with suitable supports thereon, of movable commutator-brush-carrying frames, solenoids adapted to be put in circuit with the coils of the field-magnets and having iron plungers mechanically connected to the movable frames to move said frames in the desired direction, a solenoid included in the main circuit and having an iron plunger, and circuit-connections extending from the commutator-brush-actuating solenoids and into the path of the plunger of the solenoid in the main circuit, whereby one or the other of said solenoids will be actuated in accordance with the increase or decrease of demand for current in the main circuit, substantially as set forth.

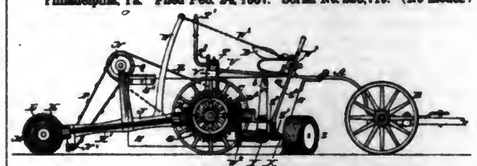
401,231. RECIPROCATING ELECTRIC-ENGINE SYSTEM. CHAS. J. VAN DEPOELE, Lynn, Mass. Filed Jan. 21, 1889. Serial No. 296,981. (No model.)

Claim.—1. An electro-magnetic reciprocating engine system, comprising a generator adapted to produce independent current phases, a reciprocating electro-magnetic engine having two or more motor-coils, and independent circuits extending between the coil or coils and the generator, substantially as described.

2. An electro-magnetic reciprocating engine having two or more sets of motor-coils and a movable core adapted to be reciprocated by the alternate action of said coils thereon, a generator producing two or more independent currents, and separate closed supply-circuits for supplying motive currents to the said motor-coils, substantially as described.

3. In an electro-magnetic reciprocating engine system, a reciprocating engine comprising two or more motor-coils, a generator adapted to produce current of different phases corresponding to the desired speed of reciprocation, and separate circuit-connections between the generator and the said motor-coils for energizing the same in alternation to produce reciprocatory movement of the piston, substantially as described.

4. In a reciprocating electric-engine system, an electric generator for producing defined electric impulses, comprising an armature divided into four or more parts, each connected to a separate insulated collector, a reciprocating electric engine or engines each having a plurality of motor-coils, and separate supply-conductors extending between the separate portions of the generating-armature and connecting the same with the motor-coils of the engine.



5. In a reciprocating electric-engine system, an electric generator for producing defined electric impulses, comprising an armature divided into four or more parts, each connected to a separate insulated collector-ring, a suitable field of force within which said armature may be rotated, a reciprocating electric engine or engines each having a plurality of motor-coils, and separate supply-conductors extending between the separate portions of the generating-armature and connecting the same with the motor-coils of the engine, substantially as described.

6. An electro-magnetic reciprocating engine comprising motor-coils, an iron core adapted to be reciprocated therein, and a magnetic cylinder enveloping the coil or coils, the mass of said cylinder being subdivided, substantially as described.

7. An electro-magnetic reciprocating engine having motor-coils and a movable core adapted to be reciprocated therein, and iron heads at each end of the coil or coils, the mass of the iron in said heads being subdivided, substantially as described.

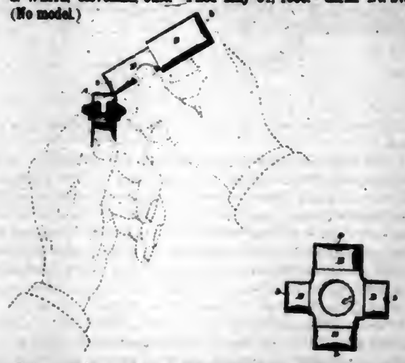
8. In a reciprocating electric-engine system, an electric generator for producing defined electric impulses, comprising a magnetic core, a primary coil thereon, a secondary in inductive relation to the primary, an electric engine or engines, and separate supply-conductors extending between different portions of the secondary coils of the generator and coil or coils of the electric engine or engines, and means for supplying continuous current to different parts of the primary coils, comprising a rotating circuit-making device and means for adjusting and determining the rate of movement thereof, substantially as described.

401,232. STREET-SWEEPING MACHINE. CHARLES WHELER, Philadelphia, Pa. Filed Feb. 24, 1887. Serial No. 228,719. (No model.)

Claim.—1. A street-sweeping machine consisting of a truck with a rising-and-falling frame pivotally mounted on its rear axle, a rotary brush and an endless apron journaled on said frame and operated by the rotation of the hind wheels of the truck, and a side brush having a tumble-joint-shaft coupling and gearing by which it is operated from the axles of one of the hind wheels of the truck, substantially as described.

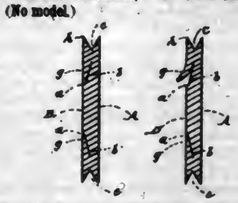
2. A street-sweeping machine consisting of a truck with a rising-and-falling frame pivotally mounted on its rear axle, a rotary brush and an endless apron journaled on said frame and operated by the rotation of the hind wheels of the truck, an adjustable box supported on said truck, a rotary shaft and chain, the latter connected to an arm of the rising-and-falling frame, and a side brush rotated by gearing connected with a bevel-wheel on the axle of one of the hind wheels of the truck, said parts being combined substantially as and for the purpose set forth.

3. In a street-sweeping machine, the gear-wheel G, mounted on one of the axles of the running-gear, in combination with the bevel-wheel W^2, the sectional rotary shaft X, having gimbal-joint Y and a brush, the gearing W^4, connecting the shaft X with bevel-wheel W^2, and the arm Z^2, hinged to the truck A and provided with collar Z' and lever Z^3, all substantially as described.



401,233. TOILET OR WRAPPING PAPER ROLL. SETH WHEELER, Albany, N. Y. Filed July 24, 1888. Serial No. 280,914. (No model.) Patented in Canada Sept. 13, 1888, No. 29,856.

Claim.—1. A roll of paper having all its incisions or perforations in the same plane, with the cut edges tending outward, substantially as described, whereby the roll is adapted to permit the introduction of a suspensory device through the incisions from the interior outwardly.

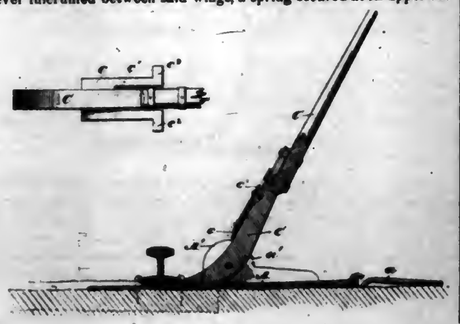


2. As a new manufacture, a roll of paper having all its incisions or perforations in the same plane, with the cut edges tending outward, and provided with a suspensory device introduced from the interior of the roll and passing outwardly through the incisions, substantially as described.

401,234. FORMER FOR RESTORING RENT WICK-TUBES. JOHN S. WHITE, Cleveland, Ohio. Filed May 31, 1888. Serial No. 275,603. (No model.)

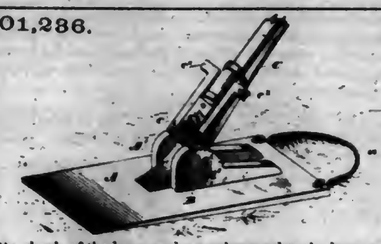
Claim.—A former for restoring wick-tubes of lamps or lanterns, said former being adapted to fit snugly inside the wick-tube, the former having a thin edge at the end thereof, substantially as set forth.

401,235. CHANNELED SHOE-SOLE. GEORGE B. WIGGIN, South New Market, and JONATHAN BARTLETT, Epping, N. H., assignors of one-half to John W. Hoard, Providence, R. I. Filed May 7, 1888. Serial No. 273,065. (No model.)



Claim.—1. The described shoe-sole having in its edge an angular groove, both edges of which are in the same plane at right angles to the surfaces of the sole, and also having a flap on the surface cut outward toward such edge, and whereby the stitches may lie within the groove and be concealed under the flap.

2. A shoe-sole having a cut one part of which extends from the surface of the sole downward at right angles to the same, and the remainder of the cut extending toward the edge of the sole, and also having a V-shaped channel in said edge, all substantially as shown, and for the purposes described.



401,236. TRACK-LIFTER. JAMES D. WILTROUT, Hyde, Colo. Filed Nov. 1, 1888. Serial No. 289,738. (No model.)

Claim.—1. The combination, substantially as described, of the shoe provided with wings having toothed segments on their upper edges, a lever fulcrumed between said wings, and a spring-pawl secured to the shank of the lever to engage the teeth of the segments.

2. The combination, substantially as described, of the shoe provided with wings having toothed segments on their upper edges, a lever fulcrumed between said wings, a spring secured at its upper end

401,236.

to the shank of the lever, and a pawl secured to the lower end of the spring.

3. The combination, substantially as described, of the shoe provided with wings having toothed segments on their upper edges, a lever fulcrumed between said wings, a spring secured at its upper end to the shank of the lever, and a V-shaped pawl secured at its lower end to the lower end of the spring and provided at its upper end with footholds extending outwardly from the lever.

401,237. VELOCIPEDE. CHARLES R. W. WOODWARD, Chicopee Falls, assignor to the Overman Wheel Company, Boston, Mass. Filed June 8, 1888. Serial No. 276,473. (No model.)

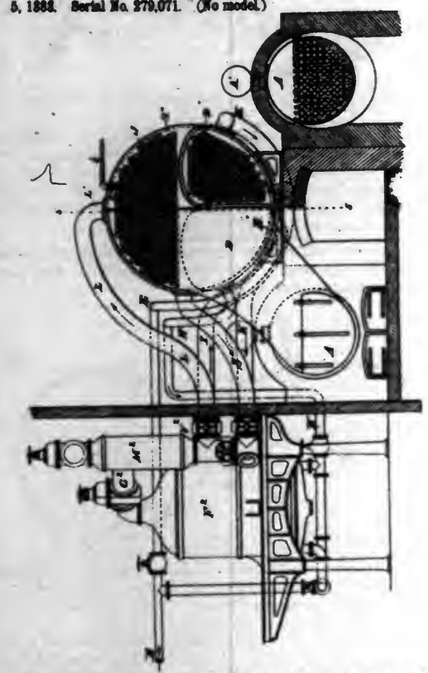
Claim.—1. In a cycle, the combination, with a main frame, of a rear-wheel frame provided with a forward extension, a crank-shaft forming a pivotal connection between the two frames, and a spring connected with the main frame and the said extension, which extends forward under the main frame, substantially as set forth.

2. In a cycle, the combination, with a main frame, of a rear-wheel frame provided with an extension located in the same horizontal plane with it, a crank-shaft forming a pivotal connection between the two frames, and a spring positively connecting the main frame and the extension and extended under the weight of the rider, substantially as set forth.

3. In a cycle, the combination, with a main frame, of a crank-shaft carried thereby, a rocking sleeve mounted on such shaft, a rear-wheel frame having a forward extension connected with such sleeve, and a spring connecting such extension and the main frame of the vehicle, substantially as set forth.

4. In a cycle, the combination, with the main frame thereof, of a crank-shaft carried thereby, a rear-wheel frame pivotally and adjustably connected to such shaft, and a spring connecting the forward end of such frame with the main frame of the vehicle, substantially as set forth.

5. In a cycle, the combination, with the main frame thereof, of a crank-shaft carried thereby, a rocking sleeve mounted on such shaft and provided with depending clamping-lugs, a rear-wheel frame having a forward extension passing between such lugs, which are clamped upon it, and a spring connecting the forward end of the extension with the main frame of the vehicle, substantially as set forth.



6. In a cycle, the combination, with the main frame thereof, of a crank-shaft carried thereby, a rocking sleeve mounted on such shaft, a rear-wheel frame provided with a tubular forward extension connected with such sleeve, a spring connecting such extension with the main frame of the vehicle, and a threaded rod mounted in the extension and provided at its forward end with adjusting-nuts and at its inner end with a pin passing through limiting-slots in the extension and connected with the said sleeve, substantially as set forth.

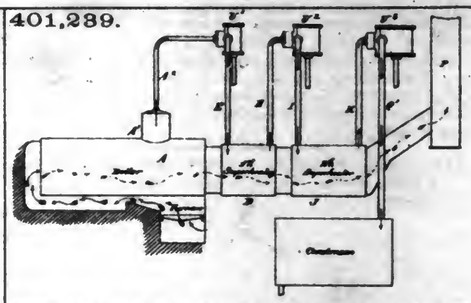
7. In a cycle, the combination, with a main frame having an upright provided at its lower end with a fork each arm whereof carries a ball-bearing case, of a crank-shaft carrying a grooved sleeve for each of such cases, a rocking sleeve located between such grooved sleeves, a rear-wheel frame provided with a forward extension connected with such rocking sleeve, and a spring connecting such extension with the main frame of the vehicle, substantially as set forth.

8. In a cycle, the combination, with the main frame having an upright provided at its lower end with a fork each arm whereof carries a ball-bearing case, of a crank-shaft passing through such cases and carrying two grooved and coned sleeves to co-operate with them, a rocking sleeve having flaring ends mounted on the axle between the

said sleeves, the coned ends whereof enter its flaring ends in the formation of raceways for anti-friction balls, a rear-wheel frame having a forward extension connected with such rocking sleeve, and a spring connecting the said extension with the main frame of the vehicle, substantially as set forth.

401,288. APPARATUS FOR EVAPORATING SACCHARINE OR OTHER LIQUIDS. ALEXANDER YOUNG, Honolulu, Hawaii. Filed July 5, 1883. Serial No. 279,071. (No model.)

Claim.—1. The combination, with the cells of a multiple-effect evaporating or vacuum pan, of a steam-generator and two (or more) superheaters arranged to be traversed in succession by the products of combustion, and pipes connecting the respective cells of the pan to the superheaters, whereby the exhaust steam or vapor from one cell is passed through one superheater and then conducted to another cell for heating the latter, and the several connections relatively arranged to pass the exhaust-vapors of higher pressure through the superheater acted upon by the hottest gases and the exhaust-vapors of lower pressure through a superheater acted upon by the gases after their temperature has become reduced, substantially as specified.



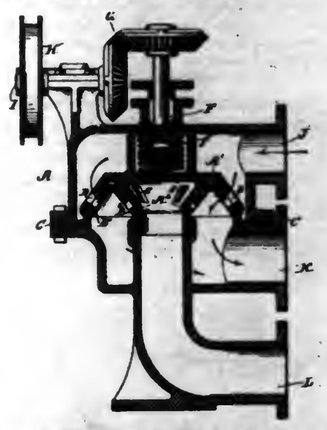
2. The combination, with the cells of a multiple-effect evaporating or vacuum pan and the vacuum-pump thereof, of a steam-generator and two (or more) superheaters arranged to be traversed in succession by the products of combustion, and exhaust-pipes connecting the respective cells to the corresponding superheaters and the latter to the heating-surfaces of the next successive cells, whereby the cells are connected in series and the vapors exhausted from each cell are superheated and used for heating the next successive cell, substantially as specified.

3. The combination, with an evaporating or vacuum pan, of a superheater, a pipe conveying steam to said superheater, a pipe conveying air to said superheater, and a pipe leading from said superheater to said evaporating-pan, whereby the latter may be heated by superheated steam or superheated air, or a mixture of both, substantially as specified.

401,239. SUPERHEATING STEAM-GENERATOR. ALEXANDER YOUNG, Honolulu, Hawaii. Original application filed July 5, 1883, Serial No. 279,071. Divided and this application filed Dec. 12, 1888. Serial No. 293,384. (No model.)

Claim.—1. The combination, with a steam-boiler and its furnace, of two or more superheaters arranged to be traversed by the products of combustion after they have traversed the boiler, and pipes or conduits adapted to return spent steam or vapor to said superheaters to be reheated, arranged to conduct the steam or vapor of the highest temperature to that superheater or portion of the superheater which is acted on by the hottest gases and to conduct the steam or vapor of the lowest temperature to that superheater or portion of the superheater which is acted on by the gases when their temperature has been reduced.

401,289.



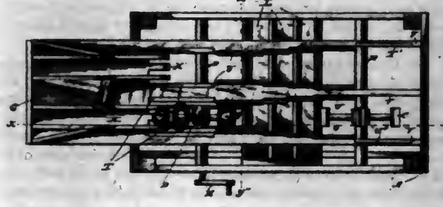
2. The combination, with a steam-boiler and its furnace, of two or more superheaters arranged to be traversed by the products of combustion after they have traversed the boiler, and pipes or conduits adapted to return spent steam or vapor to said superheaters to be reheated, arranged to conduct the steam or vapor of the highest temperature to that superheater which is being traversed by the hottest gases and to conduct the steam or vapor of the lowest temperature to that superheater which is being traversed by the gases the temperature of which has been last reduced before passing to the stack.

3. The combination, with a multiple-expansion engine, of a steam-boiler and its furnace, and two or more superheaters arranged to be traversed successively by the products of combustion after they have traversed the boiler, a steam-pipe conducting live steam from the boiler to the first cylinder, a pipe conveying the exhaust-steam from this cylinder to the superheater which is traversed by the hottest gases, a pipe conveying the reheated steam from this superheater to the second cylinder, a pipe conveying the exhaust-steam from this cylinder to a superheater which is traversed by the gases after they have passed the first superheater, and a pipe conveying the reheated steam from this superheater to the third cylinder.

4. The combination, with a boiler, of a superheater divided into compartments, a smoke box or passage for conducting the products of combustion from the boiler to one of said compartments, a smoke-box for conducting the products of combustion emerging from one of said compartments to the other compartment in order that they may return in the opposite direction through the latter and the stack, arranged to receive the products of combustion after they issue from said second compartment, and pipes for conveying steam to and from said compartments, arranged to conduct the steam or vapor of the highest temperature to that compartment which is first traversed by the gases and the steam or vapor of the lowest temperature to that compartment which is last traversed by the gases before they pass to the stack.

401,240. VALVE. LEONARD ATWOOD, Philadelphia, Pa. Filed Jan. 5, 1889. Serial No. 295,492. (No model.)

Claim.—1. A three-way valve provided with pressure and exhaust portions, each in the form of a frustum of a cone, the exhaust being a reverse from that of the pressure and valve seat corresponding with said valve, with which said valve forms a water-tight joint, but upon which it is capable of rotating, and ports in the pressure and exhaust portions of the valve and the corresponding seat portions, the position of the ports being such that when the ports of either portion of the valve are open the ports in the other portion are closed.



2. A three-way valve provided with pressure and exhaust portions, each in the form of a frustum of a cone, the exhaust being a reverse cone from that of the pressure and valve-seat corresponding with said valve with which said valve forms a water-tight joint, but upon which it is capable of rotating, and quadrilateral ports in the pressure and exhaust portions of the valve and the corresponding seat portions, the position of the ports being such that when the ports of either portion of the valve are open the ports in the other portion are closed.

3. In combination, a three-way valve provided with pressure and exhaust portions, each in the form of a frustum of a cone, the exhaust being a reverse cone from that of the pressure and valve seat corresponding with said valve, with which said valve forms a water-tight joint, but upon which it is capable of rotating, and ports in the pressure and exhaust portions of the valve and the corresponding seat portions, a valve-stem, and a spring surrounding said valve-stem.

4. In combination, a three-way valve provided with pressure and exhaust portions, each in the form of a frustum of a cone, the exhaust being a reverse cone from that of the pressure and valve seat corresponding with said valve, with which said valve forms a water-tight joint, but upon which it is capable of rotating, ports in the pressure and exhaust portions of the valve and the corresponding seat portions, a valve-stem, and means, substantially as described, to operate said valve-stem and rotate said valve upon its seat.

5. In combination, a three-way valve provided with pressure and exhaust portions, each in the form of a frustum of a cone, the exhaust portion being a reverse cone from that of the pressure and valve seat corresponding with said valve, with which said valve forms a water-tight joint, but upon which it is capable of rotating, ports in the pressure and exhaust portions of the valve and the corresponding seat portions, a valve-stem, and bevel-gear, whereby, when the bevel-gear is operated, the valve is rotated on its seat.

401,241. ORANGE-GRADER. ALFRED AYER, Lake Weir, Fla. Filed Apr. 30, 1888. Serial No. 272,339. (No model.)

Claim.—1. In an orange-grader, the combination, with a suitable frame, a hopper, G, mounted thereon, and an inclined chute, H, of an endless chain belt mounted in the vertical plane of said chute, the expanding rings mounted upon the links of said belt and each provided with a fork adapted to pass through slots in said chute and lift fruit therefrom, and guiding-surfaces adapted to act upon two opposite sides of said rings fully expanding and contracting each ring while it is making each complete circuit.

2. In an orange-grader, the combination of an endless open-link belt, expansible segmental rings mounted, respectively, in the links of said belt, arms projecting from two opposite segments of each ring, and guides adapted to carry said arms outward as the link passes along one horizontal portion of the chain's path and to press them inward as it passes along the other horizontal portion of said path, substantially as and for the purpose set forth.

3. In an orange-grader, the combination of the revoluble sprocket-wheels C, carrying the chain D, the expansible sizing-rings Y, mounted upon the respective links of said chain, the ring-arms moving in guides adapted to force them alternately outward and inward, and the transverse chutes lying below one fold of said chain, substantially as set forth.

4. In an orange-grader, an expansible grading-ring composed of radially-movable segments, the alternate segments being each provided with ways oblique to the segments' line of motion, and each intermediate segment being provided upon its opposite sides with rigid sliding arms lying, respectively, in the ways of the two adjacent segments, all combined with mechanism for operating two opposite segments, substantially as and for the purpose set forth.

5. In an orange-grader, an endless traveling belt provided with openings larger than the fruit to be graded, expansible rings mounted in said openings, a chute adapted to convey fruit to said belt, a series of forks carried by said belt and adapted to transfer fruit from said chute to each passing ring, and means for expanding said rings from their smallest to their largest limit, substantially as set forth.

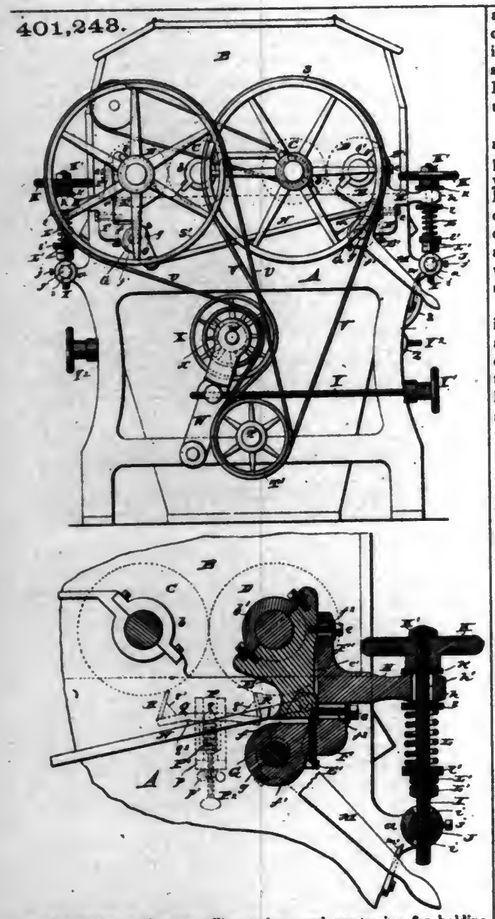
6. In an orange-grader, the combination, with two radially-moving segments, N, forming opposite sides of an expansible grading-ring and each provided with rigid arms Q, oppositely inclined to the segments' line of motion, of the opposite segments, M, forming the other two sides of the ring and each provided with ways to receive an arm, Q, from each of the segments N, substantially as set forth, whereby radial motion of the segments N causes a corresponding motion of the segments M and expands the ring symmetrically.

401,242. MIDDLINGS-PURIFIER. HIRAM A. BARNARD, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed Aug. 17, 1888. Serial No. 211,134. (No model.)

Claim.—1. In a middlings-purifier, a reciprocating screen-shoe composed of a lower half connected with the mechanism for longitudinally vibrating the shoe and an upper half mounted upon, supported by, and moving with the lower half, in combination with mechanism, substantially as described, for imparting a transverse motion to the upper half independent of its longitudinal reciprocation by and with the lower half, the two halves being inseparably connected, substantially in the manner and for the purpose specified.

2. In a middlings-purifier, a reciprocating screen-shoe composed of a lower half connected with the mechanism for longitudinally vibrating the shoe, having slots or bars extending from end to end and immovably secured therein, and an upper half carrying a sieve and mounted upon, supported by, and moving longitudinally with the lower half, in combination with mechanism for imparting an independent transverse motion to said upper half, all substantially as and for the purpose specified.

3. In a middlings-purifier, the combination of a screen-shoe, D, composed of two frames, *d d'*, the upper frame, *d*, having a screen secured to its bottom and supported upon and moving with the lower frame, *d'*, and the lower frame having longitudinal strips rigidly secured therein and sustaining the screen on the upper frame, with mechanism for imparting a longitudinal movement to the shoe, and mechanism for imparting a transverse movement to frame *d* independent of its movement with frame *d'*, all substantially as and for the purpose described.



4. The combination of the rectangular lower frame, *d'*, having the bars d^2, carrying cleaning-strips d^4, standing upward from said bars, the chute *f*, rising from its head or front end rail, and the transverse bar *f'*, with the reciprocating upper frame, *d*, shorter and wider than the lower frame, having the bolting-cloth stretched over its lower side and resting between the said chute and bar *f'*, the links d^3, supporting-frame *d'* upon the main frame, the pitman-rods E, heads *e*, shaft C, and fan-shaft by which it is rotated, and the eccentric-disks *c'* on said shaft for reciprocating the rods E and frames *d' d* longitudinally, and mechanism for reciprocating frame *d* laterally, all substantially as specified.

5. The combination of the frames *d d'*, the mechanism to longitudinally reciprocate the two frames simultaneously, with the countershaft, shaft C, and belt by which it is rotated, and a worm, g^4, on said shaft, the longitudinal shaft I, the worm-wheel *i*, and eccentrics j^3 thereon, the pivoted lever J, having the lower bifurcated arms, *j*, embracing said eccentrics, cords K, and strips *k*, all constructed substantially as and for the purpose described.

401,243. ROLLER-MILL. HIRAM A. BARNARD, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed May 26, 1887. Serial No. 239,465. (No model.)

Claim.—1. In a roller-mill, the combination of the rigid roll and the yielding roll, with the swinging arms supporting the yielding roll, the springs controlling said arms mounted on swinging supports, the transverse shaft G, journaled in the main frame below and parallel with the yielding roll and having cams formed on its ends upon which the swinging arms are supported, and the lever to oscillate the shaft and thereby shift both arms simultaneously to throw the yielding roll away from the rigid roll without disturbing the alignment of the rolls

401,248.

or the tension of the controlling-springs, and mechanism for holding the yielding roll up to the rigid roll when in operative position, substantially as specified.

2. In a four-roller mill, the combination of the rigid rolls with the yielding rolls, the swinging arms supporting the latter, the adjustable springs controlling said arms mounted on swinging supports, the two shafts G G, journaled in the main frame below the yielding roll, having cams *g* on their ends, upon which said arms are mounted, the series of connected levers for simultaneously oscillating shafts G G, to adjust the yielding rolls to or from the rigid rolls without disturbing the tension of the springs, and mechanism for holding the yielding rolls up to the rigid rolls when in operation, substantially as specified.

3. In a four-roller mill, the combination of a counter-shaft journaled in the main frame and receiving motion from the main driving-belt at one side of the machine, pulleys on the other end of said shaft at the opposite side of the machine, pulleys on the shafts of two of the rolls, and belts of unequal length diverging from the pulleys on said counter-shaft to said other pulleys, with a tightening device mounted on the main frame, having two pulleys of unequal diameters adapted to be brought, respectively and simultaneously, against the slack sides of said driving-belts, all substantially as and for the purpose specified.

4. In a roller-mill, the combination of the crushing-rolls and the main frame provided with vertical guides and horizontal brackets *p* on the inner faces of its sides with a rectangular frame, Q, carrying suitable roll-cleaning devices and having lugs *q* on its ends moving in the guides on the main frame, the springs loosely supporting the frame, and the bolts F^3, carrying the springs, whereby the frame can be adjusted, all constructed and arranged to operate substantially in the manner and for the purpose described.

5. In a roller-mill, the combination of the rigid rolls, the yielding rolls, the upright movable arms F, bearing the yielding rolls, the springs engaging said arms mounted on swinging supports, the transverse shafts G G, journaled in the main frame below the yielding rolls, having cams *g* on their ends, forming the pivotal supports of said arms, and the connected levers for oscillating said shafts simultaneously to shift arms F and throw the yielding rolls into or out of grinding position without disturbing the adjustment of the controlling-springs, with the screw-rods and their adjusting-nuts engaging arms F and projections of the main frame for regulating the grinding adjustment of the rolls, substantially as specified.

6. In a roller-mill, the combination of the rigid and yielding rolls and the independent movable arms F with the vertically-adjustable pillow-blocks mounted on arms F, forming the journal-bearings of the yielding rolls, the springs L, for regulating the adjustment of the arms F, mounted on swinging supports, the transverse shafts G G, having on their ends cams *g*, forming the pivotal supports of arms F, and the connected levers to oscillate said shaft to simultaneously shift the arms F to throw the yielding rolls into or out of grinding position without disturbing the tension of the springs, all constructed and arranged substantially in the manner and for the purpose described.

7. The combination of the swinging arms F, carrying the yielding rolls, the adjustable swinging screw-rods I, and adjustable nuts and springs L thereon controlling arms F for regulating the grinding operation of the rolls, with the transverse shafts G, having cams *g* on their ends, upon which arms F are mounted, and the levers for oscillating said shafts to shift arms F without disturbing the tension of springs L, all constructed and arranged substantially as and for the purpose described.

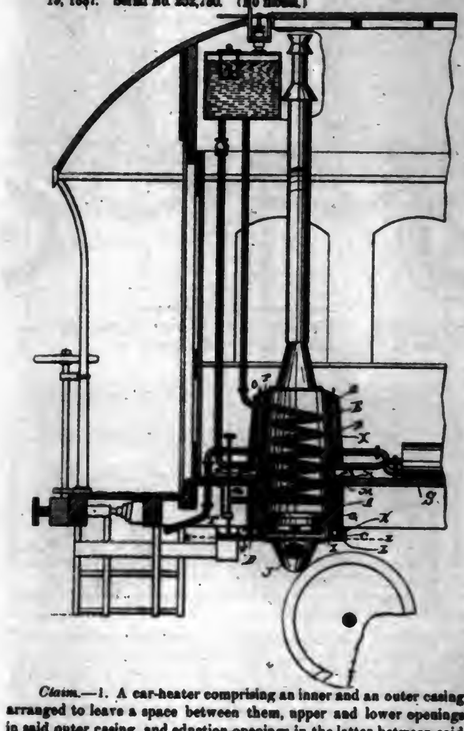
8. The combination of the adjustable angular arms F and the rod I and its nuts and springs for regulating and adjusting the arms, substantially as described, with the angular pillow-blocks E, mounted on said arms, the adjusting-bolts E' and retaining-bolts *e* for said pillow-blocks, and the rolls mounted on the pillow-blocks, all constructed and arranged to operate substantially in the manner as and for the purpose described.

9. The combination of the roll-supporting pivoted swinging arms F F, having outstanding slotted pieces H H, with the journal-nuts mounted on the main frame, the threaded rods I I, adjustably engaged at their lower ends in said nuts and playing freely through openings in pieces H H, the adjusting-nuts and jam-nuts on rods I above pieces H, and the springs L and nuts L' on said rods between nuts J and pieces H, whereby the arms F can be adjusted without disturbing the springs, all constructed and arranged to operate substantially in the manner and for the purpose described.

10. In a four-roller mill, the combination of the rigid roll, the pivoted swinging arms F, having each an outstanding piece, H, the pillow-blocks E and the yielding roll mounted in said blocks, and the shaft G, journaled in the main frame below the yielding roll and having cams *g g* on its ends, forming the pivotal supports of arms F, with the rods I, springs L, and nuts L' thereon, and the journal-nuts J, K and K', engaging piece H, whereby the arms F can be adjusted without disturbing the springs, substantially as and for the purpose specified.

11. In a roller-mill, the combination of the fast rolls having equal-sized pulleys on their shafts at one side of the mill and the slow rolls having equal-sized pulleys on their shafts at the opposite side of the mill with the counter-shaft having pulleys on its opposite ends driven by the main belt, that also drives the fast rolls, and driving the slow rolls by different belts of unequal length, and a belt-tightener composed of a bifurcated bracket pivoted on the main frame and carrying two pulleys on one shaft adapted to simultaneously tension these belts, and suitable tension devices for the main belt, substantially as and for the purpose specified.

12. The combination, in a four-roller mill having fast and slow rolls and a counter-shaft, T, having single pulley *t* at one end and double pulleys T' T' at the other, of the main belt U, driving the fast rolls and counter-shaft at one side of the mill, and the belts V *v*, driving the slow rolls from pulleys T' T' at the opposite side of the mill, with the belt-tightening devices for belts V *v*, consisting of an arm, W, pivoted to the main frame and operated by an adjustable horizontal screw-rod, Y, and bearing in its upper bifurcated end the large pulley X and small pulley *x*, mounted upon the same shaft, engaging, respectively, the belts V *v*, and the similar arm Z, bearing one pulley and its operating devices for tightening belt U, all substantially as and for the purpose described.



401,244. SPLICING DEVICE. JOHN C. BASEL, Galveston, Tex. Filed Oct. 15, 1888. Serial No. 288,165. (No model.)

Claim.—1. The combination, with the adjacent ends of two wires bent so as to interlock, of a casing, as A, surrounding said ends and having its ends bent in, as at B, substantially as described.

2. The combination, with the casing A, of the wires *a a*, entering the casing at the opposite sides of the respective ends and bent in opposite directions, so as to interlock within the casing, said casing being bent down, as at B, at each end, substantially as described.

401,245. APPARATUS FOR HEATING RAILWAY-CARS. GEORGE H. BENJAMIN, New York, N. Y., assignor, by mesne assignments, to The Safety Car Heating and Lighting Company, of New Jersey. Filed Oct 19, 1887. Serial No. 252,780. (No model.)

Claim.—1. A car-heater comprising an inner and an outer casing arranged to leave a space between them, upper and lower openings in said outer casing, and eduction-openings in the latter between said upper and lower openings, and a fire-pot secured to the inner casing, substantially as described.

2. A car-heater comprising an inner and an outer casing arranged to leave a space between them, said casings projecting below the car-floor, a perforated base-ring on the outer casing for supporting the heater, said outer casing also having upper and lower draft-openings, and a fire-pot within the inner casing.

3. A car-heater comprising an inner and an outer casing arranged to leave an air-space between them, said casings projecting below the car-floor, a perforated base ring on the outer casing, a fire-pot arranged within the inner casing, and a draft-rieg for closing the lower openings in the outer casing.

4. A car-heater comprising an inner and an outer casing projecting below the car-floor and having upper and lower openings, as described, a base-ring having perforations communicating with the space between the casings and supporting the casings, the perforated ring to which the inner casing is secured, and the damper-ring for opening and closing the lower openings.

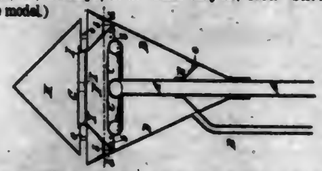
5. A car-heater comprising an inner and an outer casing having upper and lower openings and arranged to leave a space between them, said casings projecting below the car-floor, a base-ring having openings communicating with the space between the casing, the perforated base-ring to which the inner casing is secured, the fire-pot, the perforated damper-ring to close the lower openings, and mechanism, substantially as described, for operating said damper-ring from within the car.

6. A car-heater comprising two casings arranged to leave a space between them and projecting below the car-floor, said outer casing having upper and lower openings, as described, a damper-ring, and means, substantially as described, for operating it to close the lower openings, the fire-pot, the ash-chute arranged under the latter, and means, substantially as described, for operating the latter from a point within the car, substantially as described.

401,246. RUBBER BOOT OR SHOE. ERSKINE F. BICKFORD, Malden, Mass., assignor to the Boston Rubber Shoe Company, same place. Filed Jan. 14, 1888. Serial No. 296,282. (No model.)

Claim.—In a rubber boot or shoe, or a boot or shoe whose sole is of rubber, the combination, with the rubber outer or main sole, B, of the inner leather sole, D, provided with a row of perforations, as D', and the intermediate sole, C, of felt or similar porous substance, said inner sole being permanently attached to the intermediate sole, and said intermediate sole being attached to the rubber outer sole, substantially as and for the purpose set forth.

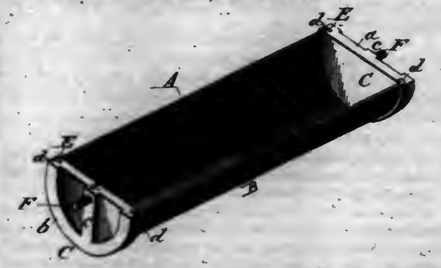
401,246.



401,247. MANUFACTURE OF KEY-BLANKS. CHARLES M. BURGESS, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Feb. 16, 1889. Serial No. 300,150. (No model.)

Claim.—That improvement in the manufacture of keys which consists in heading the stock at one end, cutting out portions of said headed blank to give the general contour of a key, then swaging it into the form of the desired key, and then removing the surplus metal, substantially as described, and for the purpose specified.

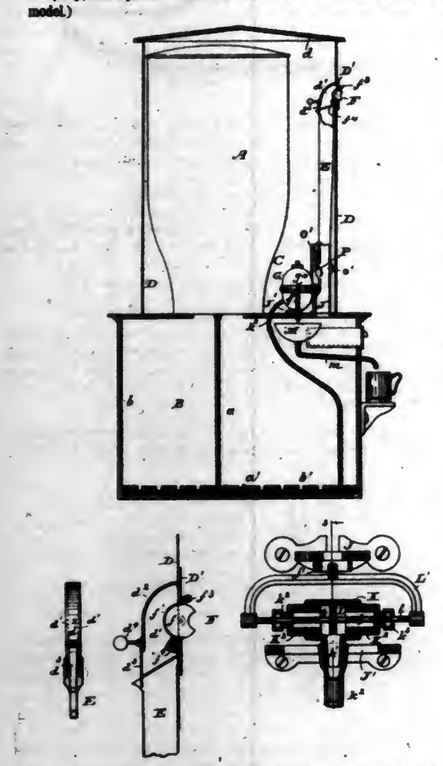
401,248. TRAP FOR EXHAUST-STEAM PIPES. THOMAS BURKHARD, Jr., Brooklyn, N. Y. Filed May 22, 1888. Serial No. 274,717. (No model.)



Claim.—1. In a trap for exhaust-steam pipes, the combination, with a funnel-shaped casing forming a chamber, of an exhaust-pipe extending into said chamber and to near the top thereof, a perforated head upon the upper end of said exhaust-pipe, an inverted funnel having its lower portion extending into the interior of the casing and contacting at its lower end with the inner wall of the casing, and a diaphragm surmounting said inverted funnel, substantially as specified.

2. In a trap for exhaust-steam pipes, the combination, with a casing, of an upwardly-extending exhaust-pipe, a circular and tubular head thereon, a perforated diaphragm at the upper end of the casing, whereby a compartment is formed below the diaphragm, and a compartment above the diaphragm, a space open to the atmosphere being provided between said compartments, substantially as specified.

3. In a trap for exhaust-steam, the combination, with a casing, of an upwardly-extending exhaust-pipe, a perforated head thereon, a perforated diaphragm at the upper end of the casing, and a top supported above said casing, so that a space will be left between the two, the diameter of the said top at its lower end being less than that of the casing at its upper end, substantially as specified.

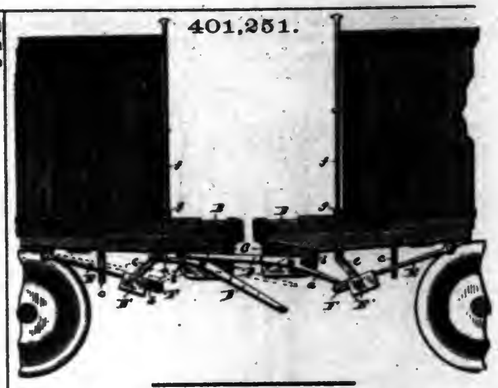


4. The combination, with an exhaust-pipe, A, terminating in a perforated head, C, casing D, discharge-pipe B, inverted funnel F, having perforations *b*, and the perforated diaphragm G, of the top H and supports therefor, substantially as described and set forth.

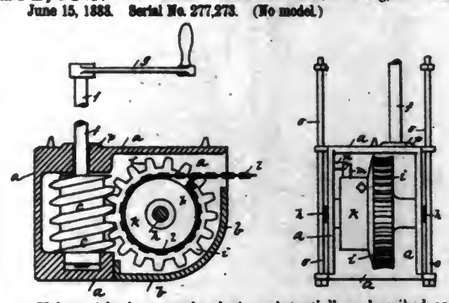
401,249. FEED-TROUGH. GEORGE D. BURTON, Boston, Mass. Filed Mar. 21, 1888. Serial No. 267,992. (No model.)

Claim.—As an improved article of manufacture, a feed-trough consisting of a body-piece having inwardly-extending flanges at its ends, and head-pieces having right-angled recesses to receive the ends of the body-piece, substantially as described, whereby a perfectly tight and secure connection is formed without the employment of bolts, rivets, or other analogous fastening devices.

401,250. LIQUID-VENDING APPARATUS. ALBERT M. BUTZ and OLE PEDERSON, Chicago, Ill., assignors to the Butz Drinking Fountain Company, same place. Filed Dec. 26, 1888. Serial No. 294,614. (No model.)



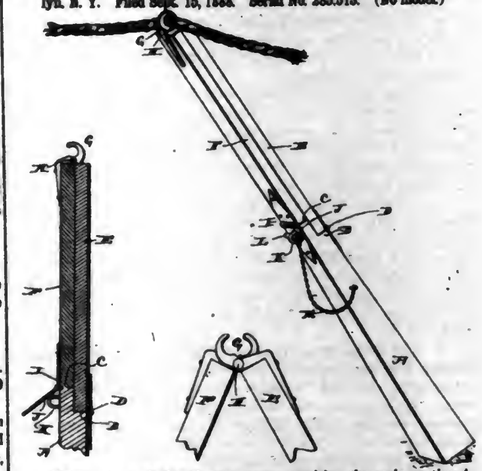
Claim.—1. The combination of the vibrating vessels, and the rock-shaft by which they are supported, with means by which the vessels are alternately filled at their highest and discharged at their lowest elevations, the notched segment, also supported by the rock-shaft, the coin-chute, and the latch pivoted between its walls and engaging the notches in the segment, substantially as and for the purpose hereinbefore set forth.



2. The combination of the liquid-carrying mechanism, the coin-chute, the latch pivoted between the walls of the coin-chute and engaging the liquid-carrying mechanism with one of its ends, while the other projects into the chute, with a roller, also pivoted between the walls of the chute and projecting slightly into it, substantially as and for the purpose hereinbefore set forth.

3. The combination of the casing having a coin-slot, the gate pivoted in the slot, closed at its inner but open at its outer edge, and adapted to receive and contain but a single coin, means for holding the gate in a position to normally close the slot, the coin-chute within the casing, and the yielding gate d^3, all arranged substantially as hereinbefore set forth.

4. The combination of the casing having a slot therein, the coin-chute terminating below the slot and having its upper end inclined and formed with flaring edges, the projecting lugs d^7 d^7, and the weighted gate d^3, pivoted between them, substantially as and for the purpose hereinbefore set forth.



401,251. 

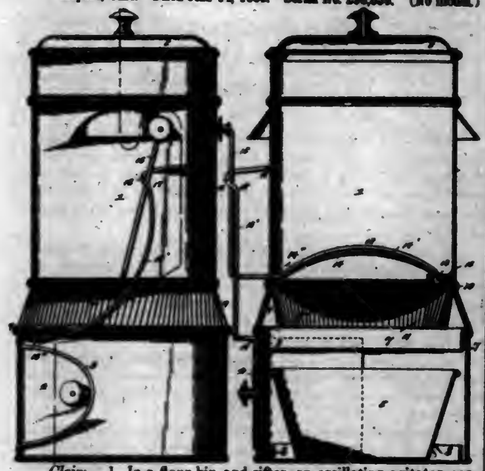
401,252. CAR-BRAKE. HARRY H. COFFIN, Pittsburg, Pa. Filed June 15, 1888. Serial No. 277,273. (No model.)

Claim.—A brake-operating device substantially as described, consisting of an inclosing case or shell, *a*, having a curved apron, *b*, forming one of the sides thereof and leaving an opening for the passage of the brake-lever chain, a worm-screw, *c*, carried by a shaft, *f*, and housed within said case, a fixed shaft, *h*, a gear-wheel fitted loosely on said shaft and having a drum, a projection, *m*, fixed to the periphery *n* on the interior of the case or shell and arranged in the path of the projection *m* to limit the drum to a single complete rotation on its axis, and a chain connected to the drum and passing through the opening in the case between the apron *b* and one side of the drum, as and for the purpose described.

401,253. CLOTHES-LINE SUPPORT. JONATHAN T. CRANE, Brooklyn, N. Y. Filed Sept. 15, 1888. Serial No. 285,513. (No model.)

Claim.—1. A clothes-line support comprising the main section A, the section E, hinged thereto, the section F, adapted to be locked to the section A, and the hooks pivoted together and connecting the sections E F, as set forth.

2. The combination of the section A, the section E, hinged thereto, the section F, connected to the section E by hooks which are adapted to clasp the clothes-line, the hinge secured to the section F and having a slotted leaf, the staple secured to the section A and projecting through the slotted leaf of the hinge, and the locking-pin attached to the section A and adapted to be inserted through said staple, as set forth.

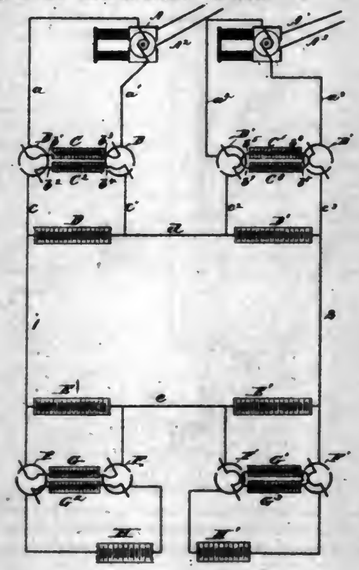


3. The combination of the section A, the section E, hinged thereto, the section F, adapted to be locked to the section A, and the hooks G, pivoted together and having their shanks bent around the ends of the sections E F and secured to the outer sides of the same, as specified.

401,251. CAR-COUPLING. GEORGE W. CAMPBELL, El Paso, Tex., assignor of one-tenth to John P. Pryor, same place. Filed Jan. 26, 1889. Serial No. 297,635. (No model.)

Claim.—1. The combination of a draw-head and draw-bar, an inclined coupling-link pivoted in the mouth of the said draw-head, and provided with an extension, *a*, and an upwardly-extending shoulder, *b*, and means for engaging the said extension, substantially as described.

2. The combination, with a draw-bar and draw-head, of an inclined coupling bar or link, D, pivoted in the mouth of the draw-head and provided with an upwardly-extending shoulder, *b*, and a rearward extension, *a*, and a pivoted weighted lever and its pawl, substantially as described.



401,254. FLOUR BIN AND SIFTER. THOMAS F. CRARY, Midlothian, Ohio. Filed Jan. 14, 1889. Serial No. 296,330. (No model.)

Claim.—1. In a flour bin and sifter, an oscillating agitator consisting of the curved laterally-spaced arms having an eye or loop at one end, and a crank-handle at the opposite end of the arms from said eye or loop, in combination with a shell or case through which the crank-handle is passed to provide a support for one end of said agitator, and a short trunnion or stud fixed to said case and fitted in the eye or loop of said agitator to support the opposite end of the agitator, substantially as described.

2. In a flour bin and sifter, the combination, with a shell or case, a sieve, and an agitator having an extended crank-handle, of a curved guard fixed in an inclined position exteriorly on the case and having one end thereof inclined toward the shell, as described, and a notch or recess contiguous to said inclined end, substantially as described.

401,255. SYSTEM OF TRANSMITTING AND DISTRIBUTING ELECTRICITY. STANLEY G. G. CURRIE, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed Aug. 23, 1888. Serial No. 283,518. (No model.)

Claim.—1. The herein-described method of distributing and transmitting electricity, which consists in producing two or more currents of low electro-motive force, transferring such currents at intervals of time to reservoirs disconnected from the generator-circuits, again transferring such currents to reservoirs connected with a main line, and finally combining the said currents to form a current of high electro-motive force, and conveying the said current over said main line, substantially as described.

2. The herein-described method of transmitting and distributing electricity, which consists in conveying a current of high electro-motive force over a main line, then converting said current to one or more currents of lower electro-motive force, then transferring such currents to reservoirs, and finally transferring said currents at intervals to distributing-reservoirs disconnected from the main line, substantially as described.

3. The method of transmitting and distributing electricity, consisting in dividing a current of high electro-motive force between several sets of secondary batteries, then transferring current from such sets of batteries individually to two other sets of similar batteries at alternate intervals, and during such intervals transferring current to distributing-batteries electrically isolated from the main conductor, substantially as described.

4. The method of transmitting and distributing electricity, consisting in conveying currents of high electro-motive force to points of consumption by main conductors, and there dividing said current and reducing its electro-motive force and transferring it to distributing-batteries at alternate intervals of time, substantially as described.

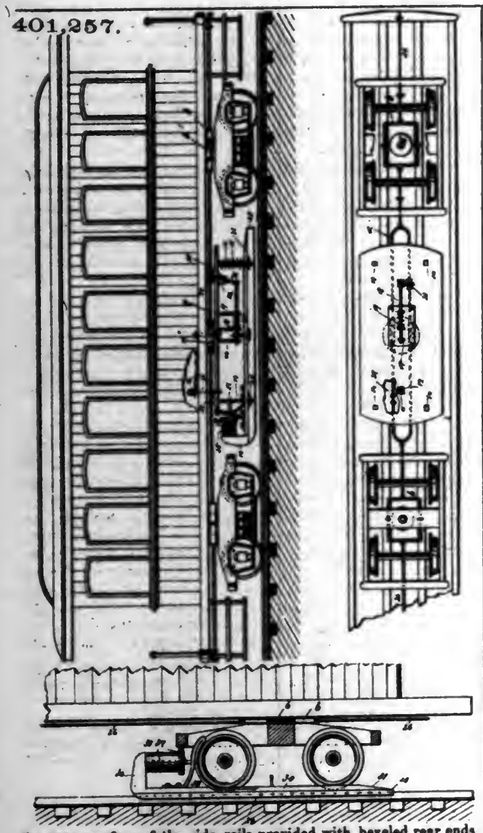
5. The method of distributing and transmitting electricity, consisting in producing two or more currents of low electro-motive force, transferring such currents at intervals of time to reservoirs disconnected from the generator-circuits, again transferring such currents to reservoirs connected with a main line and combining the said currents to form a current of high electro-motive force, then conveying said current of high electro-motive force over the main line and dividing it into currents of lower electro-motive force, then transferring such currents to reservoirs connected to the main line, and finally transferring said currents at intervals to distributing-reservoirs disconnected from the main line, substantially as described.

401,256. DROPPER-SPOUT. SYLVESTER P. DENISON, Brooklyn, assignor of one-half to Holbrook Cushman, New York, N. Y. Filed Nov. 3, 1887. Serial No. 254,940. (No model.)

Claim.—1. A dropper-spout which consists of a movable tube furnished with suitable packing and slotted at its lower extremity and passing through the base of a cylinder provided with a spring and in its base with vent-holes, said tube having attached to its lower end a plate and pliant washer and at the other end a drip-cup capable of being rotated, substantially as described, and for the purposes set forth.

2. A dropper-spout which consists of a movable tube furnished with suitable packing and slotted at its lower extremity and passing through the base of a cylinder provided with a spring and in its base with vent-holes, said tube having attached to its lower end a plate and pliant washer and at the other end a drip-cup capable of being rotated and notched at its edge, in combination with a permanent upright sliding in said notch, substantially as described, and for the purposes set forth.

401,257. BRAKE-SHOE ATTACHMENT FOR RAILWAY-CARS. GUSTAV A. DIEDEL, New York, N. Y. Filed Nov. 13, 1888. Serial No. 290,677. (No model.)



Claim.—1. The combination, with a railway-car and a turn-table pivoted beneath the same, of a brake-shoe suspended from said table and means, substantially as described, for releasing said shoe, as and for the purpose specified.

2. The combination, with a railway-car and a turn-table pivoted beneath the same, of a brake-shoe detachably suspended from the turn-table, having the side rails longitudinally grooved and provided with a track upon the upper surface, substantially as shown and described.

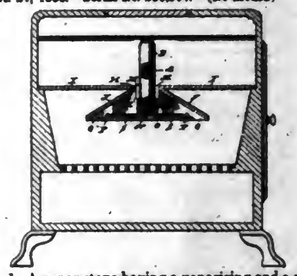
3. The combination, with a railway-car and a turn-table pivoted beneath the same, of a brake-shoe detachably suspended from the turn-table, having the side rails longitudinally grooved, a track integral with the upper surface of the said side bars provided with one beveled end, and means, substantially as described, for releasing the brake-shoe, as and for the purpose specified.

4. The combination, with a railway-car and a turn-table pivoted beneath the same, of a brake-shoe suspended from the turn-table, having the side rails thereof longitudinally grooved, a track integral with

401,257.

the upper surface of the side rails provided with beveled rear ends, buffers attached to the forward ends of said tracks, and means, substantially as described, for releasing the brake-shoe, as and for the purpose specified.

5. The combination, with a railway-car and a turn-table pivoted beneath the same, of a brake-shoe suspended from the turn-table, having the under face of the side rails longitudinally grooved, a track integral with the upper surface of the side rails provided with beveled rear ends, cushioned buffers attached to the forward ends of the rails, and means, substantially as described, for retaining the turn-table in a fixed position and releasing the shoe from the table, as and for the purpose specified.



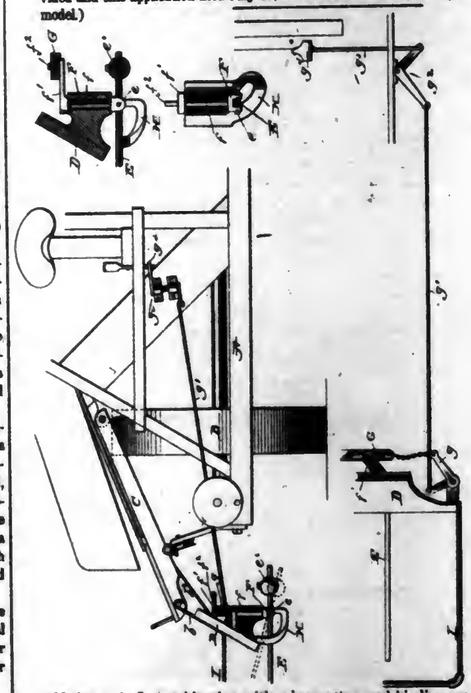
6. The combination, with a railway-car, a turn-table pivoted beneath the same, a draw-rod held to slide above the table, hangers attached to the table, a releasing-bar carried by said hangers, and a trip-lever pivoted to said bar and engaging the draw-rod, of a brake-shoe suspended from the releasing-bar, having the under face of the side bars longitudinally grooved, a track integral with the upper surface of the side bars provided with a beveled rear end, and buffers secured to the forward end of the tracks, substantially as shown and described.

7. The combination, with a railway-car, a turn-table pivoted beneath the same, a draw-rod held to slide above the table, hangers attached to said table, a releasing-bar sliding in said hangers, a trip-lever pivoted to the releasing-bar and actuated from the draw-rod, and guide-bars projected from the turn-table, of a brake-shoe suspended from the releasing-bar, provided with apertures to receive the said guide-bars, and side bars having a bottom longitudinal groove, a track integral with the upper surface of the side bars provided with a beveled rear end, and cushioned buffers secured to the forward end of the tracks, substantially as shown and described.

8. A brake-shoe for railway-cars, consisting of connected side bars spaced to the gage of a railroad-track and having a longitudinal bottom groove to receive the rails, a track integral with the upper surface of the side bars, and buffers secured to the shoe-tracks near the rear end, substantially as described.

9. A brake-shoe of the character described, having cushioned buffers on its upper side for the car-wheels to strike, substantially as set forth.

401,258. VAPOR-STOVE. CHARLES S. DRAKE, San Rafael, Cal. Filed Sept. 27, 1888. Serial No. 286,597. (No model.)



Claim.—1. A vapor-stove having a vaporizing and a vapor chamber formed of a pipe or conduit and a box with which the pipe is combined, and having a central longitudinal slot and inclined side walls converging toward such slot to deflect the draft to a point over the vapor-chamber and below the vaporizing-chamber, substantially as set forth.

2. A vapor-stove having a vaporizing and a vapor chamber formed of a pipe or conduit and a box with which the pipe is combined, and having a central longitudinal slot, and a trough receiving the vapor-chamber and located directly under such slot, over which the vaporizing-chamber extends, substantially as set forth.

3. A vapor-stove having a vaporizing and a vapor chamber formed of a pipe or conduit and a box with which the pipe is combined, and having a central longitudinal slot, and supports located at the opposite ends of such slot for supporting the pipe in position, substantially as set forth.

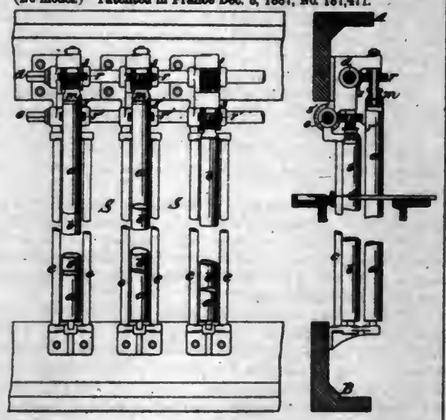
4. A vapor-stove having a vaporizing and a vapor chamber formed of a pipe or conduit and a box with which such pipe is combined, having a central longitudinal slot, a trough located under such slot and running parallel therewith, inclined side walls, draft-openings formed in the bottom of the box, and means for supporting the pipe in place therein, substantially as set forth.

401,259. SHEAF-CARRIER FOR HARVESTERS. LUCIEN W. ELLIS, Anamosa, Iowa, assignor to William Deering & Company, of Illinois. Original application filed Nov. 20, 1885, Serial No. 183,395. Divided and this application filed July 18, 1888. Serial No. 280,258. (No model.)

Claim.—1. In combination with a harvesting and binding machine, a series of laterally-projecting sheaf-receiving fingers individually connected thereto by vertical and also by horizontal axes.

2. In a sheaf-carrier, the upright crank-shafts F, in combination with the series of sheaf-receiving fingers connected thereto by horizontal axes, the bar G, connecting said shafts, and the inclined cams or tracks H to control the vertical movement of the teeth.

3. A sheaf-carrier composed of a series of vertically and horizontally swinging teeth, each combined with an inclined track or cam, H, and a counter-weight, e^3, to lift them clear of the ground when relieved from the weight of the sheaves.

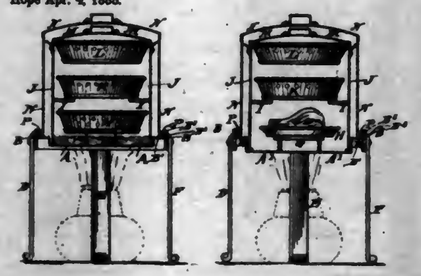


4. In combination with a grain harvesting and binding machine, a series of sheaf-receiving fingers projecting normally in a lateral direction therefrom, a series of upright shafts to which the respective fingers are connected by horizontal pivots, a bar connecting the upright shafts, and operating devices extending from said bar to a point adjacent to the driver's seat.

5. In a sheaf-carrier, a series of fingers each secured to its supporting-bar by means of a joint turning upon two axes.

6. In a sheaf-carrier, sheaf-supporting fingers independently pivoted to a supporting-bar by means of double joints.

7. In a sheaf-carrier, a series of fingers independently pivoted to a supporting-bar by means of double joints, in combination with trip mechanism.

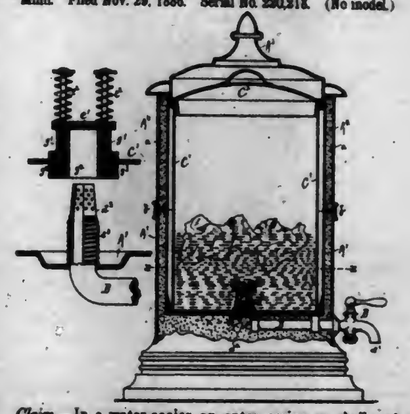


401,260. FRAME FOR EMBROIDERING-MACHINES. JAKOB FREY, Bruggen, near St. Gallo, assignor to John Jacob Rieter & Company, Winterthur, Switzerland. Filed June 28, 1888. Serial No. 278,417. (No model.) Patented in France Dec. 8, 1887, No. 187,471.

Claim.—1. In an embroidery-machine, the combination, with a frame, of two rows of upright rollers journaled therein, the rollers of one row being immediately behind those of the other row, said rollers being arranged in pairs, whereby material to be embroidered will be passed from one of the rollers of one pair to and over one of the rollers of another pair, and interposed guides by which all the pieces of material being embroidered are presented to the needles in substantially the same vertical plane, substantially as specified.

2. In an embroidery-machine, the combination, with a frame, of two rows of upright rollers carried thereby, the rollers of one row being arranged directly behind those of the other row, two horizontal shafts, gearing between said rollers and said shafts, whereby the rollers are rotated, and stretching devices for stretching the material being embroidered simultaneously and all parts and independently in a given part, substantially as specified.

401,261. PORTABLE COOKING APPARATUS. HENRY FRICKER, London, England. Filed Dec. 27, 1887. Serial No. 258,076. (No model.) Patented in England Nov. 16, 1887, No. 15,734; in France Dec. 20, 1887, No. 187,724; in Belgium Dec. 21, 1887, No. 80,012, and in Cape of Good Hope Apr. 4, 1888.

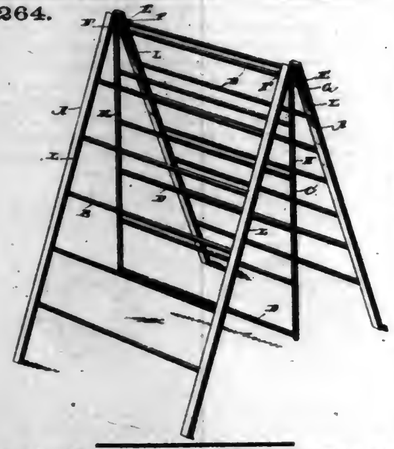


Claim.—A portable cooking apparatus consisting of the ring mounted on supporting-legs, the dished tray having a lateral flange, and a projecting bead above the flange removably supported on the ring, the dish-containing cylinder detachably resting on the bottom wall of the tray and provided with an opening and closing door in its vertical side wall and having inwardly-projecting dish-supports and a removable closely-fitting cover, and the imperforate closed cylindrical casing detachably resting on the lateral flange of the tray, above the bottom wall of the latter, and inclosing and entirely covering the dish-containing cylinder, substantially as described.

401,262. RENEWABLE PACKING-RING. HENRY R. FRISBIE, Mansfield, Ohio. Filed Apr. 11, 1888. Serial No. 270,317. (No model.)

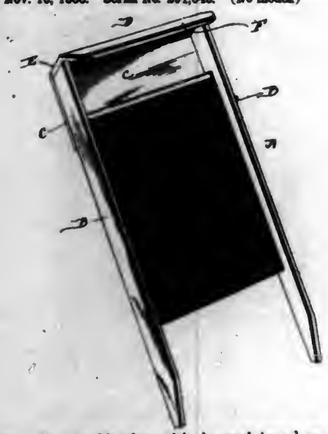
Claim.—A packing-ring consisting of two metallic concentric rings, one within the other, and the intermediate connecting-arms, $x\,x$, with openings between them, and of a yielding packing substance interposed between said rings surrounding and interlocking said arms, and having exposed bearing-surfaces at opposite ends thereof, substantially as set forth.

401,263. WATER-COOLER. WILLIAM H. FRUEH, Minneapolis, Minn. Filed Nov. 29, 1886. Serial No. 220,218. (No model.)



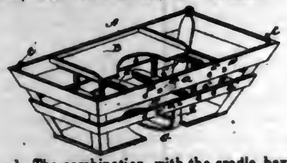
Claim.—In a water-cooler, an outer casing or shell and a discharge-pipe extending outward beneath the bottom of the compartment formed by the casing, said pipe having a vertical open-mouthed branch extending through said bottom, in combination with a removable water-reservoir which is inserted into said compartment, and which rests on the bottom of said compartment, said reservoir having an opening in its lower end which passes over said vertical branch, and a self-closing valve carried by said water-reservoir for said opening, which valve is opened by being displaced upwardly by said vertical branch when said reservoir is placed in said compartment, and which automatically closes said opening when the reservoir is removed from the compartment, substantially as set forth.

401,264. CLOTHES-DRIER. CHARLES D. FULLER, Minneapolis, Minn. Filed Jan. 4, 1888. Serial No. 259,776. (No model.)



Claim.—In a clothes-drier, the two side frames, A, resting at their lower ends on the floor, combined with the central frame, C, said central frame being shorter than the side frames, so as not to reach to the floor, and the hinge or coupling connecting the side and central frames together at their upper ends, said hinge comprising the end rings, F, to embrace the bars of the side frames, and the central ring, G, to embrace one of the bars of the central frame, as set forth.

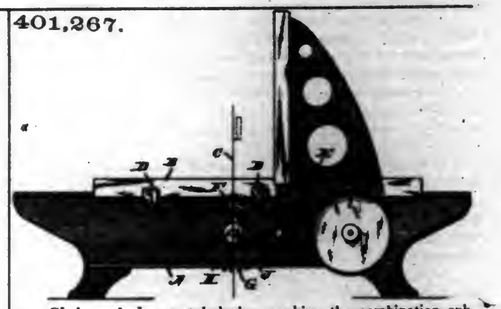
401,264.



401,265. WASH-BOARD. GEORGE P. FULLER, Kalamazoo, Mich. Filed Nov. 16, 1888. Serial No. 291,046. (No model.)

Claim.—The combination, with the wash-board provided with side bars, B B, having their upper ends beveled upward toward their front edges, and the head-board secured to the rear edges of the side bars, of the combined cap-bar and protector D, comprising the integral similar parts, E F, arranged at an angle to each other, the part E being secured to the upper beveled ends of the side bars, whereby the part F projects forwardly beyond the front edges of the side bars and forms a protector, substantially as and for the purpose specified.

401,266. BABY-JUMPER. ALBERT W. GRAY, Mazomanie, Wis. Filed Aug. 18, 1888. Serial No. 283,079. (No model.)



Claim.—1. The combination, with the cradle having openings formed in the sides thereof, of the arms for engaging the said openings, substantially as and for the purpose specified.

2. The combination of the cradle having openings formed in the sides thereof, arms for engaging the said openings, and a table provided with flanged guides for engaging the said arms, substantially as described.

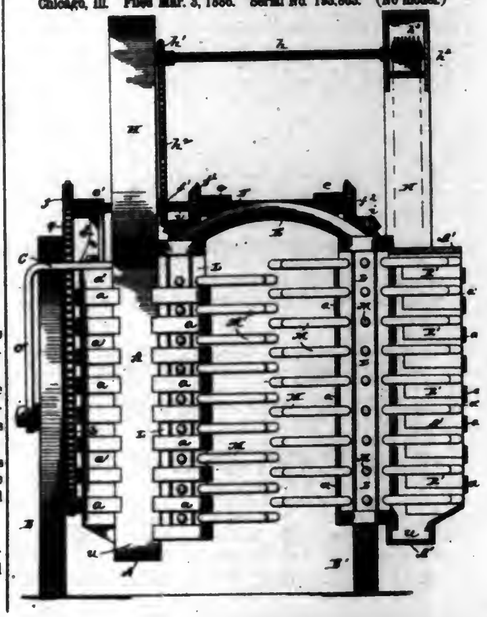
3. The combination, with the cradle, the coil-spring, and means for attaching the spring to the cradle, of a plate secured between the coils of the spring, a pulley, and a rope secured to the said plate and passing over the pulley to the floor, substantially as described.

401,267. METAL-PLANING MACHINE. GEORGE A. GRAY, Covington, Ky., assignor to the G. A. Gray Company, Cincinnati, Ohio. Filed Jan. 17, 1889. Serial No. 296,846. (No model.)

401,267.

Claim.—1. In a metal-planing machine, the combination, substantially as set forth, of a table provided with a rack, dogs on the table edge, and a bull-wheel and an oscillating tumbler having a common axis.

2. In a planing-machine, the combination, substantially as set forth, of a table provided with a rack, dogs on the table edge, a bull-wheel, a tubular shaft therefor supported by the bed, a tumbler-shaft journaled axially in the bore of the bull-wheel shaft, and a tumbler on said tumbler-shaft.



3. In a planing-machine, the combination, substantially as set forth, of a table provided with a rack, dogs on the table edge, a bull-wheel shaft mounted in bearings in the bed of the planer and adjustable endwise therein, and a bull-wheel and tumbler carried thereby upon an axis common to both.

4. In a planing-machine, the combination, substantially as set forth, of a table provided with a rack, dogs on the table edge, a tubular bull-shaft supported by the bed of the planer, and a bull-wheel at the center of length of said shaft and a tumbler at each end of said shaft, said bull-wheel and both said tumblers having an axis in common.

5. In a planing-machine, the combination, substantially as set forth, of a table provided with a rack, dogs on the table edge, a tubular bull-wheel shaft supported in bearings in the bed of the planer and adjustable endwise therein, a bull-wheel thereon, a tumbler-shaft axially disposed in the bore of the bull-wheel shaft, and a tumbler secured to each end of the tumbler shaft.

6. In a planing-machine, the combination, substantially as set forth, of a table provided with a rack, dogs on the table edge, a bull-wheel shaft, a bull-wheel thereon, a tumbler at each side of the planer adapted to receive a belt-shifting connection alternatively, the axis of oscillation of said tumblers coinciding with the axis of said bull-wheel, and a shaft uniting said tumblers and serving to impart oscillatory motion from one tumbler to the other.

401,268. MACHINE FOR PICKING COTTON. THOMAS J. GRAY, Chicago, Ill. Filed Mar. 3, 1886. Serial No. 193,863. (No model.)

Claim.—1. In a cotton-harvesting machine, the combination of horizontally-traveling endless belts or aprons carrying a series of rotating picker-stems, pinions located upon said stems, racks on the frame engaged by the pinions and imparting opposite rotations to the stem, and guides located in position on the frame to receive ends of the picker-stems and prevent their rotation while turning corners, substantially as set forth.

2. In a cotton-harvesting machine, the combination, with a traveling endless belt composed of a series of bars or slats secured at their ends in a pair of drive-chains, said chains having eyes or openings to receive the ends of the slats, of picker-stems mounted in said slats, pinions on the inner ends of the stems, rack-bars on the frame for rotating the picker-stems, and guides on the frame, through which lugs on the pinions pass to prevent their rotation while turning corners, substantially as set forth.

3. In a cotton-harvester, the combination, with a housing composed of a series of separated bars extending longitudinally of the machine, of a canvas or sheet-metal apron or lining covering the spaces between the bars, upright shafts carrying sprocket or pulley wheels, chains mounted on said wheels, vertical slats secured to the chains, and rotating picker-stems mounted in the slats, substantially as set forth.

4. The combination, with the frame-sections A A' and the bridge E, connecting the same, of the triangular frame C, in which the axle of the carrying-wheel B is supported, and the connected shafts D D', connected to the adjacent housing, substantially as set forth.

5. The combination, with housings, vertical shafts arranged therein, one behind the other, the sprocket-wheels secured on said shafts, the upper and lower drive-chains mounted on the sprocket-wheels, the upper chains having sockets on their lower faces and the lower chains sockets on their upper faces, the slats or bars secured in said sockets, picker-stems mounted in the slats, racks on the frame and pinions on the stems for rotating the picker-stems, the guides located at the ends of the housings, and lugs on the pinions for controlling the direction of movement of the slats and picker-stems, substantially as set forth.

6. In a cotton-harvesting machine, the combination, with a traveling endless belt and a series of picker-stems carried therein, said pickers having lugs on their inner ends, in combination with guides in the interior of the frame for throwing the stems downward, and wipers affixed in close proximity to the stems for removing the cotton from the stems while in this position, substantially as set forth.

7. The combination, with the frame-sections carrying the hollow elevator-frames, of the partitions forming conduits or channels *u*, communicating at the bottom with the interior of the sections and at the top with the hollow frames, and the elevators adapted to move through the conduits, substantially as set forth.

8. The combination, with a housing, an endless belt or apron therein, and picker-stems mounted in the apron and provided with flattened inner ends, of stationary guides adapted to receive the flattened ends of the picker-stems as the latter pass around the shafts, substantially as set forth.

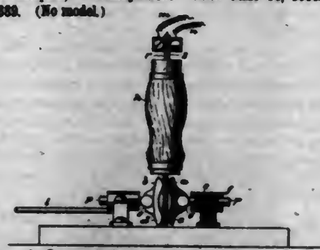
9. The combination, with an endless belt or apron mounted on vertical shafts, picker-stems mounted therein and provided with pinions, and the rack-bars, one of which is arranged obliquely, as shown, of the stationary guides located between the rack-bars and adapted to direct the stems from the rack-bar on one side of the shaft to the rack-bars on the other side of said shafts, substantially as set forth.

10. The combination, with an endless apron and oscillating flat circular bearings pivotally mounted in the apron, of picker-stems journaled in said oscillating bearings, and devices for rotating the picker-stems, substantially as set forth.

11. The combination, with the shafts I and J and sprocket-wheels mounted thereon, of endless chains engaging the sprocket-wheels, slats secured to the chains, the picker-stems mounted in the slats, pinions secured on the picker-stems and provided with the elongated lugs, and racks on the frame in position to be engaged by the pinions, of the stationary guides having grooves with which the elongated lugs engage while the stems are turning the corners, substantially as set forth.

12. The combination, with shafts I J, an endless belt or apron mounted thereon, oscillating and rotating picker-stems mounted in said belt or apron, said pickers having pinions thereon and lugs on the pinions, of rack-bars and stationary guides having inclined cam-grooves adapted to receive the lugs on the pinions, and thereby oscillate the stems as they pass through the grooves, substantially as set forth.

401,269. PROCESS OF PRODUCTION OF MATERIAL AS SUBSTITUTE FOR INDIA-RUBBER, &c. FREDERICK GREENING, Uxbridge, County of Middlesex, England, assignor to himself and John Frost, same place. Filed June 23, 1887. Serial No. 242,786. (No specimens.) Patented in England June 26, 1886, No. 8,442; in France June 15, 1887, No. 184,947, and in Belgium June 20, 1887, No. 77,879.

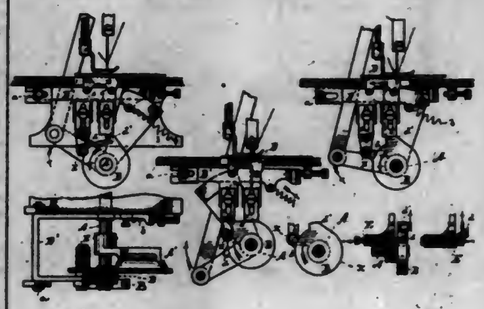


Claim.—1. The herein-described process of producing from fibrous substance a soluble base, consisting in steeping or saturating the said fibrous substance in a mixture of sulphuric acid and nitrate of potash, washing the converted fiber, then subjecting the same to a bath of liquid carbonic acid or carbonic-acid gas, and then drying the converted fiber, substantially as described.

2. The process of treating fibrous substances, consisting of steeping or saturating said substances with a mixture of sulphuric acid and nitrate of potash, washing the converted fiber, then subjecting the same to a bath of liquid carbonic acid or carbonic-acid gas, then subjecting the same to an acid bath, then drying the converted fiber, and then treating the same with a suitable solvent, as herein described.

3. The process of treating fibrous substances, consisting of subjecting the same to a mixture of sulphuric acid and nitrate of potash, washing the converted fiber, subjecting the same to a bath of liquid carbonic acid or carbonic-acid gas, then drying the converted fiber, and then treating the same with a solvent composed of a mixture of methylated alcohol, rosin, or colophony, gum benzoin or benjamin, and castor-oil, substantially as described.

4. The process of treating fibrous substances with a heated mixture of sulphuric acid and nitrate of potash, then freeing the converted fiber from excess of the mixture, washing it with water, partially drying it, subjecting it to a bath of liquid carbonic acid or of carbonic-acid gas, then drying it, then treating it with a distillate composed of a mixture of methylated alcohol, rosin, or colophony, gum benzoin or benjamin, castor-oil, and light hydrocarbon, substantially as herein set forth.



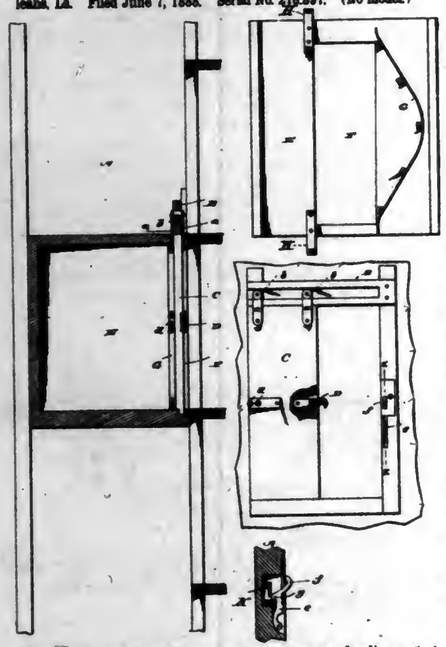
401,270. SWITCH OR CIRCUIT-CHANGER. WILLIAM W. GRISCOM, Haverford College, Pa., assignor to the Electro Dynamic Company of Philadelphia, Pennsylvania. Filed June 30, 1888. Serial No. 278,682. (No model.)

Claim.—1. In a switch or circuit-changer, two pieces of conducting material respectively pivoted at corresponding points intermediate their terminals or points of contact to reciprocating bearings and normally held in contact at two points, in combination with a plug or wedge consisting of two strips or conductors insulated from each other and adapted to successively separate said two contact-points by a continuous advance movement, substantially as described.

2. The combination, in a switch or circuit-changer, of two pieces of conducting material respectively pivoted at points midway between their extremities to reciprocating bearings and normally held in contact at two points by spring-pressure, with a plug or wedge consisting of two strips or conductors insulated from each other and adapted to successively separate said two contact-points by a continuous advance movement.

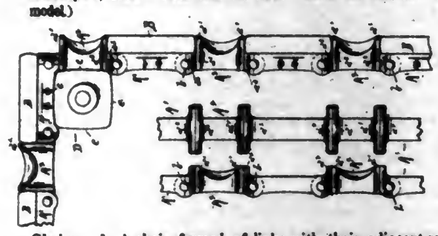
401,271. FEEDING DEVICE FOR SEWING-MACHINES. LUDWIG GUNDELACH, Leipsic, Saxony, Germany. Filed May 31, 1888. Serial No. 275,590. (No model.)

Claim.—The combination of feed-plate D and pivoted frame D', that supports said plate and has projections *d'*, with movable spring-pin E and with an oscillating cam, B, having two noses, *d d'*, the nose *d* being beveled and adapted to engage pin E, while the nose *d'* is adapted to engage projection *d'*, and with the spring *b*, substantially as specified.



401,272. SIDE SPRING FOR VEHICLES. GEORGE B. HAMLIN, Providence, R. I. Filed June 4, 1888. Serial No. 276,092. (No model.)

Claim.—1. In a vehicle-spring, the combination, with a main leaf or bar, of a series of auxiliary semi-elliptical springs secured to said bar, the ends of said springs being coupled together in substantially the same horizontal plane, as and for the purposes set forth.

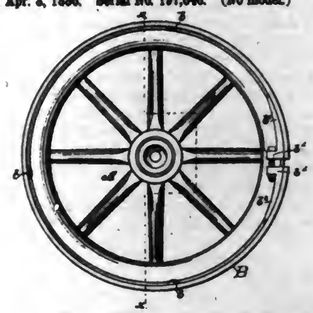


2. In a vehicle-spring, the combination, with a main leaf or spring bar, of a series of secondary springs secured at their centers to said bar, their adjacent ends being coupled together, and the extremities of the two outer springs secured to the axle or bolster supported thereby, substantially as and for the purpose set forth.

401,273. ELEVATOR-HATCHWAY. HENRY G. HESTER, New Orleans, La. Filed June 7, 1888. Serial No. 276,397. (No model.)

Claim.—In a device for operating doors at the landings of elevator-wells, the combination, with the car having the curved flange G, arranged as shown, of the shoes H, arranged at the opening of the car on the side opposite the said flange, and one directly opposite each end of the said flange, the sliding door carrying the pivoted latch and the friction-rollers *d* about midway of its length to be engaged by the said flange, and the lock arranged at the door of the landing to receive the pivoted latch, whereby the said latch may be disengaged by one of the shoes on the car pressing upon the said lock-lever as the adjacent end of the flange enters the rollers, substantially as specified.

401,274. CHAIN FOR STOCK-CAR PARTITIONS. BORN C. HICKS, Minneapolis, Minn. Filed Jan. 12, 1889. Serial No. 296,755. (No model.)



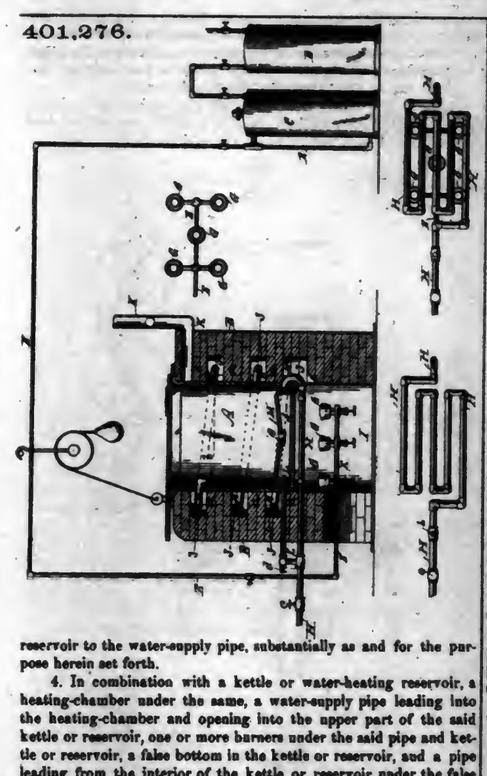
Claim.—1. A chain formed of links with their adjacent ends coupled together and curved on one side, and with stops on their other sides, whereby it is flexible in one direction and rigid in the other, substantially as and for the purpose set forth.

2. A chain formed of links with their adjacent ends coupled together and curved on one side, and with stops d' d^3 d^5 on their other sides, whereby it is flexible in one direction and rigid in the other, substantially as and for the purpose set forth.

3. A chain formed of links coupled by their ends, in combination with a carrier-sheave over which said chain is adapted to be drawn, and having sides corresponding to the length of said links, said sides and links being curved in segments of circles whose radii are in excess of the radius of said sheave, whereby a sheave of small diameter may be employed to carry a chain having long links, substantially as and for the purpose set forth.

401,275. WAGON-TIRE. ALBERT H. HOPKINS, Crookston, Minn. Filed Apr. 3, 1888. Serial No. 197,646. (No model.)

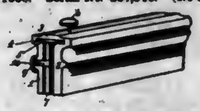
Claim.—The combination, with the wheel, of the supplementary tire, composed of the bar B, bent to embrace the rim of the wheel and having pairs of lugs at intervals to embrace the sides of the said rim, the re-enforcing stripe b^3, secured to the proximate ends of the bar B and embracing the sides of the said rim, and having their ends provided with lugs b', which extend radially inward and bear on the sides of the rim to brace the ends of the bar B, and the bolts, one on each side of the rim, passing through the said lugs b', substantially as and for the purpose described.



401,276. PROCESSING APPARATUS. JOHN S. HULL and THOMAS A. HAND, Baltimore, Md. Filed Nov. 27, 1888. Serial No. 292,041. (No model.)

Claim.—1. A vertical furnace having a spiral flue formed in the masonry, in combination with a vessel for containing water suspended in the furnace and surrounded by said flue, a heating-chamber below the vessel, and a supply-pipe passing through the heating-chamber, encircling the vessel in the path of the flue, and communicating with the upper part thereof, substantially as described.

2. A vertical furnace having a spiral flue formed in the masonry, in combination with a vessel containing water suspended in the furnace and surrounded by said flue, a heating-chamber below the vessel, and a supply and circulating pipe communicating with the vessel at the lower end thereof, passing through the heating-chamber, encircling the vessel in the path of the flue, and again communicating with the vessel near the upper end thereof, substantially as described.



3. In combination with a kettle or water-heating reservoir, a heating-chamber under the same, a water-supply pipe leading into the heating-chamber and opening into the upper part of the said kettle or reservoir, one or more burners under the said pipe and kettle or reservoir, and a pipe leading from the bottom of the kettle or reservoir to the water-supply pipe, substantially as and for the purpose herein set forth.

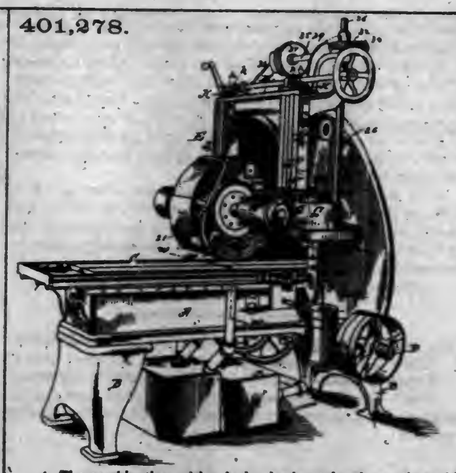
401,276.

4. In combination with a kettle or water-heating reservoir, a heating-chamber under the same, a water-supply pipe leading into the heating-chamber and opening into the upper part of the said kettle or reservoir, one or more burners under the said pipe and kettle or reservoir, a false bottom in the kettle or reservoir, and a pipe leading from the interior of the kettle or reservoir under the false bottom out and into the said water-supply pipe, substantially as and for the purpose herein set forth.

401,277. SAW-JOINTER. WESLEY A. HUSTER, Idaho Springs, Colo. Filed Oct. 5, 1888. Serial No. 287,316. (No model.)

Claim.—1. A saw-jointer adapted to be grasped in the hand and reciprocated over the edge of a saw, consisting of the side pieces or frames fixed relatively to each other, connectors or clamps uniting them and adapted to hold a file, an intermediate sliding gage or guide-piece, ways for it to slide or move upon, and means for adjusting it, substantially as set forth.

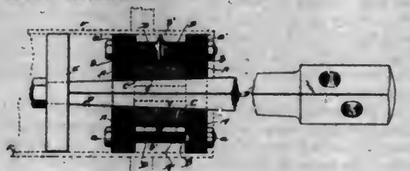
2. A saw-jointer consisting of side pieces, 1 2, clamps 3, with set-screws 6, sliding piece 7, having guide rods or arms, and the adjusting-screws 9, substantially as set forth.



401,278. SURFACE GRINDING MACHINE. ELWIN R. HYDE and RICHARD C. HORNER, Springfield, Mass. Filed Mar. 23, 1888. Serial No. 268,244. (No model.)

Claim.—1. In a surface-grinding machine, the combination, with a table and suitably-supported horizontal guideways, of the slides guided in said horizontal ways, carrying a rotatable grinding-wheel, a face-plate having a crank-pin, and a pitman-rod between said face-plate and said slide, for the purpose set forth.

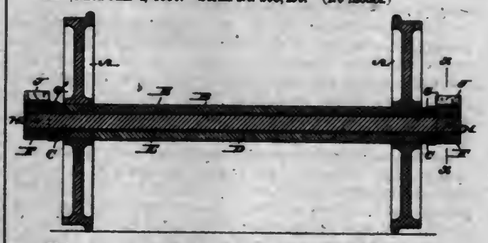
2. The combination, with a bed, a longitudinally-reciprocating table thereon, and suitably-supported horizontal guideways, of the slides guided in said horizontal ways, carrying a rotatable grinding-wheel, a face-plate having a crank-pin, and a pitman-rod between said face-plate and said slide, substantially as and for the purpose described.



3. The combination, with a bed, a horizontal reciprocating table thereon, the uprights, and horizontal guideways thereon, of slides 12 12, movable in said guideways and carrying a rotatable grinding-wheel, the shaft 35, provided with the worm-screw 34, a shaft, 26, having a worm-wheel engaged by said worm-screw, and a gear, 25, a face-plate, 17, having a shaft, 18, and a gear, 24, engaging said gear 25 and provided with a crank-pin, and a pitman-rod, 15, connecting said crank-pin and one of said slides, substantially as and for the purpose described.

401,278.

4. The combination, with a bed, a horizontal reciprocating table thereon, the uprights E E, and the screw-shafts K K, of the vertically-movable slide-blocks G G, engaging said screw-shafts having horizontal guideways, the slides 12 12, movable therein and carrying a rotatable grinding-wheel, the shaft 35, provided with the worm-screw 34, a vertical shaft, 26, having a spline-groove, a gear, 25, and a feathered worm-wheel confined against axial movement and engaged by said worm-screw, a bracket carried by one of said slide-blocks G, in which the lower end of said shaft 26 bears, the shaft 18, bearing in said bracket, provided with the gear 24, and the face-plate 17, having the crank-pin, and the pitman-rod connecting said crank-pin and one of said slides 12, substantially as and for the purpose described.



401,279. TUBE-CUTTER. JOHN E. JERROLD, Sr., Erie, Pa., and HARRY H. BARCLAY, Cleveland, Ohio. Filed Nov. 5, 1888. Serial No. 289,905. (No model.)

Claim.—1. The combination of a pair of rings having recesses therein, cutter-rollers, the trunnions of which rest in said recesses, a sectional driver located between the rings and engaging the cutter-rollers and provided with an angular socket, and bolts connecting the rings and locking the parts in position, of a tapering mandrel having a cross-section corresponding in shape to the angular socket in the driver, substantially as set forth.

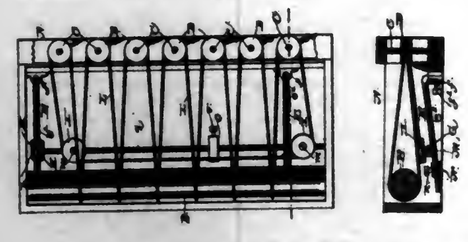
2. The combination, with a pair of rings having recesses therein, cutter-rollers, the trunnions of which rest in said recesses, springs located within the recesses outside of the roller-trunnions and bearing against said trunnions, a sectional driver located between the rings and engaging the cutter-rollers, and provided with an angular socket, and bolts connecting the rings and locking the parts in position, of a tapering mandrel having a cross-section corresponding in shape to the angular socket in the driver, substantially as set forth.

401,280. CAR-WHEEL AXLE. GEORGE W. JONES, Philadelphia, Pa. Filed Jan. 4, 1889. Serial No. 295,459. (No model.)

Claim.—1. A car-wheel axle consisting of a hollow axle carrying the wheels, a spindle passing through said axle, forming a bearing

therefor, and conical caps connected with the ends of the spindle and forming bearings for the ends of the axle, said ends also being conical, the parts being combined and serving for the purpose described.

2. A car-wheel axle consisting of a hollow axle having conical ends, a spindle passing through said axle, forming a bearing therefor, oil-ducts in said spindle for lubricating the axle, and caps secured to the spindle and having conical ends, with which the conical ends of the axle are in contact, said conical ends forming bearings, substantially as described.



3. In a car-axle, the combination, with the hollow axle, of a spindle on which said axle rotates, caps carried by the spindle and forming end bearings for the axle, and axle-boxes secured to the spindle and caps, preventing the same from turning, substantially in the manner described.

4. The conical caps G, with shoulders G', as described.

401,281. TENSION-REGULATOR FOR SPINDLE-DRIVING BANDS.

PATRICK L. KENNEY, Pittsfield, Mass., assignor of one-half to Louis C. Werner, same place. Filed Jan. 3, 1889. Serial No. 295,280. (No model.)

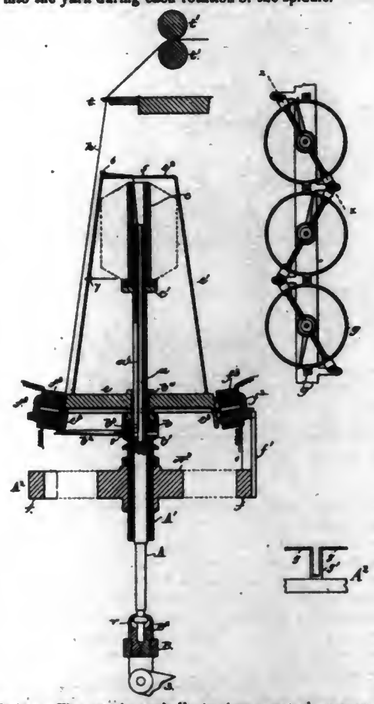
Brief.—The invention consists in the improved devices for maintaining a uniform tension upon the band employed to drive a number of spindles.

Claim.—1. The combination, with the cylinder or drum, the whirls, and the band passing around the same, of the bracket provided with a supporting-arm which inclines downwardly from the whirls, and the swinging arm bearing at its free end on the said supporting-arm and provided with idler-pulleys around which the band extends, whereby as the band slackens the swinging arm slides along the supporting-arm away from the whirls, substantially as and for the purpose specified.

2. The combination, with the cylinder or drum, the whirls, and the band passing around the same, of the brackets provided with downwardly-inclined supporting-arms d' d', the removable collar fitting on one of the arms, the swinging arm pivoted to the said collar and bearing on the other supporting-arm, and the idler-whirls secured to the swinging arms and having the band passing therearound, substantially as specified.

3. The combination, with the cylinder, the whirls, and the band extending around the same, of the castings provided with sockets, the brackets provided with vertical arms mounted in the said sockets and having downwardly-inclined arms d' d', the swinging arm provided at one end with a collar which fits on one of the inclined arms d' and bearing at its free end on the other inclined arm, and the adjustable idler-whirls provided with collars which fit on the swinging arm, substantially as specified.

4. The combination, with the cylinder, the whirls, and the band extending around the same, of the brackets having arms d' d', the collar H, mounted on one of the arms, the swinging arm bearing at one end on one of the arms d' and provided at the other end with an eye, K, the adjusting-bolt fitting in the said eye engaging a threaded aperture in the side of the collar, the conical washer arranged between the head of the bolt and the eye, and the idler-pulleys arranged on the swinging arm, substantially as specified.

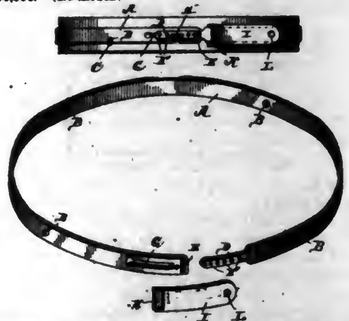


5. The combination, with the cylinder, the whirls, and the band passing around the same, of the bracket provided with a downwardly-inclined arm, d', the swinging arm bearing at its free end on the said arm and provided with idler-pulleys around which the said band passes, and the weight mounted on the swinging arm and provided with a set-screw to clamp it in the desired position, substantially as specified.

6. The combination, with the cylinder, the whirls, and the band passing around the same, of the bracket provided with an inclined supporting-arm, the swinging arm bearing at its free end on the supporting-arm, the adjustable collars M M, arranged on the arm and provided with the vertical bolts m, which fit in threaded apertures in the collars and bear against the arm, and the idler-pulleys mounted on the said bolts and having the band passed therearound, substantially as specified.

401,282. SPINNING, DOUBLING, AND TWISTING MACHINE.

ERNEST KIENEL, Tumovar, Austria-Hungary, and EDWARD R. CLAUSEN, Hartford, Conn., assignors to George Draper & Sons, Hopedale, Mass. Filed Jan. 24, 1888. Serial No. 297,363. (No model.)



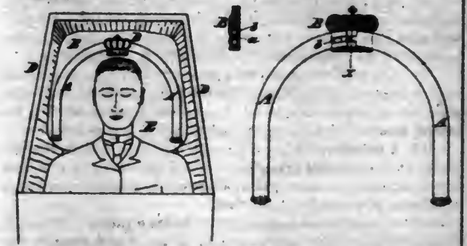
Brief.—The object of the invention is to improve the construction of spinning and twisting machines in which two turns of twist are put into the yarn during each rotation of the spindle.

Claim.—The rotating spindle having a central passage, a, the twisting device rotating in unison with the spindle, and the spool or bobbin, combined with the delivery-yoke and with a magnet to check the rotation of the said delivery-yoke with the spindle, substantially as described.

401,283. TABLE-COVER FASTENER.

EDMUND B. KNAPP and HENRY L. THOMPSON, San Jacinto, Cal. Filed June 8, 1888. Serial No. 276,538. (No model.)

Claim.—1. In a fastener for table-top covers, the combination, with the flat band having its meeting ends secured together, of the detachable covering flap or plate provided with a transverse slot fitting over the said band and covering the joint between the meeting ends of the band, substantially as specified.



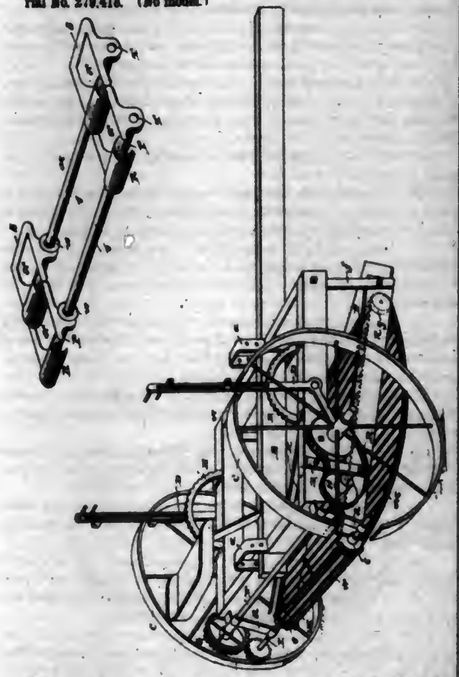
2. The fastener for table-top covers, consisting of a band having a longitudinal slot, G, and a vertical slot, E, in one end, the tongue on the opposite end passing through the vertical slot and a having a series of apertures registering with the slot G, and the staple passing through the apertures and the slot G and engaging the table-top, substantially as specified.

3. In a fastener for table-top covers, the metallic band having slots E and G therein, the apertured tongue passing through the slot

E and having its apertures aligned with the slot G, and the staple engaging the aligned apertures and slot, combined with the covering flap or plate having a vertical slot to receive the band and an aperture to receive a screw, substantially as specified.

401,284. FRAME FOR THE PILLOWS OF COFFINS.

CYRUS KRAMER, Leeper, Pa. Filed Mar. 22, 1888. Serial No. 268,040. (No model.)



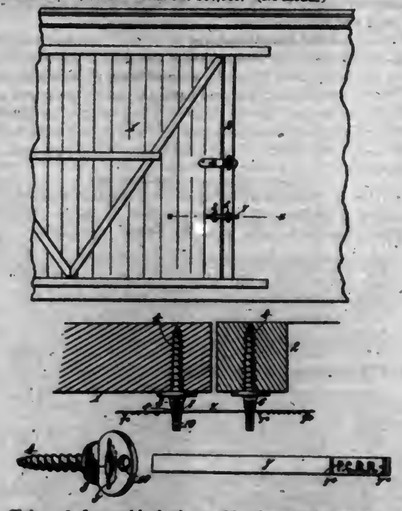
Claim.—1. The combination, with a pillow, of a frame consisting of an arc having its sides prolonged substantially parallel with each other and open at their ends, substantially as herein described.

2. A frame for a pillow, composed of two flexibly and contractibly adjustable sections united by a sleeve which conceals the joint, substantially as herein described.

3. A frame for a pillow, formed as an arc with its sides prolonged and provided with perforated flanges, whereby it may be sewed to a pillow, for the purpose set forth.

401,285. POTATO-DIGGER.

JOHN W. LOREE, Fenwick, assignor of one-half to D. W. Loree, Ridgeway, Mich. Filed July 9, 1888. Serial No. 279,418. (No model.)



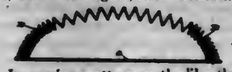
Claim.—1. In a machine for digging potatoes and the like, the combination, with the main frame, of the central vertical loops, the draft-beam placed therein, the plow-frame depending from the main frame on hangers, the endless elevator, the supporting-wheels journaled on angular levers, the gearing and drive belts, the segmental racks, and the spring-dog in the said hand-levers, substantially as specified.

2. The combination, with the main frame having the vertical loops, as described, of the angular levers D, pivoted to the said frame and carrying spindles at their lower branches, the supporting-wheels having fixed pulleys or gears and arranged on the spindles of the angular levers, the segmental racks on the main frame, an endless elevator, and the shaft I, receiving the endless elevator, the shaft F, and the intermeshing gears on the respective shafts, substantially as specified.

3. The endless elevator composed of the links having cross-bars at one end and hooks at the opposite ends and eyes between the hooks and cross-bars, and the transverse rods having shoulders near their opposite ends and adapted to enter the eyes in the links, the whole designed to serve in a machine for digging potatoes or peanuts, substantially as specified.

401,286. SEAL-LOCK.

WASHINGTON I. LUDLOW, Cleveland, Ohio. Filed Oct. 9, 1888. Serial No. 287,665. (No model.)

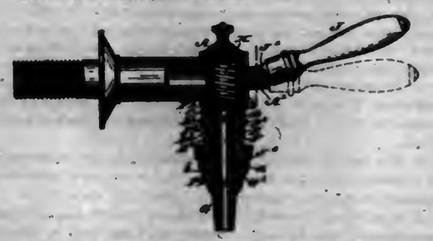


Claim.—1. In a seal-lock, the combination of a slotted plate rigidly secured to a door-casing, and a similar but independent slotted plate rigidly secured to and movable with an opening and closing door, with a thin straight metallic strip passing through the slots of the plates and having its projecting ends embossed or stamped with letters or other designs, substantially as described.

2. In a seal-lock, the combination, with plates having slots of greater length upon one side than upon the other, of a thin metallic seal-slip inserted in said slots and having its projecting ends embossed with suitable characters, substantially as described.

401,287. SPRING MATTRESS, PILLOW, &c.

ANDREW J. LITTLE, Hillsborough, Ohio. Filed Aug. 20, 1888. Serial No. 283,285. (No model.)



Claim.—1. In a spring-mattress or the like, the combination, with the spring D, having the closely-coiled end portions and the intervening integral portion formed of expanded coils, of the base a, connected to the outer ends of the closely-coiled portions, substantially as specified.

2. In a spring-mattress, the combination, with the springs D, having the closely-coiled end portions and the intervening portions formed of integral expanded coils, of the base a, connected to the outer ends of the closely-coiled portions, and the pad b, provided with eyelet-holes and covering said springs, substantially as specified.

401,288. SELF-CLOSING FAUCET.

KARL MAIER, Philadelphia, Pa., assignor of one-third to Louis Frik, same place. Filed Sept. 12, 1888. Serial No. 285,261. (No model.)

Claim.—1. A self-closing faucet consisting of a shell with a chamber, a thimble and sleeve connected to the shell, a tube within said thimble and sleeve having perforations affording communication between the chamber and the interior of the tube, and side vents opening the interior of the tube to the atmosphere, a spring within the tube bearing against the head of the tube, and a nozzle connected to the

tube, the said vents coinciding with the lower edge of the said sleeve when the faucet is closed, substantially as described.

2. A self-closing faucet having a shell with a chamber, a sliding tube projecting from said shell and having side vents and a bore, the latter communicating with the said chamber when the upper closed end of said tube is raised from its seat, a spring in said chamber bearing against said tube, and a nozzle secured to the said tube below the said vents, the said vents being uncovered when the cock is closed, said parts being combined substantially as described.

3. A self-closing faucet consisting of the shell A, with chamber B therein, the thimble D, secured to shell A, the collar E, secured to said thimble, the sliding tube F, having a closed head, F', with side openings, F^2, below said head, said head having a seat on the top of said thimble D, the spring H in said chamber B bearing against said sliding tube, the nozzle G, secured to said tube F, and the pivoted handle J, with link J^3 and annulus J^3, said parts being combined substantially as described.

401,289. SECONDARY BATTERY. WILLIAM MAIN, Brooklyn, N. Y., assignor to the River and Rail Electric Light Company, of West Virginia. Filed Jan. 10, 1889. Serial No. 295,956. (No model.)

Claim.—1. A secondary battery the hydrogen pole-piece whereof is composed in whole or in part of zinc and wherein mercury is present either in solution or as a constituent of the hydrogen pole-piece, the plates of which battery are in close proximity and horizontally placed, one or more of the hydrogen-plates being immediately below an oxygen element, said horizontal disposition facilitating the even distribution of precipitated metal upon the hydrogen-plates and preventing the accretion upon the hydrogen-plate of short-circuiting formations, substantially as described.

2. A secondary battery whereof the active material of the hydrogen pole-piece consists of mercury electrolytically combined with zinc, the electrolytic formation being more or less built up during charge and broken down during discharge, the plates whereof are in close proximity and horizontally placed, said horizontal disposition facilitating and promoting the even distribution of the electrolytic formation upon the hydrogen-plates and preventing the accretion thereon of short-circuiting formations, substantially as described.

3. A secondary-battery cell containing but a single pair of elements, the hydrogen element being composed in whole or in part of zinc and lying upon the bottom of the cell, mercury being present either in solution or as a constituent of the hydrogen element, the oxygen element being supported immediately above the hydrogen element in a position substantially parallel therewith and in close proximity thereto, the horizontal disposition of the elements facilitating the even distribution of precipitated metal upon the hydrogen element and preventing the accretion thereon of short-circuiting formations, substantially as described.

4. A secondary battery-cell containing but a single pair of elements, the hydrogen element being composed in whole or in part of zinc, mercury being present either in solution or as a constituent of the hydrogen element, the oxygen element being of lead and supported immediately above the hydrogen element in a position substantially parallel therewith and in close proximity thereto, the horizontal disposition of the elements facilitating the even distribution of precipitated metal upon the hydrogen element and preventing the accretion thereon of short-circuiting formations, substantially as described.

5. As a pair of elements for a secondary battery, amalgamated zinc constituting the hydrogen element and a laminated perforated plate constituting the oxygen element, substantially as described.

6. As a pair of elements for a secondary battery, amalgamated zinc constituting the hydrogen element and a laminated perforated lead plate constituting the oxygen element, substantially as described.

7. As a pair of elements for a secondary battery, a horizontal mass of amalgamated zinc constituting the hydrogen element and a laminated perforated plate constituting the oxygen element, substantially as described.

8. As a pair of elements for a secondary battery, a horizontal mass of amalgamated zinc constituting the hydrogen element and a laminated perforated lead plate constituting the oxygen element, substantially as described.

9. As a pair of elements for a secondary battery, amalgamated zinc constituting the hydrogen element and a laminated perforated plate having one or more layers of carbon between the laminæ constituting the oxygen element, substantially as described.

10. As a pair of elements for a secondary battery, amalgamated zinc constituting the hydrogen element and a laminated perforated lead plate having one or more layers of carbon between the laminæ constituting the oxygen element, substantially as described.

11. As a pair of elements for a secondary battery, amalgamated zinc constituting the hydrogen element and a laminated perforated plate having one or more layers of powdered graphite between the laminæ constituting the oxygen element, substantially as described.

12. A secondary-battery cell having a pair of elements, one consisting of amalgamated granulated zinc and the other of a pole-piece supported above the same and at all points substantially equidistant therefrom, substantially as described.

13. A secondary or storage battery having a pair of horizontally-disposed elements, the active material of one of said elements consisting of an electrolytically-formed layer of zinc and mercury formed upon a substratum of zinc granules, substantially as described.

14. A secondary-battery cell having two elements, one consisting of granulated zinc lying in the bottom of the cell and the other of a pole-piece supported above the same and being at all points substantially equidistant from the other element, substantially as set forth.

15. A secondary-battery cell adapted to contain two horizontally-placed pole-pieces, one of said pole-pieces consisting of granulated material lying in the bottom of the cell and the other of a laminated plate or plates suspended above the same, substantially as set forth.

16. In a secondary battery, a hydrogen pole-piece made up of granulated material horizontally placed and held in position by a perforated plate placed over it, substantially as set forth.

17. In a secondary battery, a hydrogen pole-piece made up of amalgamated granulated zinc horizontally placed and held in place by a perforated zinc plate, substantially as set forth.

18. In a secondary battery, the combination of insulating-block F, serving to prevent contact between the conductor and the oxygen element, and corner-piece G, upon which the block F rests, substantially as described.

19. The cell A, provided with supporting corner-pieces for the plate, substantially as set forth.

20. A battery-plate made up of several metallic laminæ, one or more of which is coated with finely-divided material conductive of electricity and inactive in the battery, substantially as described.

21. A compound plate for secondary batteries, made up of laminæ fastened together and having one or one layers of conductive material inactive in the battery held between the laminæ, substantially as described.

22. A compound plate for secondary batteries, made up of laminæ fastened together and provided with perforations and having one or more layers of conductive material inactive in the battery held between the laminæ, substantially as described.

23. In a secondary battery, a perforated plate made up of laminæ fastened together and having one or more layers of carbon held between them, substantially as described.

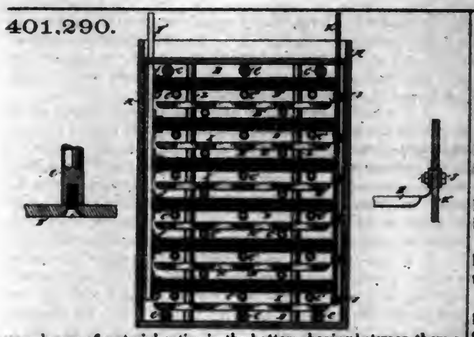
24. A compound plate for secondary batteries, made up of laminæ fastened together and having one or more layers of carbon held between them, substantially as described.

25. In a secondary battery, a compound plate one or more of the layers of which are coated with finely-divided carbon, substantially as set forth

26. In a secondary battery, a compound plate one or more of the layers of which are coated with graphite, substantially as set forth.

27. A battery-plate made up of alternate layers of oxidized lead and finely-divided carbon, substantially as set forth.

28. A battery-plate made up of layers one or more of which are coated with graphite in a state of fine subdivision, substantially as set forth.



29. A secondary or storage battery element made up of pieces of material intended to be active in the battery in metallic state, said pieces being coated with finely-divided carbon and fastened or suitably associated together to form the element, substantially as described.

30. A secondary or storage battery element made up of pieces of lead in metallic state, said pieces being coated upon their surfaces with graphite and suitably fastened or associated together to form the element, substantially as described.

401,290. SECONDARY BATTERY. WILLIAM MAIN, Brooklyn, N. Y., assignor to the River and Rail Electric Light Company, of West Virginia. Filed Jan. 10, 1889. Serial No. 295,959. (No model.)

Claim.—1. In a laminated secondary-battery element, two or more layers of material active in the battery, having between them a layer of carbonized cloth or other fabric, substantially as described.

401,290.

2. In a secondary-battery element, two or more layers of material active in the battery, having between them a layer of cloth or other fabric carbonized at a high degree of heat, substantially as described.

3. In a secondary-battery element, two or more layers of material active in the battery, having between them a layer of carbonized fabric, the compound plate so formed being perforated, substantially as described.

4. In a secondary-battery element, two or more layers of material active in the battery, having between them a layer of carbonized cotton cloth, substantially as described.

5. In a battery-cell, a frame-work for supporting the elements, consisting of two plates connected by rods of insulating material, in combination with oxygen and hydrogen elements supported thereon, substantially as described.

6. In a secondary-battery cell, a set of negative elements electrically connected to each other, a set of positive elements connected to each other, and a rack removable from the cell for supporting the elements, substantially as described.

7. In a battery-cell, a set of negative elements, a set of positive elements, and a rack formed of vertical plates of insulating material connected by rods for supporting the elements, also of insulating material adapted to receive the set of negative elements on one side and the set of positive elements on the other side thereof, substantially as described.

8. The combination, in a battery-cell, of a removable element-supporting rack and a set of elements of like name in the form of horizontal plates connected together so that they can be removed as a unit from the rack, substantially as described.

9. In a battery-cell, a rack consisting of two plates suitably connected to each other and provided with glass rods or tubes supporting the plates and elements resting upon said rods, substantially as described.

10. The combination of the cell A, a rack formed of plates B, connected by rods C and supporting-rods C', of insulating material, and oxygen and hydrogen elements D E, substantially as set forth.

11. A secondary battery having as an element a horizontal copper tray containing granulated electro-positive material, substantially as described.

12. In a secondary battery containing mercury, a plate or tray serving as a support made of rolled copper, substantially as described.

13. A secondary-battery element consisting of a copper tray or plate and amalgamated zinc supported thereby.

14. A secondary-battery element consisting of an amalgamated copper plate or tray supporting granulated material, substantially as described.

15. A secondary-battery element consisting of a perforated tray the perforations of the tray having upwardly-projecting rims or edges and the tray containing amalgamated zinc, substantially as described

16. As a pair of elements for a secondary battery, a lead plate constituting the oxygen element and a copper plate supporting amalgamated zinc constituting the hydrogen element, substantially as described.

17. A secondary battery in which the elements are horizontally arranged, the oxygen elements being of lead and alternating with hydrogen elements of amalgamated zinc, substantially as described.

18. A secondary battery in which the oxygen elements are of lead horizontally placed and alternating with trays supporting amalgamated zinc, substantially as described.

19. A secondary battery in which the oxygen elements are of lead horizontally placed and alternating with copper trays containing amalgamated zinc, substantially as described.

20. A secondary battery in which the oxygen elements are of lead horizontally placed and alternating with perforated copper trays containing amalgamated zinc, substantially as described.

21. As a pair of elements for a secondary battery, a horizontal lead plate constituting the oxygen element and amalgamated zinc constituting the hydrogen element.

22. As a pair of elements for a secondary battery, a horizontal lead plate constituting the oxygen element and amalgamated granulated zinc constituting the hydrogen element.

23. As a pair of elements for a secondary battery, a horizontal lead plate constituting the oxygen element and a copper tray containing granulated zinc constituting the hydrogen element.

24. As a pair of elements for a secondary battery, a horizontal lead plate constituting the oxygen element and a copper tray containing amalgamated granulated zinc as the hydrogen element.

25. As a pair of elements in a secondary battery, a horizontal lead plate constituting the oxygen element and a perforated copper tray containing granulated zinc constituting the hydrogen element.

26. As a pair of secondary-battery elements, a horizontal lead plate constituting the oxygen element and a perforated copper tray containing amalgamated granulated zinc constituting the hydrogen element.

27. In a secondary battery, an element consisting of a perforated copper plate or tray serving as a support for the active material, the perforations having upwardly-projecting rims or edges, substantially as described.

28. In a secondary battery, an element consisting of amalgamated zinc and a metallic plate or tray serving as a support for the same, substantially as described.

29. In a secondary battery, an element consisting of finely-divided zinc and a horizontal metallic plate or tray serving as a support for the same, substantially as described.

30. In a secondary battery, an element consisting of amalgamated zinc and a horizontal metallic plate or tray serving as a support for the same, substantially as described.

31. In a secondary battery, an element consisting of amalgamated zinc placed in a horizontal layer upon a supporting-plate or tray of conducting material electrically connected with one of the binding-posts of the battery-cell, substantially as described.

32. In a secondary battery, a series of oxygen and hydrogen elements placed vertically one above the other in a single cell, the hydrogen elements consisting of metallic plates or trays containing amalgamated zinc, substantially as described.

33. In a secondary battery, a series of oxygen and hydrogen elements placed vertically one above the other in a single cell, the hydrogen elements consisting of metallic plates or trays containing finely-divided zinc, substantially as described.

34. In a secondary battery, a series of oxygen and hydrogen elements placed vertically one above the other in a single cell, the hydrogen elements consisting of copper plates or trays containing finely-divided zinc, substantially as described.

35. In a secondary battery, a series of oxygen and hydrogen elements placed vertically one above the other in a single cell, the hydrogen elements consisting of copper plates or trays containing amalgamated zinc, substantially as described.

36. In a secondary battery, a series of oxygen and hydrogen elements placed vertically one above the other in a single cell, the hydrogen elements consisting of perforated copper plates or trays containing amalgamated zinc, substantially as described.

37. A secondary-battery element consisting of a plate or tray of material substantially inert in the electrolyte and having a mass of finely-divided metal conformed thereto and solidified thereon in the presence of mercury, substantially as described.

38. A secondary-battery element consisting of a horizontal plate or tray of material substantially inert in the electrolyte and having a mass of zinc conformed thereto and solidified thereon in the presence of mercury, substantially as described.

401,291. PROCESS OF PREPARING ELECTRODES FOR SECONDARY BATTERIES. WILLIAM MAIN, Brooklyn, N. Y., assignor to the River and Rail Electric Light Company, of West Virginia. Filed Jan. 10, 1889. Serial No. 295,960. (No model.)

Claim.—1. The process of preparing a secondary-battery pole-piece, which consists in subjecting a layer of granulated zinc to the action of an electrical current in an electrolyte and in the presence of mercury, thus causing a spongy formation of the zinc and mercury upon the granules of said layer, substantially as described.

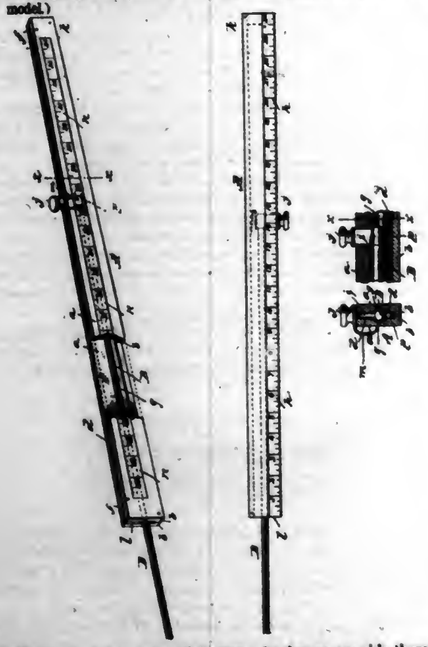
2. The process of preparing a secondary-battery pole-piece, which consists in immersing a layer of granulated zinc in a bath containing a solution of zinc and in the presence of mercury passing an electrical

current through the bath and the layer of zinc, thus forming a spongy deposit of zinc and mercury upon the granules of said layer, substantially as described.

3. The process of forming a secondary-battery pole-piece, which consists in immersing a layer of granulated zinc in a bath containing a solution of zinc and in the presence of mercury passing an electrical current through said battery and said layer of granulated zinc, thereby causing a deposit on the granules thereof of spongy mercury and zinc, and mechanically mixing said granules and said spongy deposit, substantially as set forth.

4. The process of preparing a secondary-battery pole-piece, which consists in subjecting a layer of granulated zinc to the action of an electrical current in an electrolyte in the presence of mercury, thereby procuring a spongy electrolytic formation upon the granules of said layer, and mechanically mixing said granules and said spongy formation, substantially as described.

5. The process of forming up a compound plate for a secondary battery, which consists in coating one or more laminæ with carbon or equivalent material conductive of electricity and inactive in the battery, uniting the laminæ together, and subjecting the compound plate thus formed to the action of a current until the metal of the laminæ becomes wholly or partially oxidized, substantially as described.



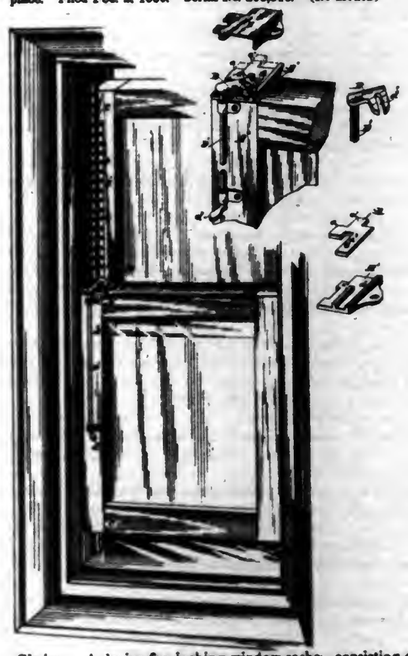
6. The process of forming up a compound plate for a secondary battery, which consists in covering the laminæ of the plates with finely-divided carbon, uniting the laminæ together, and subjecting the compound plate that is thus formed to the action of a current until the metal of the laminæ becomes wholly or partially oxidized, substantially as described.

7. The process of forming up a compound plate for a secondary battery, which consists in covering the laminæ of the plates with finely-divided graphite, uniting the laminæ together, and subjecting the compound plate that is thus formed to the action of a current until the metal of the laminæ becomes wholly or partially oxidized, substantially as described.

8. The process of forming a secondary-battery plate, which consists in placing finely-divided material upon a proper support and subjecting it to the action of a current in an electrolytic bath in the presence of mercury until it becomes solidified into a coherent mass, substantially as described.

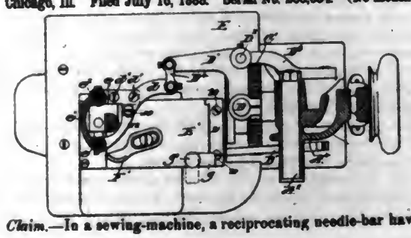
9. The process of forming a secondary-battery plate, which consists in placing finely-divided zinc upon a proper support and subjecting it to the action of a current in an electrolytic bath in the presence of mercury until it becomes solidified into a coherent mass, substantially as described.

401,292. **EXTENSIBLE MEASURING-STICK.** CHARLES M. MUNFORD, Springfield, Mass. Filed Jan. 26, 1889. Serial No. 297,672. (No model.)



Claim.—1. A measuring-stick proper having on one side thereof a scale to indicate the length and subdivisions of the length thereof, and having therein a longitudinal channel, *d*, provided with the grooves *g g* in the opposing walls thereof, and the end abutments, *f f*, combined with an extension-bar movable in said grooves *g g*, provided with the neck *i*, projecting through said channel *d*, and having a head, *j*, substantially as and for the purpose described.

2. A measuring-stick proper having on one side thereof a scale to indicate the length and subdivisions of the length thereof, and having therein a longitudinal channel, *d*, provided with the grooves *g g* in the opposing walls thereof, and the end abutments, *f f*, combined with an extension-bar movable in said grooves *g g*, provided with the neck *i*, projecting through said channel *d*, and having a head, *j*, and a pointer, *m*, adapted to measure with a scale, *n*, which is also made on said measuring-stick, substantially as and for the purpose described.



3. A measuring-stick proper composed of a pair of side strips, *a a*, each provided at one edge with a rib, *b*, said strips being secured together and forming the channel *d*, and the blocks *f f* between the ends of said side strips, and the grooves *g g*, formed in the inner end walls of said strips, combined with the extension-bar B, movable in said grooves *g*, provided with the neck *i* and head *j*, and a friction-spring secured on said extension-bar, movable therewith and bearing by its free end upon the bottom of said channel, substantially as and for the purpose described.

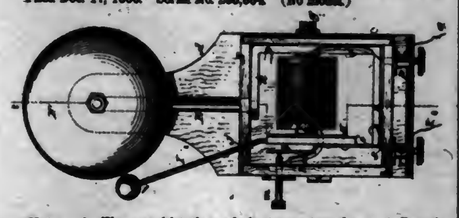
401,293. **SASH-FASTENER.** WILLIAM H. MURPHY, Cleveland, Ohio, assignor to himself, William Kanitzer, and Matthias Laven, same place. Filed Feb. 2, 1889. Serial No. 298,516. (No model.)

Claim.—A device for locking window-sashes, consisting of recesses in the parting-strip which separates the sashes of a window, recesses in the stile of the upper sash of the window, a guide-plate, a sliding bolt adapted to enter the recesses in the parting-sash strip and the stile of the upper window-sash, and an arm for throwing the sliding bolt, all arranged substantially as described.

401,294. **NEEDLE-VIBRATING MECHANISM FOR SEWING-MACHINES.** LORENZ MUTHER, Chicago, and RUSSEL G. WOODWARD, Waukegan, assignors to The Union Special Sewing Machine Company, Chicago, Ill. Filed July 16, 1888. Serial No. 280,084. (No model.)

Claim.—In a sewing-machine, a reciprocating needle-bar having an eye-pointed needle, a pivoted needle-guide, *c'*, an arm, *d*, pivotally attached thereto, an elbow-lever, D', and a link-connection between it and the arm *d*, and a link, 12, intermediate said arm and needle-guide, combined with a cam to vibrate the said elbow-lever and reciprocate the needle-guide laterally, and with the gears C C' to operate the cam, substantially as described.

401,295. **VELOCIPEDE.** MALCOLM A. NORTON, Hartford, Conn. Filed Dec. 20, 1888. Serial No. 294,169. (No model.)

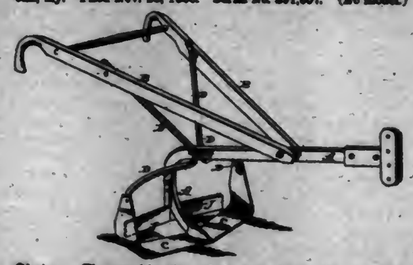


Claim.—1. A velocipede-frame consisting of the central section, 1, provided with the adjustable saddle-support 21 and the adjustable bracket 32 at or near its upper and lower ends, respectively, the V-shaped sections 2 and 3, fixed to the central section by the clamps 4 and 5 between those ends, and the reach 6, fixed to the central section, 1, between the clamps 4 and 5 by the clamp 7, all substantially as described.

2. The combination of the velocipede-fork 8, each side of which consists of the sub-bifurcations 9 and 10, with the spring 13, supporting one pair of those sub-bifurcations, and a corresponding spring supporting the other pair thereof, and with the axle of a velocipede-wheel supporting those springs, all substantially as described.

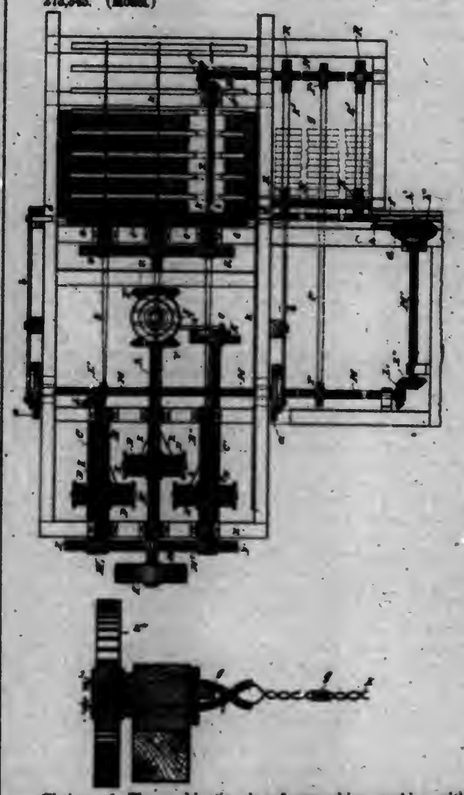
3. The combination of the axle-sections 23 and 24, longitudinally adjustable together and fixed at their outer ends to opposite sections of a velocipede-frame, the hub 27, provided with the ball-bearing boxes 28, revolving on those axle-sections and between those frame-sections, and two series of balls turning in bearings between those ball-bearing boxes and those frame-sections, respectively, all substantially as described.

4. The combination of the shaft 36, provided with the hubs 40 and 41, the ball-bearing boxes 42 and 43, inclosed within those hubs and one or both of them adjustable therein, the bushings 45 and 48, fixed in opposite ends of the bracket 32, and two series of balls turning in bearings between those ball-bearing boxes and those bushings, respectively, all substantially as described.



401,296. **ELECTRICAL CALL-BELL.** JOSEPH G. HOYER, New York, N. Y., assignor to the New Haven Clock Company, same place. Filed Dec. 17, 1888. Serial No. 293,894. (No model.)

Claim.—1. The combination of the open box-frame A B, yoke D, standard E, bell F, single magnet G, single screw *g*, that passes through the frame B and yoke D and into the magnet G, said screw thereby holding said parts B D G together and establishing a metallic connection between the core of the magnet and the yoke, armature H, perpendicular to the single magnet, spring *i*, clapper I on the armature-spring *i*, screw *m*, for engagement with the spring *i*, conductor *n*, connecting the screw *m* with one terminal of the magnet, conductor *o*, post *p*, connected with the magnet by the conductor *o*, post *r*, and conductor *s*, connecting the post *r* with the yoke D, all arranged substantially as herein shown and described.



2. The open box-frame B and removable back A, combined with the yoke D, L-shaped standard E, and bell F, the standard being screwed into the yoke D before the back A is applied to the frame B, so that the standard cannot be separated from the yoke while the back A is in position, substantially as described.

401,297. **AGRICULTURAL IMPLEMENT.** ROBERT OWEN, Paducah, Ky. Filed Nov. 23, 1888. Serial No. 291,657. (No model.)

Claim.—The combination of the bent beam, the cutter having upturned ends and secured at its center to the lower end of the beam, the braces D, bolted to the beam at or near their centers and having their ends secured to the ends of the cutter and to the handles, and the handles supported at their rear ends by the braces, substantially as shown.

401,298. **FENCE-MAKING MACHINE.** ARTHUR A. PARKER and JOHN F. LANDERS, Jersey City, N. J. Filed May 9, 1888. Serial No. 273,343. (Model.)

Claim.—1. The combination, in a fence-making machine, with a supporting-frame, a revoluble main shaft journaled in said frame, a spur-wheel and pulley mounted upon one end of said shaft without said frame, and a bevel cog-wheel mounted upon the other end of said main shaft within said frame, of parallel auxiliary shafts mounted in bearings upon said frame above said main shaft, a train of spur-wheels mounted upon said auxiliary shafts meshing together, and one of them meshing into the spur-wheel upon said main shaft, spools mounted upon said auxiliary shafts, upon which wire may be wound, to be conducted through conduits in the inner ends of said auxiliary shafts, another auxiliary shaft journaled in bearings upon said frame, a spur-wheel upon one end of such shaft without said frame and meshing into the spur-wheel on said main shaft, a disk-wheel having an eccentric groove in its face, mounted upon the other end of said shaft within the said frame and connected to a segmental spur-wheel

by a connecting-bar, said connecting-bar, said segmental spur-wheel mounted upon a shaft journaled in said frame and connected, as aforesaid, with said disk-wheel, whereby facility is afforded to oscillate said segmental wheel, another segmental wheel attached to an oscillating shaft and meshing into said first-mentioned segmental wheel, said oscillating shaft mounted upon a cross-shaft and carrying upon its upper end a beveled gear-wheel, meshing into the wheel upon the inner end of said main shaft, said bevel-wheel supported by said oscillating shaft and said cross-shaft, said cross-shaft being journaled in the center of said main shaft, and in a short shaft journaled in said frame opposite said main shaft, a bevel-wheel mounted upon one end of said short shaft and meshing into the bevel-wheel upon said oscillating shaft, a spur-wheel mounted upon the other end of said short shaft and meshing into an intermediate spur-wheel mounted upon a shaft secured in said frame, a train of spur-wheels mounted upon parallel shafts meshing together, and one of them meshing into said intermediate wheel, a series of parallel shafts journaled in bearings on said frame and upon which the wheels of said train are mounted, the said parallel shafts having conduits through which the wires from said spools are conducted to twisting-fingers, and a pair of helically-bent twisting-fingers mounted upon the end of each of said shafts and composed of tubes through which said wires pass to afford facility for twisting the same, all substantially as and for the purpose set forth.

2. The combination, in a fence-making machine, with a supporting-frame, a revoluble main shaft journaled in said frame, a spur-wheel mounted upon one end of said shaft without said frame, and a bevel-wheel mounted upon the other end of said main shaft within said frame, of an auxiliary shaft journaled in bearings on said frame, a spur-wheel mounted upon one end of said shaft without said frame and meshing into the spur-wheel upon said main shaft, a disk-wheel having an eccentric groove in its face, mounted upon the other end of said shaft within said frame, a connecting-bar connecting said disk-wheel and a segmental spur-wheel, a shaft journaled in said frame, whereon said segmental wheel is mounted, the construction and arrangement of said disk-wheel, said connecting-bar, and said segmental wheel being such as to afford facility for oscillating said segmental wheel, another segmental spur-wheel mounted upon the lower end of an oscillating shaft and meshing into the first-named segmental wheel, said oscillating shaft carrying said segmental wheel and moving upon a cross-shaft journaled in the center of said main shaft by one end, and by the other end in the center of a short shaft journaled in said frame opposite to and concentric with the said main shaft, so that the periphery of the segmental wheel upon said oscillating shaft and the oscillating motion of said shaft shall be concentric with said main shaft, a bevel-wheel mounted upon the upper end of said oscillating shaft, meshing into the bevel-wheel on the end of said main shaft and actuated thereby, a bevel-wheel mounted upon the end of said short shaft and meshing into the bevel-wheel upon said oscillating shaft, the said three bevel-wheels, said oscillating shaft, said two segmental wheels and the connecting-bar being so arranged and combined that although the main shaft and the bevel-wheel mounted upon it is in continual rotation in one direction, and the bevel-wheel on the oscillating shaft is also in continuous rotation, the rotary motion is only communicated by the bevel-wheel on said oscillating shaft to the bevel-wheel on the short shaft, as said wheel is carried one way by the motion of said oscillating shaft, and when moving the other way this bevel-wheel on the oscillating shaft rolls over the wheel on the short shaft and imparts no motion to it, thus an intermittent motion is produced and the said wheel on the said short shaft, the said short shaft, and all the mechanism propelled by them are periodically still and periodically in motion at regular intervals, substantially as and for the purpose set forth.

3. The combination, in a fence-making machine, with a supporting-frame, a revoluble main shaft journaled in bearings in said frame, a spur-wheel mounted upon said main shaft without said frame, an auxiliary shaft also journaled in bearings in said frame, a spur-wheel mounted upon one end of said auxiliary shaft without said frame and meshing into the spur-wheel upon said main shaft, and a bevel-wheel mounted upon the other end of said auxiliary shaft within said frame, of a cross-shaft journaled in bearings upon said frame at right angles to said auxiliary shaft, a bevel-wheel mounted upon said cross-shaft and meshing into the bevel-wheel upon the end of said auxiliary shaft, two disk-wheels mounted upon said cross-shaft, each having an eccentric groove in its face, an oscillating frame reaching over the upper part of said machine, pivoted by its lower part to the lower part of said supporting-frame, connecting-bars pivotally attached to said oscillating frame, and by means of friction-rollers working in the eccentric grooves of said disk-wheels, connecting them with said oscillating frame, and downwardly-projecting fingers attached to the upper part of said frame, and constructed and arranged to push pickets out of said machine when the same have been properly placed to receive wire to be twisted upon them, substantially as and for the purpose set forth.

4. The combination, in a fence-making machine, with a revoluble main shaft journaled in bearings upon the supporting-frame of said machine, a spur-wheel mounted upon said main shaft, an auxiliary shaft journaled in bearings in said frame, parallel to the said main shaft, a spur-wheel mounted upon one end of said auxiliary shaft without said frame and meshing into the spur-wheel upon said main shaft, and a bevel-wheel mounted upon the other end of said auxiliary shaft within said frame, of a cross-shaft journaled in said frame at right angles to said auxiliary shaft, a bevel-wheel mounted upon said cross-shaft and meshing into the bevel-wheel upon said auxiliary shaft, another bevel-wheel mounted upon the end of said cross-shaft, an inclined shaft also mounted in bearings in said frame, and extending upward diagonally above the upper part of said machine, a bevel-wheel mounted upon the lower end of said inclined shaft and meshing into the bevel-wheel on the end of said cross-shaft, a disk-wheel upon the upper end of said inclined shaft, an eccentric groove in the face of said disk-wheel, a slide moving in a groove in the top of said machine and propelled by a connecting-bar, coupling it to the eccentric of said disk-wheel, so that facility is afforded for pushing pickets into said machine, substantially as hereinbefore specified, a pulley mounted upon the said cross-shaft, another cross-shaft journaled in the frame of said machine parallel to the first-named cross-shaft, a pulley mounted upon said last-named cross-shaft and connected by a belt with the pulley on said first-named cross-shaft, a bevel-wheel mounted on the end of said last-named cross-shaft, an auxiliary shaft journaled in said frame at right angles to the cross-shaft, a bevel-wheel on one end of said auxiliary shaft meshing into the bevel-wheel on the said cross-shaft, a pulley on the other end of said auxiliary shaft, and three other pulleys arranged on proper bearings on the frame of said machine, a belt running over the said pulleys, and so arranged that it will be in proper position to engage and carry a picket into said machine, and springs arranged to press said picket down upon said belt as it passes into said machine, substantially as and for the purpose set forth.

5. In a fence-making machine, the combination, with the revolving main shaft A, journaled in bearings on the frame of said machine, the bevel-wheel V, mounted upon said main shaft, the shaft C', mounted upon said frame, as specified, and connected with said main shaft by means of a gear-wheel on each shaft meshing together, and an eccentric wheel upon said shaft C', of the short shaft S', journaled, as specified, in the main shaft A, and the short shaft T', the oscillating shaft S', mounted upon said shaft S', the bevel-wheel S, mounted upon said oscillating shaft S' and meshing into said wheel V, the bevel-wheel T, mounted upon the said shaft T' and meshing into the wheel S, the segmental wheel $S^{\times}$, mounted upon the lower end of said oscillating shaft S', the shaft T^{4}, journaled in said frame, as specified, the segmental wheel $T^{\times}$, mounted thereon, and meshing with the segmental wheel $S^{\times}$, the bar $K^{\times}$, connecting said segmental wheel and said eccentric wheel upon said shaft C', the shaft T', journaled in the frame of said machine and having the axis coincident with the said main shaft, and a train of wheels connecting said shaft T' with the twisting-heads of the machine, and all so constructed and arranged that, by means of said mechanism, when the said main shaft is continuously turned in one direction an intermittent rotary motion will be imparted to the said twisting-heads, substantially as and for the purpose set forth.

6. In a fence-making machine, the tubular helically-bent twisting-fingers i, mounted upon revoluble shafts journaled in the frame of said machine, and constructed and arranged substantially as and for the purpose set forth.

7. In a fence-making machine, the combination, with the supporting-frame X, the main shaft A, journaled in said frame, the pulley E, the spur-wheel G, and the bevel-wheel V, all mounted on said main shaft A, the shafts B B' B'', also journaled in said frame, the wheels H H' H'', mounted upon said shafts B B' B'', and the spools D, mounted upon the same shafts, of the said shafts, the shaft C, journaled in said frame, the spur-wheel I', mounted upon said shaft C and meshing into the wheel G, the disk-wheel K, mounted upon the same shaft C, the segmental wheel $T^{\times}$, mounted upon the shaft T^{4}, the bar $K^{\times}$, connecting the disk-wheel K and the segmental wheel $T^{\times}$, the shaft T^{4}, mounted in bearings in said frame and carrying the segmental wheel $T^{\times}$, the segmental wheel $S^{\times}$, mounted upon the lower end of the oscillating shaft S', mounted on the cross-shaft S'', the cross-shaft S'', journaled in the main shaft A, and the short shaft T'', the bevel-wheel S, mounted upon the oscillating shaft S' and meshing into the wheel V, the bevel-wheel T, mounted on the shaft T' and meshing into the bevel-wheel S, the shaft T'', journaled in said frame opposite to and concentric with said main shaft A, the spur-wheel T', mounted upon said shaft T'', the wheel $U^{\times}$, mounted upon a bearing secured to the frame of said machine and meshing into the wheels U' and T', the spur-wheels U U' U'', meshing together and mounted on short shafts journaled in the frame of said machine, the said shafts, and the twisting-fingers i, mounted thereon, all substantially as and for the purpose set forth.
